The first Portuguese minister whose wisdom was directed to the fostering of these islands was Pombal; 'he taught the Azoreans that they might become a people, and Portugal that she might cease to be a despot. During his mission, the islands were improved by his authority, adorned by his munificence, and extolled by his praise.' But the liberal administration of Pombal was succeeded by a sullen and bigoted ministry, composed of the most furious churchmen. A cabinet so formed, soon destroyed the foundations of the rising prosperity which had been laid during the former administration. The islands were inundated with bigoted ecclesiastics; a circumstance which was attended by the destruction of commerce, the extinction of arts and sciences, and the consequent introduction of indigence and barbarity. 'All the islands,' says a late historian, who had resided in the country, 'are under the religious dominion of a sordid and luxurious priesthood, and subject to the civil control of a licentious military power; to a government which condemns the country to a perpetual state of ignorance and sloth, and which confines the whole of its intercourse with the civilised world to the banks of the Tagus, or the port of Lisbon. For the last hundred and fifty years, the peaceable islanders have had to withdraw their eyes from the rest of the world, from every general public care, and fix them steadily and perpetually on the court of Portugal.' Such is, and such has long been the gloomy and miserable state of political degradation in which the Azores are sunk. The spirit of the people has been palsied by the arbitrary measures of the government; yet they are described by those who have been resident among them, as an honest race, who prefer peace to conquest, and who seek distinction in industry rather than in arms; as 'an innocent people, who are as eminent in the humble vale of domestic life, as the hero in the stormy regions of blood and warfare. Their whole happiness, however, consists in their domestic and personal comforts, for country they have none. They have no common principle of union; no common bond of action; they form a community not insensible to the ties of kindred, but uncemented by national feeling; a political blank in themselves, and comparatively useless to the parent state.' See *History of the Azores*, London, 1813.

In 1591 these islands were, for twelve successive days, shaken by violent concussions, and the Villa Franca entirely destroyed. A similar occurrence took place in 1757. There can

indeed be little doubt of their volcanic origin, and deep subterranean connexion with very active volcanoes. New islands have frequently been raised from the bottom of the sea, by the power of volcanic action. In 1720 one of these phenomena took place, on approaching which, the next day, an English captain observes, 'we made an island of fire and smoke; the ashes fell on our deck like hail and snow, the fire and smoke roared like thunder or great guns.' Another instance of this kind happened in 1811, near the western extremity of St. Michael, when flames were seen issuing from the sea, accompanied by volumes of smoke and showers of scoria and ashes. The rocks remained just below the surface, with the waves dashing violently over them, and soundings of 80 fathoms, were found almost close to the new island. The presence of subterraneous fire is also indicated by its effect on numerous springs throughout the islands. Some of these are so hot, that they burn the hand. These have of late been considerably resorted to as warm baths, which they answer the more conveniently, as a cold spring is always at hand. In other places, boiling fountains rise to a considerable height, and dissolve in vapor.

The Azores are discovered from a great distance, by a high mountain called the Pico, or peak, bearing a strong resemblance to the peak of Teneriffe, and rising about 7000 feet above the level of the ocean. Their whole appearance is mountainous, but many delightful and fertile valleys separate the rounded and conical hills, of which the greater part of their surface is composed. The islands are subject to violent winds, and the fury of the waves is sometimes injurious to the low grounds near the sea. Wheat, barley, Indian corn, and valuable woods are produced; but their chief produce is wine and fruits, both of which are exported in large quantities. The wine has some resemblance to Madeira, but is inferior in quality. The oranges are much esteemed.

The best vines are raised on the lofty sides of the Pico, from which wine is made, and exported through Fayal, by which name it is known. It is decidedly inferior to Madeira, but being 50 per cent. cheaper, obtains a considerable sale.

Pico exports a fine species of wood, little inferior to mahogany. The trade was formerly cramped, by being carried on through the medium of Portugal; but, since the emigration of the court, the inhabitants have begun to traffic directly with England and America; a circumstance that has much invigorated this commerce.

Angra, the chief town of Terceiras, is the seat of government: but Pentá del Gada, or the city of St. Michael, is the largest town of the islands, and the seat of the bishop and principal ecclesiastical authorities.

AZORES is also the name of a small group of islands of the Atlantic, north of St. Domingo.

AZORIUM, in old law Latin, azure.

AZOTE; from α , privative, and $\zeta\omega\omega$, I live; a name given by the French chemists to a species of air which is destructive of animal life; not fitted for respiration, it is also incapable of supporting combustion. It is said to form about

four-fifths of our atmosphere; but being there mixed with the remaining fifth of another air, having properties the reverse of its own, it becomes suited to our existence. See GAS NITROGEN.

AZOTH, in ancient chemistry, the first matter of mejals, or the mercury of a metal; more particularly that which alchemists call the mercury of philosophers which they pretended to draw from all sorts of metallic bodies.

AZOTH is also a name given to the philosopher's stone. When the Arabs began to study chemistry, their metaphorical and hieroglyphical manner of writing seems to have given rise to a practice of calling the means made use of for bringing metals to perfection, by the name of medicines, and imperfect metals by the name of sick men, and gold by that of a sound and lively person. Hence it was supposed, that these were to be understood literally, especially upon finding the impurities of the baser metals called by the name of leprosy; and hence rose the opinion, that the imperfect metals might be turned into gold, and the bodies of such men into sound ones, by the same preparation!

AZOTH, AZOTUS, or ASHOD, one of the five cities of the Philistines, and a celebrated sea-port on the Mediterranean, situated about fourteen or fifteen miles south of Ekron, between that and Ascalon. It was in this city that the idol Dagon fell down before the ark; and so strong a place was it, if we may believe Herodotus, that it sustained a siege of twenty-nine years by Psammiticus king of Egypt. It was, however, taken by the Maccabees in a much shorter time; who burnt both city and temple, and with them about 8000 men. The town is now called by the Arabs Hasaneyun. It is but thinly inhabited, though the situation is very pleasant. With regard to the houses, those that were built in the time of christianity, and which are now inhabited by Mahomedans, still preserve some claim to admiration; but the modern buildings, though generally of stone, have nothing in them which can attract the notice of a traveller. The streets are pretty broad, the inhabitants mostly Mahomedans, with a few christians of the Greek communion, who have a church under the jurisdiction of the archbishop of Gaza. The town is about a mile and a half in circumference; and has in it a mosque, a public bath, a market-place, and two inns. The number of the inhabitants is between 2000 and 3000. The most remarkable things in this place are an old structure with fine marble pillars, which the inhabitants say was the house that Sampson pulled down; and to the south-east, just out of the town, the water in which the Ethiopian eunuch was baptized by the evangelist Philip. There are several ancient buildings with capitals and pillars standing.

AZPEYTTIA, a town of Spain, in the province of Biscay, canton of Guipuscoa, on the river Urola. To this place belongs the village of Loyola, once the property of the celebrated father Ignatius Loyola, founder of the order of Jesuits.

AZPILCUETA (Martin), surnamed Navarre, was born at Verasoa, near Pampeluna, in Spain, in 1494. He was professor of law in several uni-

versities, and died at Rome in 1586. His works were printed at Lyons, in 6 vols. folio, 1597.

AZRAH-BEN-AREN, a town of the Arabian Irak, situated on the river Tigris, fifteen miles N.N.W. of Korna.

AZUA, a small town on the south side of the island of St. Domingo, seated on a deep bay.

AZUBAH, the daughter of Shilhi and mother of king Jehoshaphat.

AZUELA, a large river of South America, in the kingdom of Quito, which enters the Amazonas.

AZUL, a river of Mexico, in the country of the Apaches, which enters the Gila.

AZUL, RIO, or the BLUE RIVER, a river of North America, in California.

AZUM, a port of Abyssinia on the Red Sea.

AZURE, } Fr. *azur*; Ital. *azzurro*; from the
AZURED, } Arabic *hazul*, the name of a stone
AZURN. } brilliantly blue, but not transparent; sky-colored blue.

And on his shield enupoled sevenfold,
 He bore a crowned little erminil,
 That deckt the azure field with her faire pouldred skin.

Spenser's Faerie Queene, book iii. c. 2.

By whose aid

(Weak masters though ye be) I have bedimm'd
 The noon-tide sun, call'd forth the mutinous winds,
 And 'twixt the green sea and the azure vault
 Set roaring war.

Shakspeare. Tempest.

His spear

He walkt with, to support unacise steps
 Over the burning marle, not like those steps
 On heaven's azure. *Milton. Paradise Lost.*

By the rusky fringed bank,

Where grows the willow, and the osier dank,

My sliding chariot stays,

Thick set with agate, and the azurn sheen

Of turkis blue, and emerald green,

That in the channel strays. *Id. Comus.*

As when the noon, refulgent lamp of night,
 O'er heaven's clear azure spreads her sacred light;
 When not a breath disturbs the deep serene,
 And not a cloud o'ercasts the solemn scene:
 Around her throne the vivid planets roll,
 And stars unnumber'd gild the glowing pole.

Pope. Homer's Iliad.

How many bright

And splendid lamps shine in heaven's temple high,
 Day bath his golden sun, her moon the night,
 Her fix'd and wand'ring stars the azure sky.

Puffin's Trans. Tasso's Jerus. Delic.

AZURE STONE. Azure, among painters, which it present signifies a fine blue color resembling that of the sky, was formerly appropriated to lapis lazuli; which is thus defined: Lustre glistening; fine grained, uneven fracture. It scratches glass, but scarcely strikes fire with steel. Opaque, or translucent on the very edges. Easily broken. Specific gravity 2.85. In a very strong heat it intumesces, and melts into a yellowish black mass. After calcination it forms a jelly with acids. By a late and most interesting research of MM. Clement and Desormes, it appears to be composed of thirty-four silica, thirty-three alumina, three sulphur, and twenty-two soda. Ann. de Chimie, tom. 57.) In this analysis, however, a loss of eight per cent. was experienced. These chemists consider the above ingredients essential, and the 2 1/2 of lime, and 1 1/2 of iron, which they have occasionally met with, as accidental. The

best specimens are from China, Persia, and Great Bucharia. They are made red-hot in the fire, and thrown into water to render them pulverisable. They are then reduced to a fine powder, and intimately combined with a varnish, formed of resin, wax, and boiled linseed oil. This pasty mixture is put into a linen cloth, and repeatedly kneaded with hot water: the first water, which is usually dirty, is thrown away; the second gives a blue of the first quality; and the third yields one of less value. The process is founded on the property which the coloring matter of azure-stone has of adhering less firmly to the resinous cement, than the foreign matter with which it is associated. When azure-stone has its color altered by a moderate heat, it is reckoned bad. MM. Clement and Desormes consider the extraction of ultramarine as a species of saponification.

AZURE, in heraldry, the blue color in the arms of any person below the rank of a baron. In the escutcheon of a nobleman, it is called sapphire; and in that of a sovereign prince, Jupiter. In engraving, this color is expressed by lines or strokes drawn horizontally. M. Upton and his followers rank this color before gules. This color may signify justice, perseverance, and vigilance; but according to G. Leigh, when it is compounded with

Or	} it signifies	Cheerfulness.
Arg.		Vigilance.
Gul.		Readiness.
Ver.		Enterprise.
Pur.		Goodness.
Sab.		Mournfulness.

AZUREA, in entomology, a species of phryganea, with black wings, violet behind. Linn. The lower wings are obliquely violet. It inhabits the north of Europe. Also, in zoology, a species of lacerta that inhabits Africa.

AZUREUS, in entomology, a species of carabus, of an azure color, with red legs and antennae. It inhabits Leipsic. Fabricius. 2. A species of cimex, of a middle size; dull green color; and yellowish mouth and legs. Inhabiting Guinea. The abdomen is yellowish, with black dots in the middle.

AZURIN, in ornithology, a name assigned by Buffon, Hist. Ois. to the species of turdus, since called specifically cyanurus by Gmelin.

AZURITE, in mineralogy, a blue substance, which occurs principally in Styria. Its crystalline form, as well as some other of its other characters, distinguish it from lazulite, or, as it is more commonly termed, lapis lazuli, of which at its first discovery, it was regarded as a variety.

AZYGOS, in anatomy, a vein rising within the thorax, on the right side, having no fellow on the left; whence it is called *αζυγος*, or vena sine pari. See ANATOMY.

AZYMA, or **AZYMES**; from *α* negative, and *ζυμη*, ferment; the feast of unleavened bread among the Jews.

AZYME. Gr. *αζυμος*, without ferment; *α*, the privative, and *ζυμη*, ferment.

They had (they said, i. e. the translators of King James's Bible), on the one side, avoided the scrupulosity of the puritanes, who left the old ecclesiastica-

words and betook them to other, as when they put washing for baptism, and congregation for church; and on the other hand, had shunned the obscurity of the papists in their *azmes*, tunike, rational, holocausts, prepuce, pasche, and a number of such like, whereof their late translation was full, and that of purpose to darken the sense, that since they must needs translate the Bible, yet by the language thereof it might be kept from being understood.

Preface to King James's Bible.

AZYME, or AZYMUS, a term much used in the controversies between the Greek and Roman church; the latter of whom contend, that the bread in the mass ought to be azymus, unleavened, in imitation of the paschal bread of the Jews, and of our Saviour, who instituted the sacrament on the day of the passover. In the council of Florence it was decreed, that the point lay at the discretion of the church; and that either leavened or unleavened bread might be used. The Lutheran church uses unleavened bread to this day; and a respectable modern commentator says:—'If any respect should be paid to the primitive institution, in the celebration of this divine ordinance, then unleavened, unyeasted, bread should be used. In every sign or type, the thing signifying or pointing out that which is beyond itself, should either have certain properties, or be accompanied with certain circumstances, as expressive as possible, of the thing signified. Bread, simply considered in itself, may be an emblem apt enough of the body of our Lord Jesus, which was given for us; but the design of God was evidently that it should not only point out this, but also the disposition required in those who should celebrate both the antetype and the type; and this the apostle explains to be sincerity and truth (1 Cor. v. 6—8), the reverse of malice and wickedness. The very

taste of the bread was instructive; it pointed out to every communicant, that he who came to the table of God with malice or ill-will against any soul of man, or with wickedness, a profligate or sinful life, might expect to eat and drink judgment to himself, as not discerning that the Lord's body was sacrificed for this very purpose, that all sin might be destroyed, and that sincerity, *ελευθρινα*, such purity as the clearest light can discern no stain in, might be diffused through the whole soul; and that truth, the law of righteousness and true holiness, might regulate and guide all the actions of life'.—*Dr. Adam Clarke on the New Testament.*

AZYMITES, in church history, christians who administer the eucharist with unleavened bread. This appellation is given to the Latin church by the Greek, because the members of the former use fermented bread in the celebration of the eucharist. They also call the Armenians and Maronites by the same name, and for the same reason.

AZYMOUS, something unfermented, or made without leaven, as unleavened bread. Sea biscuit is of this kind; and therefore, according to Galen, less wholesome than bread that has been fermented.

AZZALUM, in the ancient physiology, a species of iron, reputed the most excellent of all, supposed to have been brought from India, whence it was called Indicum; but, in reality, according to some, brought from China.

AZZO (Portius), an Italian lawyer, was a native of Bologna, where he was chosen professor of jurisprudence in 1190. He wrote a work held in great estimation, entitled, *A Summary of the Code and the Institutes*. He died about 1220.

B.

B, the second letter of the English and most other alphabets. It is the first consonant, and first mute, and its pronunciation is supposed to resemble the bleating of a sheep.

B is also one of those letters which the eastern grammarians called *labial*, because the principal organs employed in its pronunciation are the lips. It is pronounced by pressing the whole length of them together, and forcing them open with a strong breath. It has a near affinity with the other labials P and V, and is often used for P, both by the Armenians and other Orientals, as in *Betrus* for *Petrus*, *apsens* for *absens*, &c.; and by the Romans for V, as *amabit* for *amavit*, *berna* for *verna*.

As a numeral, B was used by the Greeks and Hebrews to denote 2; but among the Romans for 300, and with a dash over it (thus B̄) for 3000.

B, is also an abbreviation, though rarely used as such.

In music B stands for the tone above A; as B^b, or ^bB, does for B flat, or the semitone major above. A B also stands for bass; and B C for *basso continuo*, or thorough bass.

BA, a small sea-port town of Africa on the Slave coast, where the Dutch have a factory.

BA, a river of Scotland, in Argyleshire.

BAA-BA, *v. n.* } Lat. *balo*, to cry like a
BAA. s. } sheep. The bleating of a sheep.

Therefore thou art a sheep;
Such another proof would make me cry *baa*.

Shakspeare.

BAADSTED, or BATSTED, a sea-port town in the province of Schonon, Sweden, situated in a bay of the Cattogat, ten miles north of Engelholm, sixteen south of Helmstadt. Long. 12° 45' E., lat. 56° 28' N.

BAAGOE, two small islands in the Baltic belonging to the crown of Denmark, the one lying between the islands of Zealand, Moen, and Fal-

ster. Long. 12° 3' E., lat. 54° 56' N. And the other in the Little Belt, lon. 9° 49' E., lat. 55° 19' N.

BAAL, [בַּעַל, Lord, Syr.] ΒΑΙ, or ΒΕΛΥ; an idol of the Chaldeans, and Phœnicians, or Canaanites. The former worshipped Mars under this name, according to Josephus: who, speaking of Thurus, the successor of Ninus, says, 'To this Mars, the Assyrians erected the first statue, and worshipped him as a god, calling him Baal.' It is probable from what is recorded, 2 Kings xxiii, 5, 11, that the Phœnicians worshipped the sun under the name of Baal. The temples consecrated to this god are called in scripture Chamanim, which signifies places enclosed with walls, in which was kept a perpetual fire. Maundrel, in his journey from Aleppo to Jerusalem, observed some traces of these enclosures in Syria. As the word baal, in the Punic language, signifies lord or master, it doubtless meant the supreme Deity, the Lord and Master of the universe. It is often joined with the name of some false god, as Baal-berith, Baal-peor, Baal-zephon, &c. This deity passed from the Phœnicians to the Carthaginians, who were a colony of Phœnicians; as appears from the Carthaginian names, Hannibal, Asdrubal, &c. according to the custom of the east, where kings and great men added to their own names those of their gods. This deity is also frequently mentioned in Scripture in the plural number, Baalim; which may signify, either that the name Baal was given to several different gods; or that there were many statues bearing different appellations, consecrated to this idol. Arnobius tells us, that Baal was of an uncertain sex; and that his votaries, when they called upon him, invoked him thus; 'Hear us, whether thou art a god or a goddess.' Some learned men think that the Baal of the Phœnicians is the Saturn of the Greeks; which is probable from the conformity there is between the human sacrifices offered to Saturn, and those which the scripture tells us were offered to Baal. Others are of opinion, that Baal was the Phœnician, or Tyrian Hercules; a god of great antiquity in Phœnicia.

BAAL. See **BAALATH-BEER**.

BAALIM. 1. A city transferred from the tribe of Judah to the Simeonites. 2. The original name of Kirjath-jearim, in Judah.

BAALATH, a city in the tribe of Dan.

BAALATH-BEER, or **BAAL**, a city of the Simeonites, on the south-west border.

BAAL-BECK, or the **VALLEY OF BAAL**, a fertile country of Asia, between Lebanon and Antilibanus, about thirty miles from Damascus; where there was formerly a magnificent temple of the sun, the ruins of which are still visible. Some geographers make it a part, and others the whole of Celo Syria; but all agree that it was one of the most pleasant spots on the earth. The ruins of the temple are still admired. See **BALBEC**.

BAAL-BERITH, the god of the Shechemites. Bochart conjectures that Berith is the same as Berœe, the daughter of Venus and Adonis, who was given in marriage to Barchus; and that she gave her name to the city of Berith, in Phœnicia, and became afterwards the goddess of it. Baal-berith signifies Lord of the covenant, and may be

taken for the god who presides over alliances and oaths, in like manner as the Greeks had their *Ζευθορκιος*, and the Romans their *Deus Fidius*, or *Jupiter Pistius*. The idolatrous Israelites made Baal-berith their god. Judges viii. 33.

BAAL-GAD, **BAGAD**, or **BEGAD**, in ancient mythology, an idol of the Syrians, whose name was composed of baal, lord, and gad, chance or fortune; the god of chance or fortune. After the god of thunder, the god of chance was one of the first worshipped by mankind.

BAAL-HAMON, a place where Solomon had a vineyard, and where probably he sacrificed to Baal, in his dotage, to please his idolatrous wives.

BAAL-HANAN, the son of Achbor, in ancient mythology, the seventh king of the Edomites. From his name it appears probable that the worship of Baal had at that early period taken place among the descendants of Esau.

BAAL-HAZOR, a city near Ephraim, about eight miles north-east of Jerusalem, between Bethel and Jericho. In this city Absalom held his treacherous festival for murdering his brother Amnon.

BAAL-HERMON, a part of Mount Hermon.

BAALIM, in antiquity, inferior deities among the Phœnicians. See **BAAL**.

BAALIS, a king of the Ammonites, who sent Ishmael, the son of Nethaniah, to murder the brave Gedaliah, the viceroy appointed by Nebuchadnezzar over the remnant of the Jews, whom he had left in Jerusalem. (Jer. xi. 17.) For this he was justly punished by Nebuchadnezzar, who soon after invaded his country, and reduced it to a desert.

BAAL-MEON, **BEON**, or **BETHBAAL-MEON**, a city of Canaan, which was taken from the Amorites and given to the Reubenites. (Num. xxxii. 38.) It was afterwards taken by the Moabites, and at last destroyed by the Chaldeans. It had been rebuilt, however, for it was inhabited in the time of the Maccabees.

BAAL-PEOR, **BAAL-PHEGOR**, or **BEL-PHEGOR**, an idol of the Moabites and Midianites. We are told, that Israel joined himself to Baal-peor, and that Solomon erected an altar to this idol upon the Mount of Olives. Baal-peor has been supposed a Priapus, and that the worship of him consisted in the most obscene practices. Others have thought that as Baal is a general name signifying Lord, Peor may be the name of some great prince deified after his death. Mede supposes, that Peor being the name of a mountain in the country of Moab, on which the temple of Baal was built, Baal-peor may be only another name of that deity, taken from the situation of his temple; as Jupiter is styled Olympus, from his temple built on Mount Olympus. Selden, who is of this opinion, conjectures likewise, that Baal-peor is the same with Pluto; which he grounds upon these words of the Psalmist, Psal. cvi. 'They joined themselves unto Baal-peor, and eat the offerings of the dead;' though by the offerings of the dead, in this passage, may be only meant sacrifices made to idols, who are very properly called the dead, in contradistinction to the true, who is justly and emphatically styled the living, God.

BAAL-PÉRAZIM, a place in the valley of

Hephaim, about three miles south-west of Jerusalem, where David routed the Philistines.

BAALE'S-BAY, and **BAALE'S RIVER**, a bay and river in West Greenland, situated between Bear's Sound and Delft's Point, opposite Hudson's Strait.

BAALE-SHALISHA, a place belonging to Samaria, probably near Gilgal, the birth place of a prophet, whose name is not recorded, who, in a time of famine, miraculously fed 100 men with twenty barley loaves. See 2 Kings iv. 42, 44.

BAALE-TAMAR, a place near Gibeah, where the tribe of Benjamin was almost extirpated by the other eleven tribes. See Judg. xx. 33.

BAALETTIS, a goddess among the Phœnicians. Some suppose that she was the same with the Diana of the Greeks.

BAALE-ZEBUB, **BEEL-ZEBUB**, or **BELZEBUB**, [בעלזבוב, i. e. the lord of flies,] the idol, or god of the Ekronites. In Scripture he is called the Prince of Devils. His name, the God-fly, some think was a mock appellation bestowed on him by the Jews. But this seems not very probable, as his worshipper, Ahaziah, called him by this name. Perhaps Beelzebub was characterised like the god Achor, who was worshipped at Cyrene, as the preserver from flies. He had a famous temple and oracle at Ekron. Ahaziah, king of Israel, being dangerously hurt, sent to this deity to enquire if he should be cured. The Jews accuse our Saviour of driving out devils in the name of Beelzebub, their prince. Scaliger derives the name of this deity from Baalim-zebahim, which signifies the lord of sacrifices.

BAALE-ZEPHON is mentioned in Exodus xiv. 2, as opposite to Pihahiroth, during the peregrinations of the Israelites in the wilderness; but whether it was a fortified place, built to guard the frontier of Egypt, at the north point of the Red Sea, or an idol erected in that station, commentators are not agreed. Perhaps both parties may be right. An idol of Baal might be set up in the fort, which would naturally take its name from the deity.

BAAN (John d'), a Dutch portrait painter, born in 1633, and died in 1702. He resided some time in England, under the patronage of Charles II. His son James, who died in 1700, at the age of twenty-seven, was little inferior to his father in portrait painting, and superior to him in some other branches.

BAANITES, the followers of one Baanes, who adopted and disseminated the Manichean notions in the early part of the ninth century.

BAAR, mountains in the duchy of Wirtemburgh, which are a part of that long range called Abenow, or Abnoba.

BAARAS, **BAHARAS**, or **BACHARAS**, an extraordinary kind of root, said to grow in the valley of Baaras, near Mount Lebanon, whence the name. By the account which Josephus gives, it seems to be a sort of vegetable phosphorus; for he represents it as of a flame color, emitting rays of light in the night, and disappearing by day.

BAARD, in old records, a transport ship.

BAART (Peter), a Dutch poet of the eighteenth century, author of 'Georgics,' describing the rural pleasures and occupations of his

countrymen, and of a poem entitled the 'Triton of Friesland.'

BAASHA בַּעֲשָׂא, Heb. i. e. pressing together, the son of Ahijah, and the third king of Israel, after its separation from Judah; one of the many monarchs who have waded through blood to a throne. 1 Kings xv. and xvi. He died A. M. 3013, in the twenty-fourth year of his reign.

BAAAT, in the language of the Siamese, answering to tical in that of the Chinese, denotes a weight and coin current in those kingdoms, and weighs about half an ounce.

BABA, a town, district, and river of South America, in the province of Guayaquil, and kingdom of Quito. The district is twenty-two leagues in extent; it abounds in cocoa; and its population amounts to 4000 souls.

BABA, an impostor, who appeared among the Turks in 1240. He maintained that there is but one God, and that he was his messenger. He drew considerable attention, and with a number of followers overran Natolia. His success, however, was short-lived, for he was defeated, and his sect sunk into obscurity.

BABA-DAGI, or **BABA-TAGH**, see **BABATAGH**.

BABAHOYO, a town, district, and river of South America, in the province of Guayaquil, and kingdom of Quito, in lat. 1° 47' S. There is a custom-house and royal arsenal in the town, which is a great mart for trade. The district is extremely level and fertile, and abounds in cattle. Cotton, rice, soap, tobacco, cocoa, and fruits are the principal exports.

BABANON, or **BALBANON**, a town of the kingdom of Cambodia, on the river Cambodia. Long. 105° 10' E. lat., 12° 17' N.

BABA-TAGH, a large town in the district of Silistria, in European Turkey, situated between two mountains. It has a college, five mosques, and 10,000 inhabitants. Here have generally been the head quarters of the Grand Vizier's army in the wars between Turkey and Russia. Bayazid I. peopled it with a Tartarian colony, and its name (Saint's Hill) is derived from the tomb of Sari Saltic Bey, a celebrated Tartarian saint, buried on one of the neighbouring mountains. This mountain-pass was the Dêrê (the neck) of the Greeks. Ptolemy places it in lat. 11°.

BAB-BAHA, one of the richest districts of Abyssinia, according to Mr. Bruce, about twelve miles from the river Baha, and near the lake Tzana. This on the south, and Woggora on the north, are the two granaries that supply the rest of the kingdom. It contains a number of small villages; in which the queen and many of her relations have their houses and possessions. These are all surrounded with kolquall trees, as large in the trunk as those of the province of Tigré, but less beautiful.

BAB'BLE, *v. & n. s.* } Germ. *babbelen*; Fr. *babiller*. Probably receives its origin from **BAB'BLING**, *a. & n.* } the tower of Babel, when the confusion of tongues took place, and marks a superfluous and improper use of speech. To talk without reflection and without meaning; noisy repetition; to betray secrets; to talk much.

with unintelligible rapidity. Babbling, among hunters, is when the hounds are too busy after they have found a good scent. It is used figuratively to indicate mere senseless sounds.

He told me meryly, y^t logicke he reckoned but *babbling* musick to serue for singers.

Sir Thomas More's Works.

John had conned over a catalogue of hard words; these he used to *babble* indifferently in all companies.

Arbuthnot.

The apostle had no sooner proposed it to the masters at Athens, but he himself was ridiculed as a *babbling*.

This is mere moral *babble*.

Rogers.

Deluded all this while with ragged notions and *babblements*, while the expected worthy and delightful knowledge.

Milton.

With volleys of eternal *babble*

And clamour more unanswerable. *Hudibras.*

To stand up and *babble* to a crowd in an alehouse till silence is commanded by the stroke of a hammer, is as low an ambition as can taint the human mind.

Hawthorth.

Utters of secrets be from thence debarred

Babblers of folly. *Faerie Queene.*

We hold our time too precious, to be spent

With such a *babbling*. *Shakspeare.*

The *babbling* echo mocks the hounds. *Id.*

The *babbling* echo had descried his face.

Addison.

There at the foot of yonder nodding beech,
That wreathes its old fantastic root so high,
His listless length at noontide would he stretch,
And por' upon the brook that *babbles* by. *Gray.*

BABY, *n. s.* } *baerd*; Ital. *bambino*; an in-
BABY-SU, *ad.* } fant; a child of either sex in
BABYRY, *n. s.* } its earliest stage of being.
Childish, belonging to infancy. applied to dolls and images and playthings, the playthings of children, and the finery that pleases them.

Who all that piteous storie which befell
About the woefull couple which were slaine,
And their young bloodie *babe* to him gan tell
With whom whiles he did in the wood remaine
His horse purloyned was by subtille traicne.

Faerie Queene.

Those that do teach your *babes*

Do it with gentle means, and easy tasks.

Shakspeare.

Come, poor *babe*:

I have heard, (but not believed,) the spirits of the dead,

May walk again; if such thing be, thy mother
Appear'd to me last night; for ne'er was dream
So like awaking. *Id.*

Command my best obedience to the queen,

If she dares trust me with her little *babe*,

I'll show't the king. *Id.*

The *baby* beats the nurse, and quite athwart

Goes all decorum. *Id.*

Sweet *babes!* who like the little playful fawns,

Were wont to trip along these verdant lawns.

Lyttleton.

The archduke saw that Perkin would prove a run-
naway; and it was the part of children to fall out
about *babe*. *Bacon.*

He'll be bashful and will soon blush;

They call him a *babush* and ill brought up thing.

Ascham.

So have I seen trim books

With the olden leaves and painted *babery*,

Of silly boys, please unacquainted sight. *Sidney.*

BABEL, a city and tower undertaken to be built by the whole human race soon after the flood, and remarkable for the miraculous frustration of the attempt by the confusion of languages. See **BABYLON**.

BABEL, a town of Egypt, in the Delta, supposed by D'Anville to be the ancient Byblos. It is forty miles north of Cairo.

BABEL (St.), a small town of France, in Auvergne, department of the Puy de Dome, eight miles north-east of Issoire, thirteen east of Brioude.

BABEL-MANDEB, or **BABELMANDEL**, literally the gate of affliction, a promontory and strait at the southern extremity of the Red Sea, about seven leagues broad; the strait forming the communication between that sea and the Indian Ocean. There is a mountain or island in the middle of the strait, sometimes called El Mandel, as well as Perim or Mehun, which divides the strait into two parts, of which the eastern, though narrowest, is most frequented, as it has deep water, and is free from shoals. 'It is at most three geographical miles in width,' says Bruce, 'and has twenty or thirty fathoms water.' lord Valentia and Niebuhr make the breadth of the strait between Perim and the Asiatic shore the same as Bruce; between it and the coast there are from fifteen to twenty English miles. His lordship observes, that 'Perim should be kept close on the larboard side, in order to avoid a deep bay to the eastward of the cape, which has been sometimes mistaken for the strait.' The wider or western channel is much obstructed by rocks and small islands. The Arabian cape is in lat. 12° 40' N., long. 43° 33' E. Niebuhr's Reisebeschreibung, i. 448. Bruce's Travels, i. 361. Lord Valentia's Travels, ii. 13. Vincent's Periplus, i. 111. The island is said to be about five miles in circumference, barren and scarcely inhabited.

BABEN, an island in the Indian Sea, about eighteen miles long, by six in breadth, surrounded by some smaller ones. Long. 130° 131' E., lat. 7° 41' S.

BABENHAUSEN, a market town in the circle of the Iller, Bavaria, with two castles, a Latin school, and 1600 inhabitants. It is sixteen miles S. E. of Ulm, twenty-six W. S. W. of Augsburg.

BABGAUM, a town of Hindostan, in Dowlatabad, twenty-two miles north of Poonah.

BABI, a small island near the west coast of Ceram, in the Eastern Seas. Long. 128° 3' E., lat. 3° 5' S.

BABIC, or **BARABEG**, a town of Persia, situated in a fertile, uncultivated plain, towards the north-west of the province of Kerman. It has formerly been a fine city, but is now falling into decay. Here are, however, four gates, from each of which long streets lead to the market-place in the centre, and the dome over the market-place, which is esteemed the largest in Persia, is in complete preservation. *Babic* being at an equal distance from the cities of Kerman, Shiraz, and Yezd, was in former times a great mart of commerce, the greater part of the merchandise which was sent to the port of Gombroon, on the Persian gulf, passing through it.

A lieutenant-governor resides here, under the control of the prince governing Kerman. The avenues to the town are planted with fruit-trees, and the gardens are said still to surpass those of both Shiraz and Ispahan in beauty and taste. Fruit of every kind is in such profusion as to have given occasion to the saying, that 'if all Persia, except this district, were a desert, Shuhre Babic would supply it with fruit.'

BABILIUS, an astrologer in the time of Nero, who advised the emperor to put all the leading men of Rome to death, that he might avert the danger which seemed to hang over his head, from the appearance of a hairy comet. Nero strictly followed this advice.

BABILLO, a river of South America, in the kingdom of Granada, which falls into the Maladana.

BABINGLEY, a village in the county of Norfolk, two miles north-east from Castle Rising, is only remarkable as being the place in which the first Christian church in East Anglia was erected. Some hills in the vicinity are said to be called Christian hills from this event.

BABINGTON (Gervase), bishop of Worcester, was born in Nottinghamshire; and sent to Trinity College, Cambridge, of which he was made fellow; and in 1578 was incorporated A. M. at Oxford. He, however, made Cambridge the place of his residence, where he became an eminent preacher; and being now D. D. was made domestic chaplain to Henry, earl of Pembroke. In 1588 he was installed prebend of Hereford, and in 1591 bishop of Landaff. In 1594 he was translated to the see of Exeter, and thence to Worcester in 1597. About this time he was made queen's counsel for the marches of Wales. He was a considerable benefactor to the library of the cathedral of Worcester, where he was buried in May 1610. Historians agree that he was a learned and pious man, but his writings, like those of most of his contemporaries, abound with puns and quaint expressions. His works were printed both in folio and quarto in 1615 and 1637.

BABINGTON (Anthony), one of the sufferers in the cause of the unfortunate Mary, queen of Scotland. He was born of a good family in Derbyshire, and inherited a plentiful fortune. Having distinguished himself by his learning and talents, he was recommended by the archbishop of Glasgow to the queen; and being naturally of an ardent temper, he resolved to devote himself to her service. Accordingly, he not only entered into the scheme of an enthusiastic priest named Ballard, for dethroning Elizabeth, but when one Savage undertook to assassinate the English queen, he agreed in the design, and engaged five other gentlemen as accomplices. But, after their design was ripe for execution, Polly, one of the associates, discovered the whole to Walsingham, secretary of state; and they were arrested, condemned, and executed, in 1586.

BABCEUF (Francis Noel), an active man in the French revolution. From a footman he had risen to a lawyer's clerk, and afterwards became attorney. When the revolution commenced, he

assumed the name of Gracchus, and engaged in conducting an incendiary journal, entitled *The Tribune of the People*; but his concern in a conspiracy being discovered, he was condemned to be guillotined, and the execution was only prevented by his killing himself in prison, in 1797.

BABOLISA, called also BABOLITZNA CA-RETHNA, a town of Hungary, or rather of Sclavonia, seated near the river Drave.

BABOLSCA, or BABOLZA, a market town of Hungary, in the county of Shumeg and circle of Canischa. It was formerly fortified, and from the middle of the sixteenth to the end of the seventeenth century, alternately in the possession of the Turks and Imperialists. It is now inhabited by Croats, and is twenty-two miles S. S. E. of Canischa.

BABOON, in zoology, the name of that tribe of apes (*simia*, Linnæus) which have short tails, comprehending the species *apedia*, sphinx, mormon, maimon, and porcaria. They have very muscular bodies. In the English language baboon has the same application as *babouin* in the French, of which many accounts have been given by Buffon, Sonnini, and others. Virey observes, that they are a ferocious and very lascivious kind of ape, found in many parts of the old world, and especially in Africa. Their muzzle, he remarks, is a little lengthened in the same manner as that of a dog, and on that account they have sometimes been called *synges cyanocephales*, and also maggots. They live on fruits, seeds, roots, leaves, insects, &c. In a state of captivity they are altogether untameable, are fond of wine and spirituous liquors; and the females, it is asserted, have an antipathy to the fair sex, as the males have against men. See *SIMIA*.

BABOUIN A MUSEAU DE CHIEN, of Sonnini (edit. Buffon), in zoology, the *simia hymadryas*, Linnæus; and dog-faced ape, Pennant.

BABOUR (Sultan), the founder of the Mogul dynasty in Hindostan, was descended from the great Timor, or Tamerlane, and was sovereign of Cabul. While engaged in an expedition against Samarcand, he was deprived of his hereditary dominions, and reduced to the utmost extremity by the Usbecks. But on recovering his fortunes, he invaded Hindostan, and in 1525 overthrew and killed sultan Ibrahim, the last Hindoo emperor of the Patan or Afghan race, and firmly established himself on the throne. He died in 1530. Ferishta, a Persian historian of Hindostan, informs us, that this prince wrote an elegant history of his own life, and is noted as the first Indian sovereign who had the roads he travelled measured after him.

BABRAHAM, formerly BADBURHAM, a small place in the county of Cambridge, four miles north-west of Linton. The manor of this place was formerly in the possession of Sir Horatio Pallavicini, collector of the Pope's dues in the reign of queen Mary; and who, on Elizabeth's accession, detained the money he had gathered. Lord Orford, in his *Anecdotes of Painting*, cites the following epitaph on him, from Sir John Crew:—

There lies Horatio Palavazene,
 Who robbed the Pope to lend the queen.
 He was a thief—a thief; thou lyeest:
 For what? he robbed hut Antichrist.
 Hym Death with besom swept from BAB'RAM
 Into the bosom of old Abraham;
 But then came Hercules with his club
 And struck him down to Belzebub.

Sir Horatio was one of the commanders against the Spanish Armada, and his portrait is preserved in the tapestry of the House of Lords. The register of this parish records the marriage of his widow with Sir Oliver Cromwell, the Protector's uncle.

BABREA, a mountainous district in the province of Gujrat, situated on the peninsula between the Gulfs of Cambay and Cutch. It contains many strong holds and various small rivers, which flow into the Gulf of Cambay. Here is the famous fortress of Chitpour and the temple of Diu. It is subject to the Mahrattas.

BABU, a small island in the Gulf of Siam, near Cambodia. Long. 103° 48' E., lat. 9° 42' N.

B A B Y L O N.

BABYLON, Heb. BABEL, in ancient geography, the capital of Babylonia or Chaldea, supposed to have been situated in N. lat. 33°, E. long. 42° 46' 30"; or, according to the observations of M. Beauchamp (Mem. Ac. Sc. Paris, 1787), N. lat. 32° 31', and E. long. 44° 12' 30" upon the river Euphrates, and considered for many ages the wonder of the world. The few vestiges that yet remain of its ancient ruins are placed by most geographical writers, at a town called Hilla or Elugo, about fifteen leagues south-west of Bagdad. It was on or near the site of this city, that the descendants of Noah, according to the Hebrew text, 101 years after the flood; or 531, according to the Septuagint, began to build a city and tower, the top of which should reach to heaven; an impious attempt, which ended in the confusion of their language, and their dispersion over the face of the whole earth. See Genesis, xi. 1—9. That before this period all mankind spoke one language cannot be thought incredible, or even improbable; for since the family of Noah, the only one in the world, are known to have dwelt together, we cannot suppose that any material change could have been effected in their language during a single century, or even the period assigned by the Septuagint calculation. Besides which, numerous histories and traditions still current in Asia, though dashed with superstition and fable, allude to the same events: all tending to confirm, in the most unequivocal manner, the main strokes and outlines of the Mosaic narrative. Josephus ascribes the building of the tower to Nimrod (See Bochart's Phalæg. i. 10.), whose name is also affixed to some of the remains of Babylon. Abydenus (as quoted by Lusebius, Prepar. Evangel. ix. 14.), observes, that the first men, contemplating the power and authority of the gods, and relying on their own extraordinary strength, built a lofty tower, which nearly reached the sky, in the place where Babel then stood. But the winds coming to the assist-

BABUAN, a small island, said to be about twenty-five miles in circumference, which is the most northerly of the Philippines. Long. 123° E., lat. 19° 43' N.

BABUYANES ISLES, a number of islands off the north coast of Luzon, the principal Philippine, between the nineteenth and twentieth degrees of north latitude. The largest are named Babuan, Calayay, Dalupiri, Camiguen, and Fuga, and are from twenty to thirty miles each in circumference. Besides these, there are many small rocky islets. Although so far north, the Babuyanes isles are much infested by the piratical cruisers of Magindarao. Their productions are wax, ebony, bananas, cocoas, and plantains.

BABUL-ALWAB. See DERBEND.

BABUL-BAWADI (Gates of the Deserts), or Mahrab, a province on the south coast of Arabia, so named from its being the southern entrance to the great central deserts with which it communicates.

ance of the gods, overturned the whole mass upon the heads of its builders, and from its ruins Babylon was afterwards built. The gods also at the same time caused mankind, who had before all spoken the same language, to speak henceforward in different tongues. Plato also, (Polit. p. 272. ed Steph.), relates a similar tradition, wherein he says, that in the golden age, one common language was spoken both by men and beasts, but that Jupiter confounded their tongues as a punishment for their insolence in claiming eternal youth and immutability. After the confusion of languages, the people 'left off to build the city', says Moses; but they must afterwards have resumed it, for in the next verse he adds, that the name of it was called Babel, which signifies confusion, alluding to the confusion in the languages of its builders. It is afterwards mentioned as the chief city of the kingdom of Nimrod, the son of Cush, from which period no further account is given of it in the sacred writings, till the captivity of Israel under Nebuchadnezzar, 730 years before the commencement of the Christian era, when it was so heightened and improved as to be called 'great Babylon,' 'the glory of kingdoms,' 'the beauty of the Chaldees' excellency,' 'the golden city,' 'the lady of kingdoms.' See the prophets Isaiah, Jeremiah, and Daniel. The Greeks have nevertheless, supplied this 1515 years interval of silence, and have given a complete history of the Assyrian and Babylonian empires, together with a magnificent sketch of their renowned metropolis in the zenith of its glory under Semiramis, Nebuchadnezzar, and others. The learned Bochart connects the sacred and profane histories together, by supposing the city of Babylon, and the tower of Belus, mentioned by the Greek historians, to be the same as those related by Moses.

Babylon, according to the concurrent testimony of the ancients, was seated on a plain (the plain of Shinar in Scripture), and surrounded by

water. The places about Babylon, as Abydenus informs us, from Megasthenes, (Euseb. Prap. Evang. l. ix. c. 41. p. 41. p. 457.), are said from the beginning to have been overwhelmed with waters, and therefore called the sea; according to the language of Isaiah, xxi. 1. 'the burden of the desert of the sea.' Jeremiah calls the city itself a mountain, li. 25, on account of the great height of its walls, towers, palaces, and temples, which, according to Berosus, as quoted by Josephus (*ubi infra*), resembled mountains. The founding of this metropolis is attributed by some historians to Semiramis, by others to Belus, who is thought by many to have been the same with Nimrod already alluded to, but was indebted for its chief improvements to Nebuchadnezzar, his son Evilmerodach, and his widow Nitocris. Nebuchadnezzar repaired, enlarged, and embellished it to such a degree, that he may be said to have built it, according to his own vain-glorious boast, Dan. iv. 30. Nor is this asserted only in Scripture, but likewise by heathen authors, Megasthenes, Berosus, and Abydenus. (See Josephus, *Antiq. l. x. c. 11. sect. i. t. i. p. 536. ed. Haverc.*) Eusebius, (*Prap. Evangel. l. ix. c. 41. p. 457. ed. Vgeri.*) The chief works of Babylon, mentioned by historians, were the prodigious walls of the city, the temple of Belus, Nebuchadnezzar's palace, the hanging gardens, the bank of the river, the artificial lake, and the canals.

This city was surrounded with walls, in thickness eighty-seven feet, in height 350, and in compass 480 furlongs, or sixty of our miles; according to Herodotus, who was himself at Babylon; and most writers give us the same dimensions. Diodorus Siculus, however, diminishes the circumference of these walls very considerably, and takes somewhat from the height of them; though he seems to add to their breadth, by saying, that six chariots might drive abreast thereon; while Herodotus writes, that one chariot only might turn upon them; but then he places buildings on each side of the top of these walls, which, according to him, were but one story high; which may pretty well reconcile them together. Those, who give the height of these walls but at fifty cubits, speak of them only as they were after the time of Darius Hystaspis, who had caused them to be beaten down to that level. The ground plan of these walls formed an exact square, each side of which was 120 furlongs, or fifteen miles, in length; and they were all built of large bricks cemented together with bitumen, which in a short time grows harder than the brick and stone which it cements. Without the walls, the city was encompassed with a vast ditch, filled with water, and lined with bricks on both sides; and, as the earth that was dug out of it served to make the bricks, we may judge of the depth and largeness of the ditch from the height and thickness of the walls. In the whole compass of the wall there were 100 gates, that is, twenty-five on each of the four sides, all of solid brass. Between every two of these gates, at proper distances, were three towers; four more at the four corners of this great square, and three between each of these corners and the next gate on either side; and each of these towers was ten feet higher than the walls, in those parts where towers were needful

for defence. For some parts of the walls, being upon a morass, and inaccessible by an enemy, they stood in no need of towers. Thus the whole number of these towers amounted to more than 250. From the twenty-five gates in each side of this square, there was a straight street, extending to the corresponding gate in the opposite wall; whence the whole number of the streets must have been but fifty; but they were each about fifteen miles long, twenty-five of them crossing the other twenty-five exactly at right angles. Besides these whole streets, we must reckon four half streets, which were but rows of houses facing the four inner sides of the walls. These four half streets were properly the four sides of the city within the walls; and were each of them 200 feet broad, the whole streets being about 150 of the same. By this intersection of the fifty streets, the city was divided into 676 squares, each of four furlongs and an half on each side, or two miles and a quarter in compass. Round these squares on every side towards the streets stood the houses, all three or four stories in height, beautified with all manner of ornaments: and the space within each of these squares was void, or taken up by gardens, &c. A branch of the Euphrates divided the city into two, running through the midst of it, from north to south, over which, in the middle of the city, was a bridge, a furlong in length, or, as some say, no less than five furlongs, though but thirty feet broad. At each end of this bridge were two palaces; the old palace on the east side, the new one on the west side of the river; the former of which took up four of the squares, and the latter nine. The temple of Belus, which stood next to the old palace, took up another of the squares. That part or half of the city on the east side of the river was the old town, and the other on the west was added by Nebuchadnezzar; both being included within the vast square bounded by the walls. It is supposed, that Nebuchadnezzar, who had destroyed the old seat of the Assyrian empire, Nineveh, proposed that this new one should rather exceed it; and that it was in order to fill it with inhabitants that he transported such numbers of the captives from other countries hither. But notwithstanding his great conquests it was never wholly inhabited; for, Cyrus removing the seat of the empire soon after to Shushan, Babylon fell by degrees to decay. So far was it from being finished according to its original design, that, when Alexander came to Babylon, Q. Curtius tells us, 'no more than ninety furlongs of it were then built;' which can only be understood of so much in length; and, if we allow the breadth to be as much, no more than 8100 square furlongs were then built upon; but the whole space within the walls contained 14,400 square furlongs; and therefore there must have been 6300 square furlongs remaining unbuilt, which, Curtius tells us, were ploughed and sown. Besides this, the houses were not contiguous, but built with a void space on each side.

The next great work of Nebuchadnezzar was the temple of Belus. The wonderful tower, however, that stood in the middle of it, was not his work, but was built many ages before, being

the famous tower of Babel, as is commonly supposed. This is said to have been composed of eight pyramidal ones raised above one another, and is stated by Herodotus to have been a furlong in height; but as there is an ambiguity in his expression, it has been disputed whether each of the towers, was a furlong in length, or the whole of them taken together. Even on the latter supposition, it must have exceeded the highest of the Egyptian pyramids by 179 feet, though it fell short of its breadth at the basis by thirty-three. The way to go up was by stairs on the outside round it; whence it seems most likely that the whole ascent was, by the benching in, drawn by a sloping line from the bottom to the top eight times round it; and that this made the appearance of eight towers, one above the other. In these different compartments or stories were magnificent rooms, with arched roofs, supported by pillars, forming parts of the temple when the tower was consecrated, those of the uppermost story being thought most sacred. Over the entire top was an observatory. Diod. Sic. l. ii.; and Calisthenes, the philosopher who accompanied Alexander in the conquest of Babylon, found astronomical observations which carried up the account as high as the 115th year after the flood, or B. C. 2334, and fifteen years from the building of the tower of Babel. Till the times of Nebuchadnezzar, it is thought that this tower constituted the whole of the temple of Belus; but he made great additions, by vast edifices round it, in a square of two furlongs on every side, and a mile in circumference; thus exceeding the square of the temple of Jerusalem by 1800 feet. On the outside of these buildings was a wall, which enclosed the whole; and, from the regularity with which the city was marked out, it is supposed, that this wall was equal to the square wherein it stood, and so is concluded to have been two miles and an half in circumference. In this wall were several gates leading into the temple, all of solid brass. In the temple were several images of massy gold, one of them forty feet in height. The whole weight of its statues and decorations, according to Diodorus Siculus, amounted to above 5000 talents in gold, above twenty-one millions of our money: an equal sum in treasure, utensils, and ornaments, not mentioned, is allowed for.

Next to this temple, on the east side of the river, stood the old palace of the kings of Babylon, which was four miles in circumference, and exactly opposite to it, on the other side of the river, was the new one built by Nebuchadnezzar, eight miles in circumference. The tower or temple stood till the time of Xerxes. But that prince, on his return from the Grecian expedition, having first plundered it of its immense wealth, demolished the whole, and laid it in ruins. Alexander, on his return to Babylon from his Indian expedition, proposed to rebuild it, and make it the seat of his empire, and even employed 10,000 men to clear away the rubbish. But his death happening soon after, a stop was put to all further proceedings in that design.

Nothing was more wonderful at Babylon than the hanging gardens, which Nebuchadnezzar

made in compliment to his wife Amyitis; who being a Mede, and retaining a strong inclination for the mountains and forests of her own country, was desirous of having something like them at Babylon. They are said to have contained a square of four plethra, or 400 feet, on each side; and to have consisted of terraces one above another, carried up to the height of the wall of the city, the ascent from terrace to terrace being by steps ten feet wide. The whole pile consisted of substantial arches upon arches, and was strengthened by a wall surrounding it on every side, twenty-two feet thick. The floors on each of them were laid in this order: first, on the tops of the arches was a pavement of stones sixteen feet long, and four feet broad; over this a layer of reeds, mixed with a great quantity of bitumen; over this were two courses of brick, closely cemented together with plaster; and over all these thick sheets of lead, and on these the earth or mould of the garden. Upon the uppermost of these terraces was a reservoir, supplied with water from the river. The other works attributed to Nebuchadnezzar by Berosus and Abydenus, were the banks of the river, the artificial canals, and the great artificial lake said to have been sunk by Semiramis. The canals were cut out on the east side of the Euphrates, to convey its waters, when it overflowed its banks, into the Tigris, before they reached Babylon. The lake was on the west side of Babylon; and, according to the lowest computation, forty miles square, 160 in compass, and in depth thirty-five feet, as Herodotus, or seventy-five, as Megasthenes will have it; the former, perhaps, measured from the surface of the sides, and the latter from the tops of the banks that were cast up upon them. This lake was dug to receive the waters of the river, while the banks were building on each side of it. But both the lake, and the canal which led to it, were preserved after that work was completed, being found of great use, not only to prevent all overflowsings, but to keep water all the year, as a common reservoir, to be let out, on proper occasions, by sluices, for the improvement of the land. The banks were built of brick and bitumen, on both sides of the river, to keep it within its channel; and extended on each side throughout the whole length of the city, and even farther, according to some writers. Within the city they were built from the bottom of the river, and of the same thickness with the walls of the city itself. Opposite to each street, on either side of the river, was a brazen gate in the wall, with stairs leading down from it to the river: these gates were open by day, and shut by night. Berosus, Megasthenes, and Abydenus, attribute all these works to Nebuchadnezzar; but Herodotus tells us, the bridge, the banks, and the lake, were the work of the queen Nitocris already alluded to, who may have finished what Nebuchadnezzar left imperfect. Such is the description ancient historians give of this city; which, if the accounts are not exaggerated, must have exceeded every specimen of human grandeur that has yet appeared. Many of the moderns, however, are of opinion that these descriptions are exaggerated; although it is certain that few other arguments can be brought against

the reality of them, than that we do not now see similar designs executed.

The taking of Babylon by Cyrus, as prophesied in the scriptures, forms one of the most striking and important events in the variable page of ancient history. War had commenced between the Medes and Persians, and Babylonians, in the reign of Neriglissar, and had been carried on with very bad success on the side of the last named people. Cyrus, who commanded the Median and Persian army, having subdued the several nations inhabiting the great continent from the *Ægean* sea to the Euphrates, bent his march towards Babylon. Nabonadius, hearing of it, immediately advanced against him. In the engagement which ensued, the Babylonians were defeated; and the king, retreating to his metropolis, was blocked up and closely besieged by Cyrus. But the reduction of the city was no common enterprise. Its walls and towers were well manned, and the place stored with all provisions for twenty years. Cyrus, despairing of being able to take it by storm, caused a line of circumvallation to be drawn quite round it, with a large and deep ditch; reckoning, that if all communication with the country were cut off, the besieged would be obliged to surrender through famine. That his troops might not be too much fatigued, he divided his army into twelve bodies, appointing each body its month to guard the trenches; but the besieged, looking upon themselves to be out of danger, insulted him from the ramparts, and despised all his efforts. Cyrus having spent two whole years before Babylon, without making any progress in the siege, at last thought of the following stratagem, which put him in possession of it. He was informed that a great annual solemnity was to be held at Babylon; and that the inhabitants on that occasion were accustomed to spend the whole night in revelry. On this night he accordingly sent a strong detachment to the head of the canal leading to the great lake, with orders at a certain time, to break down the bank which was between the lake and the canal, and to turn the whole current into the lake. At the same time he appointed one body of troops at the place where the river entered the city, and another where it came out; ordering them to march in by the bed of the river as soon as they should find it fordable. Towards the evening he opened the head of the trenches on both sides of the river above the city, that the water might discharge itself into them; by which means, and the breaking down of the great dam, the river was soon drained. Then the two bodies of troops entered the channel; the one commanded by Gobryas and the other by Gadates: and finding the gates left open, they penetrated into the heart of the city without opposition. Those who were in the palace opening the gates to know the cause of this confusion, the Persians rushed in, took the palace, and killed the king as he came out to meet them. Cyrus took possession of Babylon, in the name of his uncle Cyaxares II. called in scripture Darius the Mede: A. M. 3468.

The manner in which this city was taken is remarkable, from its coincidence with the prophecy of that event in Isa. xlv. 1, 2. 'The two-leaved gates' were literally opened before

him, and the gates were 'not to be shut,' &c. On these prophecies, see bishop Newton, bishop Lowth, on Isaiah, &c.

With Babylon fell the empire of Babylonia, according to the striking language written on the wall of the palace the same night in which the city was taken, and interpreted by the prophet Daniel; 'Mene, God hath numbered thy kingdom and finished it.' See Dan. ch. v.

The history of the ruins of this great city is all which we have now to present to the reader. An insurrection, under Darius Hystaspes, B. C. 500, provoked that prince to overthrow the walls and gates which had been left by Cyrus. We also learn from a fragment of Diodorus Siculus, produced by Valesius, and from him quoted by Vitranga, Comment. in Jesaia, ch. xiii. vol. 1, p. 421, that one of the kings of Parthia sent many of the Babylonians, under the most trivial pretences, into slavery; burnt the forum, together with some of the temples; and demolished the best parts of the city, B. C. 130 years. Diodorus Siculus, l. ii. asserts, that in his time, B. C. 44, only a small part of it was inhabited, and that the greater part of the space within the ancient walls was tilled. Strabo, who wrote fourteen years after him, in his l. xvi. p. 1073, applies to Babylon what a comic poet, said of Megalopolis in Arcadia: 'The great city is now become a great desert,' Pliny, H. N. l. 6. ch. xxx., published A. D. 66, affirms that it was reduced to solitude by the neighbourhood of Seleucia. Pausanias, A. D. 153, says, Arcad. ch. xxxiii. p. 668. ed. Kubuii, 'that of Babylon, the greatest city the sun ever saw, nothing remained but the walls.' Maximus Tyrius, Diss. 6., and Lucian, *Ἐπιον*, sive *Contemplantes*, mention it as a neglected place; the latter intimating that in a little time it would be sought for and not be found, like Nineveh. Eusebius has preserved an oration of Constantine the great, in which that emperor states, that he himself was upon the spot, and beheld the desolate and miserable condition of the city. St. Jerome informs us, that about the close of the fourth century, it was converted into a chase to keep wild beasts in, for the diversion of the Persian kings, that all was in the utmost state of desolation, except the brick walls, which were occasionally repaired to prevent the animals from escaping; a circumstance which literally fulfilled the prophecy of Isaiah xiii. 21. Hieron, Comment. on Isa. ch. xiii. ch. xiv. vol. 3. p. 111. 115. ed. Benedict. Benjamin of Teudela, who lived in the twelfth century, affirms, Itin. p. 66, that some ruins were still to be seen of Nebuchadnezzar's palace, into which travellers were afraid to enter on account of the serpents and scorpions that inhabited the interior. Teixeira, a Portuguese, is cited by Bochart, and Prideaux, as giving a similar account of this place; various other travellers have further confirmed them. Tavernier says, that at the division of the Tigris, a short distance from Bagdad, is the foundation of a city which, from its appearance, may have been a league in compass; of which some of the walls yet standing occupy sufficient breadth to allow six coaches to pass upon them abreast, and are composed of burnt bricks ten feet square and three

feet thick. This place is represented by the chronicles of the country as the seat of ancient Babylon. Hanway says, Trav. vol. 4. pt. 3. ch. xx. p. 78, that the ruins of Babylon lie fifteen leagues south of Bagdad, and are now so much effaced by time, that scarcely any vestiges of them remain to point out the original situation of the city. Niebuhr, who lived in the eighteenth century, gave a description which has thrown a light upon the question respecting the original site of Babylon. But the most complete and satisfactory account is given by Mr. Rich, who resided for some time at the court of the Pasha of Bagdad, on the part of the East India Company, and possessed greater advantages for such an inquiry than any of his predecessors. He expected, he says, to have found on the site of Babylon both more and less than he actually met with; more, because he supposed he should have been able to have identified some of the ancient buildings, which was quite impossible; less because he could form no conception of the prodigious extent of the whole mass of ruins, their size, solidity, and the perfect state of some of their parts.

The traces of the city begin to show themselves near Mohaeril, a khan or inn, nine miles from Hillah, and nearly thirteen leagues south of Bagdad; the whole country round exhibiting here and there, detached masses of bricks and bitumen. Three mounds attract particular attention by reason of their extraordinary magnitude. Hillah, in lat. 32° 28' N., stands east of the Euphrates, and on that side also, with the exception of two small elevations, and one very considerable ruin, are all the remains of any antiquity. Two miles above Hillah commences a mound or enclosure of circular appearance, thought to have been the ancient boundary wall. It includes an area of two miles and a half one way, and one mile and one third the other. On the east side two straight dykes or walls of earth run from north to south, parallel with the Euphrates, and forming, together with the river and the ends of the enclosure above-mentioned, an oblong area, containing three principal mounds of rubbish, which rise more than 100 feet above the level of the river. The largest mass of these ruins, called by the Arabs Makallebah, pronounced by the natives Majellibeh, in English *subverted*, is what Rennell and Petro della Valle thought to be the tower of Belus. The figure

is oblong, and the sides which face the cardinal points measure as follows: the northern side 200 yards, the southern 219, the western 136, and the eastern 192; the highest elevation is 141 feet. On the south-east angle appeared something like a turret, and in the rubbish were found whole bricks, having on them inscriptions in CUNÆATIC CHARACTERS, for which see.

The next important ruin is called by the Arabs El Kair, the castle, a mile to the south of the former; consisting of walls and piers, eight feet in thickness, facing, like the former, the cardinal points. It is adorned with buttresses, pilasters, and niches of fine burnt brick, laid in lime mortar of extraordinary tenacity. Beneath this building are subterranean caverns and passages, which are still unexplored. In the neighbourhood is an atheleh, *tamarix articulata*, considered by the natives to have been coeval with the city. Mr. Rich also found another curious ruin, west of the river, and about six miles south-west of Hillah, which he coincides with Niebuhr Reisse, ii. 289, in considering as the celebrated tower of Belus; especially as the Arabs call it Birs Nemrud, the tower of Nimrod. (The word birs, which embarrassed Mr. Rich, being nothing else than the Persian word borz, as Gesenius has justly expressed it.) This celebrated remain, which the Jews denominate the prison of Nebuchadnezzar, forms a mound of fine burnt bricks, with inscriptions on them; it is of oblong figure, 762 yards in circumference, and on the east side about sixty feet in height; but rises on the west in a conical form to the height of 198 feet, the base occupying a breadth of 28.

No works of art yet discovered in these ruins have been thought beautiful; but bricks and gems, with inscriptions and sculptures similar to those brought from Persepolis, evince the early connexion between the Babylonian and Persian empires. The inscriptions on the lower side of the bricks were buried in a substratum of mortar, and not designed to be seen or read; whence it has been inferred, that they are charms or magical formulæ to protect the building from the attack of demons and evil spirits. For a further illustration of this subject we refer the reader to Gesenius, in Ersch's Encyclo.; Rich's Memoir on the Ruins of Babylon, 1818; Maurice's Observations on ditto, 1816; and the numerous other works already quoted.

B A B Y L O N I A.

BABYLONIA, or CHALDEA, a renowned kingdom of Asia, said to have been the most ancient in the world, lying between thirty and thirty-five degrees of north latitude, and bounded, according to Ptolemy, on the north by Mesopotamia, on the east by the Tigris, on the west by Arabia Deserta, and on the south by the Persian Gulf and part of Arabia Felix. Babylonia was founded by Nimrod, the grandson of Ham, who is also said to have built Nivech, the ancient capital of Assyria. Various have been the conjectures of the learned respecting these two king-

doms; some supposing them to have been the same, others imagining that Babylonia was an early province of Assyria, although it is plain from the best authorities, that they remained perfectly distinct till the time of Ninus; who having conquered the former, reduced it to a tributary dependance upon the latter; in which state it continued till the effeminate reign of Sardanapalus; as did also Media, Persia, Egypt, and other kingdoms. At length Arbaces, governor of Media, taking advantage of that monarch's indolence, threw off his allegiance by the advice

of Belesis, a Chaldean priest; the Babylonians followed the example, and with the assistance of the Persians, and other allies to whom the tyranny of their Assyrian lords was equally odious, attacked the empire on all sides, and after a determined and obstinate perseverance, overthrew the Assyrian army, besieged Sardana-palus in his capital, and made themselves masters of the empire, A. A. C. 821.

The whole territory was then divided into three kingdoms, viz. the Assyrian, Median, and Babylonian. Arbaces retaining the supreme authority, fixed his imperial residence at Ecbatana, in Media; nominated Belesis to the government of Babylon, and Phul to that of Assyria; at the same time conferring upon them the title of kings. Phul, who reigned during the time of Menahem, king of Judah, re-established and greatly enlarged the Assyrian empire; and at his death bequeathed the kingdoms of Assyria and Babylonia to his two sons, the former to Tiglath-Pileser, the latter to Nabonasser, in the year B. C. 747.

From this period to the year 625, B. C. when Nabopolassar began his reign, nothing remarkable occurs in the history of Babylon, except that Assaradinus, or Esarhaddon, brother and successor of Senacherib, king of Assyria, took possession of that kingdom, B. C. 680; and that upon his death, B. C. 668, the kingdoms were again separated. The Scripture mentions only five Assyrian kings, viz. Pul, Tiglath-Pileser, Shalmaneser, Sennacherib, and Esarhaddon. In the twentieth year of Nabopolassar, B. C. 606, in the reign of Chynalidan, the Sardana-palus of the Greeks, Nineveh was taken and destroyed, by the united armies of the Medes and Babylonians, under Cyaxares and Nabopolassar, when the seat of the empire was transferred to Babylon. This Nabopolassar, called also Nebuchadnezzar, was the father of the celebrated Nebuchadnezzar, whose history is so famous in the sacred writings, and who commenced his reign 604 years B. C. two years after the conquest of Nineveh. This prince raised the empire of Babylon to its highest pitch of glory, and spread his dominions over a wide extent of territory, stretching from Media on the north-east, beyond Egypt on the south-west, and comprehending the several kingdoms of Assyria, Persia, Syria, Phœnicia, Canaan, North Arabia, Idumea, and Egypt. After Nebuchadnezzar, little is known of Babylon, except the names of his successors, Evil-Merodach and his queen Nitocris, his son-in-law Neriglissar, Laborosarchod, the son of the latter, and Nabonadius, the son of Evil-Merodach by Nitocris, Labynitus of Herodotus, and Belshazzar of Scripture, in whose reign the city of Babylon was broken up, and the empire extinguished by Cyrus the Persian, 538 years B. C. See *Anc. Un. Hist.* vol. iii. p. 367—437. *Rollin's Anc. Hist.* vol. ii. p. 1—153.

In the early ages of the world, Babylonia was known by the names of Shivar, or Shivaar, which appellation it seems to have retained in the time of Daniel. In the days of Abraham, a king of Shivar is mentioned called Amraphel, who under Chedarlaomer, King of Elam, or Persia, made

war upon the Canaanites. The name of Babylon is supposed to have been derived from the tower of Babel, and that of Chaldæa from Chaldæans or Chasdim. *Joseph Ant.* l. i. c. 7. These names were not synonymous; Babylonia, properly intending the country more immediately in the neighbourhood of Babylon, and Chaldæa, the territory lying south of the former, and reaching downward as far as the Persian gulf. Both nevertheless are commonly employed as general names of the whole empire, and in that sense are taken indifferently for each other, Chaldæa being the name used in Scripture, and Babylonia the most common in profane authors. *Diodor. Sic.* l. ii. c. 11, 12. *Strabo*, l. xvi. sub. iv.

The chief cities of Babylonia were Babelor, Vologsia or Vologesocerta, built by Vologesis, king of the Parthians, on the Euphrates, about the time of Vespasian; Barsita, thought to be the Borsippa of Strabo, sacred to Diana and Apollo, and called Borisippeni, from its being the habitation of a certain sect of the Chaldæans; Idic-cara, on the Euphrates and the borders of Arabia Deserta; Coche, in the island of Mesene, formed by the Tigris, Saura, and Pombedita, of which the situation is very uncertain.

The air of this country was for the most part salubrious and temperate, though occasionally subject to hot pestilential winds. The rains according to Herodotus, were seldom, the deficiency of which the inhabitants supplied, by inventing wheels and engines for watering the land, and also by cutting numerous canals by which the waters of the Euphrates and Tigris were carried in different directions, and diffused over the whole surface of the empire. The southern parts of Babylonia between the rivers, have been compared to the Delta of Egypt, in consequence of their natural and artificial islands, and from their lying under the same parallel of latitude. The region of Chaldæa between the mountains of Babylon and the Euphrates, is also well watered by lakes, rivers, and canals, which greatly refresh every part of the surface, and its produce, according to Herodotus, l. i. c. 193, is by this means rendered equal to a third part of Asia.

In short, it was one of the finest countries for corn in the world; and so luxuriant, that it commonly yielded a hundred times more than what was sown; and, in good years, it yielded three hundred times more than it received. The leaves of its wheat and barley were four inches broad. 'Though I know,' says Herodotus, 'that the millet and the sesame of that country grow to the size of trees, I will not describe them particularly, lest those who have not been at Babylonia should think my account fabulous.' They had no oil but what they made from Indian corn. For producing fig-trees, vines, and olives, it was not famous, but the country abounded with palm-trees, which grew spontaneously; and most of them bore fruit, of which the inhabitants made bread, wine, and honey. Some of them, as of other trees, the Greeks called male ones. They tied the fruit of the male to the trees which bore dates; that the mosquito, leaving the male, might cause the date to ripen, by penetrating it; for without that assistance it came not to maturity. Musquitoes breed in the male palms as in the wild

fig-trees. The great fertility of the soil was owing, in a great measure, to the inundations of the Euphrates and Tigris, in the months of June, July, and August, caused by the melting of the snow upon the mountains of Armenia. From the circumstance of its being low, flat, and well watered, this country abounded with willows, and was hence called the 'Valley of Willows,' as Prideaux (Con. pt. i. b. i. p. 105,) after Bochart corrects the text, Is. x. 5, 7. Israel, Ps. cxxxvii. 1, 2, sat down in their captivity by the rivers of Babylon, and hung their harps upon the willows.

To facilitate the purposes of commerce the Babylonians navigated the Euphrates, by means of small boats, nearly round, constructed like wicker baskets, which were covered with hides, and guided by two oars, or paddles. These boats had neither head nor stern; but, being of different sizes, were very useful for carrying their goods to Babylon; whence they returned by land, the strength of the current not allowing them to return by water.

The inhabitants of this country were divided, not only into two great tribes, Babylonians and Chaldeans, properly so called, but into numerous inferior sects and divisions, three of which are said to have fed upon nothing but fish, dried in the sun, formed into paste, and afterwards baked in rolls as a substitute for bread.

Physicians are said to have been unknown in Babylonia, to supply the want of which they carried their sick into the public forum, to consult those who passed by on the nature and cure of their diseases. Every one who saw a sick person was obliged to go to him to inquire into his distemper, and tell him if he ever had the same himself, or if he knew any one that had, and how he was cured; together with such other inquiries as the sick person might be induced to propose. They embalmed their dead with honey; and in their mourning imitated the Egyptians.

The laws of marriage among the Babylonians were peculiar, and were celebrated by the ancient writers for their wisdom and utility. On what ground the reader will determine. When the girls were marriageable, they were ordered to meet in a certain place, where the young men likewise assembled. They were then sold by the public crier; but he first sold the most beautiful one; and then put up others to sale, according to their degrees of beauty. The rich Babylonians were envious to carry off the finest women, who were sold to the highest bidders. But as the young men who were poor could not aspire to have fine women, they were content to take the most homely, with the money which was given with them, from the produce of the sale of the finest women! A father could not give his daughter in marriage as he pleased: nor was he who bought her allowed to take her home, without giving security that he would marry her. But after the sale, if the parties were not agreeable to each other, the law enjoined that the money should be restored. The inhabitants of any of their towns were permitted to marry wives at these auctions. Such were the early customs of the Babylonians. But they afterwards made a law, which prohibited the inhabitants of different

towns to intermarry, and by which husbands were punished for treating their wives ill.

The Babylonians were not without considerable taste for the arts. Of their music and poetry we have certain records. They also excelled in architecture and sculpture; also in the arts of designing and casting metals. Their manufactories of rich embroideries, sumptuous vestments, magnificent carpets, and fine linen, were famous; and their purple constituted a considerable article of eastern commerce. They were naturally a commercial nation, for which their metropolis afforded peculiar advantages; seated, as it was, in the midst of the world, and having, by means of its two chief rivers, an easy access to the northern and western parts; and, by means of the Persian Gulf, to the western.

At first, it is said, the Babylonians worshipped only the sun and moon; but they soon multiplied their divinities. They deified Baal, Bel, or Belus, one of their kings, and Merodach-Baladan. They also worshipped Venus under the name of Myletta. She and Belus were the principal deities of the Babylonians. The practice of sacrificing human victims is said to have been first introduced into the world by the Babylonians in the worship of these deities. They counted their day from sun-rise to sun-rise. They solemnised five days in the year with great magnificence, and almost the same ceremonies with which the Romans celebrated their Saturnalia; and the Babylonians, generally speaking, were very much addicted to judicial astrology. Their priests, who openly professed that art, were obliged to commit to writing all the events of the lives of their illustrious men; and on a fancied connexion between those events and the motions of the heavenly bodies, the principles of their art were founded. They pretended that some of their books, in which their historical transactions and revolutions were accurately compared with the courses of the stars, were thousands of years old. And although we may dispute this assertion of their astrologers, it is nevertheless, true that they had made a long system of observations; and that some of these were extant in the days of Aristotle, which were older than the Babylonish empire. See *ASTRONOMY*, Index.

The government of Babylon was despotic, and the succession hereditary. Their potentates assumed divine titles, and received divine honors, which shows the spirit and force of the Scripture comparison between Babylon and papal Rome. The officers by whom the affairs of government were administered, were both civil and military, and were divided into three classes. The first had the charge of virgins, and of their disposal in marriage. They were also to judge in cases of adultery, and all matters connected with the rights and institutes of matrimony. The second took cognizance of thefts; and the third of all other crimes. The chief officers of the king's household were the captains of the guard, who executed the commands of the sovereign. The prince of the eunuchs, who had the care of the youth of the palace; the prime minister, resembling the Turkish vizier, who sat in the king's gate to hear complaints and pass judgment;

and a master of the magicians, whose province it was to satisfy the king on all subjects that related to futurity.

Of the criminal laws of Babylon little is known, except that their punishments were cruel and capricious—as beheading, cutting to pieces, turning the house of the criminal into a dung-hill, burning, &c. Such is the account com-

monly given by historians of this renowned and ancient monarchy, one of the four great empires of the earth, so frequently employed in the land of Providence as a scourge to execute the divine threatenings upon surrounding nations. This, however, is but a general view, and for a more detailed description, we refer the reader to the authorities already quoted.

BABYLON is a term employed in the Scriptures, particularly in the first epistle of St. Peter, and the book of Revelation, to designate a great enemy to the Christian faith; and is generally applied, by Protestants, to the Roman Catholic church; which, from her pride, oppressive and persecuting spirit, but chiefly from her idolatry, bears great resemblance to Babylon. Whoever reads the sixth chapter of Baruch, and compares it with the history of the papal apostacy, will see the justice and force of the application. See also *Whitby's Paraphrase*, vol. ii. p. 661, and 753.

BABYLONIA CURA, in astrology, the art of casting nativities.

BABYLONIAN, BABYLONIUS, is used, in ancient writers, for an astrologer, or any thing relating to astrology.

BABYLONICA. See **BABYLONICS**.

BABYLONICA TEXTA, a rich sort of weavings, or hangings, denominated from the city of Babylon, where their practice of interweaving divers colors in the hangings first obtained. Hence also Babylonian garments, Babylonian skins, Babylonian carpets, housings, &c.

BABYLONICS, BABYLONICA, in literary history, a fragment of the ancient history of the world, ending at 267 years before Christ; and attributed to Berosus, a priest of Babylon, about the time of Alexander. The Babylonics are sometimes cited in ancient writers by the title of Chaldaics. They are generally consonant with Scripture, whence the author is usually supposed to have consulted the Jewish writers. Berosus speaks of an universal deluge, an ark, &c. He reckons ten generations between the first man and the deluge; and marks the duration of the several generations by saroi, or periods of 223 lunar months; which, reduced to years, differ not much from the chronology of Moses. Only a few imperfect extracts are now remaining of the work; preserved chiefly by Josephus and Syncellus. Annianus of Viterbo, to supply the loss, forged a complete Berosus!

BABYLONII NUMERI, Babylonian numbers, or the computation of astrologers.

BABYROUSSA, in zoology, a synonyme of a species of sus. It is the horned hog of Grew; porcus indicus babyroussa dictus of Ray; and baby-roussa of Buffon. In the arrangement of the French naturalists, it belongs to the genus cochons and order pachydermes. See **SUS**.

BAC, or BACK, in brewing or distilling, a large flat tub, or vessel, wherein the wort is put to stand and cool. There is a branch of trade called back-making, for furnishing these vessels.

BAC, in navigation, is used for a pram, or ferry-boat. See **BACK**.

BACA, an ancient valley in Palestine. Some

commentators suppose it to be the same with the valley of Rephaim, where the Jews, in journeying to their solemn festivals, stopped for refreshment, as it abounded with springs, and was well shaded with mulberry trees, which the name Baca signifies. See Psalm lxxxiv. 6.

BACA, or BAZA, a town of Spain, in Granada, situated in a valley called Iloya de Baza. It is encompassed with old walls, has a ruined castle, and a church, dedicated to the Virgin Mary. The land about it is well cultivated, and is fertile in wheat, wine, honey, hemp, and flax, being watered by the Guadalentin. It is thirty-five miles north-west of Almeida.

BACACUM, a town of the Nervii in Gallia Belgica; now Bavay, in Hainault.

BACAAM, or BAZAAM, a sea-port town of the Deccan of Hindostan, on the Malabar coast.

BACALAL, a lake of Mexico, in the province of Yucatan, forty miles long, and sixteen broad. It is thirty-six miles south-west of Valladolid.

BACANO, a lake of Italy, in the pope's territories, from which issues the river Varca.

BACANORA, a town of North America, in New Mexico, seated on the Hliagra.

BACANTIBI, in ecclesiastical history, wandering clerks, who strolled from church to church. The word seems formed by corruption from vacantivi.

BACASERAY, a considerable town in the peninsula of Crim Tartary. It was taken from the Turks by the Russians, in 1736. It is seventy miles south of Precop.

BACBAKIRI, in ornithology, the name by which le Merle à plastron noir de Ceylan of Buffon, is known at the Cape of Good Hope, because its note very clearly expresses the syllables bac-ba-ki-ri. It is the green-pye from Ceylon of Edwards; Ceylon thrush of Latham; and turdus Zeylonus of Linnæus.

BACCA, BERRY, in botany, is used to signify such fruits as consist of pericarpium full of juice and seeds, without any valves.

BACCÆ BERUDIENSES, in the materia medica, the berries of the sapindus, or soap-berry tree.

BACCALARIA, in middle age writers, a kind of country farms, consisting of several manses.

BACCALARIA DOMINICARIA, BACCALARIA INDOMINICATA, were more particularly used for a farm belonging to the lord, and kept in his own hands.

BACCALAUREATE, BACCALAUREATUS, a bachelor's degree; the first degree in arts and sciences in an university. See next article.

BACCALAUREUS; Latin, from bacca lev-

rea, a bay berry; a bachelor in an university, so called because anciently their heads, at graduation, were adorned with a garland of bay berries.

BACCARACII, a town of Germany, in the lower Palatinate; formerly imperial and free, but now subject to Prussia. It is famous for excellent wine; and is situated on the east shore of the Rhine, thirty-eight miles south of Coblenz, and forty-eight north of Deux Ponts. This place is mentioned by historians in the twelfth century, and the customs formerly collected on the Rhine here were so productive, that it received the name of the golden toll. A spring, of an oily consistence, rising in the middle of the river near it, affects both the smell and color of the water to a considerable distance. The island of Heil-esen, just below it, contains a monument, to be seen at low water, adorned with sculptures and inscriptions. It appears to have been an ancient altar of Bacchus; is still termed Bacchi ara, and is said to give the town its name. There are large slate quarries in the neighbourhood, and the town contains manufactures of powder and starch. Population about 1200. The town suffered much in the thirty years war. The count palatine formerly resided in the castle of Stal-hecke, near this town.

BACCARUM, in entomology, a species of acarus, found on gooseberries, currants, and other fruit-trees. Also a species of cimex, of a fulvous color. Inhabits Europe.

BACCASERY. See **BACASERY**.

BACCATED, *adj.* Lat. *baccatus*, beset with pearls: having many berries.

Johnson from Diet.

BACCATUS, in botany, berried, or soft, like a berry; an epithet for a capsule, a drupe, a silique, and an aril, as *Baccata capsula*, a capsule with a fleshy coat. *Baccata drupa*, a drupe with a succulent coat, &c.

BACCHÆ, in antiquity, 1. the priestesses of Bacchus, who celebrated the mysteries of that god; 2. the ivy crowns or garlands worn by the priests of Bacchus, in offering sacrifices to him.

BACCHANAL, *n. s.*) From Lat. *bac-*
BACCHANALIAN, *ad. & n. s.*) *chanalia*. The feasts and revels of Bacchus, the god of wine; a worshipper of Bacchus, or, in modern usage, a drunkard or riotous person.

Ha, my brave emperor! shall we dance now the Egyptian *bacchanals*, and celebrate our drink?

Shakspeare.

What wild fury was there, in the heathen *bacchanals*, which we have not seen equalled?

Decay of Piety.

Both extremes were banish'd from their walls;
Carthasian fasts, and fulsome *bacchanals*.

Pope.

And now Child-Harold was sore sick at heart,
And from his fellow *bacchanals* would flee.

Byron.

BACCHANALIA, **BACCHANALS**, religious feasts in honor of Bacchus, were celebrated with much solemnity among the ancients, particularly the Athenians, who even computed their years by them, till the commencement of the Olympiads. They are sometimes also called *orgia*, from the Greek *οργη*, fury; on account of the madness and enthusiasm wherewith the people appeared to be possessed at the time of their celebration. They were held in autumn, and took their rise from Egypt: whence, accord-

ing to Diodorus, they were brought into Greece by Melampus. The form of the solemnity depended at Athens, on the archon, and was, at first, exceedingly simple; but, by degrees, it became encumbered with a number of ridiculous ceremonies, and attended with much dissoluteness and debauchery; insomuch, that the Romans grew ashamed of them, and suppressed them by a decree of the senate throughout all Italy. The women had a great share in these solemnities, which were said to have been instituted on their account; for a great number of them, according to the tradition, attended Bacchus to the conquest of the Indies, carrying in their hands the thyrsus (i. e. a little lance, covered with ivy and vine leaves), and singing his victories and triumphs. The ceremony was kept up after Bacchus's deification, under the title of Bacchanalia, and the women were installed priestesses thereof, under that of Bacchæ, or Bacchantes. These priestesses, at the time of the feast, ran through the streets, and over the mountains, covered with tiger's skins, their hair dishevelled, their thyrsus in one hand, and torches in the other, howling and shrieking, *Ενοι σαβοι! Ενοι Βαρχε! Ιω Ιαρχε!* or *Ιω Βαρχε!* Of the men, some represented Pan, others Silenus, others satyrs. Men and women met promiscuously at the feast, quite naked, except only that the vine leaves, and clusters of grapes, bound their heads and loins; here they danced and jumped tumultuously, and, with strange gesticulations, sung hymns to Bacchus, till, being weary and giddy, they fell. Livy has left us a particular account (xxxix. 8, &c.) of the enormities practised at these festivals, and which led to their suppression. There were two principal Bacchanalia held annually, viz.

BACCHANALIA DIONYSIA, or **MAJORA**, the greater Bacchanalia, so called from one of Bacchus's names (see **BACCHUS**), celebrated in the city about spring time; and

BACCHANALIA LENÆA, or **MINORA**, the lesser festival, celebrated in the open fields about autumn.

BACCHANALIA signify also pictures, or basso relievos, whereon the feast is represented, consisting chiefly of dancing, nudities, and the like. There are antique Bacchanals, still seen on several ancient friezes. Those painted by Poussin are excellent.

BACCHANTES, priestesses to Bacchus.

BACCHARACH WINE, an excellent kind of wine, by many mistaken for Rhenish; but from which Portzius observes it differs in color, taste, flavor and strength. See **BACCARACH**.

BACCHARIS, in botany, Ploughman's Spikenard: a genus of the polygamia superflua order, and syngenesia class of plants; ranking in the natural method under the forty-ninth order, compositæ discoides. The characters are: a naked receptacle, and hairy pappus; with a cylindrical imbricated calyx, and feminine florets mixed with the hermaphrodites. There are seven species, all natives of warm climates; of which the two following chiefly merit notice. 1. *B. Halimifolia*, or Virginia groundsel tree, a native of Virginia and other parts of North America. It grows about seven or eight feet high, with a crooked shrubby stem; and flowers in October. 2. *B.*

Ivæfolia, or African tree groundsel, a native of the Cape of Good Hope, as well as of Peru and other warm parts of America.

BACCHARIS, in pharmacy, a sweet ointment used among the ancients, so called perhaps from the above plant being a principal ingredient in it.

BACCHI, in fabulous history, a kind of machines in the form of goats, said to have been used by Jupiter in his wars against the giants. Rudbeck describes two kinds of Bacchi, one made like the battering ram, wherewith Jupiter demolished the enemy's fortifications; the other contrived to cast fire, from whence the Greeks are conjectured to have framed their idea of the chimera.

BACCHIC, something relating to the ceremonies of Bacchus. The celebrated intaglio, called Michael Angelo's ring, is a representation of a Bacchic feast.

BACCHIC SONG is sometimes used for a chanson à boire, or composition to inspire jollity. But in a more proper sense, it is restrained to a dithyrambic ode or hymn.

BACCHICA, in botany, *Hedera*, or ivy.

BACCHINI (Benedict), a learned monk of the seventeenth century, was a native of Parma, and entered at the age of sixteen into the Benedictine monastery of Mount Cassino. He afterwards travelled as secretary to the abbot of Ferrara. At length he settled at Parma, and established a periodical journal, which he conducted for some years with learning and success: but his criticisms created enemies, who procured his banishment. He retreated to Modena, and resumed his journal under the patronage of the duke of Modena. He was also historiographer and librarian to the duke. He subsequently became abbot of a Benedictine monastery, and was also chosen professor of ecclesiastical history at Bologna, where he died in 1721, aged seventy. Bacchini was one of the most learned men of his time. His literary journal extends to nine vols. 4to.; besides which, he published *De Sistorum Figuris ac Differentiâ*, Bononiæ, 1691, 4to.; *De Ecclesiasticâ Hierarchiâ Originibus*, Modenæ, 1703, &c. &c.

BACCHIS, or **BALUS**, king of Corinth, succeeded his father Pruinides, and reigned with such moderation and equity, that to commemorate him his successors were called Bacchidæ. The Bacchidæ afterwards becoming numerous, they chose one as president, with regal authority. This institution was, however, overturned by Cypselus making himself absolute.

BACCHUS, a follower of Aristoxenus, supposed by Fabricius to have been tutor to the emperor Marcus Antoninus, and consequently to have lived about A. D. 140. He wrote in Greek a short introduction to music in dialogue, which Meibomius has published with a Latin translation.

BACCHUS, in ancient poetry, a foot composed of a short syllable and two long ones; as *ägêstās*. It takes its name from the god Bacchus, because it frequently entered into the hymns composed in his honor. The Romans called it likewise *ænotrius*, *tripodius*, and *saltans*; and the Greeks *Παραμυθός*.

BACCHUS and **BITHUS**, two renowned gladiators of equal age and strength; whence the pro-

verb, expressive of equality, *Bithus contra Bacchium*.

BACCHUS, in heathen mythology, the god of wine. He is seldom named in modern times, but as a sensual encourager of feast and jollity: he was regarded in a more respectable light by the ancients, who worshipped him in different countries under the appellations, in Egypt, of Osiris; in Mysia, *Fanaces*; in India, *Dionysius*; *Liber*, throughout the Roman dominions; *Adoneus*, in Arabia; and *Pentheus*, in Lucania. Mythologists furnish reasons for all these different names. The Greeks and the Romans ascribed to the Bacchus whom they worshipped, the several actions and attributes of the many divinities known by that name, and by other equivalent denominations in different countries. However, antiquity chiefly distinguished two gods under the title of Bacchus; the one of Egypt, the other of Thebes in Bœotia.

The Bacchus of Egypt was the son of Ammon, and considered as the same with Osiris. He was brought up at Nysa, a city of Arabia Felix, whence he acquired the name of *Dionysius*, or the god of Nysa; and was the conqueror of India. This Bacchus was one of the elder gods of Egypt, although, according to Sir Isaac Newton, he flourished but one generation before the Argonautic expedition. Bacchus, says *Hermippus*, was potent at sea, conquered eastward as far as India, returned in triumph, brought his army over the Hellespont, conquered Thrace, and left music, poetry, and dancing there.

BACCHUS of Thebes was the son of Jupiter by Semele, the daughter of Cadmus, and ranked as the youngest of the Grecian deities. *Diodorus Siculus* tells us, that *Orpheus* first deified the son of Semele by the name of Bacchus, and appointed his ceremonies in Greece, to render the family of Cadmus, the grandfather of the Grecian Bacchus, illustrious. According to this author, it was the son of Semele who invented farces and theatres, and who first established a musical school, excepting from all military functions such musicians as discovered great abilities in their art: on which account, says the same author, musicians formed into companies have since frequently enjoyed great privileges. *Pausanias*, in his *Attics*, speaks of a place at Athens consecrated to Bacchus the singer: whence it should seem that Bacchus was regarded by the Athenians not only as the god of wine, but of song; and it must be owned, that his followers, in their cups, have not been uninclined to pay him service in this way. Indeed it is clear, that in none of the orgies, processions, and festivals, instituted by the ancients to the honor of this prince of bonvivans, music was forgotten. We find not only that musicians, male and female, regaled him with the lyre, the flute and the song; but that he was accompanied by fawns and satyrs, playing upon timbrels, cymbals, bag-pipes, and horns; these *Suidas* calls his minstrels, and *Strabo* gives them the appellation of *Bacchi*, *Sileni*, *Satyri*, *Bacchæ*, *Lenæ*, *Thyæ*, &c. These representations have furnished subjects for the finest remains of ancient sculpture; and the most voluptuous passages of ancient poetry are descriptions of the orgies and festivals of Bacchus.

Bacchus, is represented on medals in the form of a boy or youth, an old man, or a female, as in figs. 1, 2, 3; he is mostly naked, as in fig. 4,

where he stands under the shadow of a vine-branch, near an altar, at which the emperor Commodus is offering him divine honors.

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 4.

BACCHUS, in entomology, a large species of scarabæus, that inhabits the Cape of Good Hope. 2. A species of curculio. 3. A species of monoculus.

BACCHUS, in ichthyology, a name given by some to the myxon, a fish of the mullet kind, remarkable for the red color of its lips, and the extremity of the covering of the gills. See MUGIL.

BACCHUS-BOLE. See BOTANY.

BACCHYLIDES, a famous Greek poet, the nephew of Simonides, and the contemporary and rival of Pindar. Both sung the victories of Hiero at the public games. Besides Odes to athletic victors, he was the author of love verses, prosodies, dithyrambs, hymns, paans, parthenia, or songs to be sung by a chorus of virgins at festivals, &c. The chronology of Eusebius places the birth of Bacchylides in the eighty-second Olympiad, about A. A. C. 450.

BACCHIFEROUS. See BOTANY.

BACCINA, or BACCINUM, a basin to hold water to wash the hands. The holding the basin, or waiting at the basin, on the day of the king's coronation, was an ancient tenure in serjeantry.

BACCIO, Francisco Bartolomeo, or Bartolomei di S. Marco, a celebrated history and portrait painter, was born at Savignano near Florence, in 1474, and was a disciple of Roselli; but his principal knowledge in the art was derived from Da Vinci. He understood the true principles of design better than most masters of his time, and was also a considerable painter of perspective. He studied, and he had quitted the school of Perugino, studied the art of uniting colors under the sky, as well as the rules of perspective. Some years after the departure of Raphael, Baccio visited Rome; and by the observations he made on the antiquities and the works of Raphael, which, by that time, were universally admired, he improved much, and manifested his abilities by a picture of St. Sebastian, which he finished at his return to Florence. This was so well designed, so naturally colored, and had so strong an expression of agony, that it was removed from the convent where it was exhibited, as it had made too strong an impression on the imaginations of many women. He is accounted the first inventor of the machine called a layman by the artists, and which is still in general use. Upon that he placed his draperies, to observe, with great exactness, their natural and their most elegant folds. A capital picture of the ascension by Baccio, is in the Florentine collection. He died in 1517.

BACCIO, or BACCUS (Andrew), a celebrated physician of the sixteenth century, born at St. Elpideo. He practised physic at Rome with great reputation, and was first physician to pope Sixtus V. The most scarce and most valuable of his works are, 1. De Thermis. 2. De Naturali Vinorum Historia. 3. De Venenis et Antidotis. 4. De Gemmis ac Lapidibus pretiosis.

BACCIVOROUS, *adj.* From *bacca*, a berry, and *voro*, to devour, Lat. Devouring berries.

BACCOFOE, in botany, a fruit like the banana, very common in Guinea, but whiter, thicker and shorter. The taste and smell are agreeable; and some pretend that on cutting it through transversely, there is the figure of a crucifix on each side of it. Phil. Trans. No. 108.

BACCULI. See BACILLI.

BACH, a town of Lower Hungary, in the county of Tolu, seated on the Danube.

BACH (John Sebastian), a celebrated musician, born at Eisenach in Germany in 1685. He was patronised by the duke of Saxe Weimer, who appointed him his musician in 1708; and at Dresden he gained a victory over a famous French organist, whose vanity led him to challenge all the German musicians. As an organist, he was thought equal to Handel, and the excellence of his compositions testify him to have been among the foremost in the science. He died in 1754.

BACH (Charles and John), sons of the above, were both very eminent as performers and composers of music. Charles lived at Hamburg in 1773, and John was in England in 1763.

BACHA, a river of Asiatic Russia, which joins the Jenesei on the right.

BACHA, in ornithology, a species of falco, figured in the fifteenth plate of Le Vaillant's work on the birds of Africa. It is about the size of the common buzzard, and naturally belongs to that tribe of rapacious birds.

BACHAUMONT (Francois le Coigneux de), a French poet. He was counsellor to the parliament, but his love of ease and pleasure made him give up his post and renounce his profession. Contracting an intimacy with Chapelle, he was joined with him in writing A Journey to Montpellier, in which there is much vivacity displayed; besides which he wrote several other works, in a humorous style. He died at Paris in 1702, aged seventy-eight.

BACHAUMONT (Louis-Petit), a French writer, born at Paris, was author of Secret Memoirs towards a History of the Republic of Letters in France, thirty-six volumes, 12mo. and other works. He died in 1771.

BACHELIER (Nicholas), an eminent French sculptor and architect. He was a pupil of Michael Angelo, and ornamented the churches of Toulouse, his native city. He died about 1554.

BACHELOR, *n. s.* } This is a word of
BACHELORSHIP, *n. s.* } very uncertain etymology; it not being well known what was its original sense. Junius derives it from *βακίλος*, a man of full stature but of effeminate and immature mind; Menage, from *bas chevalier*, a knight of the lowest rank; Spelman, from *baculus*, a staff; Cajus, from *buccella*, an allowance of provision. The most probable derivation seems to be, from *bucca lauris*, the berry of a laurel or bay; bachelors, being young, are of good hopes, like laurels in the berry. Dr. Lawrence observes, that Menage's etymology is much confirmed by the practice in our universities of calling a bachelor, Sir. In Latin, *baccalaureus*. The former of these words describes the person; the latter his condition. The more common acceptance is a man unmarried. Its secondary meaning is one who takes his first degree at the university in any profession; and its last and now obsolete sense, is a knight of the lowest order.

Shall I never see a *bachelor* of threescore again?

Shakspeare.

When I said I would die a *bachelor*, I did not think I should live till I were married.

Id.

Her mother, living yet, can testify,

She was the first fruit of my *bachelorship*.

Id.

But he told the latter, that is to say, Mr. Spectator, he told the *bachelors* that their lives and actions had been so peculiar that he knew not by what name to call them.

Spectator.

Being a boy, new *bachelor* of arts, I chanced to speak against the pope.

Ascham.

I appear before your honour, in behalf of Martinus Scriblerus, *bachelor* of physic.

Mart. Scriblerus.

BACHELOR, in ancient times, was a denomination given to those who had attained to knighthood, but had not a number of vassals sufficient to have their banner carried before them in the field of battle; or if they were of the order of bannerets were not of age to display their own banner, but obliged to march to battle under another's banner. It was also a title given to young cavaliers who, having made their first campaign, received the military girdle accordingly. And it served to denominate him that had overcome another in a tournament the first time he ever engaged.

BACHELOR, in the six companies of merchants at Paris, was a name given before the Revolution to the elders, and such as, having served the offices, had a right to be called by the masters and wardens to be present with them, and assist them in their functions.

BACHELORS, in the livery companies of London, are those who are not yet admitted to the livery. These companies generally consist of a master, two wardens, the livery, and the bachelors, who are yet but in expectation of dignity in the company, and have their functions only in attendance on the master and wardens. They are also called yeomen.

BACHELORS, in the university sense, are persons who have attained to the baccalaureats, or

first degree in arts, divinity, law, or physic. This degree in some universities has no existence. It was first introduced in the thirteenth century by pope Gregory IX. The following regulations are observed respecting it in Oxford and Cambridge: In the university of Cambridge, a bachelor of arts must reside the greater part of twelve several terms, the first and last excepted. The statutable exercises before admission, ad respondendum questioni (a form in which the father of the college asks each student a question before his graduation), are two acts and two opponencies. A bachelor of divinity must be a master of arts of seven years standing: his exercises are, one act, after the fourth year, two opponencies, a concio ad clerum, and an English sermon. The ten-year men, who are candidates for this degree, are tolerated by a statute 12 Eliz. They are persons who, being twenty-four years of age and upwards, are admitted at any college to take the degree of bachelor of divinity after ten years. During the last two years they must reside the greater part of three several terms. Their exercises are the same as in the regular course. A bachelor of laws must be of six years standing complete, and must keep the greater part of nine several terms. The exercise is one act. A bachelor of physic must keep the greater part of nine several terms, and may be admitted any time in his sixth year: the exercise is one act and one opponency. A bachelor of music must enter his name at some college, and perform a solemn piece of music as an exercise prior to his degree.

In the university of Oxford, a bachelor of arts must keep sixteen terms, and appear once as a respondent in the schools. A bachelor of divinity must be master of arts of seven years standing: his exercises are one act, two opponencies, and a concio ad clerum after the fifth year. A bachelor of laws must be a master of arts of three years standing: his exercises are one act and two opponencies. A bachelor of medicine must be a master of arts of one year standing: his exercises are one act and one opponency. A bachelor of music must produce a competent testimonial that he has applied himself to that science during seven years, and must perform a piece of music of five parts publicly in the music school.

BACHELORS, KNIGHTS, the most ancient, but the lowest order of knights in England; known by the name of knights only. They are styled knights bachelors, either (according to some) as denoting their degree, quasi *bas chevaliers*; or, according to others, because this title, like the fortune of an unmarried man, does not descend to their posterity. The custom of the ancient Germans was to give their young men a shield and a lance in the great council; this was equivalent to the toga virilis of the Romans. Before this they were not permitted to bear arms, but were accounted as part of the father's household, after it, as part of the public. Hence some derive the usage of knighting, which has prevailed all over the western world since its reduction by colonies, from those northern heroes. Knights are called in the Latin *equites aurati*; *aurati*, from the gilt spurs they wore, and *equites*, be-

cause they always served on horseback; for it is observable that almost all nations call their knights by some appellation derived from a horse. They are also called in our law milites, because they formed a part, or indeed the whole of the royal army, in virtue of their feudal tenures: one condition of which was, that every one who held a knight's fee (which in Henry II.'s time amounted to twenty pounds per annum) was obliged to be knighted, and attend the king in his wars, or pay a fine for his non-compliance. The exertion of this prerogative, as an expedient to raise money in the reign of Charles I. gave great offence, though warranted by law and the recent example of queen Elizabeth. At the restoration it was, together with all other military branches of the feudal law, abolished, and it now only exists in an honorary title, conferred by the king's lightly touching the person, who is then kneeling, on the right shoulder with a drawn sword, and saying, 'rise, sir.' See KNIGHT and NOBILITY.

On bachelors, or unmarried men, the Roman censors frequently imposed fines. Dion Halicarnassus mentions an old law by which all persons of full age were obliged to marry. But the most celebrated law of the kind was that made under Augustus, called the *lex Julia de maritandis ordinibus*: by which bachelors were made incapable of legacies or inheritances by will, unless from their near relations. This brought many to marry, according to Plutarch's observation, not so much for the sake of raising heirs to their own estates, as to make themselves capable of inheriting those of others. The rabbins maintain, that, by the laws of Moses, every body, except a few particular persons, is obliged in conscience to marry at twenty years of age; and that this makes one of their 613 precepts. Hence those maxims, so frequent among their casuists, that he who does not take the necessary measures to leave heirs behind him, is not a man, but ought to be reputed a homicide. Lycurgus was not more favorable to this state of life. By his laws, bachelors are branded with infamy, excluded from all offices civil and military, and even from the shows and public sports. At certain feasts they were forced to appear, to be exposed to the public derision, and led round the market-place. On one occasion, the women led them in this condition to the altars, where they were obliged to make amende honorable to nature, accompanied with a number of blows and fishes with a rod. To complete the affront, they forced them to sing certain songs composed in their own derision. The Christian religion has been supposed to be more indulgent to the bachelor state; because the apostle Paul has recommended it as preferable (as it certainly was) during the early ages of Christianity, when a man was in danger of suffering, not only in his own person or property, but in those of his nearest and dearest connexions, for the sake of religion; which rendered such persecutions more dreadful and severe upon the married than the unmarried. The ancient church, overlooking this principle, upon which the apostle's advice is evidently founded, recommended the bachelor state, as well as that of

perpetual virginity in the other sex, as not only more perfect than the married state, but even as highly meritorious: and thus gave birth to the absurd system of monasteries, nunneries, and the celibacy of the clergy; which for so many ages has burdened Europe, with thousands of idle drones of both sexes. In the canon law, we find injunctions on bachelors, when arrived at puberty, either to marry or to turn monks and profess chastity in earnest. In England there was a tax on bachelors, after twenty-five years of age, £12. 10s. for a duke; and a common person 1s. by 7 Wil. III. 1695. They were also taxed by Mr. Pitt in an extra-duty on their servants.

BACHELORS OF THE CHURCH, *baccalarii ecclesiæ*, an inferior class of ecclesiastics, mentioned in some old records, which speak of the bishop with his canons and *baccalarii*.

BACHELOR'S PEAR, in botany, a name sometimes given to the *solanum mammosum*.

BACHER, a lofty ridge of mountains in Styria, circle of Cilly, near the Drave, about sixty-five miles in circuit.

BACHIAN, or **BATCHIAN**, one of the Molucca islands in the eastern ocean, separated by a narrow channel only, from the island of Gilolo. It is about fifty miles long, and twenty in average breadth, but much narrower in the middle than towards each end. The native prince of this island early formed an alliance with the Spaniards and Portuguese, who were expelled by the Dutch in 1610. It is fertile in sago, and other fruits of the climate; and was formerly considered as producing better cloves than any other island of these seas. On this island the Dutch fixed their principal settlement, before Amboyna attained its present pre-eminence. Bachian, covered with forests, contains a burning mountain; beds of coral adorn its shores, and gold has been classed among its products. It is under the government of a sultan, the sovereign of Oby, Ceram, Goram, and another contiguous islet. The inhabitants are Malay Mahomedans, who are considered as the most eastern disciples of the Arabian prophet. The chief town is Sabongo. Latitude about 0° 48' S.; and long. 128° 0' E.

BACHILLERIA, in old law Latin, the commonalty, as distinguished from the nobility.

BACHILLI. See **BACILLI**.

BACHMUTH, or **BAKHMOUT**, the chief town of a circle in the government of Ekaterinoslav, in European Russia, situated on a river of that name, which falls into the Donetz. It is well fortified, and has a citadel for the protection of its salt-works. It has belonged successively to the governments of Voronetz and New Russia, and was erected into its present government in 1775. The circle of Bachmuth borders on the government of Voronetz, and the country of the Don Cossacs, and is one of the most fertile parts of Little Russia. When a scarcity of water prevails in the summer, the supplies are brought from the Donetz. 104 miles N.N. W. of Azoph, and 112 east of Ekaterinoslav.

BACHNEU, or **BONGHU**, a market town of Transylvania, in the county of Kokelburg, on the river Little Kokel.

BACHU. See **BAKU**.

BACILLARIA, in entomology, a genus of

the class vermes, and order infusoria: its body consisting of cylindrical, straw-like filaments. The only species is the *B. paradoxa*, seu vibrio paxilifer.

BACILLI, or **BACULI**, in medicine (from baculus, Lat. a staff.) such compositions as are made up in a cylindrical figure, like a stick.

BACILLUM, in medicine, dim. of baculum, a troche in the form of a stick.

BACILLUM, in chemistry, iron instruments in the shape of a baculum, or staff.

BACK, *n. s. v. a. & adv.* } Sax. bac, bæc; }
BACKED, *adj.* } Germ. *back*. The noun signifies the hinder part of the body; the outer part of the hand opposed to the palm; the thick part of any tool opposed to the edge. The adverb denotes the situation of being, and the direction of going. The adjective points out the back as the adjunct of being; the simple circumstance of having a back; and the verb is used in various senses, intimately connected and easily traced to one common source, the original etymon, namely, to mount on the back of a horse; to break a horse; to place upon the back; to maintain, to strengthen, to support, to defend, to justify, and to second.

His *back*, or rather burthen, show'd
 As if it stooped with its own load. *Hudibras.*

Did they not swear, in express words,
 To prop and *back* the house of lords?
 And after turn'd out the whole houseful. *Id.*

Part following enter; part remain without,
 And mount on others *backs*, in hopes to share. *Dryden.*

The epistles being written from ladies forsaken by their lovers, many thoughts came *back* upon us in divers letters. *Id.*

Factious, and fav'ring this or t'other side,
 Their wagers *back* their wishes. *Id.*

Methought love pitying me, when he saw this,
 Gave me your hands, the *backs* and palms to kiss. *Donne.*

Those who, by their ancestors, have been set free from a constant drudgery to their *backs* and their bellies, should bestow some time on their heads. *Locke.*

He might conclude, that Walter would be upon the king's *back*, as his majesty was upon his. *Clarendon.*

As the voice goeth round, as well towards the *back* as towards the front of him that speaketh, so does the echo: for you have many *back* echoes to the place where you stand. *Bacon.*

And all within it full of wyndingsis
 And hidden ways that scarce an hound by smell
 Can follow out those false footsteps of his
 Ne none can *backe* returne that once are gone amis. *Spenser. Faerie Queene.*

At the hour of death, all friendships of the world bid him adieu, and the whole creation turns its *back* upon him. *South.*

A great malice, *backed* with a great interest, can have no advantage with a man, but from his expectations of something without himself. *Id.*

Back you shall not to the house, unless
 You undertake that with me. *Shakspeare.*

That roan shall be my throne,
 Well, I will *back* him strait. O Esperance!
 Bid Butler lead him forth into the park. *Id.*

He hath a garden circummur'd with brick,
 Whose western side is with a vineyard *backed*. *Id.*

As I slept, methought
 Great Jupiter, upon his eagle *back'd*,
 Appear'd to me. *Id.*

Belike he means
Back'd by the pow'r of Warwick, that false peer,
 T'aspire unto the crown. *Id.*

You are strait enough in the shoulders, you care not who sees your back; call you that *backing* of your friends? a plague upon such *backing*! give me them that will face me. *Id.*

He sent many to seek the ship *Argo*, threatening that if they brought not *back* *Medea*, they should suffer in her stead. *Raleigh's History of the World*

Where they are, and way they came not *back*,
 Is now the labour of my thoughts. *Milton*

Back to thy native island might'st thou sail
 And leave half-heard the melancholy tale. *Pope*

So rag'd Tydides boundless in his ire,
 Drove armies *back* and made all Troy retire. *Id.*

This *Cæsar* found, and that ungrateful age,
 With losing him went *back* to blood and rage. *Waller*

I've been surpris'd in an unguarded hour,
 But must not now go *back*; the love, that lay
 Half smother'd in my breast, has broke through all
 Its weak restraints. *Addison*

How shall we treat this bold aspiring man?
 Success still follows him, and *backs* his crimes. *Id.*

To thee, Almighty God to thee,
 Our childhood we resign;
 'Twill please us to look *back* and see,
 That all our lives were thine. *Watts.*

First Fear his hand its skill to try,
 Amid the chords bewildered laid,
 And *back* recoil'd he knew not why,
 E'en at the sounds himself had made. *Collins*

Direct us how to *back* the winged horse;
 Favour his flight and moderate his course. *Roscommon.*

These were seconded by certain demilaunces, and both *backed* with men at arms. *Sir J. Hayward.*

The patrons of the ternary number of principles, and those that would have five elements, endeavour to *back* their experiments with a specious reason. *Boyle.*

We have I know not how many adages to *back* the reason of this moral. *L'Estrange.*

BACK, in the menage, and among farriers A horse's back should be straight, not hollow, which is called saddle-backed: horses of this kind are generally light, and carry their heads high, but want in strength and service. A horse with a weak back is apt to stumble. In the French riding-schools, to mount a horse a *dos*, is to mount him bare-backed, without a saddle.

To **BACK** an anchor, in maritime affairs, *empeneller une ancre*, Fr. to carry out a small anchor, as the stream or kedje, ahead of the large one, by which the ship usually rides, in order to support it, and prevent it from loosening, or coming home in bad ground. In this situation the latter is confined by the former, in the same manner that the ship is restrained by the latter.

To **BACK** astern in rowing, *scier à culer*, Fr. is to manage the oars in a direction contrary to the usual method, so as that the boat or vessel impressed by their force, shall retreat or move with her stern foremost.

BACK the starboard oars! *scie tribord! avec les avirons*, Fr. the command to confine the above management to the oars on the right hand side of the boat only, in order to turn her round more speedily to that direction.

To **BACK** and fill, *coiffer et faire servir les voiles*, Fr. is an operation generally performed in narrow rivers, when a ship has the tide in her favor, and the wind is against her.—Exam. 'We were obliged to back and fill occasionally to get up the Thames.'

To **BACK** the sails, *mettre à scier*, Fr. is to arrange them in a situation that will occasion the ship to retreat or move astern, in consequence of the tide or current in her favor, and the wind contrary, but light. This operation is particularly necessary in narrow channels, when a ship is carried along sideways by the strength of that tide or current, and it becomes requisite to avoid any object that may intercept her course, as shoals, or vessels under sail, or at anchor: it is also necessary, in a naval engagement, to bring a ship back, so as to lie opposite to her adversary, when she is too far advanced in the line; and also in fleets under convoy, where ships are too much crowded, by the above operation they may be preserved from falling aboard each other. See the article **ABACK**.

BACK the main-topsail! *brasse le grand hunier sur le mât!* Fr. the command to brace that sail in such a manner that the wind may exert its force against the fore-part of the sail, and by thus laying it aback materially retard the ship's course.

BACK, or Dutchman's Cap, an islet of the Hebrides. Long. 6° 27' W., lat. 56° 29' N.

BACKAR, or **BAKTER**, a district and town of Hindostan, in the province of Moultan. The town is situated on an island formed by the Indus, near its junction with the Dommoody; formerly it was called Munsoorah, and had a strong fort. Long. 70° 2' E., lat. 28° 31' N.

BACK BAR, the bar in a chimney, for suspending vessels over the fire.

BACK-BEAR, **BACK-BREND**, **BACKBEROND**, in old law, a criminal caught carrying off something on his back. See **BACKARRY**.

BACK-BITE, *v.* } From back and bite.
BACK BITER, *n. s.* } A familiar term for the
BACK-BITINGLY, *adv.* } calumny and calumniators which shun the presence of their victims. To censure the absent; the coward who defames in the dark.

Use his men well Davy, for they are arrant knaves and will *backbite*.
Shakspeare.

Nobody is bound to look upon his *backbiter*, or his underminer, his betrayer, or his oppressor, as his friend.
South.

BACK-BOARD, in maritime affairs, is of a semi-circular figure, placed transversely in the after-part of a boat, like the back of a chair, to recline against while sitting in the stern sheets.

BACK-BOND, in Scots law, a bond granted by him who receives a deed to declare the purpose of it, and to bind the grantor to perform accordingly.

BACK-BONE, *n. s.* from back and bone. The bone of the back.

The *backbone* should be divided into many vertebrae for commodious bending, and not to be one entire rigid bone.
Ray.

BACK-CARRY. Having on the back.

Manhood in his forest laws, noteth it for one of the four circumstances or cases, wherein a forester may arrest an offender against vert or venison in the forest, viz. stable-stand, dog-draw, *backcarry*, and bloody hand.
Cannell.

BACK-DOOR, *n. s.* From back and door. The door behind the house; privy passage.

The procession durst not return by the way it came; but, after the devotion of the monks, passed out at a *backdoor* of the convent.
Addison.

Popery, which is so far shut out as not to re-enter openly, is stealing in by the *backdoor* of atheism.

Atterbury.

BACKER, or **BAKKER** (Jacob), a painter of portraits and history, was born at Harlingen in 1609, but spent the greatest part of his life at Amsterdam. He was remarkable for an uncommon readiness of hand and freedom of pencil. His incredible expedition appeared in a portrait of a lady from Haerlem, whom he painted at half length, and began and finished in one day; though he adorned the figure with rich drapery and several ornamental jewels. He also painted historical subjects with success; and has left a fine picture of Cimon and Iphigenia. In designing academy figures, his expression was so just, and his outline so correct, that he obtained the prize from all his competitors; and his works are bought up at very high prices in the Low Countries. The Carmelites church at Antwerp has a capital picture of his of the Last Judgment. He died in 1651.

BACKER, or **BAKKER** (Jacques, or James), also a painter of history, was born at Antwerp in 1530, and learned the principles of painting from his father, who was very knowing in his profession, though his works were in no great estimation. After his death he lived with one Palermo, a dealer in pictures, who avariciously took care to keep him incessantly employed, and sent his paintings to Paris to be disposed of, where they were exceedingly admired. The judicious were eager to purchase them; and though the transactor sold them at a great price, yet the artist was not proportionably rewarded, but continued still in the same depressed condition. His merit, indeed was universally allowed, but his name, and the narrowness of his circumstances, were as universally unknown. He had a clean light manner of penciling, and a tint of color that was extremely agreeable. He died in 1560.

BACKEREEL, or **BACQUERELLI** (William), a painter of history, born at Antwerp, and a disciple of Rubens, at the same time with Vandyck. When each of them quitted that master, and commenced painters, Backereel was little inferior to Vandyck, which may be seen in the works of the former, in the church of the Augustin monks at Antwerp. He had likewise a taste for poetry; but exercising that talent too freely in writing satires against the Jesuits, they compelled him to fly from Antwerp. Sandrart observes, that in his time there were seven or eight eminent painters of this name in Italy and the Low Countries.

BACKERGUNGE, a district in the south-

east part of Bengal, a considerable portion of which, called Bokla, situated near the sea-side, was, in 1584, overwhelmed by the sea, and scarcely has recovered from the inundation: the other parts are, however, very productive, but being subject to inundations, are very unhealthy. But there are settled here a number of the descendants of the Portuguese, who, in the year 1666, were invited by the nuwab, Shaista Khan, to desert the raja of Arracan, and enter into his service. Also a town in the province of Bengal, capital of a district 120 miles east of Calcutta; it is the residence of the English magistrate, and carries on a very considerable trade in rice, salt, and cotton cloths. Long. 89° 20' E., lat. 22° 42' N.

BACK-FRAME WHEEL, for laying cordage, from a six-thread ratline, to a two-inch rope, is about four or five feet in diameter, and is hung between two uprights, fixed by tenons, on a truck, and supported by a knee of wood. Over its top is a semi-circular frame, called the head, to contain three whirls (that run on the brasses), with iron spindles, secured by a hasp and pin. They are worked by means of a leather band encircling the whirls and wheel. Three of the whirls are turned when hardening the strands, and only one when closing the rope, the strands being hung together on it. The truck, on which the back-frame wheel is fixed, runs on four wheels, and is made of three-inch oak plank, about nine feet long, and thirteen inches broad at one end, and eleven inches broad at the other.

BACKFRIEND, *n. s.* From back and friend. A friend backwards; that is, an enemy in secret.

Set the restless importunities of talebearers and *backfriends* against fair words and professions

L'Estrange.

Far is our church from encroaching upon the civil power; as some who are *backfriends* to both would maliciously insinuate.

South.

BACKGAMMON, *n. s.* From *bach gammon*, Welsh, a little battle; a play or game at tables, with box and dice.

Till finding your old foe the hangman,

Was like to lurch you at *backgammon*. *Hudibras.*

In what esteem are you with the vicar of the parish? can you play with him at *backgammon*? *Swift.*

BACKGAMMON, a game played with dice and tables, to be learned only by observation and practice. It is said to have been invented in Wales, in the period preceding the Conquest. *Gloss. ad Leges Wallias, a voc. Tawlbwrdd*, cited by Henry, vol. iv. p. 404. 8vo.

This game is played with dice, upon a table, by two persons. The table is divided into two parts, upon which there are twenty-four black and white spaces, called points. Each adversary has fifteen men, black and white, to distinguish them; and they are disposed of in the following manner: Supposing the game to be played into the right hand table, two are placed upon the ace point in the adversary's table, five upon the six point in the opposite table, three upon the cinque point in the hithermost table, and five on the six point in the right-hand table. The grand object in this game is for each player

to bring the men round into his right hand table, by throwing with a pair of dice those throws that contribute towards it, and at the same time prevent the adversary doing the like. The first best throw upon the dice is esteemed ace, because it stops the six point in the outer table, and secures the cinque in the thrower's table; whereby the adversary's two men upon the thrower's ace point cannot get out with either quatre, cinque, or six. This throw is an advantage often given to the antagonist by the superior player. When he carries his men home in order to lose no point, he is to carry the most distant man to his adversary's bar point, that being the first stage he is to place it on; the next stage is six points farther, viz. in the place where the adversary's five men are first placed out of his tables. He must go on in this method till all his men are brought home, except two, when by losing a point, he may often save the gammon, by throwing two fours or two fives. When a hit is only played for, he should endeavour to gain either his own or adversary's cinque point: and if that fails by his being hit by the adversary, and he finds him forwarder than himself, in that case he must throw more men into the adversary's tables; which is done in this manner: he must put a man upon his cinque or bar point; and if the adversary fails to hit it, he may then gain a forward game instead of a back game; but if the adversary hits him, he should play for a back game: and then the greater number of men which are taken up makes his game the better, because by these means he will preserve his game at home: and then he should endeavour to gain both his adversary's ace and trois points, or his ace and deuce points, and take care to keep three men upon the adversary's ace point, that in case he hits him from thence, that point may remain still secure to himself. A back game should not be played for at the beginning of a set, because it would be a great disadvantage, the player running the risk of a gammon to win a single hit.

A variety of instructions with regard to this curious game, are given by Mr. Hoyle, who calculates the odds of the game with great accuracy. The following particulars, however, may be of use to the generality of players. If a player has taken up two of the adversary's men, and happens to have two, three, or more points made in his own tables, he should spread his men, that he may either take a new point in his tables, or be ready to hit the man which the adversary may happen to enter. If he finds, upon the adversary's entering, that the game is upon a par, or that the advantage is on his own side, he should take the adversary's man up whenever he can, it being twenty-five to eleven that he is not hit: except when he is playing for a single hit only; then if playing the throw otherwise gives him a better chance for it, he ought to do it. As it is five to one against his being hit with double dice, he should never be deterred from taking up any one man of the adversary's. If he has taken up one of the adversary's men, and should happen to have five points in his own tables, and forced to leave a blot out of his tables,

he should endeavour to leave it upon doublets preferable to any other chance; because the odds are thirty-five to one, that he is not hit; whereas it is only seventeen to one but he is hit upon any other chance. When the adversary is very forward, a player should never move a man from his own quatre, trois, or deuce points, thinking to bear that man from the point where he put it, as nothing but high doublets can give him any chance for the hit. Instead of playing an ace or a deuce from any of those points, he should play them from his own size or highest points, so that throwing two fives, or two fours, his size and cinque points being eased, would be a considerable advantage to him; whereas, had they been loaded, he must have been obliged to play otherwise. It is the interest of the adversary to take up the player as soon as he enters. The blot should be left upon the adversary's lowest point; that is to say, upon his deuce point rather than upon his trois point; or upon his trois point rather than upon his quatre point; or upon his quatre point preferable to his cinque point, for a reason before mentioned: all the men the adversary plays upon his trois, or his deuce points, are deemed lost, being greatly out of play; so that those men not having it in their power to make his cinque point, and his game being crowded in one place and open in another, the adversary must be greatly annoyed by the player. If the player has two of the adversary's men in his tables, he has a better chance for a hit than if he had more, provided his game is forwarder than that of his antagonist; for if he had three or more of the adversary's men in his tables, he would stand a worse chance to be hit. When a player is running to save the gammon, if he should have two men upon his ace point, and several men abroad, although he should lose one point or two in putting his men into his tables, it is his interest to leave a man upon the adversary's ace point, because it will prevent his adversary from bearing his men to the greatest advantage, and at the same time the player will have a chance of the adversary's making a blot, which he may chance to hit. However, if a player finds, upon a throw, that he has a probability of saving his gammon, he should never wait for a blot, as the odds are greatly against his hitting it, but should embrace that opportunity.

The following are directions for calculating the odds of saving or winning the gammon. Suppose the adversary has so many men abroad as requires three throws to put them into his tables, and at the same time that the player's tables are made up, and that he has taken up one of the adversary's men; in this case it is about an equal wager that the adversary is gammoned. For, in all probability, the player has borne two men before he opens his tables, and when he bears the third man, he will be obliged to open his size or cinque point. It is then probable that the adversary is obliged to throw twice before he enters his men in the player's tables, twice more before he puts that man into his own tables, and three throws more to put the men which are abroad into his own tables, in all seven throws. Now the player having twelve

men to bear, he may be forced to make an ace or a deuce twice before he can bear all his men, and consequently will require seven throws in bearing them; so that, upon the whole, it is about equal whether the adversary is gammoned or not. Suppose a player has three men upon his adversary's ace point, and five points in his own tables, and that the adversary has all his men in his tables, three upon each of his five highest points. Has the player a probability of gammoning his adversary or not?

	Points.
For bearing three men from his 6th point is	18
From his 5th point	15
From his 4th point	12
From his 3rd point	9
From his 2nd point	6
	—
In all 60	
Bringing his three men from the adversary's ace point to his size point in his own tables, being eighteen points each, and making together	54
	—

There must remain 6
 It is plain from this calculation, that the player has much the best of the probability of the gammon, exclusive of one or more blots which the adversary is liable to make in bearing his men, supposing at the same time the throws to be upon an equality. Suppose two blots are left, either of which cannot be hit but by double dice; one must be hit by throwing eight and the other by throwing nine; so that the adversary has only one die to hit either of them. What are the odds of hitting either of them? The chances of two dice being in all 36

The chance to hit 6, are 6 and 2 twice	2
5 and 3 twice	2
2 Deuces	1
2 Fours	1
The chances to hit 9 are 6 and 3 twice	2
5 and 4 twice	2
2 Trois	1
	—

For hitting in all 11
 Chances for not hitting, remain 25
 So that the odds are twenty-five to eleven against hitting either of these blots.

This method may be taken to find out the odds of hitting three, four, or five blots upon double dice; or blots made upon double and single dice at the same time. After knowing how many chances there are to hit any of those blots, they must be added altogether, and then subtracted from the number thirty-six, which are the chances of the two dices, and the question is solved.

The laws of Backgammon are, 1. If a man is taken from any point, it must be played; if two men are taken from it, they also must be played. 2. A man is not supposed to be played, till it is placed upon a point and quitted. 3. If a player has only fourteen men in play, there is no penalty inflicted, because by his playing with a less number than he is entitled to, he plays to a disadvantage, for want of the deficient man to make up his tables. 4. If he bears any

number of men before he has entered a man taken up, and which of course he was obliged to enter, such men so borne must be entered again in the adversary's tables as well as the man taken up. 5. If he has mistaken his throw and played it, and his adversary has thrown, it is not in the choice of either of the players to alter it, unless they both agree so to do.

The probable method of prolonging a hit at backgammon, affords a case of instruction, as well as curiosity; for there is a probability of making the hit last by one of the players for many hours, although they shall both play as fast as usual. Suppose B to have borne thirteen men, and that A has his fifteen men in B's tables, viz. three men upon his size point, as many upon his cinque, quatre, and trois point, two upon his deuce point, and one upon his ace point. A in this situation can prolong it by bringing his fifteen men home, always securing six close points till B has entered his two men, and brought them upon any certain point; as soon as B has gained that point, A will open an ace, deuce, or trois point, or all of them; which done, B hits one of them, and A, taking care to have two or three men in B's tables, is ready to hit that man; and also he being certain of taking up the other man, has it in his power to prolong the hit almost to any length, provided he takes care not to open such points as two fours, two fives, or two sixes, but always to open the ace, deuce, or trois points, for B to hit him.

We add the following two critical cases for a back game: 1. Suppose the fore game to be played by A, and that all his men are placed as usual; B has fourteen of his men placed upon his adversary's ace point, and one man upon his adversary's deuce point, and B is to throw; who has the best of the hit? Answer: A has the best of it, gold to silver: because, if B does not throw an ace to take his adversary's deuce point, which is twenty-five to eleven against him, A will take up B's men in his tables, either singly or to make points; and then if B secures either A's deuce or trois point, A will put as many men down as possible, in order to hit, and thereby get a back game. It is evident that the back game is very powerful; consequently, whoever practises it must become a greater proficient at the game than he could by any other means. 2. Suppose A to have five men placed upon his size point, as many upon his quatre point, and the same number upon his deuce point, all in his own tables. At the same time let us suppose B to have three men placed upon A's ace point, as many upon A's trois point, and the same number upon A's cinque point, in his own tables, and three men placed as usual out of his tables; Who has the best of the hit? Answer: The game is equal till B has gained his cinque and quatre points in his own tables; which, if he can effect, and by playing two men from A's cinque point, in order to force his adversary to blot by throwing a cane, which, should B hit, he will have the best of the hit.

BACK-HEAVER, a machine long used in several parts of England, particularly in Hampshire, Wiltshire, and Sussex, for winnowing corn.

An improved construction of this machine was proposed by Dr. Hales in 1747, which not only rendered it fit for winnowing corn sooner and better than by any other means previously used, but also for clearing it of the very small corn, seeds, smut-balls, &c. It has however been since improved.

BACK'HOUSE, *n. s.* From back and house. The buildings behind the chief part of the house.

Their *backhouses*, of more necessity than cleanly service, as kitchens, stables, are climbed up unto by steps. *Carew.*

BACKHUYSEN (Ludolph), an eminent painter, born at Embden, in 1631, who received his earliest instruction from Albert Van Everdingen; but acquired his principal knowledge by frequenting the painting rooms of different masters. One of these was Henry Dubbels, whose skill in his art was great; and he was equally communicative of his knowledge to others. From him Backhuysen obtained more benefit than from all the painters of his time. His subjects were sea-pieces, ships, and sea-ports. He had not practised long when he became the object of general admiration; so that his drawings were sought after, and several of them were bought up at 100 florins. He studied nature attentively in all her forms; in gales, calms, storms, clouds, rocks, skies, lights, and shadows; and expressed every subject with so sweet a pencil, and such transparence and lustre, as placed him above all the artists of his time, except the younger Vandervelde. It was a frequent custom with Backhuysen, whenever he could procure resolute mariners, to go to sea in a storm, to store his mind with images directly copied from nature; and the moment he landed, impatiently to run to his palette to delineate those incidents of which the traces might, by delay, be obliterated. He perfectly understood the management of the Chiaro-scuro, and, by his skill in that part of his art, gave uncommon force and beauty to his objects. His works may easily be distinguished by the freedom and neatness of his touch, the clearness and natural agitation or quiescence of the water, a peculiar tint in his clouds and skies, and the exact proportions of his ships. He painted, for the Burgomasters of Amsterdam, a large view of the city, for which they gave him 1300 guilders, and afterwards presented it to the king of France. No painter was ever more honored by the visits of kings and princes than Backhuysen; the king of Prussia was one of the number; and Peter the Great often endeavoured to draw after vessels which he had designed. He died in 1709.

BACKING. See HORSEMANSHIP.

BACKING WARRANTS, in law, denotes the signing of such as have been issued by a justice of the peace in one county, by a justice of the peace in another, which is necessary before they can be executed there. This practice is authorised by statutes 23 Geo. II. c. 26. and 24 Geo. II. c. 55.

BACKNANG, a town in the kingdom of Württemberg, circle of Heilbronn, and district of the Lower Neckar. It lies on the Murr, and contains 3020 inhabitants, many of whom are woollen-weavers and tanners. Eight miles east of Marbah, and twelve north-east of Stutgard.

BACK-PAINTING, the method of painting mezzotinto prints, pasted on glass, with oil-colors. See **MEZZOTINTO**. It consists chiefly in laying the print upon a piece of crown-glass, of such a size as fits it. To do this, the print should be till in clean water for two days and nights, if the print be on very strong, close, and hard gummed paper; but if upon an open, soft, spongy paper, two hours, or more, will sometimes suffice. The paper or picture having been sufficiently soaked, take it out and lay it upon two sheets of paper, and cover it with two more; and let it lie there a little to draw out the moisture. In the mean time, take the glass the picture is to be put upon, and set it near the fire to warm; take Strasburg turpentine, warm it over the fire till it is grown fluid, then, with a hog's-hair brush, spread the turpentine very smoothly and evenly on the glass. Then take the mezzotinto print from between the papers, and lay it upon the glass; beginning first at one end, rubbing it down gently till it lie close, and there be no wind bladders between. After this rub or roll off the paper from the back of the print, till it looks black, i. e. till nothing appears but the print, like a thin film left upon the glass, and set it aside to dry. Then varnish it over with some white transparent varnish, that the print may be seen through it; and it is then fit for painting. The utmost care is necessary in rubbing or rolling the paper off the print so as not to tear it, especially in the light parts. Or the prints, instead of being soaked, may be rolled up and boiled for about two hours, more or less, according to the quality of the paper; and that will render it as fit for rubbing, rolling or peeling, as the other method. This being done, and the oil-colors prepared, ground very fine, and tempered up very stiff, lay on the back of the transparent prints such colors as each part requires; letting the master-lines of the print still guide the pencil; and thus each particular color will lie fair to the eye on the other side of the glass, and almost as well as a painted piece, if it be done neatly. The shadows of the print are generally sufficient for the shadow of every color; but if it is wished to give a shadow by the pencil, let the shadows be laid on first, and the other colors afterwards. In this kind of back-painting it is not necessary to lay on the colors very smooth. As the chief aim is to have the colors appear well on the fore-side of the print, all that is necessary is to lay the colors on thick enough, that its body may strike the color of it plainly through the glass.

BACKPIECE, *n. s.* From back and piece. The piece of armour which covers the back.

The morning that he was to join battle, his armourer put on his *backpiece* before, and his breast-plate behind. *Camden.*

BACK-QUADRANT, the same with **BACK-STAFF**. See **QUADRANT**.

BACK RIVER, a river of Maryland, which runs into the Chesapeake.

BACKROOM, *n. s.* From back and room. A room behind; not in the front.

If you have a fair prospect backwards of gardens, it may be convenient to make *backrooms* the larger.

Max. Mech. Exercises.

BACKS, among dealers in leather, denote the thickest and best tanned hides, used chiefly for soles of shoes.

BACKSIDE, *n. s.* From back and side. The hinder part of any thing; the hind part of an animal; the yard or ground behind a house.

If the quicksilver were rubbed from the *backside* of the speculum, the glass would cause the same rings of colours, but more faint; the phenomena depend not upon the quicksilver, unless so far as it increases the reflection of the *backside* of the glass. *Newton.*

A poor ant carries a grain of corn, climbing up a wall with her head downwards and her *backside* upwards. *Addison.*

The wash of pastures, fields, commons, roads, streets, or *backsides*, are of great advantage to all sorts of land. *Mortimer.*

BACK-SINEWS OF A HORSE, the extensor tendons of the foot, placed behind the fore-leg, and very frequently injured by over-exertion. The inflammation hereby produced is best removed in the first instance by emollient and astrigent cataplasms.

BACKSLIDE, *v. n.* } From back and slide.

BACKSLIDER, *n. s.* } To retrograde in religion.

BACKSLIDING. Exclusively a scriptural and theological term. Its precise signification, as employed by divines, is not apostasy as stated by Dr. Johnson, but a tendency to it. It supposes a religious profession advanced to a state of spirituality and consistency, and a receding from that state in a greater or less degree in principle or practice: but it does not amount to a total abandonment of either.

The *backslider* in his heart shall be filled with his own ways. *Solomon.*

Thy *backsliding* shall reprove thee. *Jeremiah.*

Remember thy *backslidings* from me; lament over them: confess them before me; and look to God to enable thee to take thy steps with more firmness, and to offer up thy prayers with more spirituality. *Cecil.*

BACKSTAFF, *n. s.* From back and staff; because in taking an observation, the observer's back is turned toward the sun. An instrument useful in taking the sun's altitude at sea. It was sometimes called Davis's quadrant, from its inventor, captain John Davis, a Welchman, and a celebrated navigator, who produced it about the year 1590.

This instrument consists of two concentric arches of box-wood, and three vanes: the arch of the longer radius is of 30°, and the other 60°, making between them 90°, or a quadrant: also the vane at the centre is called the horizon-vane, that on the arch of 60° the shade-vane, and that on the other arch the sight-vane. It is unnecessary to give a more minute description, since more complete and accurate instruments have entirely superseded the use of this.

BACKSTAIRS, *n. s.* From back and stairs. The private stairs in the house.

I condemn the practice which hath lately crept into the court at the *backstairs*, that some pricked for sheriffs get out of the bill. *Bacon.*

BACKSTAYS, *n. s.* From back and stay. Ropes or stays which keep the masts of a ship from pitching forward or overboard.

The **BACKSTAYS**, *Fr. galhaubans*, are long ropes extending from the top-mast-heads to the starboard and larboard sides of the ship, where they are farther extended to the channels;

they are used to second the efforts of the shrouds, in supporting the masts, when strained by a weight of sail in a fresh wind.

They are usually distinguished into breast-backstays and after-backstays; the intent of the first being to sustain the mast when the ship sails upon a wind; or, in other terms, when the wind acts upon the ship sideways; the second is to enable her to carry sail when the wind is further aft; and the third kind take their name from being shifted or changed from one side to the other, as occasion requires. There are also backstays for the top-gallant-masts, in large ships, which are fixed in the same manner with those of the top-masts.

A pair of backstays is usually formed of one rope, which is doubled in the middle, and fastened there so as to form an eye, which passes over the mast-head, from whence the two ends hang down, and are stretched to the channels, by dead-eyes and lanyards. See the article DEAD-EYES, &c.

BACKSTAY STUOL, a short piece of plank, fitted for the security of the dead-eyes, and chains for the backstays, though sometimes the channels are left long enough at the after end, for the backstays to be fitted thereto.

BACKSWORD, *n. s.* From back and sword. A sword with one sharp edge.

Bull dreaded not old Lewis at *backsword*.

Arbutnot.

BACK TACK, in Scots law, a lease granted by a mortgager or heritable creditor, who, instead of possessing the mortgage lands, grants a rent thereof to the reverser or heritable debtor, for payment of a certain sum in name of tack duty.

BACKWARD, *n. s. adv. & adj.* From back, BACKWARDS, and *peapo*,
BACKWARDLY, *adv.* } Sax. that is,
BACKWARDNESS, *n. s.* } towards the

back; contrary to forward. Backward, as an adverb, denotes simply the manner of going; and is distinguished from back, thus: a person stands back who does not wish to be in the way; he goes backward when he does not wish to turn his back on an object. As an adjective, its meaning is unwilling, or averse. And hence it is often used in the sense of hesitating, dilatory. Slow in apprehension, and in growth. The substantives take their literal and figurative meaning from the adverb and the adjective.

They went *backward*, and their faces were *backward*.
Genesis.

All things are ready, if our minds be so:

Perish the man whose mind is *backward* now.

Shakspeare.

It should seem then, that Dobbin's tail grows *backward*.
Id.

What seest thou else

In the dark *backward* or abyssin of time? *Id.*

The monstrous sight

Struck them with horror *backward*; but far worse
Urg'd them behind. *Milton.*

Then darting fire from her malignant eyes,
She cast him *backward* as Le strove to rise.

Dryden.

We are strangely *backward* to lay hold of this safe,
this only method of cure. *Auerbury.*

The thing by which we are apt to excuse our *backwardness* to good works, is the ill-success that hath been observed to attend well-designing charities. *Id.*

Cities laid waste, they storm'd the dens and caves

For wiser brutes are *backward* to be slaves. *Pope.*

Our mutability makes the friends of our nation

backward to engage with us in alliances. *Addison.*

It often falls out that the *backward* learner makes

amends another way. *South.*

To prove the possibility of a thing, there is no argument to that which looks *backwards*; for what has been done or suffered may certainly be done or suffered again. *Id.*

Like Numid lions by the hunters chas'd,

Though they do fly, yet *backwardly* do go

With proud aspect, disdaining greater haste.

Sidney.

The mind is *backward* to undergo the fatigue of *viewing* every argument. *Watts.*

BACK-WORM. See F1LANDERS.

BACO, a town of Mindoro, one of the Philippines, the capital of the island, and residence of a Spanish judge. The environs are well watered by springs from the mountains, which are covered by sarsaparilla. Long. 121° 5' E., lat. 13° 18' N.

BACO, in old Latin, a fat hog.

BACOPA, in botany, a name by which some authors call the banana tree, or *musa fructu breviori*.

BACON (Anthony), the son of Sir Nicolas, and elder brother to the celebrated lord chancellor, was born in 1558, and educated at Cambridge. He spent much of his time in travelling, and thus became personally acquainted with most of the literati of his age. In 1579, at the age of twenty-one, he went to Paris, where he resided for some time; and thence to Bourges and Geneva, where he lodged at the house of the celebrated Theodore Beza. From Geneva he successively removed to Montpellier, Marseilles, Bourdeaux, and Montauban, sometimes communicating intelligence of importance to England. In 1585 he visited Henry, king of Navarre, afterwards the great Henry IV. of France, who was then at Bearne; and became acquainted with the learned Lambert Danaus, who, as a mark of esteem, dedicated several of his works to him. His health failing, he returned to England in February, 1591-2; and in 1595 took up his residence at Essex house, where he carried on a most extensive correspondence with the foreign literati, and among others with king Henry IV. The time and place of his death is uncertain.

BACON (Francis), lord high chancellor of England, under king James I. was son of Sir Nicholas Bacon, by Anne, daughter of Sir Anthony Cook, eminent for her skill in Latin and Greek. He was born in 1650; and showed such marks of genius that he was taken notice of by Queen Elizabeth when very young. He was educated at Trinity college, Cambridge; and made such progress in his studies, that, before he was sixteen, he had not only traversed the whole circle of the liberal arts as then taught, but began to perceive those imperfections in the reigning philosophy which he afterwards so effectually exposed. On his leaving the university his father sent him to France; where, before he was nineteen years of age, he wrote a general view of the state of Europe: but Sir Nicholas

dying, he was obliged suddenly to return to England, when he applied himself to the study of the common law, at Gray's-Inn. At this period the famous Earl of Essex, who could distinguish merit, entered into intimate friendship with him; zealously attempted, though without success, to procure him the office of queen's solicitor; and, in order to comfort his friend under the disappointment, conferred on him a present of land to the value of £1800. Bacon, notwithstanding the Earl's friendship, and even the early prepossession of her majesty in his favor, met with many obstacles to his preferment during her reign. His enemies represented him as a speculative man, whose head was filled with philosophical notions, and therefore more likely to perplex than forward public business. It was with great difficulty that lord treasurer Burleigh obtained for him the reversion of register to the star chamber, worth about £1600 a-year, which only fell to him about twenty years after. He did not obtain any other preferments from queen Elizabeth; though, if obedience to a sovereign in the most disagreeable of all offices, viz. the casting reflections on a deceased friend, entitled him, he might have claimed it. The people were so clamorous, even against the queen herself, on the death of Essex, that it was thought necessary to vindicate the conduct of the administration; and to Bacon was assigned this disgraceful task. Upon the accession of James he was soon raised to considerable honors; and wrote in favor of the union of the two kingdoms of Scotland and England. In 1616 he was sworn of the privy council. He then applied himself to the reducing and recombining the laws of England. When attorney-general, he distinguished himself by his endeavours to restrain duelling, then very frequent. In 1617 he was appointed lord keeper of the great seal; and, in 1618, lord chancellor of England, and created Lord Verulam. In the midst of these honors, and the multiplicity of business, he forgot not his philosophy, but in 1620 published his great work *Novum Organum*. In 1621 he was advanced to the dignity of Viscount St. Albans, and appeared with great splendor at the opening of the session of parliament; but soon after met with a severe reverse of fortune. For about the twelfth of March, a committee of the house of commons being appointed to inspect the abuses of courts of justice, the chancellor was openly accused of corruption, and the king is said to have positively enjoined him to submit to his peers, promising to reward him afterwards! The chancellor, though he foresaw his approaching ruin if he did not plead for himself, resolved to obey; and the house of peers, on the 3d of May, 1621, gave judgment against him, 'that he should be fined £40,000, and remain prisoner in the tower during the king's pleasure; should for ever be incapable of any office, place, or employment in the state, and that he should never sit in parliament, or come within the verge of the court.' The fault which, next to his ingratitude to Essex, thus tarnished the glory of this illustrious man, is said to have principally proceeded from his indulgence to his servants, who made a corrupt use of it. One day, during his trial, passing through a room where

several of his domestics were sitting, upon their rising up to salute him, he said, 'Sit down, my masters; your rise hath been my fall.' And we are told by Rushworth, in his historical collections, 'that he treasured up nothing for himself or family, but was over-indulgent to his servants, and connived at their takings: they were profuse and expensive, and had at their command whatever he was master of. The gifts taken were for the most part for interlocutory orders. His decrees being generally made with so much equity, that though gifts rendered him suspected of injustice, yet never any decree made by him was reversed as unjust.' It was peculiar to this great man (say the authors of the *Biog. Brit.*) to have nothing narrow and selfish in his composition: he gave away without concern whatever he possessed; and believing other men of the same mould, he received with as little consideration. He retired, after a short imprisonment, from the engagements of an active life, to the shade of a contemplative one, which he had always loved. The king remitted his fine, and he was summoned to parliament in the first year of King Charles I. In his recess he composed the greatest part of his English and Latin works, and it appears from them that his thoughts were still free, vigorous, and noble. The last three years of his life he devoted wholly to his studies. He died in 1626; and was buried in St. Michael's church at St. Albans, where a monument of white marble was erected to him by Sir Thomas Meautys, formerly his secretary. A complete edition of his works was published at London in 1740. Addison has said of him, that he had the sound, distinct, comprehensive, knowledge of Aristotle, with all the beautiful light graces and embellishments of Cicero. Mr. Walpole calls him the prophet of arts, which Newton was afterwards to reveal; and adds, that his genius and his works will be universally admired as long as science exists. We must add, from another writer, with regret, 'as long as ingratitude and adulation are despicable, so long shall we lament the depravity of this great man's heart. Alas! that he, who could command immortal fame, should have stooped to the little ambition of power.'

If parts allure thee, think how Bacon shin'd;
The wisest, brightest, meanest of mankind. *Pope.*

BACON (Robert), a divine of the thirteenth century, was born about 1168. He studied at Oxford, where he distinguished himself by the quickness of his parts. Thence, according to the custom of that age, he removed to Paris, where he perfected himself in all the branches of learning. After his return he settled at Oxford, and read divinity lectures. In 1233 he was made treasurer of the cathedral church of Salisbury; and distinguished himself by a sermon before king Henry III. at Oxford. In 1240 he lost his great patron and intimate friend, Edmund, archbishop of Canterbury, and possibly this circumstance, joined to his love of a retired life, might induce Bacon, though very old, to enter into the order of Friars Preachers. In gratitude to the archbishop, Bacon wrote his life, which was

highly esteemed. He wrote also many other learned pieces, and died in 1248.

BACON (Roger), a Franciscan friar of surprising genius and learning; born near Ilchester in Somersetshire, in 1214. He studied first at Oxford, and afterwards at Paris, which, in those times, was esteemed the centre of literature. Here he made so rapid a progress in the sciences, that he was esteemed the glory of that university, and much caressed by several of his countrymen, particularly Robert Grouthead, afterwards bishop of Lincoln, his friend and patron. About 1240 he returned to Oxford, and, assuming the Franciscan habit, prosecuted experimental philosophy, with unremitting ardor. In this pursuit, in experiments, instruments, and in scarce books, he tells us, he spent, in the space of twenty years, no less than £2000, which was given him by some of the heads of the university. But such extraordinary talents, and his astonishing progress in sciences, which, in that ignorant age, were totally unknown to the rest of mankind, whilst they raised the admiration of the more intelligent few, could not fail to excite the envy and malice of his illiterate fraternity; who found no difficulty in propagating the notion of Bacon's dealing with the devil. Under this pretence, he was restrained from reading lectures; his writings were confined to his convent; and, in 1278, he himself was imprisoned in his cell. At this time he was sixty-four years of age. Nevertheless, being permitted the use of his books, he went on in the rational pursuit of knowledge, corrected his former labors, and wrote several curious pieces. When he had been ten years in confinement, Jerome de Ascoli being elected pope, Bacon solicited his holiness to be released; and towards the end of that pope's reign, obtained his liberty. He spent the remainder of his life in the college of his order, where he died in 1294, in the eightieth year of his age, and was buried in the Franciscan church. Such are the few particulars, which the most diligent researches have been able to discover concerning this very great man; who, like a single bright star in a dark hemisphere, shone forth in an age of ignorance and superstition, the light and glory of his country. His works are: 1. *Epistola fratris Rogeri Baconis, de Secretis Operibus Artis et Naturæ, et de Nullitate Magiæ*. Paris, 1542, 4to. Basil, 1593, 8vo. 2. *Opus Majus*. Lond. 1733, fol. published by Dr. Jebb. 3. *Thesaurus Chemicus*. Francf. 1603, 1620. This was probably the editor's title; but it contains several of our author's treatises on this subject. There are said to remain in different libraries several manuscripts of his not yet published.

BACON (Sir Nathaniel), K. B. and an excellent painter, was a younger son of Sir Nicholas, and half brother to the great Francis Bacon. He studied painting in Italy; but his manner and coloring approaches nearer to the style of the Flemish school. Mr. Walpole observes, that at Culford, where he lived, are preserved some of his works; and at Gorhambury, his father's seat, is a large picture by him in oil, of a cook-maid with a dead fowl, admirably painted. In the same house is a whole length of him, by himself, drawn on paper, his sword

and pallet hung up, and a half length of his mother by him.

BACON (Sir Nicholas), lord keeper of the great seal in the reign of Queen Elizabeth, was born at Chislehurst in Kent, 1510, and educated at Cambridge; after which he travelled into France, and visited Paris. On his return, he settled in Gray's Inn, and quickly distinguished himself so much, that on the dissolution of the monastery of St. Edmund's Bury, in Suffolk, he had a grant from king Henry VIII. of several manors. Two years after he was made attorney in the court of Wards, a place both of honor and profit. In this office he was continued by Edward VI. and in 1552 he was elected treasurer of Gray's Inn. His great moderation and consummate prudence preserved him through the dangerous reign of queen Mary. In the very dawn of that of Elizabeth he was knighted; and in 1558, the great seal of England being taken from archbishop Heath, was delivered to him with the title of lord keeper, and he was made one of the queen's privy council. He had a considerable share in the settling of religion: as a statesman he was remarkable for a clear head and deep counsels: but his great parts and high preferment were far from raising him in his own opinion, as appears from the modest answer he gave queen Elizabeth, when she told him his house at Red-grave was too little for him: 'Not so, madam,' returned he, 'your majesty has made me too great for my house.' After having held the great seal more than twenty years, this able statesman and faithful counsellor met with his death by falling asleep in his room with a window open, and the current of fresh air blowing in upon him. He awoke very ill, and was immediately removed into his bed-chamber, where he died in a few days, i. e. on the 26th of February, 1578-9. He was buried in St. Paul's, where a monument was erected to him, which was destroyed by the fire in 1666. Sir Nicholas was the first lord keeper that ranked as lord chancellor. He was twice married; by his first wife he had three sons and three daughters; and by his second, two sons, Anthony and Francis. Sir Nicholas left several manuscripts, which have never been printed.

BACON (John), an ingenious sculptor, born in Southwark in 1740. He very early manifested an inclination for drawing, which was encouraged by binding him as an apprentice to a manufacturer of china, at Lambeth, when about fifteen years of age. Here a considerable part of his employment was to paint on porcelain, in which he improved himself so much, in forming small ornamental pieces, that within two years all the models of the manufactory were committed to him. This situation also afforded him an opportunity of seeing various models executed by other artists, which were sent to a neighbouring pottery to be burnt. In 1758 he obtained a premium from the society for the encouragement of the arts, for a small figure of Peace, after the manner of the antique; and eight different premiums afterwards for other figures. Before his apprenticeship was out, he formed a design of making statues in artificial stone, which he afterwards perfected, and which is still carried on in a manufactory in the New Road, with suc-

cess. He first began to work in marble about 1763, and soon invented an instrument for transferring the form of the model to the marble (getting out the points as artists call it), which other sculptors have since adopted. In 1769 he received the first gold medal bestowed by the Royal Society, and next year was chosen an associate. The exhibition of his statue of Mars greatly increased his reputation; and Dr. Markham, since archbishop of York, employed him to make a bust of the king, to be placed in the hall of Christ Church College, Oxford. While he was modelling this bust, his majesty asked him 'if he had ever been out of the kingdom;' and receiving an answer in the negative, said, 'I am glad of it, you will be the greater honor to it.' By the execution of this work he obtained the royal patronage, and was employed to form another for the University of Göttingen. In 1777 he was engaged in preparing a model of a monument, to be erected in Guy's hospital to the memory of the founder, which he executed in such a manner, as recommended him to that of Lord Chatham, at Guildhall. In 1778 he became a royal academian, and finished a handsome monument to the memory of Mrs. Draper, which is in Bristol cathedral. From this period, his works are so numerous, that we can only mention a few of the principal:—Two groups for the top of Somerset-house; a statue of Judge Blackstone, for All Soul's College, Oxford; another of Henry VI. for Eton College; Lord Chatham's monument in Westminster Abbey; and Dr. Johnson's and Mr. Howard's in St. Paul's cathedral. He died of an inflammation in his bowels, in 1799, and left a widow and eight children. He was a man of most excellent character, and of his religious principles, let the inscription which he ordered to be placed over his grave testify: 'What I was as an artist, seemed to me of some importance while I lived; but what I really was, as a believer in Christ Jesus is the only thing of importance to me now.' Mr. Bacon also possessed respectable literary talents.

Bacon, *n. s.* probably from *baken*, that is, dried flesh. The flesh of a hog salted and dried.

No wine ne drank she, neyther white ne red,
Hire bord was served most with white and black
Milk, and brown bred, in which she fond no lack,
Seinde *bacon*, and sometime an ey or twey;
For she was as it were a manner dey! *Chaucer.*

When it had stabbed or broke a head,
It would scrape trenchers or chip bread;
Toast cheese or *bacon*, tho' it were
To bait a mouse-trap it would not care.

Hudibras.

High o'er the hearth a chine of *bacon* hung,
Good old Philemon seized it with a prong,
Then cut a slice. *Dryden.*

Bacon, the flesh of swine, salted, dried, and generally, in this country, smoked. It is a considerable article of commerce: we shall describe the most approved methods of preserving it; viz. that adopted in Somersetshire. The last three months of the year are selected as best adapted for curing *bacon* here. When a hog is killed for *bacon*, the sides are laid in large wooden troughs, and sprinkled all over with bay salt; then they are left for twenty-four hours, to

drain away the blood and the superfluous juices. After this first preparation, they should be taken out, wiped very dry, and the drainings thrown away. Next some fresh bay-salt, well heated in a large iron frying-pan, is to be rubbed over the meat, until it has absorbed a sufficient quantity, and this friction repeated four successive days, while the meat is turned only every other day. If large hogs are killed, the fitches should be kept in brine for three weeks, and, during that period, turned ten times, then taken out, and thoroughly dried in the usual manner; for, unless they be thus managed, it is impossible to preserve them in a sweet state, nor will their flavor be equal to those properly cured.

As the preservation of the salt used in this process, when carried on to a great extent, may be an object of economy, the following method may be adopted for recovering the saline matter contained in these drainings, or in any other brine; it was communicated by a person who had seen it practised on the continent, where culinary salt is sold at a considerable price. He first added such a quantity of boiling-water, to the brine or drainings, as was sufficient to dissolve all the particles of the salt. This solution he then placed in either an iron or earthen vessel, over a fire, which, by boiling, forced all the feculent animal particles to the top, so that they were carefully removed by a perforated ladle. After the liquid had become clear, it was set aside for twenty-four hours, in a cool place, that the coloring matter might subside. But, as the combination it had formed with the boiled liquor was very tenacious, he contrived two different ways of separating it: 1. A solution of alum in water, one pint to an ounce of that substance was gradually dropt into the cold liquor, in the proportion of a table-spoonful of the former to every gallon of the latter; and the whole allowed to stand for several hours; or, 2. If time and circumstances would permit, he filtered the liquor by means of long flannel slips, cut longitudinally by the web, but previously soaked in another strong and perfectly clear solution of salt; these slips were so immersed into the colored fluid that the projecting external end reached another vessel, which had been placed much lower than that containing the brine, or drainings. When these particulars were properly attended to, the absorbed liquor became almost colorless, and pellucid. Having thus procured a clear liquid solution, nothing more was required than to evaporate it to dryness, in order to reproduce the salt in its original granulated form. This process may be imitated without any difficulty, and at very little expense. Dr. Willich, from whose Domestic Encyclopædia we now quote, says, the second method of discharging the color is preferable; as by this no alum will be required, which only contaminates the salt.

BACON, THE SERVICE OF THE, a custom, mentioned by our old historians and law-writers; as well as in the Spectator, as held in the manor of Whichenacre in Staffordshire, and in the priory of Dunning in Essex. In the former of these places, by an ancient grant of the lord, a fitch of *bacon*, with half a quarter of wheat, was to be given to every married couple who could swear that having been married a year and a day, they

would never within that time have once exchanged their mate for any other person on earth, however richer, fairer, or the like. But they were to bring two of their neighbours with them to attest that they swore the truth. On this the lord of another neighbouring manor of Rudlow, was to find a horse, saddled, and a sack to carry the bounty in, with drums and trumpets, as far as a day's journey out of the manor; all the servants being summoned to attend, and pay service to the bacon. The bacon of Dunmow, first erected under Henry III. was on much the same footing; but the tenor of the oath was only that the parties had never once repented their connexion, or wished themselves unmarried again.

BACON, a town of Persia, in the province of Seistan, eighty miles N. N. E. of Zareng.

BACON, a town on the east coast of the island of Luçon.

BACON'S ISLAND, a small island in the Chinese Sea. Long. $113^{\circ} 5' E.$, lat. $11^{\circ} 13' N.$

BACON-FOSSIL, in modern chemistry, a singular body discovered in the parish of Cruwys-Morchar, Devon, a few years since, in the following manner:—Some workmen, in sinking a pond, had arrived at a depth of ten feet from the surface, when they struck upon a spongy substance, which appeared to be a very thick cuticle of a brown color: they soon found pieces of bone and solid fat of the same hue. At length the entire body of a hog was extricated, reduced to the color and substance of an Egyptian mummy: the flesh was six inches thick, and the hair upon it very long and elastic. On proceeding in the work, a considerable number of hogs, of various sizes, were found in different positions; in some places two or three together, in others singly; the bodies, when exposed to the air, still retained their consistency, and the stratum continued for twelve feet; after which the pond, being sufficiently deep, was filled with water. The ground was never known to have been broken up before; but here had formerly been a monastery of Augustine friars. The family which preceded the present possessor has a journal of all remarkable events which have occurred in the parish during three centuries; but there was no entry which could lead to a solution of the phenomenon. The Rev. Mr. Polwhele, who obtained a specimen, mentions, in his History of Devon, that the bed in which the fossils lay was of stiff clay. He describes the piece in his possession to be very light, somewhat spongy, mottled like mottled soap, and evidently of a sebaceous nature. On a slight chemical analysis, it was mostly soluble in spirit of wine, while hot; but separated into white flakes on cooling, in which it resembles spermaceti; but it was easily convertible into soap on being boiled in a fixed alkaline lixivium. By a reference to the above particulars it will be obvious that what is here termed a 'fossil' really consisted of adipocere or animal fat, which has frequently been found in receptacles for the dead.

BACONGEN, a town on the west coast of the island of Sumatra. Long. $6^{\circ} 58' E.$, lat. $2^{\circ} 52' N.$

BACONO, a river of the Caraccas, South America. It runs in the mountains near Truxillo, and serves as a line of demarcation to the provinces of Varinas and Venezuela. Thence passing through the plains, it enters the Guanare, which discharges its waters into the Portuguese. There is a settlement of the same name near its source.

BACONTHORPE, or **BACONDORP** (John), styled the resolute doctor, a learned monk, born in the thirteenth century at Baconthorp, in Norfolk. He spent the early part of his life in the convent of Blackney, near Walsingham; whence he removed to Oxford, and thence to Paris; where he obtained degrees in divinity and law, and was esteemed the principal of the Averroists. In 1329 he returned to England, and was chosen twelfth provincial of the English Carmelites. In 1333 he was sent for to Rome; where, we are told, he first maintained the pope's sovereign authority in cases of divorce, but that he afterwards retracted his opinion. He died in London in 1346, with the character of a monk of genius and learning. He wrote, 1. *Commentaria seu Quæstiones super Quatuor Libros Sententiarum*; and 2. *Compendium Legis Christi, et quodlibeta*: both which underwent several editions at Paris, Milan, and Cremona. Leland, Bale, and Pits, mention a number of his works never published.

BACOPA, in botany, a genus of plants of the class pentandria, and order monogynia. Its generic characters are CAL. perianth, one-leaved; COR. one-petalled; STAM. filaments, five; antheræ, sagittate; PIST. germ, ovate; style short; stigma, headed; PER. capsule, one-celled; seeds, very many. The only species is the *B. aquatica*, native of Cayenne. *Linn. Spec. Plant.*

BACOUÉ (Leo), a French divine of the seventeenth century. He was first of the Protestant persuasion, but afterwards changed to the Roman Catholic faith, turned Franciscan, and was made bishop of Pamiers. He was author of a Latin poem on the education of a prince. He died in 1694, in his ninety-fourth year.

BACRAG, the same with Baccharach wine.

BACRAS, a town of Sennaar, in Africa, twenty-five miles east of Sennaar.

BACRE, a small town in the territory of Sierra Leone. Long. $12^{\circ} 11' W.$, lat. $8^{\circ} 40' N.$

BACTISHUA (George Ebn), a Christian physician at the court of the caliph Almanson who sent him as a present 3000 dinars, with three beautiful girls to supply the place of his wife, who was old: Bactishua sent them back, observing that his religion forbade him to have more than one woman for his wife.

BACTRIA, or **BACTRIANA**, now Chorassan, or Khorasan, an ancient kingdom of Asia, bounded on the west by Margiana, on the north by the Oxus, on the south by Mount Paropismus, and on the east by the Asiatic Scythia and the country of the Massagetæ. It was a large, fruitful, and well-peopled country; containing, according to Ammianus Marcellinus, 1000 cities, though of these only a few are particularly mentioned; of which, that formerly called Maracanda, now Samarcand, is the most considerable. Of the history of this country we know but little. Authors

agree that it was subdued first by the Assyrians, afterwards by Cyrus, and then by Alexander the Great. Afterwards it remained subject to Seleucus Nicator and his successors, till the time of Antiochus Theos; when Theodotus, from governor of that province, became king, and strengthened himself so effectually in his kingdom, while Antiochus was engaged in a war with Ptolemy Philadelphus, king of Egypt, that he could never afterwards dispossess him of his acquisitions. His posterity enjoyed the kingdom for some time, till they were driven out by the Scythians, who possessed Bactria during the reigns of Adrian, Antoninus Pius, &c. The Scythians were in their turn driven out by the Huns and Turks, and these often conquered by the Saracens and Tartars; although they were in possession of this country, in the time of Ladislaus IV. king of Hungary.

BACTRIANS, the inhabitants of Bactria. In ancient times they differed little in their manners from the Nomades; and being near neighbours of the Scythians, who were a very warlike people, the Bactrian soldiers were reckoned the best in the world. Their appearance was very savage; they being of an enormous stature, having rough beards, and long hair hanging down their shoulders. Some authors assert that they kept dogs on purpose to devour such as arrived at extreme old age, or who were exhausted by long sickness. They add, that for all their fierceness, the Bactrian husbands were such dupes to their wives, that they durst not complain of them even for conjugal infidelity, to which it seems the latter were very much addicted.

BACTRIANUS, in zoology, a species of the camel.

BACTRIS, in botany, a genus of plants of the class monœcia, order hexandria. Its generic characters are *cal.* spathe universal, one-leaved: *cor.* one-petalled: *stam.* filaments, six; antheræ, oblong: *pist.* germ, ovate; style, very short; stigma, headed: *per.* drupe, coriaceous, seed-nut, roundish. The species are, 1. *B. minor fructibus.* &c. seu *cocos* (quincensis) aculeata, &c. a shrub, native of South America. 2. *B. major fructu.* &c. seu *fructus exoticus*, a shrub, native of South America.

BACTRIS, in entomology, a species of bruchus.

BACTROPERATE, from *βακτρον*, a staff, and *πιπρα*, a bag; an ancient appellation given to philosophers by way of contempt, denoting a man with a staff and a budget. It seems to be of this sect that Paschasius Radbertus speaks, under the corrupt names of Baccoperitæ, or Baccionita, whom he describes as philosophers who, by way of contempt for earthly things, kept nothing but a dish to drink out of; and that one of this order seeing a peasant scooping up the water in his hand, threw away his cup as a superfluity.

BACULARES, a sect of Anabaptists, so called, as holding it unlawful to bear a sword, or any other arms, besides a staff.

BACULARIUS, in writers of the middle age, an ecclesiastical apparitor or verger: who carries a staff, baculus, in his hand, as an ensign of his office.

BACULE, in fortification, a kind of portcullis,

or gate, made like a pit-fall with a counterpoise, and supported by two great stakes. It is usually made before the corps du guard, near the gate of a place.

BACULI. See **BACILLI**.

BACULI STI. PAULI, batons of St. Paul, a kind of figured stones, of the same substance with those resembling the bristles of some American echini, called by Dr. Plott, lapides Judaica.

BACULO'METRY, *n. s.* From *baculus*, Lat. and *μετρον*. The art of measuring distances by one or more staves.

BACULOMETRY. See **GEOMETRY**.

BACULOSUS ECCLESIASTICUS, in some ancient laws, is used for a bishop, or abbot, dignified with the pastoral staff, or crozier.

BACULUS DIVINATORIUS, or **VRIGULA DIVINA**. See **BAGUETTE DIVINATOIRE**.

BACUR'IUS, or **BATURIUS**, king of the Iberians, a people on the side of the Caspian sea. One day being hunting, he lost sight of his company, through a great storm and sudden darkness; upon which he vowed to the God of his christian slave, that if he were delivered, he would worship him alone: the day breaking up immediately, he is said to have made good his promise, and became the apostle of his country.

BAD', *adj.*

BAD'LY, *adv.*

BAD'NESS, *n. s.* } *Quoad*, Dut.; Sax. *baed*;
} Ger. *bös*; probably connected
} with the Lat. *pejus*, worse, and
} the Heb. *bosch*. Comparative worse; superlative worst. Bad respects moral and physical qualities indiscriminately; whatever offends the taste and sentiments of a rational being, is bad; food is bad when it disagrees with the constitution; the air is bad which has any thing in it disagreeable to the senses or hurtful to the body; books are bad which only inflame the imagination and the passions. In one word, bad is equally descriptive of mental, moral, and corporeal disease, and implies misfortune or delinquency, only from its application. Badly means in the manner of bad. It is always annexed to the action; but never to the quality of things.

'Tis good; though music oft hath such a charm,

To make *bad* good, and good provoke to harm.
Shakespeare.

How goes the day with us? O tell me, Hubert.
Badly, I fear. How fares your majesty? *Id.*

It was not your brother's evil disposition made him seek his death; but a provoking merit, set a work by a reproveable *badness* in himself. *Id.*

Thou may'st repent,
And one *bad* act, with many deeds well done,
May'st cover. *Milton.*

Thus will the latter, as the former, world
Still tend from *bad* to worse. *Id.*

Our unhappy fates
Mix thee amongst the *bad*, or make thee run
Too near the paths which virtue bids thee shun.
Prior.

Daughter of Jove, relentless power,
Thou tamer of the human breast,
Whose iron scourge, and tort'ring hour,
The *bad* affright—afflict the best. *Gray.*

The sun his annual course obliquely made,
Good days contracted, and enlarg'd the *bad*.
Dryden

Reading was *bad* for his eyes, writing made his head ache. *Addison.*

I did not see how the *badness* of the weather could be the king's fault. *Id.*

There is one convenience in the city, which makes some amends for the *badness* of the pavement. *Id. on Italy.*

BAD, } The preterite of bid.
BADE, }

Our council was not longe for to seche,
Us thought it was not worth to make it wist,
And granted withouten more advise,
And *bad* him say his verdict as him leste. *Chaucer.*
And for an earnest of greater honour,
He *bade* me, from him, call thee Thane of Cawder. *Shakspeare.*

She thank'd me,
And *bade* me, if I had a friend that lov'd her,
I should but teach him how to tell my story,
And that would woo her. *Id.*

Thus God and nature link'd the general frame,
And *bade* self-love and social be the same. *Pope.*

But thou, O hope, with eyes so fair,
What was thy delighted measure?
Still it whisper'd promis'd pleasure,
And *bade* the lovely scenes at distance hail! *Collins.*

BADAGIS, a town of Persia, in the province of Khorassan, forty miles north of Fusheng.

BADAJOZ, or **BADAJOX**, a large and strong town, the capital of Estremadura, in Spain. It is seated on an eminence on the south side of the Guadiana, over which there is a bridge of twenty-eight arches, and nearly 1900 feet in length, said to have been founded by the Romans. On this bridge the Portuguese were defeated in 1661, by Don John of Austria. Here are also five ancient gates, but the public buildings, with the exception of the cathedral, merit no notice: the only manufacture is hats. Population 14,300. The Roman Pax Augusta, of which Badajoz is supposed to be a corruption, stood on much higher ground. Badajoz has always been regarded as an important barrier against Portugal; from the frontiers of which it is little more than four miles. The Goths captured it in the fifth century; the Moors in the eighth, and Alphonso of Castile reconquered it in 1230. Lord Wellington invested Badajoz on the 18th of March, 1812; and breaches having been made on the 6th of April, it was assaulted on the same night. General Picton established himself in the castle; but after repeated attempts upon the town itself, the British troops were obliged to retire: the possession of the castle, however, so far commanded the works, that the French commandant thought it advisable to surrender: 1200 men out of a garrison of 5000, were killed or wounded during the siege, and of the besiegers, British and Portuguese, upwards of 4000. But the possession of Badajoz, in conjunction with Ciudad Rodrigo, secured the defence of Portugal, and was thought well worth the price paid for it. The bishop of Badajoz, suffragan to the archbishop of St. Jago, has under his inspection a cathedral chapter, an archdeaconry, and fifty parishes. The chapter is composed of seven dignitaries, twelve canons, four prebendaries, and six subprebendaries. There are besides in the town five parish churches, seven monas-

teries, five nunneries, and five hospitals. It is the residence of the captain-general and intendant of Spanish Estremadura, a civil and military governor, a royal lieutenant, an alcade major, and a contador. It has fourteen companies of militia, a garrison, two forts (Cristobal and las Pardaleras), and an arsenal. It is eighty-two miles N. N. W. of Seville, forty-nine S. of Alcantara. Long. 6° 47' W., lat. 38° 49' N.

BADALONA, or **BADELONA**, a sea-port town of Spain, in Catalonia, with a citadel. Earl Peterborough landed here with the arch-duke Charles in 1704. Four miles north-east of Barcelona. Long. 2° 7' E., lat. 41° 25' N.

BADANACOUPI, a town of the Mysore, Hindostan, twenty-eight miles south of Seringapatam.

BADAR, a town of Hindostan, in the province of Bejapour, on the south side of the Krishna, thirty miles south of Mirjee. Long. 75° 32' E., lat. 16° 40' N.

BADASKY, a town of Siberia, in the government of Irkutzk, on the river Angara, eighty miles N. N. W. of Irkutzk.

BADCOCK (Samuel), the son of a reputable butcher, was born at S^b Molton, Devonshire, in 1747, and bred a dissenting clergyman. He was first pastor at Beer-Regis in Dorsetshire, and afterwards at Barnstaple, for about ten years. Here meeting with some of Dr. Priestley's publications, he paid the Dr. a visit, and established a correspondence with him. Upon investigation of the subject, however, he found it impossible to embrace Unitarianism. In 1777 he removed to his birth-place, and in 1780, engaged as a writer in the Monthly Review. The controversy then agitated by Dr. Priestly, Price, and others, respecting the materiality of the soul, led him to publish his thoughts upon the subject, in a pamphlet entitled, A Slight Sketch of the Controversy between Dr. Priestly and his Opponents; which was repeatedly quoted with great approbation. In 1781 he wrote a poem, entitled the Hermitage, and reviewed Madan's Thelyphthora, greatly to the satisfaction of the public. In the controversy concerning the authenticity of Rowley's Poems, he took the negative side, and displayed his usual ingenuity. In the Monthly Review for 1785, he attacked Dr. Priestly's History of the Early Opinions relative to Jesus Christ, with such strength of reasoning, that the doctor, without knowing his antagonist, complimented him in his Reply, as a formidable and respectable antagonist. Being applied to by Dr. White, to assist him in completing his Bampton lectures, he wrote the greater part of the first, third, fourth, fifth, seventh and eighth; with part of the notes subjoined to them. In 1787, having expressed an intention of conforming to the established church, he was ordained in Exeter cathedral by his friend bishop Ross; who gave him the order of deacon and priest, on two succeeding Sundays. He died May 19th, 1788, at the house of his friend Sir John Chichester, bart. in May-fair. His disposition was gentle, humane, and lively; his judgment acute and comprehensive; and his literary attainments great and various. He was equally eminent as a preacher and a writer.

BADDAMMY, a town of Hindostan, in the province of Bejapour, in the territories of the Mahrattas. It is a place of some strength. Thirty miles south-east of Merritch. Long. 74° 54' E. lat. 16° 6' N.

BADDERLOCKS, in natural history, a Scottish name given to the *fucus esculentus*, or eatable sea-weed. It is about four feet long, and seven or eight inches wide, but varies in length from three yards to a foot, and in breadth, from a foot to two inches; the substance is thin, membranaceous, and pellucid; the color, green or olive. This *fucus* is eaten in the north of Scotland both by men and cattle, and is in its greatest perfection in September; that which is eaten by the common people about Edinburgh is the *F. PALMATUS*, *DULSE*, or *DILS*, which see.

BADEAUT, **LOCH**, or, as it is erroneously spelt in some maps, **BADWELL**, a good harbour of Scotland, on the coast of Sutherland, in the parish of Edderachylis; where shipping of all sizes can enter, and moor close to the land, in perfect safety.

BADEN, in geography, formerly a margravate of Germany, in the circle of Suabia, stretching along the east bank of the Rhine, and forming, at present, the most important part of a grand duchy of the same name. It consisted of two divisions, viz. Baden-Baden, and Baden-Durlach; of which the former, and part of the latter, formed a compact territory, surrounded by Spire, Wirtemberg, the bishopric of Strasburg, and the Rhine. The country is for the most part level, but intersected on the east by branches of the hilly Schwartzwald, or Black Forest. The most considerable part of Baden-Durlach lay disjointed and insulated towards the south; and that part in the upper margraviate lying in the direction of Bale, was covered with mountains, except in the immediate vicinity of the Rhine. These divisions, taken together with the county of Eberstein, include a space of 1186 square miles, and a population of more than 180,000 inhabitants, independent of the military. Within the limits of this margravate were seventeen towns, fourteen boroughs, and upwards of five hundred villages and hamlets; the whole yielding an annual revenue of nearly £150,000 sterling. The country abounds with wood, wine, iron, cobalt, and silver. The Rhine which flows over the whole surface, from north to south, supplies abundance of excellent salmon. Whilst the flax, hemp, linen, and fruits, which are found in considerable quantities, not only supply the aggregate home consumption of the inhabitants, but form important articles of exportation. Silk has also been cultivated here; but not with any great advantage. The principal manufactures are of cloth, stuffs, stockings, jewellery, &c. There is also one of steel, at Pfortzheim, and one of beautiful earthenware at Durlach.

The house of Baden is descended from Herman, second son of Berthold I. duke of Zähringen, who died A. D. 1074. About the middle of the sixteenth century it split into the two lines of Baden-Baden, and Baden-Durlach, in which state it continued for some time; but, on the extinction of the former, in 1771, the latter succeeded to the whole inheritance. At the diet of the empire, the margrave of Baden had three

votes in the council of princes, and one in the bench of counts, in virtue of his title as count of Eberstein. Before the memorable revolution in France, this prince possessed the following territories: his patrimonial lands, different territories in Suabia and Bohemia, portions of the county of Sponheim-Grafenstein, together with the bailiwick of Roth on the French side of the Rhine, the lordships of Rodemachern and Hespingen, in Luxemburg, and several estates in Alsace; but when the possessions on the left bank of the Rhine were ceded to France by the peace of Lunneville, concluded on the 9th of February, 1801, the German princes were indemnified for their losses by the secularisation of ecclesiastical possessions; the reduction of the imperial cities, and other alterations on the right bank of the Rhine, and the margrave of Baden on that occasion acquired the bishopric of Constance, part of Bale-Strasburg, and Spire, several bailiwicks of the Lower Palatinate, and in Hesse, the lordship of Lahr, a number of secularised abbeys, and several imperial towns, together with the title of elector, and three additional votes at the diet. His augmented possessions at this time contained a territory of 2770 English square miles, and a population of 410,000 inhabitants, yielding in annual revenue £372,000 sterling; and, in the year 1803 were separated into three divisions, viz. the margraviate, the palatinate, and the upper principality.

When the coalition was formed against France in 1805, Bavaria, Wirtemberg, and Baden were the allies of Buonaparte; and after the defeat of the confederated powers at Ansterlitz had led to the peace of Presburg. and the subsequent formation of the Rhenish confederation in 1806, these states participated in the ceded possessions. Baden was erected into a grand duchy, and in exchange for the towns and territory of Biberach, which had been reduced from its imperial dignity, and assigned to Baden, in 1802, and now ceded by that government to Wirtemberg, she received the following accessions, the towns and territories of Billingen and Baeunlingen, the greater part of the Brisgau, the principality of Heitersheim, the county of Bondorf, the district of Ortenau, the commandery of Bengen, and the possessions of the provincial nobility; also the sovereignty over a great part of Furstenberg, Salm-Krautheim, and Loevenstein-Werheim, as well as over the whole of the Cletgau and Thengen. The county of Nellenburg was shortly afterwards added, together with several adjacent territories, and by means of new acquisitions and interchanges, the detached districts on the lake of Constance were rendered contiguous to the other dominions. These acquisitions raised the importance of Baden, and were all guaranteed to the grand duke, in 1815, by the Congress at Vienna.

Baden, in its present state, therefore, remains to be considered as a grand duchy of Germany, including the territories already described. Its division into a landgraviate, a margraviate, and a palatinate, or the provinces of the Upper, Middle, and Lower Rhine, was superseded in 1809, two years after its commencement, by the following distribution into nine circles, thus peopled, according to Mr. Hassel's statistics:

No.	Circles.	Population.	No.	Chief Towns.	Population.
1	The Lake (Seekreis)	89,604	1	Constance	4,503
2	The Danube	72,735	2	Villingen	3,316
3	The Weisen	116,954	3	Lorrach	1,906
4	The Treisam	125,867	4	Freyburg	10,108
5	The Kinzig	117,640	5	Offenburg	2,888
6	The Murg	85,112	6	Rastadt	4,204
7	The Pfinz and Enz	131,518	7	Durlach	3,916
8	The Neckar	166,818	8	Manheim	18,213
9	The Maine and Tauber	95,382	9	Wertheim	3,227
		1,001,630			52,281

For the general superintendance of the circles are established two divisions of the civil government, at Manheim and Freyburgh, besides which each of the circles individually has a director and two counsellors of its own. For the administration of justice there are inferior courts, and above them three courts of appeal at Freyburg, Rastadt, and Manheim, together with an upper court at the town last mentioned, analogous to what is called in France the 'Court of Cassation.' The French code, also commonly called the code of Napoleon, was introduced during the usurpation of Buonaparte, and is still in force, with a few modifications. The seat of the government is held at Carlsruhe, where the Grand Duke resides, under the designation of Royal Highness. There are four ministers connected with the executive part of government, viz. those of the interior, finance, justice, and war. The legislative part is conducted by the Baden cabinet, called the ministerial conference, of which the Grand Duke, hereditary duke, or, failing both, the oldest minister is president. The government has of late manifested considerable solicitude for the welfare of the people, by the formation of roads, the abolition of feudal vassalage, the establishment of an excellent system of forest laws, and above all, by the erection and endowment of schools, academies, and public libraries. The principal of these are at Heidelberg, Manheim, Baden, and Carlsruhe, Heberlingen, Offenburg, Rastadt, Bruchsal, &c. Religious toleration is also universally granted, although the religion of the Grand Duke and national establishment is Lutheranism.

M. Hassel thus enumerates the different religions:—

Roman Catholics	620,000
Lutherans	305,000
Calvinists	61,000
Jews	15,080
Mennonites	1,290

The surface of Baden is beautifully diversified by every variety of landscape, hill and dale, plain, and mountain, breaking on the sight in regular succession. The climate is agreeable, and the soil, generally speaking, fertile; the only part incapable of cultivation being a portion of the Black Forest, in Brisgau. The country is intersected by the Maine and the Neckar, and bounded on the west by the Rhine; tributary to these are numerous smaller rivers and streams,

from several of which the circles derive their names. The country bordering upon Switzerland is mountainous, and a chain runs from the confines of that division through the southern part of Baden into the kingdom of Wirtemberg. It afterwards forms a part of the separating boundary between them, and is joined by another chain stretching from east to west, over the whole breadth of the southern region.

Perhaps one of the most beautiful portions of this grand duchy is the country lying round Heidelberg and its suburbs. The town itself exhibits a romantic site, mild air, delightful prospects, curious and extensive subterranean walks, which have been lately closed, an ancient electoral palace; but the environs, if possible, are still more beautiful. Manheim is also well situated, and forms a delightful appearance at the confluence of the Neckar and the Rhine. At the commencement of the seventeenth century, it was only a pleasant village, but being shortly after fixed upon as the residence of the elector, and seat of the court, it became a flourishing place, although when the court was removed, in 1777, the town considerably declined. The palace of the Grand Duke, the tower of the observatory, the custom house, churches, and other public buildings, together with the gallery of paintings, cabinet of antiquities, &c. are objects worthy of notice; as are also the bridge of boats over the Neckar, and the flying bridge over the Rhine. The horses of Baden are an excellent breed. In other respects the domestic and wild animals resemble those of the other states of Germany.

BADEN, a town of Germany, in the grand duchy of the same name, formerly the capital of the upper margraviate, but included, since the year 1810, in the circle of the Murg. The town is seated among hills, on rocky and uneven ground, which renders the streets inconvenient and crooked. It derives its name from its baths, the word bad, in German, signifying bath. These baths were known to the Romans before the Christian era, and are supplied by upwards of 300 mineral springs, the waters of which are strongly impregnated with sulphur, salt, and alum. Some of these springs are hot, and are accounted good, in nervous cases. Baden contains a population of 2000 inhabitants, and is now the head of an upper bailiwick. It has a lyceum, with several flourishing manufactures of earthenware, potash, candles, soap, and leather. The ancient castle, now in ruins, stand-

ing on a neighbouring eminence, overlooks the river Oelbach, commanding the pleasing and extensive prospects of a beautiful wine country. The town is twenty-two miles N. E. of Strasburg, and forty S. S. W. of Heidelberg. Long. $8^{\circ} 18' E.$, lat. $48^{\circ} 46' N.$

BADEN, a small town of Lower Austria, seated on the rivulet of Schwocha, in a plain not far from a ridge of hills which runs out from the mountain Cetius. It is much frequented by the people of Vienna, and the neighbouring region, on account of its warm baths, which are said to be twelve in number, and beneficial in disorders of the head, as also for the gout, dropsy, and most chronic distempers. It contains three churches, 250 houses, and 1500 population, is surrounded by walls, and is twelve miles S. S. W. of Vienna. Long. $16^{\circ} 14' E.$, lat. $48^{\circ} 2' N.$

BADEN, a district of Switzerland, in the canton of Aargau, bounded by Suabia on the north, Zurich on the east, Lucerne on the South, and Aargau proper on the west. It is thirty miles in length, and from eight to twelve in breadth, including a territory of 176 square miles; and, according to an enumeration made in 1803, contained nearly 47,000 inhabitants, which have since increased considerably. This country is one of the finest in Switzerland, and is watered by three navigable rivers, the Limmet, the Russ, and the Aar. It is divided into three parts and eight bailiwicks, producing great abundance of corn, fruit, and wine. Before the peace of 1712, this district formed a separate canton, but when the articles of treaty were concluded between Zurich and Berne, it was divided among these cantons and that of Glaris. The two first seizing upon seven-eighths, and the last the one-eighth then remaining. In the constitution of 1798 it was restored to its original independence, but in the re-organization of the cantons by the emperor Napoleon, in 1803, it was united to that of Aargau, in connexion with which it has ever since remained.

BADEN, the capital of the above district, is a small town containing about 1700 inhabitants, and carrying on a considerable trade. It is seated on the side of the Limmet, in a plain flanked by two hills, between which the river runs. This city owes its rise to its baths, which were famous before the Christian era, and known to the Romans by the name of *Thermæ Helveticæ*. Several monuments of antiquity have been found here, particularly in 1420; when the inhabitants, on opening the large spring of the baths, found statues of several heathen gods, made of alabaster, Roman coins, of Augustus, Vespasian, Decius, &c. made of bronze, and several medals of the Roman emperors, of gold, silver, copper, and bronze. There are two churches in Baden; one of which is collegiate, and makes a good appearance, and the other a monastery of the Capuchins, near the town-house. The inhabitants are rigid Roman Catholics, and formerly behaved in a most insolent manner to the Protestants, but they are now obliged by their masters to be more submissive. In this town were held formerly the general assemblies of the canton, who met in a handsome room, fitted up for their reception within the Capuchin's monastery;

here, too, the negotiations for peace between France and the empire, which had been opened at Rastadt, were brought to a close, on the seventh of September, 1714. The town at present chooses its own magistrates, and enjoys other privileges. The governor resides in a fine castle on the other side the Limmet, erected after the destruction of the old edifice in 1712; a handsome wooden bridge hangs over the river, forming a beautiful entrance to the castle, and in front of this magnificent residence is a stone pillar erected in honor of Trajan, who paved a road in this country, eighty-five Italian miles in length. The baths, which are on each side the river, are a quarter of a league from the city. Joining to the small baths there is a village, and to the village a town, which may pass for a second Baden. It is seated on a hill, of which the ascent is steep. There the baths are brought into inns and private houses, by means of pipes, which are about sixty in all. There are also public baths in the middle of the town, from a spring which rises in the street, where the poor bathe gratis, but they are exposed quite naked to all that pass by. All the baths are hot, and one to so great a degree as to scald the hand. The springs, which originate in a place called Ort-Zum-Baden, are eight in number, and are impregnated with a great deal of sulphur, accompanied with a little alum and nitre. The waters are used for drinking, as well as bathing, and are said to cure all diseases from a cold cause, head-aches, vertigos, &c. They strengthen the senses, cure diseases of the breast and bowels, asthma, and obstructions, and are peculiarly excellent for diseases of women. Baden is about fourteen miles N. W. of Zurich, twenty-seven S. E. of Basle. Long. $8^{\circ} 12' E.$, lat. $47^{\circ} 24' N.$

BADEN, a parochial village of Switzerland, in the Valais, jurisdiction of Leuck. Here is the celebrated bath commonly called the bath of Leuck, or Valais, which is of heat sufficient to boil an egg, and the water of which is used by the inhabitants both for the purposes of bathing and drinking.

BADENOCH, a large district of Inverness-shire, of which it is the most easterly part, bounded by Inverness on the north, Moray on the east, Athol on the south, and Lochaber on the west. It extends about thirty-three miles in length from east to west, and twenty-seven from north-east to south-west, where it is broadest. It has no considerable town, and is very barren and hilly, but abounds with deer and other kinds of game.

BADENS (Francis), a historical and portrait painter, was born at Antwerp in 1751, and first initiated in the art by his father. Having visited Rome, he formed an excellent taste for design, and a manner exceedingly pleasing. On his return, he was usually distinguished by the name of the Italian painter. His touch was light and spirited, and his coloring warm; and he was the first who introduced a good taste in coloring among his countrymen. While his acknowledged merit was rewarded with every public testimony of esteem, he received an account of the death of his brother, who had been assassinated on a journey; and the intelligence affected him so

violently, that it occasioned his own death suddenly, in 1603.

BADERALLY, a town of Hindostan, in the province of Bejapour, seventeen miles south-west of Raibaug.

BADEW (Richard de), the original founder of Clare-hall, Cambridge. He was born at Badow, in Essex; and in 1326 was chancellor of Cambridge, when he laid the foundation of a building to which he gave the name of University-hall. This being afterwards burnt down, was rebuilt by a daughter of Sir Gilbert de Clare, earl of Gloucester, and named Clare-hall.

BADEY, a town of Persia, in the province of Khorassan, 140 miles north-west of Herat.

BADGE, *v. a. & n. s.* A word of uncertain etymology; derived by Junius from *bode* or *bade*, a messenger, and supposed to be corrupted from *badage*, the credential of a messenger; but taken by Skinner and Minshew from *bagge*, Dut. a jewel, or *bague*, Fr. a ring. It seems to come from *bejulo*, Lat. to carry, The substantive denotes a mark; or ornament worn to show the relation of the wearer to any person or cause. It also signifies a token of rank or character. An outward and visible distinction, either honorable or disgraceful.

But on his breast a bloody cross he bore,
The dear resemblance of his dying lord;
For whose sweet sake that glorious badge he wore.
Spenser.

A savage tigress on her helmet lies;
The famous badge Clarinda us'd to bear. *Fairfax.*
Mark the badge of these men, then say if they be true. *Shakspeare.*

Might I but know thee by thy household badge. *Id.*
Sweet mercy is nobility's true badge. *Id.*
Your royal father's murdered —
—Oh, by whom? —

Those of his chamber, as it seem'd had done't;
Their hands and faces were all badg'd with blood,
So were their daggers. *Id.*
Let him not bear the badges of a wreck,
Nor beg with a blue table on his back. *Dryden.*

The outward splendour of his office is the badge and the token of that sacred character which he inwardly bears. *Atterbury.*

BADGE, in naval architecture, a sort of ornament placed on the outside of small ships, very near the stern, containing either a window for the convenience of the cabin, or a representation of it. It is commonly decorated with marine figures, martial instruments, or such like emblems.

BADGE'LESS, *adj.* From badge and less. Having no badge.

Whiles his light heels their fearful flight can take,
To get some badgeless blue upon his back.
Bishop Hall's Satires.

BAD'GER, *n. s.* Perhaps from the Lat. *bajulus*, a carrier; but by Junius derived from the badger, a creature who stows up his provision. One that buys corn and victuals in one place, and carries it unto another.—*Cowel.*

BAD'GER, *n. s.* From *bedour*, Fr. *melis*, Lat. An animal that earths in the ground, and used to be hunted.

That a brock, or badger, hath legs of one side shorter than the other, is received not only by theorists and unexperienced believers, but most who behold them daily. *Brown.*

BADGER, in zoology, the English name of a species of ursus. See *URSUS*.

BADGER-BAITING, or **BADGER-HUNTING**. The badger has suffered more perhaps from vulgar prejudices than any other animal. He has been accused of destroying lambs and rabbits: the first unquestionably without foundation, and it is uncertain whether the last charge be better supported; for many naturalists maintain that his sole food consists of roots, fruits, grass, insects, and frogs. From this general and double accusation, however, the harmless badger has been selected to make sport, as it is called, for the vulgar, in both hunting and baiting.

Hunting the badger is in general only performed by moonlight: the badger, from his natural habits, being never to be found above-ground by day. In this sport the hunters are obliged to oppose art to cunning, and obtain by stratagem what they cannot effect by strength. At a late hour in the evening, when the badger is naturally concluded to have left his kennel or his castle in search of food, some of the party, as previously adjusted, proceed to place a sack at length within the burrow, so constructed that the mouth of the sack directly corresponds with the mouth of the earth, and is secured in that position by means of a willow hoop, which, from its pliability, readily submits to the form required. This part of the business being completed, the parties withdrawn, and the signal whistle given, their distant companions lay on the dogs, either hounds, terriers, lurchers, or spaniels, encouraging them through the neighbouring woods, coppices, and hedge-rows; which the badgers abroad no sooner find, than being alarmed, and well knowing their inability to continue a state of warfare so much out of their own element, instantly make to the earth for shelter; where, for want of an alternative, and oppressed with fear, they rush into certain destruction, by entering the sack: being entangled in which, they are soon secured by those who are fixed near the spot for that purpose. If the badger escape by the ill-construction or accidental falling of the sack, and safely enter the earth, digging him out is not only a very laborious but very precarious attempt; for the badger, from instinctive ingenuity, will be generally found to have formed his retreat before he can be reached: to render which the more easy, he usually constructs his kennel among the roots of some old pollard, in the banks of moors, or underneath some hollow tree; from the spreading root branches of which the burrows run in such various and perplexing directions, that his assailants are often compelled, after tiring themselves by digging fifteen or twenty feet, to relinquish the pursuit; corroborating the opinion of the common people, that in a loose and sandy soil badgers can make a way as fast as their hunters can pursue them: whence drawn-battles in such situations are very common results.

Badger-baiting is a different sport, and if possible of a lower description. It consists in attacking the animal at a distance from his burrow, with dogs of almost any kind; but most successfully with the terrier. The badger is so rapid in his motions, that the dogs are often desperately

wounded, and compelled to give up the contest. The looseness and thickness of the badger's skin are admirably contrived for his advantage; in consequence of the latter, and especially in conjunction with the coarseness and toughness of his hair, it is difficult for the dogs to lay hold of him; and in consequence of the former, he finds great facility of escaping from their grasp when they have succeeded. These sports have given rise to a very expressive proverb of 'badgering a man with a request' for payment of debts, &c.

BADGER-LEGGED. From badger and legged. Having legs of an unequal length, as the badger is supposed to have.

His body crooked all over, big-bellied, *badger-legged*, and his complexion swarthy. *L'Estrange.*

BADGUM, a town of Hindostan in Dowlatabad, six miles S. S. W. of Oudghir.

BADIHUNTOUL; Gael. a den of refuge; a place in the parish of Fordice, in Banffshire, in former times used as a place of refuge from the Danish invasions.

BADIA, in conchology, 1. A species of cyprea having an oblong gibbous shell.—Gmelin. 2. A species of helix, called by Born, helix unguilina; and, 3. A species of patella.

BADIA (D.), a Spaniard, who devoted himself, in 1803, and four or five following years, to the profession of Mahommedanism, as a means of exploring Mahommedan countries. He assumed the name of Ali Bey el Abassi, and submitted, it is said, to the most distinguishing rite of Islamism, the better to pursue his plans. Mr. Burckhardt writes thus, respecting him, from Aleppo: 'He called himself Ali Bey, and professed to be born of Tunisian parents in Spain, and to have received his education in that country. Spanish appears to be his native language, besides which he spoke French, a little Italian, and the Mozgrabeyan dialect of Arabic, but badly. He came to Aleppo by the way of Cairo, Yaffa, and Damascus, with the strongest letters of recommendation from the Spanish government to all its agents, and an open credit upon them. He seemed to be a particular friend of the Prince of Peace, for whom he was collecting antiquities: and from the manner in which it was known that he was afterwards received by the Spanish ambassador, at his arrival at Constantinople, he must have been a man of distinction. The description of his figure, and what is related of his travels, called to my recollection the Spaniard Badia, and his miniature in your library. He was a man of middling size, long thin head, black eyes, large nose, long black beard, and feet that indicated the former wearing of tight shoes. He professed to have travelled in Barbary, to have crossed the Lybian desert, between Barbary and Egypt, and from Cairo to have gone to Mecca and back. He travelled with eastern magnificence, but here he was rather shy of showing himself out of doors: he never walked out but on Fridays, in the prayers of noon in the great mosque. One of the before-mentioned dervises told me that there had been a great deal of talking about this Ali Bey, at Damascus and Hamar: they suspected him of being a Christian, but his great liberality and the pressing letters which he brought to all

people of consequence, stopped all further inquiry. He was busily employed in arranging and putting in order his journal during the two months of his stay at Aleppo.' His travels were published at London and in Paris, in 1814, in 2 vols. 8vo. under his assumed name. He is now known to have been an agent of Godoy, the Prince of the Peace, employed at the instigation of Napoleon. He died in Spain shortly after his return to Europe.

BADIA, LA, a town of Italy, on the Adigetto, at the place where it branches from the Adige. It is small and open, but well-built, populous and wealthy; and was formerly called Castello Piazone, having two castles. The Adige is here crossed by a handsome bridge five miles from Legnano, and fifteen W. S. W. of Rovigo.

BADIAGA, in the materia medica, the name of a sort of spongy plant, common in the shops of Moscow and some other northern kingdoms. It is used to take away the livid marks, occasioned by blows and bruises, which the powder is said to do in a night's time. We owe the knowledge of this medicine, and its history, to Buxbaum. He observes, that the plant is always found under water, and is of a very peculiar nature. It somewhat resembles the alcyonium, and somewhat the sponge, but differs from both, it being full of small round granules, resembling seeds. It is of a loose, light, and spongy structure; is made up of a number of fibres of an herbaceous matter, and is dry, rigid, and friable between the fingers. Such is the generic character of the badiaga, of which this accurate observer has found three different species. Linnæus makes it a species of sponge.

BADIANA, **BADIANE**, or **BANDIAN**, the seed of a tree which grows in China, and smells like anise seed. The Chinese, and the Dutch in imitation of them, sometimes use the badiana to give their tea an aromatic taste.

BADIGEON, in joiner work, saw-dust mixed with strong glue, wherewith they fill up the chaps and other defects in the wood after it is wrought.

BADIGEON, in statuary, a mixture of plaster and free-stone well ground together, and sifted; used by statuaries to fill up the little holes, and repair the defects in stones, whereof they make their statues and other work.

BADILE (Antonio), history and portrait painter, born at Vienna in 1480, was an eminent artist: but derived greater honor from having two such disciples as Paolo Veronese and Baptista Zelotti. He died in 1560. His coloring, especially of his carnations, was beautiful; and his portraits preserved the perfect resemblance of real life.

BADINAGE, foolery, buffoonery.

BADIS, a fortress of Livonia, subject to Russia, twenty miles east of Revel.

BADITES, in botany, the Nymphæa, or clava Herculis: the root of which, according to Marcellus Empiricus, bruised and eaten with vinegar for ten days by a boy, makes him an eunuch without excision.

BADKIS, or **PASIN**, a town of Persia in the province of Khorassan, thirty-six miles north of Herat. Long. 60° 27' E. lat. 35° 30' N.

BADONG, a district of the island of Bali, where the Dutch had a small settlement, afterwards taken by the British.

BADOO, two towns in the kingdom of Woolli, in Africa. They both united their strength in enforcing the payment of custom from Mr. Park.

BADOUCE, in natural history, the East Indian name of a fruit, very common in that part of the world. It is round, and of the size of one of our common apples; yellow on the outside, and white within. It resembles the mangoustan; but its pulp is more transparent; its taste is very agreeable, and has some resemblance to that of our gooseberries.

BADRACHILLUM, or the SACRED MOUNTAIN, a town of Hindostan, in Golconda, on the north-east side of the river Godavery, consisting of 100 huts. Here is a pagoda of great celebrity. Distant seventy-two miles N.W. of Rajamundry, 150 east of Hydrabad, and 134 from Vizagapatam.

BADROWLY, a town of Hindostan, in Guzerat, sixteen miles east of Surat.

BADRYCAZRAM, an extensive mountainous district on the northern borders of Hindostan, between the thirty-first and thirty-third degrees of northern latitude; very unproductive and thinly inhabited.

BADSHIFT BAY; a bay on the coast of Patagonia, in the straits of Magellan. Long. 74° 24' W. lat. 53° 35' S.

BADUEL (Claude), a French protestant divine, born at Nismes. He went to Switzerland in 1557, where he taught philosophy and mathematics, and exercised his ministry till his death in 1561.

BADULATO, a town and territory of Naples, in Calabria Ultra, extremely productive in wine, oil, honey, turpentine, cotton and silk. Fourteen miles S. S. E. of Squillace.

BADULE, a town of Ceylon, fifty-four miles S. E. of Candy.

BADY, a large town of Africa, in the kingdom of Woolli, governed by an independent chief, under the appellation of Faranba.

BAEA, in botany, a genus of plants, of the class diandria, and order monogynia. Its generic character is cor. ringent, the tube very short, upper lip flat, tridentate; lower lip flat, bilobate: caps bilocular, quadrivalvular, contorted: CAL. quinquepartite, equal.

BÆCKEA, in botany, a genus of the octandria order, and monogynia class of plants, named after Abraham Baecka, a friend of Linnæus. The calyx is a permanent perianthium, consisting of a single funnel-shaped leaf, cut into five fragments at the brim; the corolla consists of five roundish petals inserted into the calyx; the pericarpium is a globose capsule, made up of four valves, and containing four cells, in which are a few roundish angular seeds. The species are shrubs.

BÆDOO, an extensive kingdom of central Africa, south of Tombuctoo, and east of Bambarra, to which latter country it is tributary. It is traversed by a river called the Ba Nimma, descending from the mountains of Cong. The interior is little known.

BÆLAMA, in zoology, the Arabian name, according to Forskal, of a species of clupea.

BÆNA, or **VÆNA**, a town of Spain, in the Andalusian province of Cordova, surrounded with walls, and containing four parish churches, five religious houses, and 4800 inhabitants. Here are some excellent salt works. It is eighteen miles E. S. E. of Cordova.

BÆOBOTRYS, in botany, a genus of plants, of the class pentandria, and order monogynia. Its generic character are cor. tubulose, quinquefid: CAL. double, superior; exterior of two leaves; inferior campanulate quinqueentate. Berry unilocular, many-seeded. Willdenow describes two species; one, a native of Arabia, is figured by Mart. Vahl. *Symbola Botanica*, tab. 6.

BAERSUIS, or **VEKENSTIL** (Henry), a printer and mathematician of the sixteenth century. He settled in Louvain, where he published Tables of the Longitudes and Latitudes of the Planets, in 1528.

BAERWALDE, or **BARWALDE**, a town of New Mark of Brandenburg, in the Prussian states, circle of Konigsburgh, population 1500. Here Gustavus Adolphus entered into a secret treaty with France in 1631. It is thirteen miles N. N. W. of Custrin, and forty-two E. N. E. of Berlin.

BÆTERRÆ, an ancient town of the Tertogages in Gallia Narbonensis, on the east bank of the Obriis. It is now called Besiers.

BÆTICA, a province of ancient Spain, so called from the river Bætis. It was bounded on the west by Lusitania; on the south by the Mediterranean, and Sinus Gaditanus; on the north by the Cantabric sea, now the Bay of Biscay. On the east and north east its limits cannot be so well ascertained, as they are known to have been in a continual state of fluctuation, each petty monarch having had an opportunity of encroaching upon his neighbour. The province was divided into two by the river Bætis, on the side of which, towards the Anas, were situated the Turdetani, from whence the kingdom was sometimes called Turdetania, though more generally Bæturia. On the other side, along the Mediterranean, were situated the Bastuli, Bastetani, and Contestani. The whole province of Bætica, according to the most probable account, is contained in what is now called Andalusia, part of the kingdom of Grenada.

BÆTIS, a famous river of ancient Spain, afterwards called Tartessus, and now Guadalquiver, or the Great River.

BÆTOLO, a town of ancient Spain, in the Terraconensis; now Badelona, in Catalonia.

BÆTURIA. See **BÆTICA**.

BÆTUS, in ichthyology, a name given by Aristotle, and others of the ancient Greeks, to the fish called by the Latin writers cottus; particularly to that species called by us the bull-head, or miller's thumb.

BÆTYLIA, anointed stones, worshipped by the Phœnicians, by the Greeks before the time of Cecrops, and by other barbarous nations. They were commonly of a black color, and consecrated to some god, as Saturn, Jupiter, the Sun, &c.—Some are of opinion that the origin of this practice is to be derived from the pillar of

stone which Jacob erected, and near which he worshipped, at Bethel. These bætylia were much the object of the veneration of the ancient heathens. Many of their idols were no other. In reality, no sort of idol was more common in the eastern countries, than that of oblong stones erected, and hence termed by the Greeks, *κίονες*, pillars. In some parts of Egypt they were planted on both sides of the highways. In the temple of Heliogabalus in Syria, there was one pretended to have fallen from heaven. There was also a famous black stone in Phrygia, said to have fallen from heaven. The Romans sent for it, and the priests belonging to it, with much ceremony, Scipio Nasica being at the head of the embassy. The priests of Cybele carried a bætylum on their breasts representing the mother of the gods.

BÆTYLOS, the same with BÆTYLION; plural, BÆTYLIA. See last article.

BAEZA, or BAECA, a town of Spain, in the province of Jaen, Andalusia. Its streets and squares are handsome, and it was in former times a place of considerable importance, the residence of a Moorish king. It was subsequently a bishop's see, and the seat of a university. At present it is fallen into decay, but has still two chapters, several parish churches and cloisters, a confraternity, a society under the title of economical, several good tanneries, and a population of 15,000. It is seventy miles N. N. E. of Cordova. Long. 3° 35' W., lat. 37° 4' N.

BAIZA, a city of the province and government of Quixos and Maaco, in the kingdom of Quito. It was formerly rich and populous, but has been wasted by the Indians. Lat. 26° S.

BAJBA, or Boro, a sea-port on the Grain Coast of Africa, which carries on a considerable trade in pepper. Long. 8° 52' W., lat. 5° 10' N.

BAJBA, a sea-port town on the west coast of the island of Cyprus, the ancient Paphos, situated on a rocky eminence close to the sea. Its harbours are filled up with sand, and is generally avoided by mariners, because of its dangerous approach, and from its having no shelter from the violence of the winds. The Turks have built a castle on the point of a rock to the south-west, which is defended by artillery; and it is the residence of a Turkish pasha. Of several Christian churches only one remains, in which the Greeks officiate; who still have a bishop here, suffragan of the metropolitan of Nicosia. Pieces of fine rock crystal are sold here under the name of Bafia diamonds; and in this also, of superior quality, is found in the north-east wood. It is called cotton stone by the natives. Various ruins and some antiquities are scattered over the vicinity of Bajba, among which are many highly polished blackish and black columns, traditionally supposed by the natives to have been the materials of the palace of Aphoditus. Further east, others of a large size denote the site of a temple. There is also cut out of the rock a subterraneous church, dedicated to the seven sleepers, and a large excavation supposed to have been a cistern. Long. 2° 47' E., lat. 34° 49' N.

BAJBA, a town on the south-west coast of the island of Cyprus. Long. 32° 18' E., lat. 34° 49' N.

BAGG, or BAYAS, a cloth made of

coarse white cotton thread, which comes from the East Indies. That of Surat is the best.

BAFFIN'S BAY; a large gulf or bay of North America, lies between seventy and eighty degrees of north latitude. It opens into the Atlantic ocean through Baffin's and Davis's straits, between Cape Chidley, on the Labrador coast, and Cape Farewell on that of West Greenland; both of which are in about the sixtieth degree of north latitude; and abounds with whales and walruses. On the south-west side of Davis's straits it has a communication with Hudson's bay, through a cluster of islands, in lat. 74° 20'; it communicates with Sir James Lancaster's sound, through which Captain Parry passed triumphantly, and discovered Barrow's straits, Prince Regent's Inlet, &c.

BAFFLE, *v. a. & n. s.* } In Fr. *befler*, from
BAFFLER, *n. s.* } *buffle*, an ox, and
BAFFLED, *adv.* } signifies to lead by

the nose as an ox; that is, to amuse or disappoint; to perplex by a feint. Its general acceptance is eluding the schemes of others by dextrous management. It is sometimes explained by the words to defeat, to disconcert, and confound. Dr. Johnson employs these terms in his definition of it. But Crabbe has well distinguished them, and given them different shades of meaning in their application. Baffle expresses less than defeat; defeat less than confound; and disconcert less than all. Obstinacy, perseverance, skill, or art, baffles; force or violence defeats; awkward circumstances disconcert; the visitation of God confounds.

Where thou wilt, lad, I'll make one; an I do not, call me villain, and baffle me. *Shakspeare.*

Go, baffled coward, lest I run upon thee. *Milton.*

They made a shift to think themselves guiltless, in spite of all their sins; to break the precept, and at the same time to baffle the curse. *South.*

He hath deserved to have the grace withdrawn, which he hath so long baffled and defied. *Atterbury.*

Experience, that great baffler of speculation, assures us the thing is too possible, and brings, in all ages, matter of fact to confute our suppositions.

Government of the Tongue.

Etruria lost,
He brings to Turnus' aid his baffled host. *Dryden.*

When the mind has brought itself to close thinking, it may go on roundly. Every abstruse problem, every intricate question, will not baffle, discourage, or break it. *Locke.*

Now shepherds, to your helpless charge be kind,
Baffle the raging year, and fill their pens
With food at will. *Thomson.*

BAG, *v. a. & n.* A sack, pouch, or purse
Either artificially constructed, or the work of nature.

Cousin, away for England; haste before,
And, ere our coming, see thou shake the bags
Of hoarding abbots; their imprison'd angels
Set thou at liberty. *Shakspeare.*

Sing on, sing on, for I can ne'er be cloy'd;
So may thy cows their burden'd bags distend. *Dryden.*

Two kids that in the valley stray'd
I found by chance, and to my fold convey'd:
They drain two bagging udders every day. *Id.*

Like a bee, bagg'd with his honey'd venom,
He brings it to your hive. *Id. Don Sebastian.*

Once, we confess, beneath the patriot's cloak,
From the crack'd *bag* the dropping guinea spoke.

Pope.

We saw a young fellow riding towards us full gallop,
with a bob wig and black silken *bag* tied to it.

Addison.

BAG, in commerce, a term signifying a certain quantity of some particular commodity; a bag of almonds, for instance, is about 300 weight; of anise seeds, from 300 to 400; of pepper, from $1\frac{1}{4}$ to 300; of cotton yarn, from $2\frac{1}{4}$ to $4\frac{1}{4}$, &c. Bags are used in most countries to put several sorts of coin in, either of gold, silver, brass, or copper. Bankers, and others, who deal much in current cash, label their bags of money, by tying a ticket or note at the mouth of the bag, signifying the coin contained, the sum total, its weight, and of whom it was received. Tare is allowed for the bag.

BAG, in farriery, is when, in order to retrieve a horse's lost appetite, they put in an ounce of assafœtida, and as much powder of savin, into a bag, to be tied to the bit, keeping him bridled for two hours several times a-day; as soon as the bag is taken off, he will fall to eating. The same bag will serve a long time.

BAC, in medicine and pharmacy, a kind of fomentation, prepared of proper ingredients, enclosed in a bag, to be applied externally to a part diseased, for present relief. Dispensatory writers describe cordial bags, used in deliquiums; bags for the side, for the stomach, in weaknesses of the stomach; anodyne bags to ease pain in any part. Wines and ale are frequently medicated by putting into them bags full of proper ingredients. Sweet bags, are composed of perfumes, scented powders, and the like, enclosed in bags, to give a fragrantcy to clothes, &c.

BAGA. See *RUTA BAGA*.

BAGADAT, or **BAGALIN**, a name by which some call the carrier pigeon, the columba tabularia of Moore. The name is probably a corruption of the word Bagdat, the city from whence they are sometimes brought to Europe; being originally brought thither from Bazona.

BAGALÆN, or **BUGELÆN**, a district in the south of Java, nearly about the centre of the island, from east to west. The dialects of Scindo and of this district, are said to be very distinct from the Javanese Proper. From the Bugelen dialect the Sooloo language is supposed to be derived.

BAGAMADER, or **BAGAMEDRI**, a province of Abyssinia in Africa: so named from the great number of sheep bred in it; meder signifying land or earth, and bag a sheep. Its length is estimated about sixty leagues, and its breadth twenty, but formerly it was much more extensive; several of its provinces having been dismembered from it, and joined to that of Tigre. A great part of it, especially towards the east, is inhabited by wandering Gallas and Caffres.

BAGATELLE, *n. s.* *Bagatelle*, Fr. A trifle; a thing of no importance.

Heaps of hair rings and cypher'd seals;

Rich trifles, serious *bagatelles*.

Prior.

BAGAUDÆ, or **BACAUDÆ**, a faction of peasants, or malcontents, who ravaged Gaul about

A. D. 290, and assumed the name Bagaudæ, which, according to some authors, signified, in the Gaelic language, forced rebels; according to others, robbers. After seven months' siege they stormed the city of Autun. Villages and open towns were everywhere abandoned to their ravages; and they shook off the yoke of slavery only to show their incompetency for freedom, by a perpetration of the most cruel barbarities. Two of their most daring leaders, Ælianus and Amandus, had the boldness to assume the title and decorations of the Cæsars; and the cabinets of the curious still contain medals which they coined. Maximian, when associated with Dioclesian in the imperial government, devoted himself to the reduction of the Bagaudæ. It has been said that they were Christians; but even Mr. Gibbon (ii. 123) rejects this fact.

BAGAUZE, the name given, in the Antilles, to the sugar-canes, after they have passed through the mill; they are dried, and used for boiling the sugar.

BAGDAD, or **BAGDAT**, a celebrated city and pachalic of Asia, in Arabian Irak, seated on the eastern banks of the Tigris, which is here upwards of 600 feet wide. It is 300 miles N.N.W. of Bassora, 210 south of Mosul, and 1350 east of Constantinople. This city is of an oblong figure, about 1500 paces in length, by 800 in breadth, environed with a high but ruined wall, and a deep ditch. It has six gates surmounted with cannon, a castle, and an armoury; but the whole of its defences are in a very feeble and contemptible state. Here are some handsome houses; the markets are well supplied, and the bazaars are magnificent, containing from 1200 to 1500 shops, loaded with every description of eastern merchandise. Bagdad, in fact, is the great link of communication between Asia Minor, Syria, and even Europe and the East. The chief imports from India are, gold brocade, cloths, sugar, pepper, tin, sandal-wood, iron, china-ware, spice, cutlery, arms, and broad-cloth; in return for which they send bullion, copper, gall-nuts, tamarisk, leather, and otto of roses. From Aleppo are imported European silk-stuffs, broad-cloth, steel, cochineal, gold thread, and several other European articles, which are brought in Greek vessels to Scanderoon. The imports from Persia are, shawls, carpets, silk, cotton, white cloth, leather, and saffron: and those from Constantinople are, bullion, furs, gold and silver thread, jewels, brocade, velvets, and otto of roses. Its principal manufactures are red and yellow leather (which is much esteemed), silk, cotton, and woollen stuffs; and latterly a foundry of cannon has been erected.

Bagdad exhibits the ruins of a number of antique buildings. On the west side of the river is a suburb connected with the city by a bridge of boats, upon which the Bâb jisir, (Bridge gate) opens: The great extent of this city anciently on the west, as well as on the east side of the river, appears from the ruins all round this suburb. Here are the tombs of many Mahommedan saints; among others, those of the Imâms Abû Hanîfak and Hânel, founders of two of the orthodox sects; and of Mâsa Kâzim, one of the twelve Imâms, the successors of Ali,

so much venerated by the Persians. To the literary traveller it offers many other objects of interest; such as the tombs of Haroun Al Raschid, and his consort Zobeidah, so often mentioned in the Arabian Nights; and the remains of some fine mosques and colleges, monuments of the most brilliant period of Arabian history. But even the wrecks of many palaces and public buildings, celebrated by eastern writers, have not entirely disappeared.

Bagdad was founded by the caliph Abu Jafar Almansor in 766, and completed in four years. In the following century the celebrated Haroun Al Raschid reigned here, and under the auspices of Zobeida, his queen, and the vizier Jaffer Barmakeed, it rose into great splendor and importance; but was almost totally destroyed by the Turks, 100 years later; and in the thirteenth century was stormed by the Tartar prince Holaku, the grandson of Jenghis Khan, who put the sovereign to death, and abolished the caliphate. Tamerlane seized upon Bagdad in the year 1416, and Kara Yusef in 1436. Shah Ismael, the first of the royal Persian house of Sefi, rendered himself master of it in the following century, since which time, it has been an object of constant contention between the Turks and Persians.

Bagdad sustained a memorable siege by the Turkish emperor Amurath IV. who, with an army of 300,000 men, reduced it to great extremities: it surrendered in 1638, on the promise of indemnity; but the savage victor, having gained possession of the place, put a great proportion of the inhabitants to the sword. During the following century, Nadir Shah endeavoured in vain to wrest it from the Turks, and was obliged to retire with disgrace; and in the course of later years its safety has been frequently menaced by the Wahabees. In 1750 the inhabitants prevailed upon the Porte to appoint the pasha whom they chose to name: and they have ever since maintained this species of virtual independence.

The commerce of Bagdad was once very extensive and flourishing; but, from the improvident oppression of its rulers, it has now greatly declined. It is however, a place of great resort; the residence of a pasha; and a constant resort of pilgrims. Tavernier rated the population in his time at 150,000, but they probably do not amount to 50,000 at present. This population consists of Arabs, Persians, Turks, Jews, Armenians, and other eastern Christians, who are represented as generally courteous to strangers, and of an independent spirit. The truth is, that the pashas are sensible of the advantage of their distance from Constantinople, and obey or disobey the orders of the sultan, according to their own convenience.

Great extremes of heat and cold are felt here: in summer, especially when the *sann-yeli*, or poisonous wind, blows, the inhabitants are obliged to take refuge in the well ventilated cellars with which most of the houses are provided; and in winter the cold is sufficient to produce ice half an inch thick. This is considered as intolerable; and many of the natives are said to perish by it. The natives are like-

wise subject to a cutaneous disorder, for which no cure has yet been discovered: it appears in the form of a pimple, then degenerates into an ulcer, and at the end of eight or ten months dries up of itself, leaving a prominent mark. The inhabitants of Aleppo, and other towns in Syria, are also subject to this disease.

The pachalic, or vice-royalty, of which Bagdad is the capital, is one of the largest in the Turkish dominions. It contains eighteen sanjaks, or military divisions, and two districts of Kurdistan. According to the present distribution of the empire, it comprehends all its south-eastern angle; having Diyar-boer and Mount Sinjah on the north; Persia on the east; the Persian gulf on the south; and the Euphrates on the west. It therefore very nearly corresponds with the Mesopotamia of the ancients. Its area is about 178,100 square miles. The pacha is commander-in-chief of the troops stationed in his pachalic; next to him are the aghas of the janissaries and sipahis. Their whole number amounts to 30,000; infantry and cavalry in nearly equal proportions. A corps of 500 men, trained in the European manner, which was raised a few years ago, is still kept up.

This province has some very fertile spots: but is too much exposed to the depredations of banditti to be cultivated in any proportion to its capabilities. It includes many celebrated cities and towns, such as Bagdad, Bassora, Mosul, and Merdin.

The revenue derived from the customs, a capitation-tax, occasional contributions of the towns and cities, and the tribute levied on the Arab tribes, does not exceed 7,500,000 piastres, or £375,000.

BAGDASHAN, a very ancient city and district of Bokharia, in the province of Balkh, situated at the foot of the mountains which separate Hindostan from Great Tartary. The city is not large, but exceedingly strong by its situation; and belongs to the khan of Proper Bukharia, who uses it as a kind of state prison. It is well built and very populous. It stands on the north side of the river Amu, about 100 miles from its source; and is a great thoroughfare for the caravans designed for little Bukharia. The inhabitants are enriched by mines of gold, silver, and rubies, which are in the neighbourhood; and those who live at the foot of the mountains gather gold and silver dust, brought down in the spring by torrents occasioned by the melting of the snow on the top. It is 150 miles east of Balkh.

BAGE (Robert), a novel-writer of the last century, was the son of a paper-maker at Derby, and born in 1728. He was brought up to the same occupation as his father, but having a taste for literature, he gained a knowledge of mathematics, and of the French and Italian languages. He wrote *Mount Henneth*, 2 vols. 1781; *Barham Downs*; *The Fair Syrian*; *James Wallace*; *Man as he is*; and *Hermisprong*, or *Man as he is not*. The last two, which appeared, when the author was nearly seventy years of age, were decidedly superior to the preceding. He died at Tamworth in 1801. Three of the earlier novels of this writer have been republished in

the ninth volume of Ballantyne's *Novelist's Library*, edited, with biographical prefaces, by Sir Walter Scott.

BAGFORD (John), an antiquary, and great collector of old English books, prints, &c. was born in London. He had been, in his younger days, a shoemaker; afterwards, a bookseller; and lastly, for the many curiosities wherewith he enriched the famous library of Dr. John Moore, bishop of Ely, his lordship got him admitted into the Charter-house. He was several times in Holland, and on the Continent, where he procured many valuable old books, prints, &c. some of which he disposed of to the late earl of Oxford, who purchased his collections, papers, &c. for his library. In 1707 were published, in the *Philosophical Transactions*, his Proposals for a General History of Printing. He died at Islington, May 15, 1716, aged 65; and was buried in the cemetery of the Charter-house.

BAGGAGE, *n. s.* From *bag*; *baggage*; Fr. and from *bagaglia*, Ital. The furniture and utensils of an army; or any goods that are moveable. It is likewise employed to designate a dissolute woman of the baser sort, because such usually follow camps.

No barricado for the helly; it will let in and out the enemy *bag* and *baggage*. *Shakspeare.*

They were probably always in readiness, and carried among the *baggage* of the army. *Addison on Italy.*

Dolabella designed, when his affairs grew desperate in Egypt, to pack up *bag* and *baggage*, and sail for Italy. *Arbutnot.*

A spark of indignation did rise in her, not to suffer such a *baggage* to win away any thing of hers. *Sidney.*

When this *baggage* meets with a man who nasyvants to credit relations, she turns him to account.

BAGGAGE, in antiquity, was distinguished by the Romans into two sorts; a greater and less. The lesser was carried by the soldier on his back, and called *sarcina*; consisting of the things most necessary to life, and which he could not do without. Hence *colligere sarcinas*, packing up the *baggage*, is used for decamping, *castra movere*. The greater and heavier was carried on horses and in vehicles, and called *onera*. Hence *onera vehiculorum*, *sarcinæ hominum*. The *baggage* horses were denominated *segmentarii equi*. The Roman soldiers in their marches were heavily laden, in so much that they were called, by way of jest, *muli mariani*, and *ærumnæ*. They had four sorts of luggage, which they never went without, viz, *buccellatum*, or corn, utensils, valli, and arms. Cicero observes, that they used to carry with them above half a month's provisions; and we have instances in Livy, where they carried provisions for a whole month. Their utensils comprehended those proper for gathering fuel, dressing their meat, and even for fortification or entrenchment; and what is more, a chain for binding captives. For arms, the foot carried a spear, shield, saw, basket, rutrum, hatchet, lorum, falx, &c. Also stakes or pales, valli, for the sudden fortifying a camp; sometimes seven, or even twelve of these pales were carried by each man, though generally, as Polybius tells us, only three or four. On the Trajan column we see

soldiers represented with this fardle of corn, utensils, pales, &c. gathered into a bundie and laid on their shoulders. Thus inured to labour, they grew strong, and able to undergo any fatigue in battle; the greatest heat of which never tired them, nor put them out of breath. In after times, when discipline grew slack, this luggage was thrown on carriages and porters' shoulders. The Macedonians were not less inured to hardship than the Romans; when Philip first formed an army, he forbad all use of carriages; yet, with all their load, they would march, in a summer's day, twenty miles, in military rank.

BAGGAGE, in modern military affairs, denotes the clothes, tents, utensils of divers sorts, provisions, and other necessaries belonging to the army. Before a march, the waggons with the *baggage*, are marshalled according to the rank which the several regiments bear in the army; being sometimes ordered to follow the respective columns of the army, sometimes to follow the artillery, and sometimes form a column by themselves. The general's *baggage* marches first; and each wagon has a flag, showing the regiment to which it belongs.

BAGLAFECITE, in ornithology, the name of Gmelin's *loxia philippina*, var, β , in Buffon's history of birds.

BAGLANA, or **BUAGELANA**, a large district in the Mahratta territories, in the province of Aurungabad, situated principally betwixt the 20th and 21st degrees of north latitude. It is exceedingly mountainous, but contains many fertile plains; and its natural strength is augmented by a number of strong fortresses, erected on the summits of the mountains. The rivers are small, and the only towns of any note are Chandere, Tarabad, and Ingauw.

BAGLIVI (George, M. D.) an illustrious physician of Italy, born in Apulia, about 1668. He graduated at Padua, and afterwards went to Rome, where he was chosen professor of anatomy. His works were printed first in 1710, in 4to. The *Praxis Medica*, and *De Fibra Matricis* are his principal pieces. He wrote a Dissertation upon the Anatomy, Bite, and Effects of the Tarantula, and gave a particular account of the earthquake at Rome and the adjacent cities in 1703. His works are all in Latin.

BAGNA DI AQUA, a town of Italy, in Tuscany. It is divided into the upper and lower towns, the former of which is called *Petraja*, and the latter *Perlascic*. It has long been celebrated for its warm baths, and is fifteen miles east of Leghorn.

BAGNAGAR, a town of Asia, in the dominions of the Great Mogul, once the capital of Golconda. Its suburbs were three miles long, and chiefly remarkable for a magnificent reservoir of water, 220 miles north-west of Fort St. George, and as many east of Goa.

BAGNAJA, a small town of the ecclesiastical states, one mile south of Viterbo, where is held yearly a great cattle market. The Dominicans have here a large monastery, with an elegant church.

BAGNALS, PUNTA DE, a point on the north coast of the island of Barbadoes, between Indian river and the bay of Carlisle.

BAGNARA, a town of Naples, in Calabria Ultra, with the title of duchy, and 5000 inhabitants. It was destroyed by an earthquake in 1783, but has recovered from the calamity, and carries on a trade in wood, pitch, and excellent Muscadel wine. It is fourteen miles west of Oppido.

BAGNAREA, a town of Italy, in the states of the Church; the see of a bishop, and stands on a little hill. Five miles south of Orvieto, and twelve north of Viterbo. Long 12° 10' E., lat. 42° 38' N.

BAGNERES DE CAMPIN, or **EN BIGORRE**, a town of France, in Gascony; the capital of an arrondissement, in the department of the Upper Pyrenees. It contains about 6000 inhabitants, who are employed in tillage and pasturage. It is famed for its hot springs, of which there are no less than thirty-two; they were known in the time of the Romans. The accommodations for visitors are respectable. It is eleven miles south of Tarbes, and 450 S. S. W. of Paris.

BAGNIO, *n. s.* *Bagno*, Ital. *balneum*, Lat. bath. A house for bathing, and other less innocent purposes.

I have known two instances of malignant fevers produced by the hot air of a *bagnio*.

Arbutnot on Air.

When I see a young profligate squandering his fortune in *bagnios*, or at a gaming-table, I cannot help looking on him as hastening his own death, and in a manner digging his own grave.

Connoisseur.

BAGNIOS. The word is metaphorically applied to houses of bad fame. In Turkey it is become a general name for the prison where the slaves are enclosed, it being usual in those prisons to have baths.

BAGNOLS, a town of France, in Languedoc, the head of a canton in the department of the Gard, arrondissement of Uzès. It stands on a rock, has a manufactory of various kinds of silk, and contains 4800 inhabitants. An expensive road has been cut through a hill, four miles in length, leading from this place to the Pont du Gard and Nismes. The sands of the neighbouring river Ceze yield gold occasionally. It is twenty or six miles east of Nismes.

BAGNOLENSIS, or **BAGNOLIAN**, in church history, a sect of heretics, who in reality were Arians, and held the Old Testament and part of the N. T. to be the word to be eternal; affirmed that God did not create the soul, when he infused it into the body; and denied his prescience.

BAGOAS, a Persian name for the king's eunuch, employed in history to denote Bagoas, an Egyptian, who governed for a long time under Artaxerxes' reign. He poisoned his master, and then put to death Arses, whom he had set up as king's successor, but was at length killed by Darius, against whom he had conspired. This eunuch appears to be Bagoas mentioned in Judith.—*Historia Antiqua*, Joseph. *Antiq.* 4. 11. c. 7. 2. A eunuch who was in great favor with Alexander the Great.

BAGS, among the ancient Persians, were the same with what are called by the Romans *spondones*, and the species of eunuchs.

BAGOLINO, a town of Venice, on the river Caferro, which runs into the lake of Idro. It has many iron-works, and contains 3600 inhabitants. Twenty-four miles north of Brescia.

BAGONES, a river of Brasil, in the province of Rio Janeiro. It runs S. S. E., and enters the sea near Cape Frio, in lat. 22° 5' S.

BAGONGUENOU, two of the Laccadive islands, in the Indian ocean, and in the vicinity of each other. Long. 71° 56' E., lat. 11° N.

BAGOPHANES, a governor of Babylon, who, when Alexander approached the city, strewed all the streets and burned incense on the altars, &c. 2 *Curt.* 5. 1.

BAGOT (Lewis), an English prelate, son of Sir Walter Bagot, bart. and brother to the first Lord Bagot, was born in 1740. He was educated at Westminster, and chosen thence student of Christ Church, Oxford, took his degrees of A. M. and L.L.D. in 1764 and 1772; was made canon of Christ Church in 1771, installed dean in 1777; promoted to the see of Bristol in 1782; translated to Norwich the year following, and thence to St. Asaph in 1790, where he died in 1802. In this latter diocese he rebuilt the episcopal palace. He wrote, 1. A Defence of Subscription to the Thirty-nine Articles, as it is required in the University of Oxford, 1772, which was an anonymous answer to an anonymous pamphlet, entitled Reflections on the Impropriety and Inexpediency of Lay Subscription in the University of Oxford. 2. Twelve Discourses on the Prophecies, preached at the Warburtonian lecture in Lincoln's-inn Chapel.

BAGPIPE, *n. s.* } From bag and pipe. A

BAGPIPER, *n. s.* } musical instrument, consisting of a leathern bag, which blows up like a foot-ball, by means of a port-vent or little tube fixed to it, and stopped by a valve and three pipes or flutes; the first called the great pipe or drone, and the second the little one, which pass the wind out only at the bottom; the third has a reed, and is played on by compressing the bag under the arm, when full; and opening or stopping the holes, which are eight, with the fingers. The bagpipe takes in the compass of three octaves.—*Chambers*.

Wel coude he stelen corne and tollen thries,
And yet he had a thomb of gold parde,
A white cote and a blew hode wered he
A *baggepipe* wel coude he blow and soune,
And therewithall be brought us out of toune.

Chaucer.

No banners but shirts, with some bad *bagpipes*,
Instead of drum and life.

Sidney.

Yea, or the drone of a Lincolnshire *bagpipe*.

Shakspeare.

Some that will evermore peep thro' their eyes,
And laugh like parrots, at a *bagpiper*.

Id.

This light inspires and plays upon,
The nose of saint-like *bagpipe* drone,
And speaks through hollow empty soul,
As through a trunk or whispering hole.

Hudibras.

BAGPIPE. The peculiarity of the bagpipe, and from which it takes its name, is, that the air which blows it, is collected into a leathern bag, from whence it is pressed out by the arm into the pipes. These pipes consist of a bass and

tenor, or rather treble; and are different according to the species of the pipe. The bass part is called the drone, and the tenor or treble part the chanter. Bagpipes are chiefly used in Scotland and Ireland. In all the species, the bass never varies from its uniform note, and therefore very deservedly gets the name of drone; and the compass of the chanter is likewise very limited. There is a considerable difference between the Highland and Lowland bagpipe of Scotland; the former being blown with the mouth, and the latter with a small pair of bellows; though this difference is not essential, every species of bagpipe being capable, by a proper construction of the reeds, of producing music either with the mouth or bellows.

The Highland BAGPIPE consists of a chanter and two short drones, which sound in unison with the lowest note of the chanter, except one. This is exceedingly loud, and almost deafening, if played in a room; and is therefore mostly used in the fields, for marches, &c. It requires a prodigious blast to sound it; so that those unaccustomed to it cannot imagine how Highland pipers can continue to play for hours together, as they are often known to do. For the same reason, those who use the instrument are obliged either to stand on their feet, or walk when they play. The instrument has but nine notes; its scale, however, has not yet been reduced to a regular standard, by comparing it with that of other instruments. Those who are best acquainted with it, affirm that it plays only the natural notes, without being capable of variation by flats or sharps.

The Irish BAGPIPE is the softest, and in some respects the most melodious of any, so that music books have been published with directions how to play on it. The chanter, like that of all the rest, has eight holes like the English flute, and is played on by opening and shutting the holes as occasion requires; the bass consists of two short drones, and a long one. The lowest note of the chanter is D on the German flute, being the open note on the counter string of a violin; the small drone (one of them commonly being stopped up) is tuned in unison with the note above this, and the large one to an octave below; so that great length is required in order to produce such a low note, on which account the drone has sometimes two or three turns. The instrument is tuned by lengthening or shortening the drone till it sounds the note desired.

The Scots Lowland BAGPIPE is also a very loud instrument, though less so than the former. It is blown with bellows, and has a bass like the Irish pipe. This species is different from all the rest, as it cannot play the natural notes, but has F and C sharp. The lowest note of a good bagpipe of this kind is in unison with C sharp on the tenor of a violin, tuned concert pitch; and as it has but nine notes, the highest is D in alt. From this peculiar construction, the Highland and Lowland bagpipes play two species of music essentially different from one another, as each of them also is from every other species of music in the world. This kind of bagpipe was formerly very much used in Scotland at weddings and other festivals; being extremely well

calculated for playing that peculiar species of Scots music called reels. But it has been often a matter of surprise how this was possible, as the instrument has only a compass of nine or ten notes at the utmost, which cannot be varied as in other instruments. In this respect, however, it has a very great compass, and will play an inconceivable variety of tunes. Its notes are naturally so high, there is scarce any one tune but what is transposed by it, so that what would be a flat note on the key proper for the violin, may be a sharp one on the bagpipe; and though the latter cannot play any flute note, it may in this manner play tunes which on other instruments would be flat.

The small BAGPIPE has the chanter not exceeding eight inches in length; for which reason the holes are so near each other, that it is with difficulty they can be closed. It has only eight notes, the lower end of the chanter being commonly stopped. The reason of this is to prevent the slurring of all the notes, which is unavoidable in the other species; this, by having the lower hole closed, and also by the peculiar way in which the notes are expressed, plays all its tunes in the way called by the Italians staccato, and cannot slur at all. It has no species of music peculiar to itself; and can play nothing which cannot be much better done upon other instruments; though it is surprising what volubility some performers on this instrument will display, and how much they will overcome the natural disadvantages of it. Some of this species, instead of having drones like the others, have their bass parts, consisting of a winding cavity in a kind of short case, and are tuned by opening them to a certain degree, by means of sliding covers; from which contrivance they are called shuttle-pipes.

The bagpipe appears to have been an instrument of great antiquity in Ireland, though it is uncertain whence they derived it. Mr. Pennant, by means of an antique found at Richborough, in Kent, has determined that the bagpipe was introduced at a very early period into Britain; whence it is probable that both the Irish and Danes might borrow the instrument from the Caledonians. But that writer observes, 'We must still go further, and deprive even that ancient race of the credit; and derive its origin from the mild climate of Italy, perhaps from Greece. There is now in Rome a most beautiful bas-relievo, a Grecian sculpture of the highest antiquity, of a bagpiper playing on his instrument, exactly like a modern Highlander. The Greeks had their *Ασκαλης*, or instrument, composed of a pipe and blown-up skin; the Romans in all probability borrowed it from them, and introduced it among their swains, who still use it under the names of piva and cornu-musa. That master of music, Nero, used one; and had not the empire been so suddenly deprived of that great artist, he would (as he graciously declared his intention) have treated the people with a concert, and, among other curious instruments, would have introduced the utricularius, or bagpipe. Nero perished; but the figure of the instrument is preserved on one of his coins, highly improved by that great master: it has the

bag and two of the vulgar pipes; but was blown with a bellows like an organ, and had on one side a row of nine unequal pipes, resembling the syrinx of the god Pan. The bagpipe, in the unimproved state, is also represented in an ancient sculpture; and appears to have had two long pipes or drones, and a single short pipe for the fingers. Tradition says, that the kind played on by the mouth was introduced by the Danes: as theirs was wind music, we will admit that they have made improvements, but more we cannot allow; they were skilled in the use of the trumpet; the Highlanders in the piobh, or bagpipe.'

Aristides Quintilianus informs us, that it prevailed in the Highlands in very early ages; and indeed the genius of the people seems to render the opinion highly probable. The attachment of that people to their music called pibrachs is almost incredible, and on some occasions is said to have produced effects little less marvellous than those ascribed to the ancient music. At the battle of Quebec, 1760, while the British troops were retreating in great disorder, the general complained to a field-officer in Frazer's regiment, of the bad behaviour of his corps. 'Sir (said he, with some warmth), you did very wrong in forbidding the pipers to play this morning: nothing encourages the Highlanders so much in the day of action. Nay, even now, they would be of use.'—'Let them blow like the devil, then (replies the general), if it will bring back the men.' The pipers were now ordered to play a favorite martial air; and the Highlanders, the moment they heard the music, returned and formed with alacrity in the rear. In the late war in India, Sir Eyre Coote, sensible of the attachment of the Highlanders to their favorite instrument, gave them £50 to buy a pair of bagpipes.

There was once a kind of college in the island of Sky, where the Highland bagpipe was taught; the teachers making use of pins stuck into the ground instead of musical notes. This, however, was for some time entirely dissolved, and the use of the Highland pipe became much less general than before. At last a society of gentlemen, thinking it perhaps impolitic to allow the ancient martial music of the country to decline, resolved to revive it by giving an annual prize to the best performers on the instrument. These competitions were held at Falkirk. The Lowland bagpipe was reformed, and the music improved by George Mackie, who is said to have attended the college of Sky seven years. He had before been the best performer on that instrument in that part of the country where he lived; but, while attending the college at Sky, adapted the graces of the Highland music to the Lowland pipe. Upon his return, he was heard with astonishment and admiration; but unluckily, was not able to commit his improvements to writing, and indeed the nature of the instrument scarcely admits of it.

BAGRE, in ichthyology, a small bearded fish, of the anguilliform kind, of which there are several species. It has no scales, but is covered over the whole body with a soft mucous skin of a silvery whiteness, and the beard, the head, and the fins are all of the same color; the eyes are

large, the mouth small, and without teeth. It is caught in the American seas, and is eaten; but if any body is wounded by its thorns, it gives great pain, and is difficult to cure. In the Linnean system it is classed as a species of silurus.

BAGRE DE RIO, a name by which some call the fish more frequently known by the name of nhamdia.

BAG-REEF, in maritime affairs, a fourth or lower reef, sometimes used in the royal navy.

BAGSHAW, a romantic little town in the High Peak of Derbyshire.

BAGSHOT, or BADSHOT, a small town in Surry, two miles and a half south-west from Staines, and twenty-six from London. This place is famous for its excellent mutton, brought hither from the Hampshire downs. It was formerly called Holy Hall, and our kings had anciently a house and park here. The church was rebuilt in 1676, having been destroyed by lightning. Bagshot-heath, which surrounds the town, is mostly uncultivated, but upon its borders are some handsome seats, and one is the residence of his royal highness the duke of Gloucester.

BAGUETTE, *n. s.* Fr. a term of architecture. A little round moulding, less than an astragal; sometimes carved and enriched.

BAGUETTE DEVINATOIRE, the divining-rod, generally regarded as a piece of philosophical quackery. It is nothing else than a forked piece of hazle, the two branches of which are often from fifteen to eighteen inches in length, and form an angle of thirty or forty degrees. They are held in the hands in a certain manner, so that the trunk or middle is turned towards the heavens. Some persons, it is said, are endowed with such a property, that if they hold this rod as above described, it tends by a violent effort to turn its trunk downwards, when in the proximity of a spring, or of precious metals concealed in the bowels of the earth, or stolen money, &c. Nay, some have even asserted that it has pointed out, in this manner, the traces of criminals, robbers, or assassins. (See Hutton's Translation of Montucla's Ozanam, vol. iv. p. 260.) A lady of rank, on reading his account of the divining-rod, wrote several letters to Dr. Hutton on the subject, describing the way in which she discovered that she possessed the faculty of finding water by such an instrument; and relating that she actually found water, by means of the hazle, in the duke of Manchester's park, at Kimbolton, Huntingdonshire, about thirty years ago. The same lady also exhibited successfully her method of discovering water, at Woolwich Common, to Dr. Hutton and his friends. See DIVINING ROD.

BAGYON, or BOEENDORF, a market town of Transylvania, in the county of Kolosch, not far from the Marosch, with churches of the Catholic, Reformed, and Unitarian creeds

BAHALATOHS, a small island in the eastern seas, near the east coast of Borneo. Long. 118° 21' E., lat. 5° 45' N.

BAHAMA, or LUCAYAS ISLANDS, the easternmost of the Antilles are situated in the Atlantic Ocean, to the south of Carolina, between 21° and 28° N. lat. and 71° and 81° W.

long. They extend along the coast of Florida down to the isle of Cuba; are said to be 300, or, according to others, 500 in number, some of them only mere rocks; but twelve or fourteen of them are large and fertile, and differing but little from the soil of Carolina. Proceeding from the southern to the northern extremity of the chain, the group may be thus enumerated:—

1. Turk's islands,
2. The Caucus, or Caicos,
3. The Heneagas,
4. Mayaguana,
5. Crooked island Group,
6. Long island,
7. Watlings,
8. The Exumas,
9. San Salvador,
10. Eleuthera, or Harbour Island,
11. Providence,
12. Andros,
13. Lucayo, or Abaco,
14. Bahama.

In addition to the islands included in this group, two extensive sand-banks, called the great and little Bahama banks, occupy a wide space of sea, the boundaries of which are indicated by a vast number of keys and islets. The population of the whole cluster is stated at 16,600. These islands were the first fruits of Columbus's discoveries, and the feelings with which they inspired that great commander are expressed in the name of San Salvador, which he gave to the island on which he landed. It was called Guanahani by the natives, and was first seen on the 11th of October, 1492, being the earliest authenticated discovery of the western hemisphere. These islands are said to have been at this time inhabited by a peaceable race of Indians, whom the Spaniards transported to work in the mines of St. Domingo. They were not known to the English till 1667, when captain Seyle, being driven among them in his passage to Carolina, first gave his own name to one of them; but being a second time driven upon it, he gave it the name of Providence. The English government observing the advantageous situation of these islands, as a check on the French and Spaniards, attempted to settle in them in the reign of Charles II.; but they were little more than harbours for the buccaneers, until, in 1718, captain Woodes Rogers was sent out with a fleet to dislodge the pirates and make a settlement. A fort was now erected and an independent company stationed on the island. Ever since these islands have been slowly improving. In 1781 they were surrendered to the Spaniards, but restored to the British by treaty at the end of the war. At this period, also, many of the British loyalists and planters repaired to the Bahamas, chiefly from the southern states of North America; from which period the principal islands have been regularly settled. In 1773 the number of whites was 2052, and the blacks about 2241. Previously to May 1803 lands were granted by the crown, in the whole of the Bahamas, to the amount of 265,381 acres, for the purpose of cultivation. At that time the population amounted to about 14,318, including 11,395 blacks and people of color, and it appears, by a return to the House

of Commons in 1805, that the number of slaves imported for two years previously to the year 1803 amounted to 2523, of whom 2230 were exported, leaving only 293 for the use of the colony. The physical characteristics of the whole of this group are very similar: the surface of the whole is flat, the soil fertile, and the climate serene, but they are all thinly inhabited, and by persons who subsist chiefly by supplying necessities to the crews of vessels driven on the coast. The thermometer generally varies from 80° to 90° during summer, and from 60° to 65° in winter; but the southern isles experience the influence of the trade-winds through the greater part of the year. The soil in a few places is rich: the chief cultivated product is cotton, besides which they yield mahogany and some kinds of dye woods, salt, turtle, and several species of fish. Cattle and sheep also thrive well, and great numbers of birds are met with, generally of the same kinds as those of the West India islands.

New Providence, being the seat of government, absorbs nearly the whole trade of the group, which is chiefly with England, the West Indies, and North America. Nassau is the principal town, and the seat of government for all the islands. This is founded upon that of the mother country, and resembles those of her other colonies in preserving the legislative, executive, and judicial powers distinct: the governor is the representative of the crown; and in him the executive power is vested. He is commander-in-chief of the military, convenes and prorogues the national assembly, and has power to annul their proceedings, subject to a reference to the king in council. By his judicial character he presides in all the courts. The council consists of twelve persons, appointed by the king, who form the upper house of the legislature, and participate with the governor in his judicial authority. The house of assembly consists of twenty-six members, who are elected by the respective districts. See Edwards's History of the West Indies; and M'Kimm's Account of the Bahama islands.

BAHAMA, GREAT, ISLAND OF, one of the Bahama's, sixty-three miles long and about nine broad, situated on the south side of the Little Bahama bank, and extending from the Florida stream almost to the island of Abaco. The soil is fertile, the air serene, and the island well watered. It formerly produced guaiacum, sarsaparilla, and red wood; all which the Spaniards are said to have destroyed. This island is fifty-seven miles from the coast of east Florida. Long. 78° 10' to 80° 24' W., lat. 26° 40' to 27° 5' N.

BAHAMA CHANNEL, the narrow sea between the coast of America and the Bahama islands, about forty-five leagues in length, and sixteen in breadth. It is sometimes called the Gulf of Florida. Here the current flows with that rapidity which renders the passage extremely dangerous, except under favorable circumstances.

BAHAMA BANK, GREAT, a sand-bank, extending nearly from the island of Cuba to the shores of the Bahama group. It commences about 22° 20', and stretches to 26° 15' of north latitude. A smaller bank of the same kind and name occupies a considerable space on the north of the island of Bahama.

B A H A R.

BAHAR, from the Sanscrit Vihar, a Buddhist monastery, a large and populous province of Hindostan, formerly called Magadha, and once an independent kingdom. It lies between the twenty-second and twenty-seventh degrees of north latitude, is separated from the Nepaul dominions by an extensive range of hills, rising upon the northern frontier. On the east it has the province of Bengal, on the south the ancient Hindoo province of Gundwana, and on the west a part of the latter, Allahabad and Oude. It was anciently separated from the Benares territories by the river Caramnassa. This province at present is one of the most fertile and highly cultivated territories of Hindostan. Its included area of arable ground is computed at 26,000 square miles, and separated north and south into two equal divisions by the river Ganges, which flows from west to east in a course of 200 miles.

The northern division stretches a distance of seventy miles from the forests of Nepaul and Moring to the borders of the above river. It is separated on the east from Purneah in Bengal by the Cōsa or Cōsi, and on the west from Goracpoor in Oude, by the Gunduck, and a crooked line between that river and the Dewah, or Goggrah. The whole included area is one unbroken plain, and was subdivided by the emperor Acber into four districts, namely, Hajypoor, Tirhoot, Sarun, and Chumparin, or Bettiah including four pergunnahs from Monghyr.

The central division extends from the Ganges south as far as the Vinlhyachil range of hills, a distance of sixty miles. It is separated from Bengal on the east by a branch of the above southern hills, extending to the Louinghury pass, on the confines of Rajemal; from Chunar, in Allahabad on the west, by the river Caramnassa. The district Bahar, which lies in the centre of this division, occupies one half of the inclusive level area; the plains of Monghyr one sixth more, and the rest is mountainous. The district of Rotas lies to the south-west, chiefly between the rivers Soane and Caramnassa, and that of Shahal stretches along the southern side of the Ganges. This central division is usually considered the most important and fertile of the whole province, abounding in opium, and yielding nearly two thirds of the whole produce.

Independent of the above divisions there is a starling hilly country of 8000 square miles, which is almost barren, and still further to the south, a mild elevated region of barren rugged rock, to the extent of 18,000 square miles. This country, namely, including the modern subdivisions of Gonda, Nagpoor, Ramghur, and Palamow, is separated on the west by the Soubah of Allahabad, and to the south by Orissa, and on the east by Bengal. Amongst geographers it is termed the Terges Bellads or Gantons, and is sometimes considered under the appellation of Koserah, but is more properly called A.N. from the supposed south of its ancient names.

The extent of this province may easily be perceived from the following table in square miles:—

Assessed lands of eight districts	26,287
Hilly territories in Rhotas, Monghyr, &c.	7,133
Content of lands belonging to Palamow, Ramgheir and Nagpoor.	18,553
Total content of the province.	51,973

The following extract from the celebrated institutes of Acber, compiled by Abul Fazel, A. D. 1582, may not be unacceptable to the geographical reader.

‘The length of Bahar from Gurher to Rotas, is 120 coss, and the breadth from Terhoot to the northern mountains includes 110 coss. It is bounded on the east by Bengal, has Allahabad, and Oude to the west; and on the north and south are large mountains. The principal rivers of this Soubah are the Ganges and the Soane. The river Gunduck comes from the north, and empties itself into the Ganges near Hadjypoor. The summer months are here very hot, but the winter is temperate. The rains continue for six months. In the district of Monghyr is raised a stone wall extending from the Ganges to the mountains, and this wall is considered to be the boundary between Bengal and Bahar. The Soubah contains seven districts, viz. Bahar, Monghyr, Chumparum, Hajypoor, Sarun, Tirhoot, and Rotas. These are subdivided into 199 pergunnahs. The gross amount of the revenue is 55,47,985 sicca rupees. It furnishes 11,415 cavalry, 449,350 infantry, and 100 boats.’

The natural features of Bahar are by no means uninteresting. It possesses all the advantages of a rich soil, a temperate climate, and a central geographical situation, shaded by mountains and watered by rivers and small streams. Of these the Ganges, the Soane, the Gunduck, the Dum-moodah, Caramnassa, and the Dewah are the most remarkable.

In Bahar and the contiguous districts a parching wind from the westward prevails during a portion of the hot season, and blows with great strength during the day, but at night it is succeeded by a cool breeze in the opposite direction. Both occasionally cease for days, and even weeks together, giving way to easterly gales; and during the cold season a blighting frost frequently occurs in both the provinces of Bahar and Benares.

Agriculture, manufactures, and commerce have always flourished in this province, owing perhaps in a great measure to its natural advantages. The chief productions are opium, saltpetre, grain, sugar, betel-leaf, indigo, oils, essences, &c. together with fine timber for boat-building. Cotton cloths, for exportation, are manufactured all over the districts, and the hills are supposed to contain coal, sulphur, iron and other metals. The numerous productions of Bahar, together with its

internal, means of communication serving as a thoroughfare for the commerce of Bengal and foreign maritime countries with the province of Hindostan, raised this territory into a state of prosperity, soon after the Patan conquest, and this continued under the Mogul dynasty. Opium may be considered as the staple commodity of the province, although saltpetre is a great article of exportation. The latter is produced in considerable quantities, in the districts of Hajypoor and Sarun, where it is manufactured for exportation. The production of this article is always greatest during the prevalence of the hot winds, which are perhaps essential to its formation. These winds did not formerly extend their influence beyond the eastern confines of Bahar; but by the change of seasons which have been remarked within the last thirty years, they have reached to Bengal Proper, where it is now said saltpetre might be manufactured with nearly the same success as in Bahar. The opium that is produced in this and the neighbouring provinces is monopolized by government, and sold in Calcutta by public sale. The common produce is eight pound of opium for every beegah, which measures about one-third, of an acre, besides which the cultivator reaps about fourteen pounds of seed. The preparation of the raw opium is under the immediate superintendance of the company's agent, and is as follows: The watery particles are first evaporated by the sun, and replaced by oil of poppy-seed to prevent the drying of the resin; after which the opium is formed into cakes, covered with the petals of the poppy, and when sufficiently dried is packed up in chests with the fragments of the capsules, from which the poppy-seeds have been thrashed out. The opium is frequently adulterated by intermixing an extract obtained from the stalk and leaves of the poppy, and sometimes the gum of the mimosa; but the adulteration is difficult of discovery.

Bahar was, in common with the greater part of Hindostan, anciently supplied with salt from the lake of Sambher, in the province of Ajmeer; but its supplies of that article are now brought from Bengal and Coromandel, and imported under the protection of government.

Although an intimate connexion has always existed between this province and Bengal, and their histories have been blended, there are, in the nature of landed property, several important distinctions; of which the following are worthy of notice. In Bengal the zemindaries are very extensive, but in Bahar they are comparatively small; hence the Bengalese zemindars assume a degree of power and influence which those of Bahar are not able to maintain. Those of the latter also from their comparative distance having been placed under a provincial administration, have been precluded from that information which the zemindars of Bengal have derived from their access to the offices of government. Though the lands of Bahar have been let to farm, from time immemorial, yet no general settlement had been concluded between government and the proprietors of the soil from the acquisition of the Dewanny until the final and perpetual assessment in 1792; from which circumstance the cultivator

was placed under great disadvantages. There are, at present, few instances of jaghires in Bengal; but in Bahar they are common. The custom of dividing the produce of the land in certain proportions between the cultivator and the government was almost universal in Bahar, but in Bengal it was very partial and limited; so that compared with those of the latter province, the land-proprietors of Bahar, generally speaking, were in a degraded condition. There are now in this province three principal zemindars, viz. the rajahs of Tirhoot, Shahabad, and Sunnote Tekaroy; and it has been observed, that the permanent fixing of the revenue system, which was supposed to be fraught with so much mischief, has not been found so injurious in practice as it appeared in theory: the actual cultivators of the earth being now in a much better condition than they were before the adoption of that measure.

It appears from the geographical chapters of the Puranas, the only documents of their ancient geography which the Hindoos possess, that Bahar was originally the seat of two independent sovereignties, viz. that of Magadha or south Bahar, and that of Mithila (Tirhoot) or north Bahar. Different dialects were anciently used, and even now prevail, in those countries; namely, that of Mithila, or Tirhoot, which both in the terms and form of its character has considerable affinity to the Bengalé; and that of Magadha, in which the resemblance to that language is still more characteristic and striking.

Of the general population of the province, at least one-fourth are Mahomedans; Bahar having been conquered by that people at an early period, and afterwards retained in subjection; so that the Brahmins have acquired an unusual degree of influence. Gaya, the birth-place of the great prophet and legislator Buddha, is a place of pilgrimage, and the central resort of sectaries of that persuasion; but among the resident inhabitants few Buddhists are to be found, owing to the intolerance and cruelty of the Brahmins, together with the Mahomedans' mode of propagating and confirming their faith.

The chief towns are Patna, Monghyr, Buxa, Rotas, Gayah, Dinapoor, and Boglipoor. The revenue is considerable, amounting in 1815 to 6,701,538 rupees, or nearly £837,944 sterling. The inhabitants visibly improve, and appear to be of a different race from the Bengalese, whom they excel both in strength and stature.

The province of Bahar is at present divided into the following districts; which, with their natural features and local peculiarities, we shall subjoin for the satisfaction of the reader.

1. **BOGLIPOOR**, south-east of Bahar, and comprehending a part of the Mogul province of Bengal, is bounded on the north by Tirhoot and Púrínijah, on the east by the latter and Mursheed-ábád; on the south by Birb'hum and Rámgaith, and on the west by that district and Bahar. It extends 133 miles one way, and eighty the other, forming a total area of about 8225 square miles, and, according to Ayeen Akberry, ii. 25. 197 was known anciently by the name of the sercar of Mongér. The hills are imperfectly cultivated. The winds shift twice a year, blowing almost

invariably from east to west, between the months of June and February; after which they change from west to east. The heats are frequently oppressive, and the cold season comparatively mild. The soil is in many places rich, and fit for agriculture; but in others, rocky and barren. Hot springs are frequently found in this district; in some of which, particularly at B'hinebaud, the thermometer rises to 144° Fahrenheit. The general character of the population is respectable, but the mountaineers are wild and uncivilised: some of them have been lately brought, under the guidance of the Brahmins, who teach them, to worship Durgà before a bil-tree.

The most remarkable places in the district are as follow: B'hágal-púr, the capital, situated in lat. 25° 13' N., long. 86° 58' E.; 110 miles north-west of Murshid-ábád. It is a mean-looking town, in the midst of a beautiful country; and contains a population of more than 30,000 inhabitants, chiefly Mahomedans. Champánager, in lat. 25° 14' N., long. 65° 55' E., three miles west of B'hágal-púr, contains, together with Laeshmí-gani, a population of 9000. A Mahomedan saint, nine cubits high, is said to have been buried here, whose tomb is still a place of pilgrimage. Ghidd'hór, or Ghiddhore, lat. 24° 52' N., long. 86° 10' S. S. W. of Mongér, is remarkable for the ruins of a castle, said to have been built by the Afghán Shir Sháh, A. D. 1544; the massive walls of which are still remaining.

Mongér, Monghyr. (Mudga or Mucti-giri), in lat. 25° 23' N. long. 86° 26' W., on the south bank of the Ganges. Its fort, surrounded by a deep ditch, has been a place of note from remote antiquity. The town is formed by the assemblage of sixteen distinct hamlets, provided with only two regular streets, which lie near the eastern and southern gates of the fort. The population is about 30,000. Its most remarkable curiosity, the shrine of Pér Sháh Kosein Lohauni, is most venerated, both by Mussulmans and Hindus. About five miles distant from the above town is the celebrated hot spring called Sitá-cand, or the pool of Sita; in oriental mythology, the wife of Ráma the Indian Baccchus. The waters are received into a brick cistern, about eighteen feet square, from which air-bubbles are constantly emitted, although the nature of the gas has not been ascertained. The heat of this spring is different at different times, varying from 92° to 132° of Fahrenheit's thermometer.

Muti jharna, or Mootyjharna (the pearl dropping stream) lies about eight miles inland from the Ganges; is a remarkable cascade, formed by two fine waterfalls, together measuring 105 feet perpendicular. The waters sweeping over the summit of the rocks, and falling from that lofty altitude, are received into a basin below, which has been conjectured, not upon slight grounds, to be the original crater of an extinct volcano. A view of this magnificent cascade is given in Hodge's Travels in India. Cobl-gáng, (spelt ganá, and pronounced gánúg), a small town, in lat. 25° 14' N., long. 87° 15' E., on a peaked hill, ten common cós south-east of Bogh-poor. Telh'agar hill, or Telhaghurry, is a small town twenty-three miles north-west of Rájá-mudá; lat. 25° 15' N., long. 87° 37' E. It is

remarkable for an old castle, built by the Sultan Shujáá, in the seventeenth century. The Vind'hya hills here, come down close to the river, and form the line of boundary between the provinces of Bahar and Bengal, in the Mogul division.

2. BAHAR is a large district lying in the centre, the boundaries of which are ill defined, but generally traced to the Ganges, on the north, to Ramgur and Monghyr on the south, to the latter, with the river Soane on the east, and the district of Rotas on the west; including a territory of 6680 square miles. The level land is highly cultivated, but interspersed with naked and barren hills, which are entirely isolated. Some of these rise in clusters, exhibiting a rugged irregular appearance, of which the most remarkable are, the Beráber pahár, west of the Phalgú; the Rájá-gríha, or Ráj-mahal, hills on its eastern side; and a long narrow range contiguous to Shaikh púrah. The southern hills form a part of the Vind'hyan chain, continued with little or no interruption for a great extent, and, in the opinion of some, even to Cape Comorin. These hills no where approach the river, and the country, though generally lofty, exhibits the immense stretch of one continued plain. The winds commonly blow east and west, shifting twice in the year. The soil is highly fertile, and the climate warm; producing not only the comforts, but even luxuries of life. The rivers and streams which water the country are numerous. The Ganges rolls along its magnificent stream to the width of an English mile. The Sonar, almost equal in the width of its channel, is navigable in the rainy season, and is celebrated for its handsome pebbles and fine fish. The Phalgú, held in religious veneration by the Hindus, is tremendously deep and rapid, and is formed by the union of two immense torrents above the city Gayá, where it spreads to the breadth of 500 yards. The Punpun, Muraba, Dard'ha, Sacri, and Panchane, are all rivers of considerable importance. The population of this district is overflowing. In 1811 it amounted to 2,755,150 souls, and the increase has been almost incredible. The revenue in 1814 was equal to 1,748,006 rupees, or £218,500 sterling. In point of religion, Mahomedanism is widely extended, although idolatry is the most prevalent. There are six great Hindoo shrines, visited by pilgrims, and two belonging to the Jain in the division of Nawada.

The principal towns of this district are, Patná, (in Sanserit, Padmarati, the lotus-bearing) the capital of the province of Bahar, in lat. 25° 37' N. long. 85° 15' E., on the south side of the Ganges, which is here five miles wide in the rainy season. Including the suburbs, it covers an area of twenty square miles, and contains 312,000 population. The public buildings are paltry, the fortifications are in ruins; and even the handsomest mosque is now let as a warehouse. Patná is a place of considerable trade. It has a court of appeal and circuit; a judge and magistrate; collector, commercial-resident, and opium agent; is garrisoned by a provincial battalion, but has few European houses or inhabitants. Patná lies 400 miles from Calcutta, by Murshed-ábád.

Daná-púr, in lat. 25° 37' N. long. 85° 5' E., ten

miles west of Patnà, is one of the principal stations of the European troops, and, accordingly, has magnificent barracks, good roads, elegant villas, and is, in short, compared with Patnà, a perfect paradise. Its population is between 20,000 and 30,000.

Gayà, in lat. 24° 49' N., long. 85° E., is the capital of the district of Bahar, and consists of 1. Gayà Proper, the residence of the Brahmins; and 2. Sabibganj, the residence of the remaining inhabitants, both containing a population of nearly 40,000. This place is celebrated by the Buddhists as the birth-place of their great legislator, and by the Hindoos as the scene of one of Vishnu's victories over an unmanageable asur or giant. Pilgrims without number crowd from all parts, and their amount is rapidly increasing; since from 31,000 who visited it in 1811, 200,000 at present are said to arrive annually. These pious visitants are taxed by the British government according to the number of holy places they visit. The utmost sum is 14½ rupees, or £1 12s. sterling. We have only to add, that the crimes arising from so great an influx of strangers, too evidently shows the deplorable tendency of the Hindoo superstition. The ruins of Budd'hà-gayà, and the number of images scattered round them for fifteen or twenty miles, are astonishing, and render it probable that this was once the centre of Budd'hism, and the residence of some powerful monarch professing that faith.

3. The third district of the province, viz. Tirhoot, or Tìrhút, is on the north-west of the province, bounded on the south by the Ganges, on the west by Saren, or Sarun district, on the north by the Saptari woods of Népal, and on the east by Purnéyah in Bengal. The district is high, healthy, and well-watered, producing, besides the commodities above-mentioned, turmeric, ginger, and several other valuable articles. Its chief rivers are the Gaud'achi, B'hagmati, and Gagari. The whole area in 1784, before the alteration, was upwards of 5000 square miles; the revenue, as late as 1814, amounted to 1,274,717 rupees, or £159,339 sterling; and the population in 1801 was 2,000,000. It was anciently a part of the province, or rather kingdom, of Mit'hilá, which comprehended the greater part of the three districts, Tìrhút, Púrínigá, Sàren, together with part of the Nepalese territory; and was bounded by the Gandac, Cósá, and Ganges, together with the mountains of Nepal on the north. It was subdued by the Moguls in the fourteenth century, and became part of the British empire in 1765. This district has been recently selected by government for improving the breed of horses, the soil and climate appearing favorable to that purpose; accordingly many of the first quality are reared in the Zilát, or division of Hájì-púr.

The most remarkable mountain feature is the towering peak of D'hólá-giri in the Himaláya chain, near which the Gaud'achi, or Sálagrámi river, supposed to be the Condochates of Arrian, takes its rise in lat. 29° 30' N., and long. 83° 45' E., or nearly. The summit of this mountain was calculated by Mr. Colebroke to reach nearly 27,000 feet above the level of the sea. *As. Res.* xii 276. In its bed are found schistose stones,

or salgráms, containing remains of the cornu ammonis, which are thence dispersed, are objects of adoration all over India. From which circumstance the mountain is called Sálgrámi in Népal. The spiral lines are supposed to be traces of Vishnu, and some of these stones sell for 2000 rupees, or £225. sterling.

Within the limits of Tìrhút, or Tirhoot, is the town Hájypoor, or Hájì-púr, with a district of the same name, including an area of 2782 square miles, whence the company obtain most of their saltpetre. The town lies nearly opposite Patnà, at the confluence of the Ganges and Gaud'achi rivers, in lat. 25° 41' N., and long. 85° 21' E. It is celebrated for its horse-fair, held every November, to which, in 1807, no fewer than 6000 horses were brought, two of which sold for 4000 rupees, or £450 each. Durb'haugá, in lat. 26° 9' N., long. 86° 20' E., was a considerable place in the time of Acbar; and near Sing'híá, east of the Gaud'achi, lat. 25° 52' N., long. 85° 15', are some very curious ruins.

4. The fourth district is SAREN (the Asylum), comprehending Bettá or Champáran, formerly a separate district, and is bounded on the north by Macwan-púr and Gónac'h-pur, on the south by the Ganges, on the west by the Dówa or G'hara river, and on the east by Tìrhoot, including, in 1784, an area of 5106 square miles. The whole of Saren suffered extremely from the famine in 1770, by which nearly half the inhabitants perished; but is in general a well cultivated and highly fertile country, and greatly improved since the decennial settlement by Lord Cornwallis. There are only two Mahomedan zemindars in the whole district, and the revenue, in 1814, was 1,233,385 rupees, or £138,756. The population is considerable, amounting, in 1801, to 1,200,000, of whom one tenth were Mahomedans.

Teryáni, or Turyáui (the country of boats) lies at the foot of the northern hills and the lower lands, where the rivers become navigable. The base of the mountains is covered with wood, and the intervening lands between it and the cultivated districts are covered with grass, intersected by streams and rivers, which in the rainy season are navigable. The confined air, stagnant water, and putrid vegetable matter, in this district render the climate unwholesome in the wet months, especially in the low-lands. The forests are inhabited by elephants, bears, tigers, rhinoceroses, wild boars, jackals, foxes, hares, and hog-deer. The palás (erythrina monosperma) and simul (bombax heptaphyllum) are found on the Nepalese confines. Of this district Cháprah is the capital, lying in lat. 25° 46' N., long. 84° 46' E., and extending nearly a mile along the northern bank of the Ganges. The population of this town, in 1817, amounted to 43,700, and is now greatly increased. The Patnà bearers of Calcutta, or the original C'harwa tribe, are settled near the borders of this town, although they emigrated originally from Chóta Nag-púr, lying in the southern part of the province.

5. SHAH-ABAD (the royal residence), is an extremely fertile and populous district, bounded on the north by the Ganges, on the east and south by the Són, and on the west by Chunàr,

in the province of Allah-ábád; and including, in 1784, an area of 1869 square miles, since which it has been materially augmented. The population is about 2,000,000, and the revenue, in 1814, amounted to 1,177,462 rupees, or £132,465 sterling.

Arrah, the capital of this district, lat. $25^{\circ} 35'$ S., and long. $84^{\circ} 40'$, is extensive and populous. Bâgsar, or Bacsar, south of the Ganges, in lat. $25^{\circ} 35'$ N., long. $83^{\circ} 57'$ E., is the place of the celebrated engagement in 1764, when Sir Hector Munro, with 6215 Sipákis and 856 Europeans, defeated the combined armies of Shujá'ud daulah and Kásim Ali Khán, amounting to 40,000 men. Here also is a police station, at which all travellers are obliged to exhibit their passports. Sasram, Sesarúng, Sahasram, or Sahasráung, lying in lat. $24^{\circ} 58'$ N., long. $83^{\circ} 58'$ E., is celebrated for the splendid mausoleum of Shir Khán the Afghán, built in the midst of a great reservoir or tank, upwards of a mile in circumference. Rohtas is the chief town of the westerly pargah of this district, bounded by the Caramnása, which joins the Ganges at Bacsar, and contained, in 1784, as many as 3680 square miles. The fortress Rohtás gar'h, on the level summit of a mountain, in lat. $24^{\circ} 38'$ N. and long. $83^{\circ} 50'$ E., was thought impregnable till taken from Rájáh Chintáman in 1542, by Shir Sháh, the celebrated Afghán. After this it was again surprised, and in 1764, when Kásim Ali evacuated the province, came into possession of the English.

6. RAM-G'HAR (the house of Rama), the sixth division of the province, is a hilly and mountainous district in the south, bounded on the north by Bahár proper, on the east by Bardáhwán and Bhául-pur, on the west by Bilaunja, Seraunja and Jeshpúr, and by that district, Gang-and Sing'h-bhúm on the south. A great part of this district belonged to the ancient province of Góndwána; but now, in addition to its own peculiar territory, it comprehends Palamò, Pa-

chét, and Chûta Nág-púr. The population has been estimated at half a million, who, though improving, are at present uncivilised. The woods, wild beasts, and savage inhabitants, render this district a perilous residence; whilst superstition, rapine, and murder, are to be seen in all directions. The extent of the Rám-g'har territories in 1784 was 21,732 square miles, of which two-thirds was waste land. Iron is found in many of the hills. The Máhwap tree, or *Bassia longifolia*, grows abundantly among the rocks, and furnishes a farinaceous pulp which is a substitute for bread, and a nutritious infusion which is used as tea. The chief rivers are Barácar and Damódar; and the largest towns are Macaud-gauj, Chitra, and Rámgar'h. Rámgar'h, on the Damódar, is now a second-rate town, in lat. $23^{\circ} 39'$ N., long. $95^{\circ} 43'$ E. Palamò, or Palamau, the residence of a powerful rajah, is a hilly and woody territory on the Mahratta frontier. Berwa, in lat. $53^{\circ} 20'$ N., long. $84^{\circ} 46'$ E., lies contiguous to Nazári Bágh, the head quarters of the corps stationed in Rámgar'h. Pachét, a zemindári of uncivilised population, contains 2779 square miles. The town is in lat. $23^{\circ} 36'$ N., and long. $86^{\circ} 50'$ E. Ch'hóta Nág-púr is a high, woody, and unhealthy zemindári, at the southern extremity of this province, bordered on three sides by Góndwána, and never completely subdued by the Mahomedans. The Chatauri, Cieri, and D'hangar tribes, have never embraced the religion of the Brahmins; but have a religion and language of their own. The productions are similar to those found in the other parts of the district. Iron is commonly met with, but is not manufactured, because that metal can be procured at a smaller expense from the European markets.

For a further illustration of the general features and economy of this province we refer the reader to Hamilton's Hindostan; Asiatic Researches; Bernouilli's Hindostan, i. and ii.; Rennell's Memoir; Ayeen Akberry, &c.

BAHAR, a town in the province of Bahar, district of Bahar, 35 miles S. E. from Patna. Lat. $25^{\circ} 13'$ N., long. $85^{\circ} 37'$ E.

BAHAR, or BARRI, in commerce, weights used in several places in the East Indies. They have been distinguished as the great bahar, with which they weigh pepper, cloves, nutmegs, ginger, &c. and the little bahar, with which they weigh quicksilver, vermilion, ivory, silk, &c. But this weight varies much in different parts of the East. The bahar of Acheen, in Sumatra, consists of 100 rattes, and is equal to 490lbs. avoirdupois. The bahar of Bellefackee, in Arabia, consisting of forty fards, is = 815½lbs. avoirdupois. The bahar of Bencoolen = 560 lbs. avoirdupois. The bahar of Junkseylon of eight capus = 133lbs. 5oz. 5½dr. The bahar of Mokaer, of three peculs = 105lbs. avoirdupois. The bahar of Mecha, of fifteen franks = 445lbs. avoirdupois.

BAHAREN, or BAHREIN, a cluster of islands in the Persian Gulf, chiefly remarkable for the pearl fishery of the neighbourhood. They

have often changed masters. With Ormus they came under the dominion of the Portuguese, were again restored to Persia by Thomas Khoulí Khan; and after his death, the confusion into which his empire was thrown, gave an opportunity to an enterprising and ambitious Arab of taking possession of them. But he was soon compelled to relinquish them once more to the Persians; who have lately been, in their turn, driven from them by the rising sect of the Wahabees. Baharen, or Awal the principal island, was famous for its pearl fishery even when pearls were found at Ormus, Kareke, Kasly, and other places in the Persian Gulf: but became of much greater consequence when the other banks were exhausted. It lies about fifteen miles from the coast, and ninety W. N. W. of Bushire; and is covered with villages and date gardens. The capital, Medina, containing 800 or 900 houses, and a strong fort, which was some time ago garrisoned by 300 Persians. The town is destitute of water; but here is a harbour which will admit vessels of 200 tons burden, and a strong castle.

It lies about three miles from the coast. The Persians are said to resort hither habitually for the study of Arabic, under the Shuats, the disciples of Ali. Another of these islands is Arad, divided by an isthmus into two parts, the principal of which is called Samoki, and has a small town, Mahared. A third island, sometimes noticed in the Eastern maps, is Gutter Sahari, called by the English, Meritan Rock. The earliest time of fishing is in April, and the latest in October. The pearls taken at Baharen, though not so white as those of Ceylon or Japan, are much larger than those of the former place, and more regularly shaped than those of the latter. They have a yellowish color; but have also this good quality, that they preserve their golden hue, whereas the whiter kind lose much of their lustre by keeping, especially in hot countries. Those of deeper color are generally bought by the Mahrattas, and the paler are transported through Bassora and Bagdad all over Asia. It is said to be on the whole the richest and most productive pearl fishery in the world; and to average a profit to the individuals who farm it of £100,000 per annum. The oyster banks, lying fifteen or twenty feet below the surface, stretch from about 25° to 26° 40' N. lat., and the shells from two to ten inches in diameter, are considered valuable, as well as the pearls. It is a practice with those who are employed in opening the shells, to put the finer pearls into their mouths, believing that this adds to their brilliancy; and the fishermen always anticipate success after copious rains. Latterly the produce of the fishery has in some measure declined, in consequence of the English markets for the Ceylon fishery being transferred to the straits of Manaar; and the pearls are chiefly sent to Surat.

BAHARY, a town of Sennaar, fifteen miles south-east of that place.

BAHAS, a town of Arabia, in the kingdom of Yemen, near the Red Sea, sixteen miles N.N.W. of Lohcia. Lat. 15° 59' N.

BAH-ATRICALLY, a town of Cochin, with a pagoda, twenty-three miles S. S. E. of Cochin.

BAIBETT, **BALBEIT**, or **BHABEIT**, a ruined place in the Delta of Egypt, where there are the remains of a magnificent marble temple. Pococke supposes it to have been a temple of Isis; but this is disputed by D'Anville and Savary. The figures on the basso relievo are beautiful, but ill drawn. Pococke supposes Bahbeit to be the ancient Busiris. Seven miles S. S. W. of Mansora.

BAHBELGONGE, a town of Hindostan, in the country of Baglana, situated on the river Godavery, sixty miles east of Nassuck, sixty-five west of Aurangabad. Long. 74° 52' E., lat. 19° 43' N.

BAHREIN, or **AR'DU'L BAHREIN** (the Land of the two Seas), is the name of a province of Arabia, between Omàn and Basrah. It is called also Hajar and Lahsà, or El-Ahsà. This district is bounded by the Arabian desert to the north; by Nejed on the west; by the sea on the east; and by Omàn on the south. It appears to be in a flourishing condition; and is governed by the Arabs of the tribe of Beni Khá-

lid. The principal towns are on the coast, viz. 1. Lahsà, or Hajar, the residence of the sheik, or head of the tribe. 2. Katif, a sea-port, about twenty miles from the islands of Al Bahreïn. It is inhabited by people employed in the pearl-fishery. 3. Coweit, or Korein (Græn), sixty or seventy miles from Zobeirch, Old Basrah. It is populous, and maintained, like other places on this coast, by the pearl-fishery.

BAHIA DE TODOS LOS SANTOS, a province and captainship of Brasil, extending to a considerable distance along the coast; being bounded on the north by the St. Francisco, which runs into the sea in lat. 11° S., and on the south by the province of Minas Geraes, including the district of Ilheos, forming a separate province. The climate is always warm, but is refreshed by the sea-breeze. The soil is peculiar, and those parts between the mountains and the sea are esteemed the best in Brasil for the growth of the sugar-cane. It is also well adapted for tobacco and cotton. Coffee is grown in great quantities, but the quality is inferior.

BAHIA, or **ST. SALVADOR**, the capital of the above province, is populous and opulent; and the second city in Brasil. It is strong by nature and well fortified; and was, for two centuries, the residence of the governor-general of Brasil. It is still an archiepiscopal city; and, including its suburbs, is about four miles long. The upper town is situated upon an eminence, and the lower, which consists principally of a single street, parallel to the beach, at its western base. Here is the chief seat of its commerce, a dock-yard, and a marine arsenal. The streets of the upper town are so steep that carriages can rarely be used. The churches, chapels, and convents, of Bahia are splendid structures; and with the archbishop's palace, the mint, and the governor's residence, are the first and most conspicuous objects that meet the eye of a stranger. The grand church, formerly belonging to the jesuits, is by far the most superb structure in this city. It is entirely composed of European marble, imported at an immense expense. The wood-work of the altar is inlaid with tortoise-shell, and covered with paintings, gilding, and a profusion of ornaments. The chief commerce of Bahia is in linen, and other kinds of cloth, hats, silk and thread, stockings, grain, rice, flour, biscuit, wine, oil, slaves, butter, cheese, bacon, and household furniture; for which gold, sugar, tobacco, skins, hides, Brasil wood, balsam, and several kinds of drugs, are exported. The population, including the suburbs, has been lately estimated at 100,000, about 30,000 of whom are whites, and the rest mulattoes and negroes. It stands in 12° 59' S. lat., and longitude 37° 23' W.

BAHIA, a province of the island of Luzon, one of the Philippine islands, so called from a lake in the neighbourhood, which is said to be ninety miles in circumference.

BAHIA DE CHETUMEL, or **Hanover Bay**, a bay on the east coast of the peninsula of Yutuacan, in the bay of Honduras.

BAHIA, **HONDA**, a large, well sheltered harbour of the island of Cuba, on the north side, which has fifteen and ten fathoms of water in the bay, eight at the entrance into the harbour, and

anchorage in four and five fathoms. Long. 83° 6' W., lat. 22° 58' N.

BAHE, or **BAUER**, an island on the coast of Arabia, in the Red Sea. Also a small town opposite to it on the shore.

BAHOUDA, an extensive desert district to the north of Sennaar, between that country and Dongola.

BAHIR, a Hebrew term, signifying famous or illustrious, but particularly applied to a book of the Jews, the most ancient of the Rabbinical works, and which treats of the profound mysteries of the Cabbala.

BAHIRA, **BAHRI**, or **RIF**, or the maritime province, a name given by the Arabian geographers to the Delta of Egypt, and the districts immediately adjoining it east and west. It contains Alexandria, Rosetta, Damietta, Menuf, and Mansoura.

BAHIRA, among the ancient Arabs, a name given to one of the four kinds of camels or sheep, which, according to their religion, were turned out at liberty with an ear mark, no longer to be used for service like other cattle. The bahira, with the sabahi, wasita, and hami, were abolished by Mahomet.

BAHLINGEN, a large and well built village in the grand duchy of Baden, circle of the Treasam, upper bailiwick of Hochberg. It contains 1620 inhabitants, who cultivate the vine to a great extent.

BAHUS, a town of the Prussian states, in Further Pomerania, and circle of Cöpenhagen. It contains about 1200 inhabitants, who derive their subsistence chiefly from tillage, the neighbouring country being very fertile; straw hats are also manufactured here. Twenty miles S.S.W. of Stargard, thirty-two north of Custrin.

BAHOVAN, a small island in the Sooloo archipelago. Long. 126° 57' E., lat. 6° 9' N.

BAHOUCHE, **DIAN**, the title of the sovereign of Aloosi. See **AVOSI**.

BAHRABAD, a town of Persia, in the province of Eborissan, ten miles north of Sebsvar.

BAHR BELAH, or river without water, a deep valley in the west of Egypt, supposed to have formerly formed a canal of communication between Lake Moeris, Faioum, and the Lake of Gattis. See **BAHRAL**.

BAHREDF (Charles Frederick), a German philosopher, born at Bieschfswald, in 1741. He studied at Leips., where his father was professor of metaphysics in the department of A.M., and afterwards held his father's deputy. In consequence of an illness he was obliged to leave his studies, and resided at Erfurt, as professor of metaphysics. Here in 1769 he published an Essay towards a system of the Doctrines contained in the Bible, in which several heterodox opinions were introduced. He soon after left Erfurt, and went to Göttingen in Hesse, where he published a number of theological tracts, abounding with extravagant notions, confidently maintained. From Göttingen he removed to Durlheim, in 1774, and here count Von Leinhausen Dachsburg appointed him his preacher, and gave him a course for a summary of education, designated the Pfaffenprogramm, which was opened in 1777. To obtain pupils, he often travelled to Holland

and England; but on his return, finding a prosecution had been commenced against him at Vienna, he fled to Prussia. Some time after he settled at Halle, where he became an avowed deist, and commenced tavern-keeper, and farmer. At Halle he instituted a new society of freemasons, on account of which he lay twelve months in prison, but afterwards continued his business as a landlord. He died in 1792.

BAHR EL ABIAD, or the White River, a name given to the real Nile, near its first origin; the sources of which in the African Alps of Kumri remain to be explored.

BAHR EL AZREK, Blue River, or Abyssinian Nile, has its chief spring in a small hillock, situated in a marsh, and joins the Bahr el Abiad, or true Nile, about lat. 16° N.

BAHR EL ACCABA, an arm of the upper extremity of the Red Sea, penetrating into Arabia.

BAHR EL SOWDA, a name said to be given to the lake of Antioch.

BAHIRY, a town of Hindostan, in the dominions of the rajah of Dhoulpore, 10 miles north of the river Chumbul.

BAIURIM, a city of the Benjamites, about a mile or two north-east of Jerusalem. Ahimaz and Jonathan hid themselves in a well in this town, when pursued by Absalom's messengers.

BAJA, or **BAIE**, an ancient village of Campania, in Italy, between the promontory of Misenum and Puteoli, on the Sinus Baianus; famous for its natural hot-baths, which served the wealthier Romans for the purposes of medicine and pleasure. The variety of these baths, the softness of its climate, and the beauty of its landscape, captivated the minds of opulent nobles, whose passion for bathing was unbounded. The wearing of linen, and the disuse of ointments, render the practice less necessary in modern life; but the ancients performed no exercise, and engaged in no study, without previous ablutions, which at Rome required an enormous expense in aqueducts, stoves, and attendants: a place, therefore, where waters naturally heated to every degree of warmth bubbled spontaneously out of the ground, in the pleasantest of all situations, was such a treasure, as could not be overlooked. Baie possessed these in the highest perfection; its easy communication with Rome was also a point of great weight. Hither at first retired for a temporary relaxation the mighty rulers of the world, to string anew their nerves and revive their spirits, fatigued with bloody campaigns and civil contests. Their habitations were small and modest; but soon increasing luxury added palace to palace, till ground was wanting for the vast demand; enterprising architects, supported by immense wealth, now, therefore, carried their foundations into the sea, and drove that element back from its ancient limits. It has since taken ample revenge, and recovered much more than it ever lost. From being a place of resort for a season, Baie grew up to a permanent city: whoever found himself disqualified by age, or infirmity, for sustaining any longer an active part on the political theatre, or from an indolent disposition, sought a place where the pleasures of a town were combined with the sweets of a rural life; whoever wished to withdraw from the dangerous

neighbourhood of a court, or the baneful eye of informers, flocked thither, to enjoy life untainted with fear and trouble. The affluence of wealthy inhabitants rendered Baiæ, therefore, as much a miracle of art as it was before of nature: its splendor may be inferred from its innumerable ruins, heaps of marbles, mosaics, stucco, and other precious fragments of taste. It flourished in full glory down to the days of Theodoric, the Goth; but the destruction of its enchanted palaces followed quickly upon the irruption of the northern conquerors, who sacked and burnt all before them, and destroyed or dispersed the whole race of Roman nobility. Moles and buttresses were now torn asunder and washed away; promontories, with the proud towers that once crowned their brows, undermined and tumbled headlong into the deep, where, many feet below the surface, pavements of streets, foundations of houses, and masses of walls are still to be described. Internal commotions of the earth contributed also largely to this general devastation: and mephitic vapors and stagnated waters have converted this favorite seat of health into the abode of pestilence, at least during the estival heats. Yet Baiæ in its ruined state, and stripped of all its ornaments, presents many beautiful and striking subjects for the pencil. It lies in the Terra di Lavoro, twelve miles west of Naples, and two from Pozzuolo. Don Pedro, the viceroy of Charles V. erected a castle on a neighbouring eminence to defend the harbour; and about a century ago, another was built on an island adjacent, which communicates to the shore by a bridge.

BAJA, BAIÄ, BAJJAH, or BÉGIA, a town of the kingdom of Tunis in Africa, supposed to be the ancient Vacca of Sallust, and Oppidum Vaggenese of Pliny. The Tunisians say that if there was in the kingdom such another town as this for plenty of corn, it would become as cheap as sand. It has a great annual fair, to which the most distant Arabian tribes resort with their families and flocks. Notwithstanding this, the inhabitants are very poor, and great part of the land about the town remains uncultivated. The town stands on the declivity of a hill, on the road to Constantina, about ten leagues from the northern coast, and thirty-six south-west of Tunis. On the highest part is a citadel that commands the place, but is of no great strength. The walls were raised out of the ruins of the ancient Vacca, and have some ancient inscriptions.

BAJA, or BAYA, a populous market town of Hungary, on the Danube, thirty-five miles north-west of Esseeck. It has a Catholic and Greek parish church.

BAJA, in entomology, a species of phalæna, (noctua), of the middle size, that inhabits Europe. It feeds on the deadly night shade.

BAIA DE RAMA, a town of European Turkey, in Walachia, district of Mehedinza, situated on the river of the same name.

BAIABAD, a town of Asiatic Turkey, in Nætolia, twenty-eight miles south-east of Kastamoni.

BAIAC, a town of Asiatic Turkey, in Nætolia, thirty miles south-east of Kutayah.

BAJAD, in zoology, a species of silurus.

BAJADOR, CAPE, a cape on the west coast

of the island of Luzon, being its extremity Long. 120° 40' E., lat. 18° 40' N.

BAJADOUR, in old records, a carrier or porter.

BAJANA, in conchology, a species of *ven-12* found on the shores of Brasil.

BAIANUS LACUS, a lake, or bay, mentioned by Tacitus, which some suppose to be the lake Lucrinus, and others the bay of Baiæ.

BAIANUS SINUS, or BAIARUM PORTUS, a bay of Naples, so called from Baiæ, which was enlarged by Augustus, by giving entrance to the sea into the Lacus Lucrinus and Avernus. He ordered it to be called Portus Julius apud Baias. The modern name is Golfo di Pozzuolo. See **POZZUOLO**.

BAJAPOUR, a town of Baglana, Hindostan, on the river Godavery, twenty miles east of Bahbelgong.

BAIAS, or BALE, a town of Syria, at the north-east extremity of the bay of Alexandretta, supposed to be the ancient Issus. On the hills fronting it, are the ruins of a triumphal arch, or of some other structure of gray marble. It is sixteen miles from Alexandretta, and the fine gardens round the town supply Aleppo with oranges and lemons. In a small bay, to the north of the town, are seen the ruins of an ancient port, which is now much exposed to the south-west winds, which are very dangerous here. On the south side there is a mountain torrent, the bed of which is conjectured to have been the boundary between Syria and Cilicia.

BAJAZET I. emperor of the Turks, succeeded Amurath I., A. D. 1373. He was a renowned warrior, but a tyrant. In the beginning of his reign he was very successful. In 1393 he had conquered all Thrace, Macedonia, Thessaly, and the greater part of Mysia and Bulgaria; and in 1396 he brought an army of 300,000 men against Emanuel II. emperor of Constantinople, whom he defeated, and slew 20,000 of the Christians, but not without considerable loss on his own side. But in 1397 Tamerlane, or Timour Beg, the celebrated prince of the Tartars, brought an army against him of 400,000 horse and 600,000 foot; and having overcome him in a pitched battle, wherein 200,000 Turks were slain, took Bajazet himself prisoner, and exposed him, it has been said, in an iron cage, the fate he had destined for his adversary, if he had been the victor. This story, however, has been rejected as a fable by many modern writers. Mr. Gibbon has given the following narrative of this memorable transaction: 'No sooner was Timour informed that the captive Ottoman was at the door of his tent, than he graciously stepped forward to receive him, seated him by his side, and mingled with just reproaches a soothing pity for his rank and misfortunes. 'Alas!' said the emperor, 'the decree of fate is now accomplished by your own fault: it is the web which you have woven; the thorns of the tree which yourself have planted. I wished to spare, and even to assist, the champion of Moslems: you braved our threats, you despised our friendship; you forced us to enter your kingdom with our invincible armies. Behold the event. Had you vanquished, I am not ignorant of the fate which you reserved for myself

and my troops. But I disdain to retaliate: your life and honor are secured; and I shall express my gratitude to God by my clemency to man.' The royal captive showed some signs of repentance, accepted the humiliation of a robe of honor, and embraced with tears his son Mousa, who, at his request, was sought and found among the captives of the field. The Ottoman princes were lodged in a splendid pavilion; and the respect of the guards could be surpassed only by their vigilance. On the arrival of the harem from Boursa, Timour restored the queen Despina and daughter to their father and husband; but he piously required that the Servian princes who had hitherto been indulged in the profession of Christianity, should embrace without delay the religion of the prophet. In the feast of victory, to which Bajazet was invited, the Mogul emperor placed a crown on his head and a sceptre in his hand, with a solemn assurance of restoring him with an increase of glory to the throne of his ancestors. But the effect of this promise was disappointed by the sultan's untimely death: he died of apoplexy at Akshehr, the Antioch of Pisidia, about nine months after his defeat. The victor dropped a tear over his grave. His body, with royal pomp, was conveyed to the mausoleum which he had erected at Boursa; and his son Mousa, after receiving a rich present of gold and jewels, of horses and arms, was invested, by a patent in red ink, with the kingdom of Anatolia. Such (continues the historian) is the portrait of a generous conqueror, which has been extracted from his own memorials, and dedicated to his son and grandson nineteen years after his decease; and at a time when the truth was remembered by thousands: a manifest falsehood would have implied a satire on his real conduct. On the other hand, of the harsh and ignominious treatment of Bajazet there is also a variety of evidence. The Turkish annals, in particular, which have been consulted or transcribed by Leunclavius, Pococke, and Cantemir, unanimously deplore the captivity of the iron cage; and some credit may be allowed to national historians who cannot stigmatise the Tartar without uncovering the shame of their king and country.'

BALAZET II. emperor of the Turks, the youngest son of Mahomet II. who took Constantinople, succeeded his father, A. D. 1480. Like him too he was a great conqueror. In 1484, he took waste Wallachia; in 1486, he subdued the Morea; in 1491, he took Epidaurum in Sclavonia; in 1493, he defeated the Christians in Croatia, in an obstinate and bloody battle, wherein he lost 10,000 of his own troops: in 1493, he over-ran Russia and Dalmatia, with 70,000 men; and, in 1500, he took Modon, in the Morea, from the Venetians. He died in 1512.

BAICHA, two rivers of Siberia, flowing into the Turuchan, thirty-two and fifty-six miles north-west of Turuchansk.

BAIDENH, a valley in the great road from Cairo to Suez, at the northern extremity of which there are stands.

BAIDHA, a town of Arabia, in the province of Heljan, thirty miles north-west of Yadilkova.

BAIDYNATHI, a small town of Hindostan, in the Kemáon hills, celebrated for an ancient temple, dedicated to the Hindoo god of medicine, and much frequented by pilgrims.

BAIEU, in zoology, the name of the cervus Mexicanus, or Mexican stag, in Bancroft's Guiana, &c.

BAIGNE, *v. a.* *Bagner*, Fr. To drench; to soak: a word out of use.

The women forsook not to *baigne* them, unless they plead their heels, with a worse perfume than Jugurth found in the dungeon. *Carew's Survey of Cornwall.*

BAJITH, a city of Moab, mentioned in Isaiah xv. 2. whither the king went to bewail the state of his nation, and supplicate aid from his idols.

BAIKAL, a large lake of Siberia, lying between 52° and 55° lat. N. It is reckoned to be 550 versts, or 318 German miles in length; but only about thirty versts broad, and in some places not above fifteen. It is environed on all sides by high mountains. In one part of it, which lies near the mouth of the river Barguzin, it throws up an inflammable sulphureous liquid called naphtha, which the people of the adjacent country burn in their lamps. There are likewise several sulphureous springs near this lake. Its water at a distance appears of a sea-green color: it is fresh; and so clear that objects may be seen in it several fathoms deep. It does not begin to freeze till near the end of December, and thaws again about the beginning of May; from which time till September, a ship is seldom known to be wrecked on it; but by the high winds which then blow, many shipwrecks happen. The fishery on the shores begin in May; and the southern shore is divided into districts, and farmed out by the government. This lake is called by the Russians Swætoie More, or the Holy Lake; and Dalai Nor by the Tartars. When it is frozen over, people travel upon it in the road to China; camels have for this purpose a particular kind of shoes, sharp at the bottom, and the oxen have sharp irons driven through their hoofs, without which it would be impossible for them to pass. The shores and islands, consisting of granite rocks, called the Yablonian and Tunkinski chain, running from east to south-west, are well wooded, and form, by their frequent projections into the lake, bays and promontories, but with little good anchorage. The high road from Irkutsk to Kiakhta, passes along its southern shores. On the western shore copper has been found. Its depth, where greatest, is from eighty to 490 fathoms, but in some places it is unfathomable, and so variable that it has been conjectured with great probability to have arisen from a deep rent in the mountains, occasioned by an earthquake. Under the waters of this lake, grows a peculiar species of sponge, called by the Russians morskaya súba, or sea-sponge, the spongia baicalensis of Pallas. It is used for giving the first polish to metals. The common seal (*phoca vitulina*) seldom found in fresh water, or at a distance from the ocean, is taken here in April, basking on the ice, and the sale of their skins is a source of considerable profit. It yields a sort of blubber, so rank that even ravens will not touch its carcase; yet its oil is highly esteemed and purchased by the Chi-

nese. The *baikalensis*, a species of *callionymus* that inhabits the deep parts of the lake, is about nine inches long, soft, slender, and rather compressed; and has ventral fins; of carp, tench, sturgeon, devil's lampreys, (*salmo oxyrrynchus*), lenki (*salmo salvelinus*), there is abundance; the most important fish is the omul, or migratory salmon, somewhat resembling the herring. They are taken in October, and being dried by the frost, can be conveyed fresh almost to any distance. The climate around this lake is extremely severe; in the midst of summer frosty nights being common; and snow, as early as August, falling on the neighbouring mountains. The vegetable productions are principally the *pinus cembra*, *empetrum nigrum*, and *pyrola uniflora*, the silky knotgrass (*polygnum sericeum*), a beautiful plant, and the *triticum littorale*, which the peasants call *dikaya koch*, wild barley. Rivers flowing into the lake Baikal are, on the north side, in lat. 55° 51' the Upper Angara, on the east the Barguzin, in latitude 54°. At its mouth is the Cape, called the Holy Promontory; and on the west, the Tunga, Selenga, and Buguldeika, the last of which discharges itself by three mouths. The only outlet is the Lower, or Greater, Angara, which rushes from the lake, in lat. 50° 54' N. and long. 105° E. with great impetuosity, and joins the Yenisei near *Ust Tungurskoyé* in north lat. 58°. The channel through which it quits the lake is more than a mile broad.

BAIKALITE, in mineralogy, a variety of pyroxene, found near the lake Baikal in Siberia. See **PYROXENE**.

BAIKALENSIS. See **BAIKAL**.

BAIL, *n. s.* & *v. a.* } Of this word the etymologists give many derivations; it seems to come from the French *bailler*, to put into the hand; to deliver up, as a man delivers himself up in surety. '*Bail* is the freeing or setting at liberty one arrested or imprisoned upon action either civil or criminal, under security taken for his appearance. There is both common and special *bail*; *common bail* is in actions of small prejudice, or slight proof, called common, because any sureties in that case are taken; whereas, upon causes of greater weight, or apparent speciality, *special bail* or surety must be taken. There is a difference between *bail* and mainprise; for he that is mainprised is at large, until the day of his appearance: but where a man is *bailed*, he is always accounted by the law to be in their ward and custody for the time; and they may, if they will, keep him in ward, or in prison at that time, or otherwise at their will.'—*Cowell*. A bail is therefore a surety or bondsman; one who gives surety for another. *Bailable* relates to the less atrocious offences, where security for the appearance of the offender may be legally offered and accepted. To give or to admit to bail, is to render or to accept the security which the law prescribes in a bailable case. In Spenser the word is figuratively used to signify power or jurisdiction.

So did Diana, and her maydens all,
Use silly Faunus now within their *baile*. *Spenser*.

Let me be their *bail*.—

They shall be ready at your highness' will,
To answer these suspicions.—

Thou shalt not *bail* them.

Shakspeare.

They are not *bailable*,

They stand committed without *bail* or mainprise.

B. Jonson.

Worry'd with debts, and past all hopes of *bail*,
The unappy'd wretch lies rotting in a jail.

Roscommon.

And bribe with presents, or, when presents fail,
They send their prostituted wives for *bail*.

Dryden.

BAIL, is originally derived from the Greek, *βαλλειν*, to deliver, and so called because by means of it, the party restrained is delivered into the hands of those that bind themselves for his forthcoming, in order to a safe keeping or protection from prison; and the end of the bail is to satisfy the condemnation and costs, or render the defendant to prison. The commitment of a person being only for safe custody, wherever bail will answer the same intention, it ought to be taken; as in most of the inferior crimes: but in felonies, and other offences of a capital nature, no bail can be a security equivalent to the actual custody of the person. For what is there that a man may not be induced to forfeit, to save his own life? or what satisfaction or indemnity is it to the public, to seize the effects of him who has bailed a murderer, if the murderer himself be suffered to escape with impunity? Upon a similar principle, the Athenian magistrates, when they took a solemn oath never to keep a citizen in bonds that could give three sureties of the same quality with himself, did it with an exception to such as had embezzled the public money, or had been guilty of treasonable practices.

Bail may be taken either in court, or, in some particular cases, by the sheriff or other magistrate; but most usually by the justices of the peace. To refuse or delay to bail any person bailable, is an offence against the liberty of the subject, in any magistrate, by the common law; as well as by the statute Westm. 1. 3 Edward I, c. 15, and the habeas corpus act, 31. Car. II. c. 2. And, lest the intention of the law should be frustrated by the justices requiring bail to a greater amount than the nature of the case demands, it is expressly declared by statute 1. W. and M. st. 2. c. 1. that excessive bail ought not to be required; though what bail shall be called excessive, must be left to the courts, on considering the circumstances of the case, to determine. And on the other hand, if the magistrate takes insufficient bail, he is liable to be fined, if the criminal does not appear.

In civil cases, every defendant is bailable. But it is otherwise in criminal matters. Regularly, all offences either against the common law or act of parliament, that are below felony, the offender ought to be admitted to bail, unless it be prohibited by some special act of parliament. By the ancient common law, before and since the Conquest, all felonies were bailable, till murder was excepted by statute: so that persons might be then admitted to bail almost in every case. But the statute W. 1. 3 Ed. I. c. 15. takes away the power of bailing in treason, and in divers instances of felony. The statutes 23 Hen. VI. c. 9.

and 1 & 2 Ph. & Mar. c. 13. gave farther regulations in this matter: and upon the whole we may collect, that no justices of the peace can bail, 1. Upon an accusation of treason: nor, 2. Of murder: nor, 3. In case of manslaughter, if the prisoner be clearly the slayer, and not barely suspected to be so; or if any indictment be found against him: nor, 4. Such as, being committed for felony, have broken prison; because it not only carries a presumption of guilt, but is also superadding one felony to another: 5. Persons outlawed; 6. Such as have abjured the realm: 7. Persons taken with the mainour, or in the act of felony: 8. Persons charged with arson: 9. Excommunicated persons, taken by writ de excommunicato capiendo: all which are clearly not admissible to bail by the justices. Others are of a dubious nature, as, 10. Thieves openly defamed and known: 11. Persons charged with other felonies, or manifest and enormous offences, not being of good fame: and, 12. Accessaries to felony, that labor under the same want of reputation. These seem to be in the discretion of the justices, whether bailable or not. The last class are such as must be bailed upon offering sufficient surety; as, 13. Persons of good fame, charged with a bare suspicion of manslaughter, or other infamous homicide: 14. Such persons being charged with petit larceny or any felony, not before specified: or, 15. With being accessory to any felony. Lastly, it is agreed, that the court of king's bench, or any judge thereof in time of vacation may bail for any crime whatsoever, be it treason, murder, or any other offence, according to the circumstances of the case. And herein the wisdom of the law is very manifest. To allow bail to be taken commonly for such enormous crimes, would greatly tend to elude the public justice; and, in these cases, though they rarely happen, in which it would be hard and unjust to confine a man in prison, though excused even of the greatest offence. The law has therefore provided one court, and only one, which has a discretionary power of bailing in any case: excepting only even to this high jurisdiction, and of course to all inferior ones, such persons as are committed by either house of parliament, so long as the session lasts; or such as are committed for contempts by any of the king's superior courts of justice.

In the civil processes, in which an actual arrest and imprisonment is not now allowed, such as suits for the recovery of sums of less amount than £15, or of damages, the precise amount of which cannot be shown before the jury shall have estimated them as damages of trespass, or for any injuries, either personal or pecuniary, but to an unascertained amount, no arrest can be made, and, consequently, no bail need be demanded. But in such as the writ, which now forms the commencement of all civil actions, was formerly a process issued against a defendant, who had neglected to comply with certain anterior summonses, and who was thereby liable to imprisonment, in order to secure his appearance in court on the day appointed to shew cause, as to make his return of the writ, and any delay is previous contempt of law, and contumacy, shown a manifest to be trusted at all: it was a consequence that he could not

avoid imprisonment, but by giving bail. And, as by the tenor of the writ, and by fiction of law, a defendant in all cases is now held to be in the same circumstances, it is necessary that he should put in common bail: which is a mere formal entering of the names of two fictitious persons, John Doe and Richard Roe, as his sureties.

In actions for a sum certain, if the plaintiff make affidavit that that sum is fifteen pounds, or upwards, the defendant must give what, technically, in distinction from the fictitious bail of which we have just spoken, is called special bail: that is, in order to avoid imprisonment, he must find two real and responsible persons to be sureties for him. As soon as an arrest has been effected, these sureties give a bond to the sheriff, for the defendant's appearance on the day of the return of the writ, and this is called bail to the sheriff, or bail below. On that day, or within four, or in some cases, six or eight days after, they enter into recognizances, that if judgment be given against the defendant, he shall pay the damages and costs, or surrender his person. This is called giving bail above, or bail to the action. If the plaintiff requires it, they must justify, as it is termed, or perfect the bail; that is, they must swear (if in London or Middlesex, before a judge; or, in the country, before commissioners appointed for that purpose), that they have the requisite qualifications: which are, the being housekeepers, and worth, each of them, the full sum for which they become bail, after payment of all their debts. Thus securing the plaintiff the person or property of his defendant, if the latter is insufficient to discharge the claim, the bail are entitled to apprehend him by warrant, or in any other way, to surrender his person.

When a defendant has failed to put in bail above, and the sheriff is unable to produce his body, that officer is answerable to the plaintiff for the sum for which the bail below was given: and he has his own remedy against the bail, by action upon their bond. But, as a simpler plan, the sheriff usually assigns the bond to the plaintiff, and he proceeds upon it. It is, however, optional with the plaintiff to accept or refuse the assignment.

BAIL-BOND, an obligation entered into by one or more sureties, upon giving bail, insuring the defendant's appearance at the time appointed by the court.

BAILEMENT. See **BAILMENT**.

BAILEY (Nathan), an English lexicographer, who kept a school at Stepney, where he died June 27, 1742. He published *Dictionarium Domesticum*, or a *Household Dictionary*, 8vo; *The Antiquities of London and Westminster*, 12mo; and several school books: but his principal work was an *Etymological English Dictionary*, which first appeared in octavo, and being enlarged into a folio, volume became the basis of Dr. Johnson's dictionary.

BAILIE, in Scots law, a judge anciently appointed by the king over such lands, not erected into a regality, as happened to fall to the crown by forfeiture or otherwise: now abolished. It is still the title of one or more magistrates in royal boroughs, and of the judge appointed by a baron

over lands erected into a barony. There are four bailies in the town council of Edinburgh, three in those of Glasgow, Aberdeen, Perth, &c.

BAILIFF, *n. s.* } Borrowed from the Fr.
BAILTWICK, *n. s.* } *baillie*. In our old voca-
BAILY, *n. s.* } bularies written baily, and
 so a steward is still called in many places. Bailiff is the person who sustains the office; bailiwick is the place of his jurisdiction; and baily is the office or jurisdiction itself.

Every beggarly corporation affords the state a mayor or two *bailiffs* yearly. *B. Jonson.*

BAILIFF, **BALLIVUS**, from the French word *bailli* or *bailiff*, that is, *præfectus provinciæ*: and as the name, so the office itself was answerable to that of France, before the revolution; where there were eight parliaments, which were high courts, from whence there lay no appeal; and within the precincts of the several parts of that kingdom, which belonged to each parliament, there were several provinces to which justice was administered by certain officers called *bailiffs*.—In England there are several counties in which justice has been administered to the inhabitants, by the officer now called *sheriff* or *viscount* (one of which names descended from the Saxons, the other from the Normans); and though the *sheriff* is not called *bailiff*, yet it is probable that was one of his titles, because the county is often called *balliva*. And in *Magna Charta*, cap. 28. and 14 Ed. 3. c. 9. the word *bailiff* seems to comprise both *sheriffs* and *bailiffs* of hundreds. As the realm is divided into counties, so every county is divided into hundreds; within which, in ancient times, the people had justice administered to them by the officers of every hundred. But now the hundred courts, except certain franchises, are swallowed in the county courts; and the *bailiff's* name and office is grown into contempt, they being generally officers to serve writs, &c. within their liberties. In other respects, however, the title is still in esteem: for the chief magistrates in divers towns are called *bailiffs*, or *baillies*; and sometimes the persons, to whom the king's castles are committed, are termed *bailiffs*, as the *bailiff* of Dover Castle, &c. Of the ordinary *bailiffs* there are several sorts.

BAILIFFS ERRANT, or **BAILIFFS ITINERANT**, are those whom the *sheriff* appoints to go up and down the country to serve writs and warrants, to summon county courts, sessions, assizes, &c. The *sheriff* being answerable for the misdemeanor of these *bailiffs*, they are usually bound in an obligation for the due execution of their office, and thence called *bound bailiffs*, which is vulgarly corrupted into a much more homely appellation.

BAILIFFS OF BOROUGHs, were magistrates anciently in cities and towns, answering, in some measure, to what, in later times were called *portgrave*, *mayor*, &c. *Canterbury* was a *bailiff* town 500 years before it was made a *mayor* town. *Westminster*, *Southwark*, *Scarborough*, &c. are still governed by *bailiffs*.

BAILIFFS OF FORESTS and **MANORS**, direct husbandry, fell trees, gather rents, pay quit-rents, &c.

BAILIFFS OF FRANCE, under the monarchy, were appointed over the provinces originally belonging to the crown.

BAILIFFS OF FRANCHISES, or **BAILIFFS OF LIBERTIES**, in England, are those *bailiffs* who are appointed by every lord within his liberty, to execute process and do such offices therein as the *bailiff* errant doth at large in the county.

BAILIFFS OF THE EMPIRE, were anciently *vicars* or *regents* of the empire; as appears from a letter of *Henry of Flanders* to *pope Innocent III.* wherein he says, the princes, barons, and knights have elected me *ballivum imperii*.

BAILIFFS, PROVINCIAL, among the French, under the old despotism, were officers appointed in certain provinces or counties, with an authority somewhat like that of *justices of assize*, instituted by the dukes and counts in their several territories, after they had procured the inheritance of them. These acted in the name, and by the authority, not of the king as *justiciaries*, but of the dukes or counts who appointed them, and whose deputies they were.

BAILIFFS, ROYAL, in France, were appointed by the king over provinces annexed to the crown.

BAILIFFS, SHERIFF's, in England, or *sheriff's* officers, are either, 1. *bailiffs* of hundreds, or 2. *special bailiffs*, and appointed over their respective districts, to collect fines; summon juries; attend the judges and justices at the assizes and quarter sessions; and to execute writs and processes in the several hundreds.

BAILIFFS, WATER, officers appointed in all port-towns, for the searching of ships, gathering the toll for anchorage, &c. and arresting persons for debt, &c. on the water.

BAILII (*David*), painter of perspective views and portraits, the son of *Peter Bailii*, an artist of some note, was born at *Leyden* in 1584. Having acquired the rudiments of the art under his father, he improved under *Verburg*, and still more under *Vandervoort*, with whom he spent above six years. While with him, he copied a perspective view of the inside of a church, by *Stenwyck*, with such accuracy, that even *Stenwyck* himself could scarcely determine which was the original. He travelled through several parts of Italy to see the works of masters, and for a few years resided at *Rome*. The correctness of his drawing, and the delicate finishing of his pictures, have been much admired. He died in 1638.

BAILIWIC, **BAILYWICK**, or **BAYLIWICK**, *balliva*, in law, the jurisdiction of a *bailiff* over that liberty which is exempted from the *sheriff* of the county. *Stat. 27th Eliz., ch. 12.* *Wood's Just. 206.*

BAILLET (*Adrian*), a very learned French writer and critic, born in 1649, at *Neuville* near *Beauvais*. His parents being poor, he obtained his education by favor of the bishop of *Beauvais* who afterwards presented him with a small vicarage. In 1680 he was appointed librarian to *M. de Lamoignon*, advocate general to the parliament of *Paris*, of whose library he made a copious index, in thirty-five volumes folio. He died in 1706. His principal works are, *A History of Holland*, from 1609, to the peace of *Nimiguen* in 1679, 4 vols. 12mo. *Lives of the Saints*, 3 vols. folio, which he professed to have purged from fables. *Jugemens des Savans*, 9 vols. 12mo. and *the Life of Des Cartes*, 2 vols. 4to. which he also abridged to 1 vol. 12mo.

BAILLEUL, a town of France, in the department of the North, formerly very strong. It has been several times burnt by accident. It lies nine miles S.W. of Ypres.

BAILLIAGE, the office of a baniff, or the place where he keeps his seat, and the territory subject to his jurisdiction; which last is also denominated Bailiwick.

BAILLIAGE, Water, an ancient duty received by the city of London, upon all goods and merchandises brought in or carried out of port.

BAILLIE (Robert), M. A. a presbyterian divine of Scotland, was born at Glasgow in 1599, and studied at that city; having received orders from Abp. Law, in 1622 he was chosen regent of philosophy at Glasgow, and some time after was presented to the church of Kilwinning, by the earl of Eglinton. In 1633, he declined the offer of a church at Edinburgh, but in 1638 was chosen a member of the famous assembly at Glasgow, which was a prelude to the civil war, and was a member of all the succeeding assemblies, excepting those which sat while he was at Westminster. In 1640 he was sent to London by the Covenanting Lords, to draw up an accusation against Abp. Laud. In 1642 he was appointed joint professor of Divinity in the University of Glasgow, with Mr. Dickson; which he preferred to similar offers from the other three universities. In 1643 he was one of the commissioners to the celebrated assembly of Divines at Westminster, and returned in 1646. When after the execution of Charles I. his son was proclaimed in Scotland, he was appointed by the assembly to wait on Charles II. at the Hague, and after the restoration was made principal of the university of Glasgow. He died in 1662, at the age of sixty-three.

BAILLIE (Matthew), M. D. a celebrated anatomist. He was the son of the Rev. James Baillie, professor of divinity at Glasgow, by the sister of Dr. William Hunter. He studied at Glasgow and Balliol College, Oxford, and afterwards became the pupil of his uncle. Being made physician to St. George's hospital, he succeeded Dr. Hunter as lecturer on anatomy, in conjunction with Mr. Cruikshank. He continued a public lecturer till 1799. Dr. Baillie was one of the physicians in ordinary to Geo. III. and Geo. IV. and long stood in the first rank among his medical contemporaries. He published *The Morbid Anatomy of the most important parts of the Human Body*, two, 1793, subsequently enlarged and improved; a *Series of Engravings* tending to illustrate *Morbid Anatomy*; also a *Description of Gray's Crus*; and contributed several important papers to the *Philosophical Transactions* and *Medical Collections* of his day. Dr. Baillie formed a valuable museum of anatomical specimens which he presented to the College of Physicians, where it in 1823, in the 85th year of his age, was taken by his wife, and he died of Dr. Baillie's son and a daughter.

BAILLEBOROUGH, a town of Ireland, in the county of Carlow, thirty-three miles from Dublin.

BAILLEBOROUGH, a family, a charge in coats and arms, representing a lion rampant, holding a shield in his mouth.

BAILLY (John Sylvian), a celebrated philosopher and astronomer, born at Paris in 1763. His family had been respectable as painters for several generations, and he had commenced his studies in the same profession; but he was too much bent on the pursuit of literature, to apply himself successfully. His early acquaintance with La Caille the celebrated geometrical, determined the science which was in future to engross his attention. The calculation of the comet which appeared in 1759, was his first labor. In 1763 he became a member of the Academy of Sciences; and in the course of the same year, published a reduction of La Caille's observations on the zodiacal stars in 1760 and 1761. He was next employed in considering the theory of Jupiter's satellites; and in 1766 published the results of his investigation, with the history of that part of astronomy. In 1771 he gave the world a very valuable memoir on the light of the satellites, marking their eclipses in a very precise and accurate manner. The genius of Bailly was not confined to abstract science, or profound physical speculations; it was equally brilliant in those departments of literature where the nicest discrimination of character and the most powerful eloquence is requisite. His eulogies upon Charles V. Corneille, Leibnitz, Moliere, Cook, La Caille, and Gresset, raised universal admiration. In 1775, he published at Paris the first volume of the *History of Ancient Astronomy*; and in 1778 the second. The *History of Ancient Astronomy*, from the foundation of the Alexandrian school to the present age, followed in 1779. He next published *Letters on the origin of the Sciences, and of the people of Asia*; to which he added a series of *Letters on the Atlantis of Plato and the ancient History of Asia*; which he addressed to Voltaire. He was also very intimate with Buffon, till he opposed the election of the Abbé Maury into the French academy; to which Bailly had been chosen secretary in 1784. This year he was named one of the commission to investigate the nature of the animal magnetism of Mesmer, practised by Deslon. His report, which was presented to the Academy of Sciences, and has been since translated into English, contains the most satisfactory and decisive evidence upon the subject. It is highly valuable in developing the physical effects produced by moral causes. In 1785 he was admitted into the Academy of Inscriptions and Belles Lettres; and thus was at the same time a member of all the three academies of Paris, which none had been since Fontenelle. We must now leave the peaceable haunts of philosophy, and follow Bailly to the revolutionary stage, on which he acted a principal part. Here, though we behold him struggling with opposite interests in the midst of a lawless mob; zealous for freedom, and contending in its cause with enthusiasm, we hear not a charge of selfish motives, or want of integrity, brought against him by any party; yet he fell a sacrifice to that violence which nothing could control. In 1789 he was appointed deputy to the Tiers Etat, and was soon after elected president; a station which he held when the national assembly was constituted, and when the king issued his proclamation for dispersing

them. In the contest between the popular assemblies and the court, Bailly was zealous to maintain the rights of the people; and the famous oath to the members of the Tiers Etat, to resist tyrants and tyranny, and never to separate till they should obtain a free constitution, was dictated by him. Next day, the 14th of July, memorable for the taking of the Bastille, he was chosen mayor of Paris; and though in this high office he greatly promoted the different measures by which the popular party became victorious over the court, yet he is allowed to have discharged the arduous duties of it, at this trying juncture, with integrity, moderation, and firmness. The public mind was now, however, become like the ocean in a tempest: a people ever fond of novelty, free from the fetters of despotism, with enthusiastic and erroneous ideas of liberty, were every day more eager for a change, and could suffer no restraint. The disposition of the people to anarchy was evident, and Bailly, still anxious that the laws should be respected, imagined that, by the vigorous execution of them, tranquillity might be maintained. Deputies from the military insurgents at Nancy were arrested by his orders, and he firmly opposed Marat and Hubert in their proceedings. He entered into a society more select than that of the Jacobins' club; and used every argument that the king and the royal family might be allowed to go to St. Cloud. Thus he lost the confidence of the people; and being called by the national assembly to dismiss the tumultuous meeting, demanding the abolition of monarchy, on the 17th July, 1791, he ordered the soldiers to fire, which rendered him completely obnoxious to them. In the end of the same year, when the constituent assembly was dissolved, he therefore resigned his office, and retired to his philosophical studies. Yet a bloody proscription reached him; as an enemy to the republic he was seized, imprisoned, arraigned before a savage tribunal, summarily condemned, and executed in the fifty-seventh year of his age. He bore his sufferings with great magnanimity, though they were purposely lengthened out. To mark him as a conspirator, he was dressed in a red shirt, placed in a cart, with his hands tied behind his back; and though the rain pored incessantly on his head, the mob threw mud at him while he passed to the place of execution, and insulted him in the cruellest manner. As he ascended the platform, a person near him cried out in a sneering manner, 'Bailly you tremble.' 'Yes (answered he) but not with fear.' His person was tall, his countenance sedate, but striking. Scarcely any philosopher has appeared more eminent in the different branches of science and literature. While he filled the magisterial office, he gave away no inconsiderable part of his fortune to relieve the necessities of the poor. He left a wife whom he had married in 1787.

BAILMENT, *n. s.* The delivery of goods; or their consignment from one person to another, for the benefit of a third party. Sometimes also to be delivered back to the *bailor*, that is to him that so delivered them: sometimes to the use of the *bailee*, that is of him to whom they are delivered.

BAILMENT, in law, is a delivery of goods in trust, upon a contract, expressed or implied, that the trust shall be faithfully executed on the part of the bailee. Thus if cloth be delivered, or (in our legal dialect), bailed to a taylor to make a suit of clothes, he has it upon an implied contract to render it again, when made, and that in a workmanly manner. If money or goods be delivered to a carrier, to convey from Oxford to London, or from Glasgow to Edinburgh, &c. he is under a contract in law to pay, or carry them to the person appointed. If a horse or other goods be delivered to an inn-keeper or his servants, he is bound to keep them safely, and restore them when his guest leaves the house. If a man takes in a horse, or other cattle, to graze and pasture in his grounds, which the law calls agistment, he takes them upon an implied contract to return them on demand to the owner. If a pawnbroker receives plate or jewels, as a pledge or security for the repayment of money lent thereon, at a certain day, he has them upon an express condition to restore them, if the pledger performs his part, by redeeming them in due time; for the due execution of which contract, many useful regulations are made by statute 30 Geo. II. ch. 24. If a landlord distrains goods for rent, or a parish officer for taxes, these for a time are only a pledge in the hands of the distrainers; and they are bound by an implied contract in law to restore them on payment of the debt, duty, and expenses, before the time of sale, or when sold, to render back the overplus, &c. Sir William Jones, in his learned work on the law of bailments, distinguishes five species of this contract. 1. Depositum, or deposit, which is a bailment of goods to be kept for the bailor without reward. 2. Mandatum, or commission; a bailment of goods to be carried from place to place, or to have some act performed about them, without reward. 3. Commodatum, or loan for use; a bailment of a thing for a certain time, to be used by the borrower without paying for it. 4. Pignori acceptum, or pawn; a bailment of goods by a debtor to a creditor, in pledge as a security for the debt. 5. Locatum, or letting to hire; of which there are three subdivisions distinct enough to demand enumeration. (1.) Locatio rei, or bailment of a thing, to be used by the hirer for a reward. (2.) Locatio operis faciendi, or letting out of work and labor to be done, or care and attention to be bestowed, by the bailee, on the goods bailed for a reward. (3.) Locatio operis mercium vehendarum, or letting of care and pains in carrying the things bailed from place to place for a reward.

If a bailee refuse to return the things bailed upon a lawful demand, he becomes answerable for even the slightest neglect. If a guest be robbed by the servants or inmates of an inn, the innkeeper is responsible. And, if goods bailed to a common carrier be lost by any means, except by the act of God, or of the kings enemies, the carrier is bound to indemnify the owner.

BAILO, or **BALIO**, a title formerly given at Constantinople, to the ambassador of Venice residing at the Porte. The Venetian consuls at Aleppo, Alexandria, Smyrna, and other parts of the Levant, are also denominated bailo.

BAILOQUE, in commerce, or **BALLOQUE**, a French name for the ostrich feathers that are used as ornaments without dyeing.

BAIL-PIECE, the parchment containing the recognisance entered into by those who give bail for the appearance of another.

BAILS, in sea-language, the hoops that bear up the tilt of the boat.

BAILS, CLERK OF THE, is an officer belonging to the court of King's Bench: he files the bail-pieces taken in that court, and attends for that purpose.

BAILYBOROUGH, a market town of Cavan, Ireland, twenty-five miles from Dublin. Between this place and King's Court, is a pool on the summit of a mountain, much frequented for its antiscorbutic virtues. Many bathe in the lake, and even rub the affected parts with the mud, which is of a greasy substance like tar. It has not been known to be frozen even in the severest winter.

BAIMALPOUR, a town of Bejapour, Hindostan, fourteen miles east of Satarah.

BAIN, a town of Brittany, in France, with 3450 inhabitants, and woollen manufactures; the head of a canton in the department of the Ille Vilaine, arrondissement of Redon, sixteen miles south of Rennes, and twenty-four south-west of Vitre.

BAINA, a market town of Hungary, in the county of Gran. It was formerly a considerable place.

BAINBRIDGE, a township of England, in the North Riding of Yorkshire, distant two miles from Askring, near the Ure, conjectured to have been a Roman station.

BAINBRIDGE, POINT, an inlet on the west coast of North America, extending about twenty miles northward. Long. of its west point, $212^{\circ} 9\frac{1}{2}'$ E. lat. $50^{\circ} 55'$ N.

BAINBRIDGE (Dr. John), an eminent physician and astronomer, born at Ashby-de-la-Zouch, in 1592. He taught a grammar school for some years, and practised physic, employing his leisure hours in astronomy. At length he removed to London, was admitted a fellow of the college of physicians, and raised his character by his description of the comet in 1618. The next year Sir Henry Saville appointed him professor of astronomy at Oxford; and the masters and fellows of Merton college made him first junior, and then superior reader of Linacre's lecture. He died in 1642, leaving valuable MSS. preserved in the library of Trinity College, Dublin.

BAIOLCO, a copper coin current at Rome, equivalent to a tenth part of the julio, or a hundredth part of the denar. It is worth about nine denars, French money.

BAIRAM, or **BEIRAM**, a Turkish word which signifies a sole or feast. The Mahomedans have two Bairams, the great and the little.

BAIRAM, THE GREAT, is properly that held by the pilgrims at Mecca, commencing on the fourth of Olu Hapic, when the victims are slain, and lasting three days. This is called by the Arabs, Id al adha, that is, the feast of sacrifice, as being celebrated in memory of the sacrifice of Abraham, whose son, God redeemed with a great victim. By European writers it is called the Lesser Bairam, as being less taken notice of by

the generality of the people, who are not struck with it, because the ceremonies with which it is observed are performed at Mecca, the only scene of the solemnity. On this feast, after throwing little stones, one after another, into the valley of Mina, they usually kill one or more sheep, some a goat, bullock, or even a camel; and after giving a part thereof to the poor, eat the rest with their friends. After this, they shave themselves. The second day is a day of rest. On the third, they set out on their return home.

BAIRAM, THE LITTLE, is properly that held at the close of the fast Ramazan, beginning with the first full moon in the following month Shawal. This is called, in Arabic, Idal Fetz, or the Feast of breaking the Fast; by European writers, the Turkish Easter, because it succeeds Ramazan, which is their Lent, more usually the Great Bairam, because observed with great ceremony and rejoicing at Constantinople, and through Turkey, for the common people, to make amends for the mortification of the preceding month. The feast commencing with the new moon, the Mahomedans are very scrupulous in observing the time when the new moon commences; to which purpose, observers are sent to the tops of the highest mountains, who, the moment they spy the appearance of a new moon, run to the city, and proclaim Muzhdaluk! welcome news! as it is the signal for beginning the festivity.

BAIRDSTOWN, a post town of the United States, the capital of Nelson county, in the state of Kentucky. It is seated on the east side of Beech-Fork; thirty-five miles from Frankfort.

BAIR-MAN, or **BARE MAN**, an old law term for an insolvent debtor, who was obliged to swear that he was not worth more than 5s. 5d.

BAIRNS PART OF GEAR, in the Scots law, i. e. the children's share of effects, is that portion which by the law falls to the children of a marriage, on the death of either of their parents; viz. two thirds when the father, and one third when the mother, dies first.

BAIROUT, or **BAGREUTH**, formerly Berytus, a sea-port town of Syria situated on a plain in the pchalic of Saide, or Acre. There was formerly a harbour here, which is now choked up, nothing being seen of it but a pier, apparently of ancient construction, which will shelter a few boats. The town is surrounded by a wall, built by the famous Djezzar Pacha, after the place was bombarded by the Russians. With the same view he pulled down and rebuilt a high tower to the north-east. The streets of Bairout are narrow and irregular, and the suburbs nearly as large as the town. The environs are extremely agreeable, and they are laid out in gardens and plantations full of fine trees, especially mulberries. A stream descending from Mount Lebanon winds to the sea through the country. The population amounts to 7000 or 8000. It is the residence of a Greek, and a Maronite bishop; and there is a monastery of Capuchins. The staple commodity of commerce is raw silk, which is carried to Cairo, Aleppo, Damascus, and Europe. Earthen jars and jugs of a particular kind are also manufactured here; and are much esteemed from the nature of the clay. The cotton cloth is manufactured by the inhabitants

of the adjacent mountains, and exported in considerable quantity. The trade to Europe is chiefly managed by French and Italian merchants; but the place is the emporium to which the Druses and Maronites send their products, and in return receive rice, tobacco, coffee, and specie. It is, indeed, considered the chief town of the Druses. Agrippa, the grandson of Herod the Great, constructed a theatre and amphitheatre here, as well as baths, and no expense was spared in embellishing them. Four magnificent granite columns, of which three are within the precincts of the town, with other ancient buildings, attest its former grandeur. Bairout long remained in the sole possession of the Druses, and has only of late been united to the pachalic of Acre.

BAIT, *v. a. & n. & n. s.* *baian, Sax. baitzen, Germ. battre, Fr. perhaps from baita, Goth.* According to these different derivations, the meaning of this word varies. As derived from the Saxon and German it means to put meat upon a hook to tempt fish or other animals; or to supply food to one's self or horses. Johnson intimates that in this latter sense it is a corruption of *bate*, to abate speed on a journey. As derived from the French and Gothic it assumes a very different signification, namely to invite, to stir up, to attack with violence, to harass by the help of others, as we bait a boar with mastiffs, but a bull with bull-dogs. In hawking, the hawk is said to bait when she flutters or claps her wings, as if preparing to fly.

The kinges lawe wol no man deme
Angerliche withouten answer,
But if any man these misqueme
He shall be *baited* as a bere,
And yet wel worse they wol him tere,
And in prison wolleh him pende,
In gines and in other gere,
When that God woll, it may amende. *Chaucer.*
On mony a sory mele now may she *bait*,
After hers dethe ful often may she waite,
Or that the wild waves wol hire drive,
Unto the place ther as she shal arive. *Id.*
Like a wilde bull that being at a bay,
Is *bayed* of a mastiffe and a hound,
And a curre dog that doe him sharpe assay,
On every side and beat about him round.

Faerie Queene.

What so strong,

But, wanting rest, will also want of might;
The sun, that measures heaven all day long,
At night doth *bait* his steeds the ocean waves among. *Spenser.*

The pleasant'st angling is to see the fish
Cut with her golden oars the silver stream,
And greedily devour the treach'rous *bait*.

Shakspeare.

She steals love's sweet *bait* from fearful hooks. *Id.*
Are these thy bears? We'll *bait* thy bears to death.

Id.

All plum'd like estridges, that wing the wind;
Baited like eagles having lately bath'd;
Glittering in golden coats like images. *Id.*

A grove hard by, sprung up with this their change,
His will who reigns above, to aggravate
Their penance, laden with fair fruit like that
Which grew in Paradise the *bait* of Eve,
Us'd by the tempter. *Milton.*

Many sorts of fishes feed upon insects, as is well known to anglers, who *bait* their hooks with them.

Ray.

BAIT. See **ANGLING.**

BAIT, WHITE, in ichthyology, a small fish, which is caught in great plenty, from August 1. to October 1. by stat. 30. Geo. II. ch. 21, in the river Thames, near Blackwall, and is esteemed very delicious. They are the fry of some fish, and have been attributed to the shad, the sprat, the smelt, and the bleak-fish. Pennant observes, that it belongs to the genus of cyprinus, because it has only three branchiostegous rays, and one dorsal fin; its body is compressed like that of the beak; its usual length is two inches; the under jaw is the longest; the irides are silvery, and the pupil black; the dorsal fin consists of about fourteen rays; the side line is straight; the tail forked, and the tips black.

To **BAIT**, in falconry, the action of a hawk when she claps her wings, or stoops to catch her prey.

BAITHOSUS, a Jew who, with Sadoc his fellow disciple, founded the sect of the Sadducees, denying a future state and resurrection. From Baithosus, they were for some time called Baithosæi as well as Sadducees, but are now only known by the latter denomination.

BAITING, the act of smaller or weaker beasts attacking and harassing greater and stronger; as the baiting of bulls or bears by mastiffs, or bull-dogs with short noses, that they may take the better hold. Utility has been pleaded in justification of bull-baiting; the chaffing and exercise of the animals making the flesh tenderer and more digestible. But a spirit of barbarism has the greatest share in supporting the sport: bulls are kept on purpose, and exhibited as standing spectacles for the public entertainment. It is a very popular amusement in Spain. In this sport, the chief aim of the dog is to catch the bull by the nose, and hold him down; to which end he will creep on his belly: the bull's aim, on the contrary, is, with equal industry, to defend his nose; in order to which he thrusts it close to the ground, where his horns are also in readiness to toss the dog. Bull-baiting was first introduced into England as an amusement in the reign of king John, about 1209.

BAJULUS, an ancient officer in the court of the Greek emperors. There were several degrees of bajuli; as, the grand bajulus, who was preceptor to the emperor; and the simple bajuli, who were sub-preceptors. The word is derived from the Latin verb *bajulare*, to carry or bear a thing on the arms or on the shoulders; and the origin of the office is thus traced by antiquaries. Children, and especially those of condition, had anciently, besides their nurse, a woman called *gerula*, as appears from several passages of Tertullian; when weaned, or ready to be weaned, they had men to carry them about and take care of them, who were called *geruli* and *bajuli*, a *gerendo et bajulando*. Hence it is, that governors of princes and great lords, were still denominated *bajuli*, and their charge or government *bajulatio*, even after their pupils were grown too big to be carried about. The word passed in the same sense into Greece.

BAJULUS is also used by Latin writers in the several senses wherein we use *bailiff*.

BAJULUS was likewise the title of a conventual

officer in the ancient monasteries, to whom belonged the charge of gathering and distributing the money and legacies left for masses and obits; whence he was also denominated *bajulus obituum novorum*.

BAJULUS, in entomology, a species of *cerambyx* (*callidus*) that is found in the trunks of trees in the northern parts of Europe. The thorax is villous, with two tubercles; body brown. Fabricius. This is the *cerambyx caudatus* of Degeer; and *leptura bajula* of Scopoli.—Gmelin. Obs. a variety of this species (β) is described by Linnaeus; the color of which is testaceous: thorax cinereous, and villous, with two little glabrous lines; in the Fabrician mantissa. Another variety (γ) is noticed, a native of Saxony, and only half the size of the former.

BAIZE', *n. s.* 'A kind of coarse open cloth stuff, having a long nap; sometimes frizzed on one side, and sometimes not frizzed. This stuff is without wale, being wrought on a loom with two treadles, like flannel.'—*Chambers*.

BAKE', *v. a. & n.* } *Bæcan*, Sax. *becken*,
BAKEN, *part.* } Ger. supposed by Wach-
BAKED, *adjec.* } ter to come from *bee*,
BAKER, *n. s.* } which, in the Phrygian
BAKERHOUS', *n. s.* } language, signified bread.

Bread, and the process of preparing it, are very naturally identified, as the one always suggests the other. It signifies to heat or to harden by fire, and is of a more general application than to the staff of life; though the substantives have no other reference, unless they have an affix, *sugar-baker*, &c. To *bake*, is then to heat or to harden any thing in the fire, in a furnace, an oven, or in the sun; or to do the work of baking. *Baking* denotes the progress towards the completion of this work. *Baker* is the agent by whom it is accomplished. *Baked* describes the quality of these substances which have gone through the entire process, as *baked meats*, contrasted with those from viands of a different description; and *bakchouse* is a place appropriated to the business of baking.

He will take thereof, and warm himself; yea, he smelleth it, and *bake*th bread. *Isaiah*.

There was a cake *baken* on the coals, and a cruse of water, at his head. *2 Kings*.

He could poste and sethe, and broile and frie, *Chaucer*.
 Baken mornwex and wel *bake* a pie,
 But gret harm was it as it thoughte me,
 That on his shinne a mormal hadde he.

His brede, his ale, was alway after on,
 A better envy'd man was no where non;
 Withouten *baken mete* never was his house,
 Of fish and flesh, and that so plenteous
 It snowed in his hoons of mete and drinke,
 Of all the demities that man cou'd thinke. *Id.*

Loose of Ulypt the king Don Pharao,
 His *Baker* and his Porter also,—

Whiche of the one I ben non object in dremes. *Id.*
 I ben his *baker*, and I wash, wring, brew, *bake*,
 I wash, wring, and make the beds, and do all mys-
 se. *Shakespeare*.

The *baker* that in many a rowe plow'd the food,
 And, as he went, the *baker* that plow'd the mud. *Dryden*.

They *bake* the flour, as we say, in *baking*; and what-
 soever they *bake*, *baketh*, *bake*, &c. in some degree, dis-
 solve. *Bacon*.

There be some houses wherein sweetmeats will re-
 lent, and *baked meats* will mould, more than others. *Id*

With vehement suns
 When dusty summer *bakes* the crumbling clods,
 How pleasant is 't, beneath the twisted arch,
 To ply the sweet carouse! *Philips*.

In life and health, every man must proceed upon
 trust, there being no knowing the intention of the
 cook or *baker*. *South*.

BAKING, as a term of art, though applicable to the drying of any moist substance by heat, has been used more particularly to describe the art of preparing bread, or of reducing meal of any kind, whether simple or compound, into bread. We read, indeed, as in Chaucer, (Prologue v. 436) of 'bake mete, of fish, and flesh;' and some of our modern inventions in the way of cooking apparatus seem destined to extend the triumphs of this art, and to bake a whole Lord Mayor's dinner in less time than even his worshipful guests consume in eating it. But the 'baker,' historically and legally, has been the baker of bread. In an Anglo-Saxon colloquy, preserved in the Cotton Library (MS. Tib. A. 3.) and presenting a lively picture of the manners of our ancestors, a sort of dialogue occurs with the baker (*bæcere*):—'Of what use is your art? We can live long without you.' He replies, 'You may live through some space without my art, but not long, nor well. Without my craft every table would seem empty; and without bread (*hlafe*) all meat would seem nauseous.'

We have therefore only here to remark, generally, that the art of baking, of the highest antiquity, is, in regard to its origin, involved in entire obscurity: traces of it being found in the history of all ancient nations. Abraham and Lot, in the patriarchal ages, evinced their hospitality by providing baked cakes or unleavened bread for their guests; and shortly after (Exod. xii. 15.) the prohibition of leavened bread to the Israelites proves that the art of making it was well known and ordinarily practised. In Egypt it is highly probable the Jews became acquainted with this art: though the Chaldeans are said to have practised it as early as any people. The Greeks ascribe the invention of it to Pan, who Diodorus informs us, was originally an Egyptian deity, and that Thebes was built to his honor, (lib. i.) The Romans were long reproached as a pulse-eating people. Until 580 years after the founding of their metropolis it contained no professed bakers. They first settled in it, we are told by Pliny (Hist. Nat. xviii. 11), during the war with Perseus, king of Macedonia: we find, however, before this time families baking their own bread.

Bakers, as we have seen, were esteemed important members of society by our ancestors. The incorporation of a London company with this title took place in the early part of the fourteenth century (1307), and by a statute 22 Hen. VIII. cap. 13., their trade was exempted from being reckoned as handicraft. Until a late act of parliament abolished their control of the price, called the *assize of bread*, this constituted an important portion of the duties of the London magistracy.

Under the word **BREAD**, we propose to treat of the entire manufacture of that important article: and the reader will find much useful information connected with the economy of fuel in baking under **COMBUSTION, HEAT, CHEMISTRY, and FURNACE.**

BAKER (David Erskine), son of Henry Baker, was a young man of genius and learning. Having been adopted by an uncle, who was a silk throwster in Spitalfields, he succeeded him in the business; but wanted the prudence and attention necessary to secure prosperity in trade. Like his father, he was both a philosopher and a poet; and wrote several occasional poems, some of which were much admired at the time. His principal publication was, *The Companion to the Play-house*, in two volumes, 1764, 12mo; a work, which though imperfect, has considerable merit.

BAKER (Henry), an ingenious and diligent naturalist, was born in Fleet-street, London, about the end of the seventeenth, or beginning of the eighteenth century. He was brought up under an eminent bookseller, who preceded the elder Dodsley, but being of a philosophical turn, and having studied the methods practicable in the cure of deaf and dumb persons, he made this the employment of his life. In the prosecution of so valuable and difficult an undertaking he was very successful. He married Sophia, youngest daughter of the famous Daniel Defoe, who brought him two sons, both of whom he survived. In January, 1740, he was elected a fellow of the Society of Antiquaries; and, on the twelfth of March following, the same honor was conferred upon him by the Royal Society. In 1744 Sir Godfrey Copley's gold medal was bestowed upon him, for discoveries in the crystallisation and configurations of saline particles. Having led a very useful and honorable life, he died in the Strand in 1774, aged above seventy. Mr. Baker was a very constant and useful attendant at the meetings of the Royal and Antiquarian Societies, and in both was frequently chosen of the council. Several of his communications are printed in the *Philosophical Transactions*; and he was the means, by his extensive correspondence, of conveying to the Society the intelligence and observations of many other inquisitive and philosophical men, at home and abroad. The society for the encouragement of arts, manufactures, and commerce, is under singular obligations to him. Being one of its earliest members, he contributed greatly to its rise and establishment, and at its first institution officiated for some time gratis as secretary. He drew up a short account of its origin, which was read before the society of antiquaries. Mr. Baker was a poetical writer in the early part of his life. His *Invocation of Health* was printed without his knowledge; but reprinted by himself in his *Original Poems*, serious and humorous, part I. 8vo. 1725. Part II. came out in 1726. Among these poems are some tales as witty, and as loose as *Prior's*. He was the author likewise of the *Universe*, a poem, which has been several times reprinted. His account of the water polype, originally published in the *Philosophical Transactions*, was afterwards enlarged into a separate treatise, and has gone

through several editions. But his principal publications are, *The Microscope made Easy, and Employment for the Microscope.*

BAKER (Sir Richard), author of the *Chronicle of the Kings of England*, was born at Sissingherst, in Kent, about the year 1568. After completing his studies at Oxford, he travelled, and upon his return was created A. M. In 1603 he was knighted by king James I. and in 1620, high sheriff of Oxfordshire; but engaging to pay some of the debts of his wife's family, he was reduced to poverty, and obliged to retire for shelter to the Fleet prison. His works are, 1. *Meditations and Disquisitions on the Lord's Prayer.* 2. *Meditations, &c. on several Psalms.* 3. *Meditations and Prayers upon the Seven Days of the Week.* 4. *Cato Variiegatus, or Cato's Moral Distiches varied, &c.*—Mr. Granger observes, 'That his *Chronicle of the Kings of England* was more esteemed by readers of the lower class, than by such as had a critical knowledge of history. The language of it was called polite: and it long maintained its reputation, especially among country gentlemen. The author seems to have been sometimes more studious to please than to inform, and with that view to have sacrificed even chronology itself to method.' In 1658 Edward Philips, nephew to Milton, published a third edition of this work, with the addition of the reign of Charles I. It has been several times reprinted, and is now carried as low as the reign of George I. Sir Richard also translated several works from the French and Italian. He died in the Fleet, very poor, in 1645.

BAKER (Thomas), an eminent mathematician, was born at Ilton, in Somersetshire, about 1625, and entered at Wadham College, Oxon, 1640; after which he was vicar of Bishop's Nymmet, in Devonshire, where he wrote *The Geometrical Key, or the Gate of Equations unlocked*, by which he gained a considerable reputation. A little before his death, the members of the Royal Society sent him some mathematical queries, to which he returned such satisfactory answers, that they presented him a medal. He died at Bishop's Nymmet, in 1690.

BAKER (Thomas), a very ingenious and learned antiquary, descended from an ancient family, was born at Crook, in 1656; educated at the free school at Durham, and thence removed to Cambridge in 1674. He proceeded B. A. in 1677; M. A. 1681; was elected fellow, March, 1679-80: ordained deacon by Bishop Compton, Dec. 20th, 1685, and priest by Bishop Barlow, Dec. 19th, 1686. Being chaplain to Lord Crew, bishop of Durham, his Lordship collated him to the rectory of Long-Newton, June, 1687; and intended to have given him that of Sedgfield, worth about £700 a year, with a golden prebend, had he not incurred his displeasure for refusing to read King James II.'s declaration for liberty of conscience. Mr. Baker resigned Long-Newton, August 1st. 1690, refusing to take the oaths; and retired to his fellowship at St. John's, in which he was protected till Jan. 20th, 1716-17, when he was dispossessed of it, in consequence of scrupling to take the oaths required on the accession of George I. but he retained his chambers at St. John's college, where he was highly esteemed, and M1.

Prior, the celebrated poet, gave the profits of his own fellowship to Baker, in order to supply the loss of income which he had suffered. He is said to have retained a lively resentment of his deprivations; and designated himself in his books, as well as in those which he gave to the college library, *socius ejectus*, and in some, *ejectus rector*. He continued to reside in the college as commoner master till his death, July 2d, 1740. Mr. Baker's correspondence with men of learning was extensive; and he was liberal in his literary communications to those who solicited information; particularly to bishop Burnet, who was indebted to him for several remarks and corrections relating to his History of the Reformation. Of his extensive collections, he left twenty-three volumes in folio, written by his own hand, to Lord Oxford, and they now compose part of the Harleian collection in the British museum. He also bequeathed fifteen volumes folio, of a like kind, to the public library at Cambridge, together with other MSS. and printed books. *Biog. Brit.* 'Mr. Baker,' says the Earl of Orford, was 'perhaps the sole instance of a man who bequeathed his worldly goods to a society that ejected him, and to the ministers of a church in which he had lost preferment.' The only works he printed were, 1. *Reflections on Learning*, showing the insufficiency thereof in its several particulars, in order to evince the usefulness and necessity of Revelation, Lond. 1709-10; and 2. The Preface to bishop Fisher's funeral sermon for Margaret, Countess of Richmond and Derby, 1703; both without his name. Dr. Knight styles him 'the greatest master of the antiquities of this our university;' and Hearne pays him a similar compliment; expressing his wish that his collections were published. Mr. Baker intended something like an *Athenæ Cantabrigienses*, on the plan of the *Athenæ Oxonienses*.

BAKER (Sir George), M. D. was the son of a Devonshire clergyman, born in 1722, and educated at Eton and Cambridge. He commenced practice at Stamford, whence he soon removed to London, and soon attained considerable reputation, being appointed physician in ordinary to the king, and physician to the queen: he was also chosen fellow of the Royal and Antiquarian Societies. In 1776 he was created a baronet, and in 1797 was placed at the head of his profession, and elected president of the College of Physicians. He died June 15th, 1809. Sir George Baker had the reputation of being an elegant classical scholar and critic. His published works are, *An Essay on the Cause of the Epidemical Cholera of Devonshire*, (about 1767), which gave rise to a controversy relative to the origin of that malady, which he attributed to the use of cyder, and which is quoted with eulogium in a late edition of the *Pharmacopœia of the Medical College*, with many other Essays in the *Medical and Philosophical Journals* of his time.

BAKERS' COMPANY: there are two companies of this name, the White and the Brown Bakers. The White Bakers are of great antiquity, being found a company as early as Edward I. Their arms are (Fig. 1.) 'gules, three garbs, or on a chief; an arm issuing out of a cloud,

proper, holding a pair of scales, or, between three garbs of the first.'

Fig. 1.

Fig. 2.

The Brown Bakers were incorporated the 19th of James I. Their arms (fig. 2) are 'gules, a hand issuing out of the clouds, *proper*, holding a pair of scales; and an anchor in a chief, barry wavy, or and azure, on a chevron, *gules* between three garbes.

BAKEWELL (Robert), a famous grazier, born in 1726, on his father's estate of Dishley, in Leicestershire. For some years before his father's death, he had the management of the farm, and his attention was much taken up in improving the breed of his cattle. In pursuit of this object, he travelled over England into Ireland and Holland; and such was his success, that in a short time the Dishley sheep were prized so much above others, that he could let one of his rams for no less than 400 guineas! and for one in particular, he drew the enormous sum of 800 guineas, besides the ewes from his own stock, which, by the same calculation, makes a total of 1200 guineas! Dishley sheep are distinguished by the fineness of their bone and flesh, the lightness of the offal, and quiet disposition, which makes them fatten with less food than other sheep equally heavy. Mr. Bakewell also greatly improved his black cattle; and could let his bulls at fifty guineas a season each. He died in 1795. On the other hand, it has been stated that he failed in business more than once; and, with regard to the effect of his improvements, it has been sarcastically remarked, that they enabled him to make meat too fat for any body to eat, and too dear for any body to purchase.

BAKEWELL, a market town and parish in the hundred of High-Peak, Derby, eleven miles west from Chesterfield, and 152 north from London. It is seated on the river Wye, and contains 1700 inhabitants. It is supposed to have been a Roman town. The place is much resorted to by anglers; the Wye producing plenty of trout, grayling, &c. There are several good quarries of stone, and lead and zinc mines, in the neighbourhood; here is also a large cotton manufactory. Three miles distant is Chatsworth, a magnificent seat of the duke of Devonshire. This celebrated mansion was erected by William the first duke of Devonshire, in the year 1702. The unfortunate Mary, queen of Scots, was doomed to thirteen years' captivity in the old mansion at this place. On the east side, not far distant from the town, is a high mountain, on the top of which millstones are dug. The living of Bakewell is in the gift of the dean and chapter of Litchfield; and the parish is exempt from episcopal jurisdiction. Market on Monday. Its fairs are on Easter Monday, Whit Monday, the Monday

after October 10th, and the Monday after November 22d. At a short distance from Bakewell is Ashford, where are some marble works that were the first of the kind established in England. Great quantities of black and gray marble are sawed and polished by means of machinery kept in motion by water. About two miles south of Bakewell is Haddon Hall, a truly venerable mansion, belonging to his grace the duke of Rutland. The high turrets and embattlements of this house, when beheld at some distance, give it the appearance of an ancient fortified castle. It presents, perhaps, a more complete specimen of the ancient English baronial mansion than is to be found in any other house in the kingdom. For a particular description of it see the *Beauties of England and Wales* vol. iii. p. 494.

BAKHISHISARAI, or simply **BACCA-SERAI**, 'the summer-house,' a large town of European Russia, in the Crimea, government of Taurida, formerly the residence of the khans, situated between two hills, and containing from 10,000 to 12,000 inhabitants. Here are manufactures of Turkey leather, saddles, silk stuffs, and cutlery. Fifty miles north of Caffa. Long. 33° 52' E., lat. 45° 10' N.

BAKOONGAR, one of the Sooloo islands. It is high and rocky, and has some inhabitants.

BAKOS, a river of Great Bukharia, from which and others the Harrat is formed.

BAKOU, or **BAKU**, a town of Persia, in the province of Shirvan, situated at the extremity of the Gulf of Ghilan, occupying the peninsula of Abasharon, on the west coast of the Caspian. It is esteemed the most commodious haven in that sea, as vessels may ride securely at anchor in seven fathoms of water, within eighty yards of the shore; but the number of shoals, islands, and sand banks, render the entrance, in some places, difficult and dangerous. The town is of an obtuse triangular form; it occupies a strong and fine situation, and is defended by a strong wall and deep ditch. Good cotton is yielded in the neighbourhood, together with opium, rice, silk, wine, salt, and naphtha. In the latter article is the principal trade of Bakou, 1000 or 1500 pounds of it being yielded by the wells in this district daily. The country around is highly volcanic, abounding with inflammable gases, which, being collected in leather flasks, will ignite at a distance. Hence, the town and its environs abound in monuments of the superstition of the Guebres, Parsees, and other fire worshippers, some of whom yet frequent a spot called Ateschjah. Various temples built of stone appear; in one of which a blue lambent flame issued from a large hollow cane near the altar. The jurisdiction of Baku extends over thirty-two villages. It was ceded to Russia in the year 1723, and restored to Persia in 1735; but retaken by the Russians in 1801, who have ever since kept possession of it.

BAKTEGAN, or **BAKTEGHIAN**, a salt lake in the province of Fars, Persia, about seventy-five miles in circuit. It is nearly dry in summer, when a quantity of fine salt, left by evaporation, is collected from the bottom. Distant ten miles south-east of Shiraz.

BAKTSCHISARI, an open town on the west side of the Crimea, near the sea, seated between two mountains. It is one of the places of residence of the cham of Tartary.

BAKU. See **BAKOU**.

BAL, a Gaelic word, used in the composition of the names of many places, particularly in Scotland and Ireland, and signifying a town, village, or place of residence.

BALA, a market town of Merionethshire, in North Wales, and a borough by prescription, but sending no member to parliament. It is 202 miles north-west of London, and 26 from Welshpool. Population 1163. The assizes for the county are held here alternately with Dolgelly. There are vestiges of three Roman camps in the neighbourhood, and adjacent to the town is a large artificial mount, called Tommen y Bala, supposed to be of Roman origin. Its manufactures are woollen gloves, stockings, and the caps called Welsh wigs.

Pemle Mere, Llyn Tegid, or Bala lake, lies a few miles to the south of the town, and is the largest sheet of water in Wales, being four miles in length, and about three quarters of a mile in breadth. Its depth of water is about forty feet; but it sometimes rises above its usual level, overflowing the beautiful vale of Eidernion. It abounds in fish, and the tradition of the country states that the river Dee, like the Rhone at Geneva, passes through without mixing its waters with those of the lake.

BALAAAM; from בלר, without, and עז, people; the son of Beor, a prophet and diviner of Pethor, upon the Euphrates, whose practices with Balak, king of the Moabites, are recorded in Numbers xxii.—xxiv. as well as his involuntary prophecies of the prosperity of Israel. Jewish writers are generally of opinion that he was a pretending astrologer, who observing when men were under a bad aspect of the stars, pronounced a curse upon them; which sometimes coming to pass, gained him reputation. Several ancient fathers suppose him to have been a common soothsayer, who undertook to tell future events, and discover secrets, by no very justifiable arts. Origen will have it, that he was one of the devil's sorcerers, and that of him he went to enquire; but that God prevented him, and put what answers he pleased into his mouth. It cannot be denied, however, that the Scriptures expressly call him a prophet, 2 Pet. ii. 16, and therefore some later writers have imagined that he had once been a good man, till loving the wages of iniquity, and prostituting the honour of his office to covetousness, he apostatised from God, and devoted himself to idolatrous practices. Philo, in his Life of Moses, passes over the miracle of his ass speaking to the prophet in silence; and Maimonides pretends that it happened to Balaam in a prophetic vision only. St. Peter, however, assuredly speaks of the fact as literal and certain. We must own, says Calmet, that this is a miraculous fact related by an inspired writer, whose authority we ought not to call in question in the least particular; but we should study such ways of explaining it as are most conformable to reason, and most proper to solve the difficulties of it, without attacking the truth of the history. The miracle, says

bishop Newton, was not unnecessary. 'It evidenced, that the same divine power, which caused the ass to speak, compelled Balaam to utter blessings contrary to his inclination. And accordingly he was overruled to bless the people, though he came prepared and disposed to curse them; which, according to Bochart, was the greater miracle of the two, for the ass was merely passive, but Balaam resisted the good motions of God.'

BALAAMITES, a sect in the first ages of Christianity, of the same import in the Hebrew language with Nicolaitans in the Greek.

BALABAC, an island of the eastern seas, off the south extremity of Palawan. Long. 117° 10' E., lat. 8° N.

BALABEA, an island of the South Pacific Ocean, off New Caledonia. Long. 164° 22' E., lat. 20° 7' S.

BALABOLA, one of the Society Islands in the South Sea, visited by Captain Cook. It is only eight leagues in circumference, but has a very capacious harbour on the west side.

BALACHNA, or **BALAKHAN**, a town of European Russia, in the government of Nishnei-Novgorod, on the right bank of the Wolga. The salt springs here were closed in 1755. The inhabitants, engaged partly in agriculture and partly in trade, amount to 5000. It is eighteen miles W. N. W. of Nishnei-Novgorod, and 120 E. S. E. of Petersburg.

BALADAN, the scripture name for a king of Babylon, Isa. xxxix. 1. 2 Kings xx. 12, called by profane authors Belesus or Belesis, Nabonassar or Nabrus. He at first was no more than governor of Babylon; but entering into a confederacy with Arbaces, governor of Media, and rebelling against Sardanapalus, king of Assyria, these two generals marched against him with an army of 100 000 men, and were beat in three different battles. But the Bactrians deserting the king, and coming over to Baladan and Arbaces, the rebels attacked the enemy in the night, and made themselves masters of his camp. After this misfortune, Sardanapalus retreated to Nineveh, and left the command of his army to his brother-in-law Salamenes. The conspirators attacked Salamenes, and defeated him in two great battles; after which they laid siege to Nineveh. Sardanapalus sustained the siege for three years; but the Tigris, in the third year, overflowing its banks, beat down twenty furlongs of the walls: whereupon the conspirators entered the city and took possession of it, after Sardanapalus had burnt himself and all his most valuable effects upon a funeral pile, erected for that purpose in his palace. Baladan was thereupon acknowledged king of Babylon, as Arbaces was of Media. Sir Isaac Newton supposes Baladan to have been the son of Pul, king of Assyria, and to have had Babylon for his portion.

BALÆNA, the whale, in zoology, from βαλαω, to cast up, because it throws up water, a genus of the mammalia class, belonging to the order of cetæ. The characters of this genus are, the balæna, in place of teeth, has a horny plate on the upper jaw, and a double fistula or pipe for throwing out water. There are five principal species; 1. *B. bosops*, the pipe-headed

whale, has a double pipe in its snout, three fins and a hard horny ridge on its back. The belly is full of longitudinal folds or rugæ. It frequents the northern ocean. The length of that taken on the coast of Scotland, as remarked by Sir Robert Sibbald, was forty-six feet, and its greatest circumference twenty. This species takes its name from the shape of its nose, which is narrower and sharper pointed than that of other whales. 2. *B. Musculus*, has a double pipe in its front, and three fins; the under jaw is much wider than the upper one. It frequents the Scotch coast, and feeds upon herrings. 3. *B. mysticetus*, the common whale, which has many turnings and windings in its nostrils, and no fin on the back. This is the largest of all animals; it is commonly found of from fifty to sixty feet; but some have been taken in modern times, in the northern seas ninety feet in length. But as Mr. Scoresby observes, 'there is every probability of an error having been committed two or three centuries back (from which period some of our dimensions have been derived), when we know that whales were usually viewed with superstitious dread, and their magnitude and powers in consequence highly exaggerated. Of 322 individuals, in the capture of which I have been personally concerned, no one, I believe, exceeded sixty feet in length, and the largest I ever measured was fifty-eight feet from one extremity to the other, being one of the longest to appearance I ever saw. From fifty to sixty feet therefore may be considered the average length of the Greenland whale.' The head is very much disproportioned to the size of the body, being one third of the size of the fish, and the under lip is much broader than the upper. The tongue is composed of a very soft spongy fat, capable of yielding five or six barrels of oil. The gullet is very small, not exceeding four inches in width. In the middle of the head are two orifices through which it spouts water to a vast height, and with a great noise, especially when disturbed or wounded. The eyes are not larger than those of an ox, and when the chrystalline humor is dried, it does not appear larger than a pea. They are placed towards the back of the head, being the most convenient situation for enabling them to see both before and behind; as also to see over them, where their food is principally found. They are guarded by eye-lids and eye-lashes, as in quadrupeds; and they seem to be very sharp sighted. Nor is their sense of hearing in less perfection; for they are warned at a great distance of any danger preparing against them. It would seem as if nature had designedly given them these advantages, as they multiply little, in order to continue their kind. It is true, indeed, that the external organ of hearing is scarcely perceptible, for this might only embarrass them in their natural element; but as soon as the thin scarf-skin after mentioned is removed, a black spot is discovered behind the eye, and under that is the auditory canal, that leads to a regular apparatus for hearing. In short, the animal hears the smallest sounds at very great distances, and at all times, except when it is spouting water; which is the time that the fishers approach to strike it.

What is known by the name of whalebone, adheres to the upper jaw of the whale; and is formed of thin parallel laminae, some of the longest four yards in length; of these there are commonly 350 on each side, but in very old fish more; about 500 of them are of a length fit for use, the others being too short. They are surrounded with long strong hair, not only that they may not hurt the tongue, but as strainers to prevent the return of their food when they discharge the water out of their mouths. The real bones of the whale are hard, porous, and full of narrow. Two great strong bones sustain the upper lip, lying against each other in the shape of an half moon. The tail is broad and semi-circular; and when the fish lies on one side, its blow is tremendous. The tail alone it makes use of, to advance itself forward in the water; and it is surprising to see with what force and celerity its enormous bulk cuts through the ocean. The tail occupies a surface of eighty or 100 square feet, it is only five or six feet long, but from eighteen to twenty-four or twenty-six feet in breadth, and is placed horizontally: its motions are rapid and universal. The fins are only made use of for turning in the water, and giving a direction to the velocity impressed by the tail: they are from seven to nine feet long, and four to five broad, being capable of motion in any direction; but they are prevented from being raised above the horizontal position by the tension of the skin and flesh below; the account therefore of whales supporting their young on their back by means of their fins, must be fabulous. The whale varies in color; the back of some being red, the belly generally white. Others are black, some mottled, others quite white. Their colors in the water are extremely beautiful, and their skin is very smooth and slippery. The outward or scarf skin of the whale is no thicker than parchment; but this removed, the real skin appears, of about an inch thick, and covering the fat or blubber that lies beneath: this is from eight to twelve inches in thickness; and is, when the fish is in health, of a beautiful yellow. The muscles lie beneath; and these, like the flesh of quadrupeds, are very red and tough. The teats in the female are in the lower part of the belly. The fidelity of the male and female to each other exceeds whatever we are told even of the constancy of birds. Some fishers, Anderson informs us, having struck one of two whales, a male and a female, that were in company together, the wounded fish made a long and terrible resistance: it struck down a boat with three men in it, with a single blow of its tail, by which all went to the bottom. The other still attended its companion, and lent it every assistance; till, at last, the fish that was struck, sunk under the number of its wounds; while its faithful associate, disdainful to survive the loss, with great bellowing, stretched itself upon the dead fish, and shared his fate. The whale goes with young nine or ten months, and generally produces one young one, and never above two. When she suckles her young, she throws herself on one side on the surface of the sea, and the young one attaches itself to the teat. Nothing can exceed the tenderness of the female

for her offspring; she carries it with her where ever she goes, and when hardest pursued, even when wounded, she still clasps her young one; and when she plunges to avoid danger, takes it to the bottom; but rises sooner than usual, to give it breath again. In June 1811, says Mr. Scoresby, one of my harpooners struck a sucker, with the hope that it would lead to the capture of the mother. Presently she arose close by the 'fast boat,' and seizing the young one, dragged about a hundred fathoms of line out of the boat with remarkable force and velocity. Again she arose to the surface; darted furiously to and fro; frequently stopped short, or suddenly changed her direction, and gave every possible intimation of extreme agony. For a length of time she continued thus to act, though closely pursued by the boats; and, inspired with courage and resolution by her concern for her offspring, seemed regardless of the danger which surrounded her. At length, one of the boats approached so near, that a harpoon was hove at her. It hit, but did not attach itself. A second harpoon was struck; this also failed to penetrate; but a third was more effectual, and held. Still she did not attempt to escape, but allowed other boats to approach; so that in a few minutes three more harpoons were fastened; and in the course of an hour afterwards she was killed. The young ones continue at the breast for a year; during which time, they are called by the sailors, short-heads. They are then extremely fat, and yield above fifty barrels of blubber. The mother at the same time is equally lean and emaciated. At the age of two years they are called stunts, as they do not thrive much immediately upon quitting the breast: they then yield scarcely above twenty or twenty-four barrels of blubber: after this they are called skull-fish, and their age is wholly unknown. 4. B. physalus, or fin-fish, is distinguished from the common whale by a fin on the back, placed very low and near the tail. The length is greater than that of the common kind, being often 100 feet; but much more slender. It is furnished with whalebone in the upper jaw, mixed with hairs, but short and knotty, and of little value. The blubber also on the body of this kind is very inconsiderable. These circumstances, added to its extreme fierceness and agility, which render the capture very dangerous, cause the fishers to neglect it. The natives of Greenland, however, hold it in great esteem, as it affords a great quantity of flesh, which to their palate is very agreeable. The lips are brown, and like a twisted rope: the spout hole is as it were split in the top of its head, through which it blows water with much more violence, and to a greater height, than the common whale. The fishers are not very fond of seeing it, for on its appearance the others retire out of those seas. Some writers conjecture this species to have been the *ουσαλος*, and phlyseter, or blowing whale of Oppian, Ælian, and Pliny: but, since those writers have not left the least description of it, it is impossible to judge which kind they meant; for in respect to the faculty of spouting out water, or blowing, it is not peculiar to any one species, but common to all the whale kind. The physalus inhabits the

European and American Oceans: it feeds upon herrings and other fish. 5. *B. rostrata*, beaked whale: *rostrata mysticete*. The nose of this species is elongated to a beak, and the dorsal fin fat. It inhabits the Norway seas, is rarely seen near England, is very black, much resembling the boops, swims rapidly, and is about twenty-five feet long.

Each species of whale propagates only its own kind, and does not at all mingle with the rest: however, they are generally seen in shoals, of different kinds together, and make their migrations in large companies. They are gregarious animals; which implies their want of mutual defence against the invasions of smaller but more powerful fishes. It seems astonishing, therefore, how a shoal of these enormous animals find subsistence together. To increase our wonder, we not only see them herding together, but usually find them fatter than any other animals of whatsoever element. We likewise know that they cannot swallow large fishes, as their throats are so narrow that an animal larger than a herring could not enter. How then do they subsist, and grow so fat? A certain sort of small snail, or, as Linnaeus tells us, the medusa, or sea-blubber, is sufficient for this supply. (See *MEDUSA*.) They float in vast abundance in the northern seas. Content with this simple food, it pursues no other animal, leads an inoffensive life in its element, and is harmless in proportion to its strength to do mischief. But Martens says he has found a barrel or more of herrings at a time in the belly of the whale. Inoffensive in itself, however, it has many enemies ready to take advantage of its disposition, and of its unfitnes for combat. There is a small animal of the shell-fish kind, called the whale-louse, that sticks to its body as we see shells sticking to the foul bottom of a ship. This insinuates itself chiefly under the fins; and whatever efforts the great animal makes, it still keeps its hold, and lives upon the fat, which it is provided with instruments to arrive at. The sword-fish, however, is the whale's most terrible enemy. See *XIPHIAS*. 'At the sight of this little animal,' says Anderson, 'the whale seems agitated in an extraordinary manner; leaping from the water as if with affright; wherever it appears, the whale perceives it at a distance, and flees from it in the opposite direction. I have been myself,' continues he, 'a spectator of their terrible encounter. The whale has no instrument of defence except the tail; with that it endeavours to strike the enemy; and a single blow taking place would effectually destroy its adversary; but the sword-fish is as active as the other is strong, and easily avoids the stroke; then bounding into the air, it falls upon its great subjacent enemy, and endeavours, not to pierce it with its pointed beak, but to cut it with its toothed edges. The sea all about is seen dyed with blood, proceeding from the wounds of the whale; while the enormous animal vainly endeavours to reach its invader, and strikes with its tail against the surface of the water, making a report at each blow louder than the noise of a cannon.' In calm weather, the fishermen lie upon the rocks as spectators of this scene, until they perceive the whale at an extremity: then they row towards him; and his enemy re-

tiring at their approach, they enjoy the fruits of the victory. Seamen report, that a fish called the thresher, a species of *squalus*, is in league with the sword-fish; and that the former keeps on the back of the whale, while the latter wounds it underneath in the belly. The grampus, and other large fishes of the cetaceous order, are attacked and destroyed by the same enemies in a similar manner. The whale has other desperate enemies in sharks of different sizes, from one to three fathoms; and it generally avoids the seas where sharks abound. But among all the enemies of this harmless animal, man may be ranked as the greatest.

Viewing the whale in a commercial light, we must observe, that the English were late before they engaged in this fishery. It appears by a set of queries, proposed by a merchant, in 1575, in order to get information in the business, that we were at that time totally ignorant of it, being obliged to send to 'Biskaie for men skilful in the catching of the whale and ordering of the oil, and one cooper skilful to set up the staved cask.' This seems strange: for by the account Ochter gives of his travels, to king Alfred, near 700 years before that period, it is evident that he made that monarch acquainted with the Norwegians practising the whale fishery; it seems therefore that all memory of that gainful employment, as well as of the able voyager Ochter and his important discoveries, was lost for nearly seven centuries. The earliest notice we find of this article in our commerce is by Hackluyt, who says it was brought from the Bay of St. Laurence by an English ship that 'went there for the barbes and fynnes of whales and train oil, A. D. 1594, and found there 700 or 800 whale fynnes, part of the cargo of two great Biskaine ships, that had been wrecked three years before.' About 1598, the town of Hull had the honor of first seriously attempting this profitable branch of trade; which has largely contributed to its aggrandizement.

We will resume the history and description of it, however, under *FRYSERIÆ*, which see. Linnaeus makes the physeter and delphinus, which are ranked among the whales by some writers, two distinct genera. See *PHYSETER* and *DELPHINUS*.

BALAGHAR, a district of Persia, in the principality of Baku, including some villages, near which are twenty-five wells of black naphtha. There is also one of a very inflammable white naphtha: this remains lighted on the surface of water; whence it is a common amusement among the inhabitants to throw pieces of it, during calms, into the sea. It is subject to Russia.

BALAGHAUT, or **BALAGATE**, the upper passes of a chain of mountains which divides the coast of Malabar from that of Coromandel, running almost the whole length of the peninsula on this side the Ganges. Some parts of them are covered with fine red earth, which is blown by the strong west winds as far as Ceylon; and when the rays of the sun are reflected from these mountains, they seem to be on fire. They make surprising alterations in the seasons; for on the north side of the cape Comorin, it is winter in May, June, July, August, and September, in which months it is summer on the south side: on one side there are continual tempests, thunder

and lightning, while the other enjoys a constant serenity. When black clouds are gathered about the mountains, they are followed by sudden rain, which causes the overflowing of the rivers, and chokes them up with sand, inasmuch that they are unnavigable for some time afterwards. The buildings and clothes of the inhabitants of this region are scarcely sufficient to defend them from the weather. They live upon rice, milk, roots, and herbs, with very little meat; they have likewise a sort of small arrac, but they are not given to drunkenness. These mountains are also called the Ghauts.

BALAGUER, a town of Spain, in Catalonia, situated on the Segre, at the foot of a steep hill, in a tract of uncommon fertility. It contains four convents, a castle, and 3700 inhabitants. The neighbourhood is very fertile. In 1709 Balaguer was taken by Stahremberg, for Charles III. and in 1710 by the duke de Vendome, for Philip V. It is the capital of a district, and lies sixty-three miles north-west of Barcelona, and 219 north-east of Madrid. Long. $0^{\circ} 40' E.$, lat. $41^{\circ} 55' N.$

BALAK; בלק, Heb. i. e. a destroyer; the son of Zippor, a king of the Moabites, who, alarmed at the success of the Israelites, and jealous of their prosperity, sent for Balaam, and bribed him to curse them, Num. xxiii. and xxiv. The divinations of Balaam, however, and the still more powerful enchantments of the fair Moabitesses, appear to have been the only weapons employed by Balak against the prosperity of Israel; for we find Jephthah urges it as an argument, in his manifesto against the king of the Ammonites (Judges xi. 25.), that Balak never actually fought against them.

BALAKLMA, or **BALACHRA**, a town of Russia, in the province of Nizney Novgorod, on the Volga, twenty miles north of the city of Nizney Novgorod. Long. $44^{\circ} 0' E.$, lat. $56^{\circ} 30' N.$

BALALUAN, a volcano in the island of Sumatra, situated in the northern part of the island, near Acheen.

BALAMATTA, a town on the east coast of the island of Bourou. Long. $126^{\circ} 17' E.$, lat. $3^{\circ} 12' S.$

BALAMBANGAN, a fertile island in the Eastern seas, between Borneo and Magindanao. It is about fourteen miles in length from south-east to north-west, and three to six in breadth, and has two harbours. Being ceded by the king of Sooloo to the English East India Company, a settlement was established upon it in 1773; but the Sooloo surprised it in 1775, and seized the effects of the company, to the value of above £200,000 sterling. A new establishment was formed in 1803, which proving expensive, was withdrawn. Previous to 1774 it was nearly uninhabited. Distant fifteen miles from the northern extremity of Borneo. Long. $117^{\circ} 5' E.$, lat. $7^{\circ} 15' N.$

BALAMBUAN, or **BALLANBOUANG**, or **PALAMBUAN**, a district and town in the south-east of the island of Java, along the shore of the straits of Bally; formerly governed by an independent sovereign. A range of mountains, intersecting the island longitudinally, commences here. Considerable trade in pepper was once

carried on here; but the European resident having removed to Bagnouangay, it has been transferred thither. The town stands on a river of the same name, and is protected by a fort.

BALAMBUAN, or **PALAMBUAN**, a strong trading town of Asia, in the East Indies, on the east end of the island of Java, and capital of a territory of the same name.

BALAMIO (Ferdinand), of Sicily, was physician to pope Leo X. who greatly regarded him. He was no less skilled in the belles lettres than in medicine; and he cultivated poetry and the Greek learning with much success. He translated from the Greek into Latin several pieces of Galen, which were first printed separately, and afterwards inserted in the works of that ancient physician, published at Venice, 1586, in folio. He flourished at Rome about the year 1555.

BALAM-PULLI, in botany, a name used by some authors for the tree whose fruit is the tamarind of the shops.

BALANCE, *n. s. v. a. & n.* } Fr. *balance* ;
BALANCING, } Lat. *bis lanx*. One
BALANCER. } of the six simple

powers in mechanics, used principally for determining the difference of weight in heavy bodies; and consequently their masses or quantities of matter. For further definition and description, see **CLOCK-MAKING** and **MECHANICS**. The metaphorical applications of the different parts of this word are various. To balance in the mind is to compare one thing with another. The act of comparing two things together is called a balance; it also is used to signify fluctuation between equal motives: as applied to accounts, it means that which is wanting to make two parts even, and the payment of what is deficient, to produce equality in the debtor and creditor statements. In general to keep in a state of just proportion, in equilibrio. Balance of trade is the equal importing of foreign commodities with the exporting of the native. Balance of power is the exact equipoise of strength and resources between rival nations, formed by alliances and treaties with neighbouring states, in order to keep each other in check, to preserve peace, and to promote the advantage of all. In astronomy, the balances are one of the twelve signs of the zodiac, commonly called Libra.

Ten thousand mark and mo, that now er in *balance*,
 And I betrayed of alle, bi God, that all may auance,
 I salle bring him to stalle, but he make acquaintance.

R. Brunne, p. 156.

If the *balance* of our lives had not one scale of reason to poise another of sensuality, the blood and baseness of our nature would conduct us to most preposterous conclusions.

Shakespeare.

I have in equal *balance* justly weigh'd
 What wrong our arms may do, what wrongs we suffer:
 Griefs heavier than our offences.

Id. Henry VI.

Comfort arises not from others being miserable, but from this inference upon the *balance*, that we suffer only the lot of nature.

L'Estrange.

Upon a fair *balance* of the advantages on either side, it will appear, that the rules of the gospel are more powerful means of conviction than such message.

Atterbury.

Since there is nothing that can offend, I see not why you should *balance* a moment about printing it.

Id. to Pope.

Little that is truly noble can be expected from one who is ever poring on his cash book, or *balancing* his accounts.

Spectator.

Though I am very well satisfied, that it is not in my power to *balance* accounts with my Maker, I am resolved, however, to turn all my endeavours that way.

Addison. Id.

They pass the planets sev'n, and pass the fix'd
And that crystalline sphere whose *balance* weighs
The trepidation talk'd, and that first mov'd.

Milton.

Were the satisfaction of lust, and the joys of heaven, offered to any one's present possession, he would not *balance*, or err, in the determination of his choice.

Locke.

Judging is *balancing* an account, and determining on which side the odds lie.

Id.

Care being taken, that the exportation exceed in value the importation; and then the *balance* of trade must of necessity be returned in coin or bullion.

Bacon's Advice to Villiers.

Heav'n that hath plac'd this island to give law,
To *balance* Europe, and her states to awe.

Waller.

A balance of power, either without or within a state, is best conceived by considering what the nature of a *balance* is. It supposes three things; first, the part which is held, together with the hand that holds it; and then the two scales, with whatever is weighed therein.

Swift.

Give him leave

To *balance* the account of Blenheim's day.

Prior.

BALANCE, THE ANCIENT OF ROMAN, called also the *Statera Romana*, or steel-yard, consists, as is well known, of a lever or beam, moveable on a centre, and suspended near one of its extremities: the bodies to be weighed are applied on one side of the centre; and their weight is shown by the division marked on the beam, where the weight, which is moveable along the lever, keeps the steel-yard in equilibrio. This balance is still often used in weighing heavy bodies.

BALANCE, *DICHIFFU*, or that which cheats by the inequality of its brachia, is founded on the same principle as the steel-yard. Let there be, for example, a balance so constructed, that both the brachia with their scales shall equiponderate, but that the length of the one arm shall be to that of the other as ten to nine. In this case a weight of nine pounds put into the scale of the longest arm, will counterpoise one of ten pounds put into that of the shorter one: but the cheat is immediately discovered by shifting the weight from one scale to the other: in which case, the balance will no longer remain in equilibrio. The true weight is a geometrical mean proportion between the two false weights.

BALANCE, *ASSAY*, is a very nice balance used in decimastical operations, to determine exactly the weight of minute bodies; see plate BALANCE, fig. 1. This should be made of the best steel, and of the hardest kind; because that metal is not so easily spoiled with rust as iron; and it is more apt than any other to take a perfect polish, which at the same time prevents the rust. The structure of the assayer's scale is little different from that of common scales, excepting in purity and smallness. The longer the beam of it is, the more

exactly may the weight of a body be found; however, ten or twelve inches are a sufficient length. Let the thickness of it be so little, that two drams may hardly be hung at either of its extremities without its bending; for the largest weight put upon it seldom exceeds one dram. The whole surface of this beam must be altogether without ornaments, which only increase the weight and gather dust, &c. We give in the plate, one made by Fontin of Paris, so delicate, that when charged with a weight of a thousand grammes in each scale, it will turn with the addition of one grammé. LL' is the beam of the balance, made of the finest steel, and of sufficient dimensions to prevent any sensible deflection in it, with the greatest weights it is proposed to charge it with; the arms are of course of equal length and figure, and the whole is balanced on a knife-edge suspension at C, the plate G being also of polished steel, and rendered as hard as possible, to prevent the action of the knife-edge upon it. In order to relieve the suspension of the balance when the instrument is not in use, the two crotches FF are brought up by the screws shown in the figure, so as just to take off the pressure from the point of support. When the equilibrium is nicely supported, the needle, or index, CS, corresponds very accurately with zero on the graduated arc attached to the top or bottom of the principal stem, and which former, being fixed to the beam, will be displaced by, and indicate any want of due equipoise. The whole apparatus is, when used for nice experiments, enclosed in a case or frame, with glass faces, and which are only opened sufficiently to introduce the weights and body to be weighed. An instrument in its case, with the index pointing downwards, to save room, is shown in the figure.

The method of weighing a body is this:— Place the body, which we may denote B, in one of the scales of the balance; as, for example, in the scale A, to be put in equilibrio, by placing in the other scale A', bodies of any weight, such as grains of lead, small pieces of copper, or the like; and lastly, small pieces of leaf copper, or paper, till the needle, or index, points exactly to zero on the graduated arc; the beam is then in equilibrio, and the weight in the two scales equal, or very nearly so. Take out now the body B, and replace it by different known weights, till the equilibrium is again obtained; and these weights together, will express the precise weight of the body. This method, it is obvious, is independent of the length of the arms, and even of the quantity of friction on the axis, because the body B, and its equal weights, are placed precisely in like circumstances, which is not the case in the common method of weighing. One thing, however, is here very essential, and must be attended to; viz. not to shake or disturb the apparatus in removing the body from the scale, as this may change a little the point of support, and alter the degree of friction. To prevent this, the crotches F, F', are brought up to the beam, without removing it from its support; then before the body B is removed, another body, of about half its weight, is added. The former body B is now taken out, and weights, as

Fig. 7.

nearly as can be judged equal to it, are put in the scale; the other body is then removed, the crotches let down, and the balance left on its point of support as at first; and successive small weights added, till the equipoise is perfect.

BALANCE, THE BENT LEVER, is represented in fig. 7. Here ABC is a bent lever supported on its axis B in the pillar IH. At A is suspended the scale E, and at C is affixed a weight or a heavy knob. Draw the horizontal line KBG through B, the centre of motion, on which from A and C let fall the perpendiculars AK, CD; then if BK and BD are reciprocally in proportion to the weights at A and C, they will be in equilibrio; but if not, the weight C will move one way or other along the arc FG, till that ratio be obtained. If the lever be so bent that when A coincides with the line GK, C coincides with the vertical line BH, then as C moves along from F to G, its momentum will increase; whilst that of a weight in the scale E will decrease; hence, the weights in E corresponding to different positions of the balance, may be expressed on the graduated arc of the plate FG, the whole being used in the manner of the steel-yard.

BALANCE, THE CHINESE, is a steel-yard somewhat different in its form and application: it is much used by the eastern merchants in weighing gems and precious metals. The beam is a small rod of wood or ivory, about a foot in length: upon this are three lines of measure made of fine silver studded work, beginning from the end of the beam, whence the first is extended eight inches, the second six and a half, and the third eight and a half. The first is European weight, the other two Chinese. At the other end of the beam hangs a round scale; and at three several distances from this end are fastened so many fine strings at different points of suspension. The first distance makes $1\frac{1}{2}$ or $\frac{3}{4}$ of an inch; the second $3\frac{1}{4}$ or double the former; and the third, $4\frac{1}{2}$, or triple the same. When the instrument is used, it is held up by some one of the strings, and a sealed weight, of about an ounce and a quarter, troy, is hung upon some one of the divisions of the rule, so as to produce an equilibrium, the weight of the body being indicated by the graduated scale above referred to.

BALANCE, THE DANISH, is a kind of balance or steel-yard, in common use upon various parts of the continent of Europe. It consists of a batten of hard wood, having a heavy lump or knob at one end, and a swivel hook at the other. The goods to be weighed are suspended on the hook, and the whole is carried in a loop of whip-cord, in which it is slidden to and fro (when placed horizontally), till the goods suspended from the hook at one end are balanced by the knob at the other. The weight of the goods is estimated by the contact of the loop with a scale of divisions in harmonic progression.

BALANCE, BRADY'S, or WEIGHING APPARATUS. One of the best modern inventions of the kind is represented in fig. 6. It unites the properties of the bent lever balance and the steel-yard. ABC is a frame of cast iron, having a great part of its weight towards A, where it is thicker than in its other parts: F is a fixed fulcrum, and E a move-

able suspender, having a scale and hook at its lower extremity; K, E, G, are three distinct places to which the suspender EH may be applied; and to which belong respectively, the three graduated scales of division, or weights, fC , cd , ab . When the scale and suspender are applied at G, the apparatus is in equilibrio, with the edge AB horizontal, and the suspender cuts the zero on the scale ab ; now a weight being applied, the whole apparatus turns about F, and the part towards B descends, till the equilibrium is again established; when the weight of the body is read off from the scale ab , which registers to ounces, and extends to two pounds. If the weight of the body exceeds two pounds, and be less than eleven pounds, the suspender is placed at E, and when the upper edge of the balance is horizontal, the weight or number 2, is found a little to the right of the index of the suspender; if now weights exceeding two pounds be placed in the scale, the whole again turns about F, and the weight of the body is shown on the graduated arc cd , which extends to eleven pounds, and registers to every two ounces.

If the weight of the body exceeds eleven pounds the suspender is hung on at K, and the weights are ascertained in the same manner on the scale fC to thirty pounds, the subdivisions being on this scale quarters of pounds. The same principles would obviously apply to weights greater or less than the above. To prevent mistake, the three points of support, G, E, K, are numbered 1, 2, 3; and the corresponding arcs are respectively numbered in the same manner. When the hook is used instead of the scale, the latter is turned upwards, there being a joint at m for that purpose.

BALANCE, HYDROSTATIC, an instrument contrived to determine accurately the specific gravity of both solid and fluid bodies. It is constructed in various forms. We shall describe that which appears to be the most accurate.—V C G, fig. 2, is the stand or pillar of this hydrostatic balance, which is to be fixed in a table. From the top A, hangs, by two silk strings, the horizontal bar B, B, from which is suspended by a ring i , the fine beam of a balance b ; which is prevented from descending too low on either side by the gently springing piece $txyz$, fixed on the support M. The harness is annulated at o , to show distinctly the perpendicular position of the examen, by the small pointed index fixed above it. The strings by which the balance is suspended, passing over two pullies, one on each side the piece at A, go down to the bottom on the other side, and are hung over the hook at v ; which hook, by means of a screw P, is moveable about one inch and a quarter backward and forward, and therefore the balance may be raised or depressed so much. But if a greater elevation or depression be required, the sliding piece S, which carries the screw P, is readily moved to any part of the square brass rod V K, and fixed by means of a screw. The motion of the balance being thus adjusted, the rest of the apparatus is as follows:—H H is a small board, fixed upon the piece D, under the scales d and e , and is moveable up and down in a low slit in the pillar above C, and fastened at any part by a screw behind. From the point in the middle of the

bottom of each scale hangs, by a fine hook, a brass wire $a d$ and $a c$. These pass through two holes $m m$ in the table. To the wire $a d$ is suspended a curious cylindrical wire, $r s$, perforated at each end for that purpose: this wire $r s$ is covered with paper, graduated by equal divisions, and is above five inches long. In the corner of the board at E , is fixed a brass tube, on which a round wire $h l$ is so adapted as to move neither too tight nor too free, by its flat head I . Upon the lower part of this moves another tube Q , which has sufficient friction to make it remain in any position required: to this is fixed an index T , moving horizontally when the wire $h l$ is turned about, and therefore may be easily set to the graduated wire $r s$. To the lower end of the wire $r s$ hangs a weight L ; and to that a wire $p n$, with a small brass ball g , about one-fourth of an inch in diameter. On the other side, to the wire $a c$, hangs a large glass bubble R , by a horse-hair. Let us first suppose the weight L taken away, and the wire $p n$ suspended from S : and, on the other side, let the bubble R be taken away, and the wire F suspended at c , in its room. This weight F we suppose to be sufficient to keep the several parts hanging to the other scale in equilibrium; at the same time that the middle point of the wire $p n$ is at the surface of the water in the vessel O . The wire $p n$ is to be of such a size, that the length of one inch shall weigh four grains. Now it is evident, since brass is eight times heavier than water, that for every inch the wire sinks in the water, it will become half a grain lighter, and half a grain heavier for every inch it rises out of the water: consequently, by sinking two inches below the middle point, or rising two inches above it, the wire will become one grain lighter or heavier. Therefore, if, when the middle point is at the surface of the water in equilibrium, the index T be set to the middle point a of the graduated wire $r s$, and the distance on each side $a r$ and $a s$ contains 100 equal parts; then, if in weighing bodies the weight is required to the 100th part of a grain, it may be easily had by proceeding in the following manner: Let the body to be weighed be placed in the scale d . Put a weight in the scale e , and let this be so determined that one grain more shall be too much, and one grain less too little. Then the balance being moved gently up or down, by the screw P , the equilibrium will be nicely shown at a ; if the index T be at the middle point a of the wire $r s$, it shows that the weights put into the scale e are just equal to the weight of the body. By this method we find the absolute weight of the body: the relative weight is found by weighing it hydrostatically in water, as follows: Instead of putting the body into the scale e , as before, let it hang with the weight F , at the hook e , by a horse hair, as at R , supposing the vessel O of water were away. The equilibrium being then made, the index T standing between a and n , at the thirty-sixth division, shows the weight of the body put in to be 102,556 grains. As it thus hangs, let it be immersed in the water of the vessel O , and it will become much lighter: the scale e will descend till the beam of the balance rests on the support s . Then 5,000 grains put into

the scale d restore the equilibrium precisely, so that the index T stands at the thirty-sixth division above a ; it is evident that the weight of an equal bulk of water would, in this case, be exactly 100 grains. In a similar manner this balance may be applied to find the specific gravity of liquids, as is easy to conceive.

LUKIN'S HYDROSTATIC BALANCE, an American invention, has the recommendation of simplicity, and is said in the Report of the Committee of the Academy of Sciences at Philadelphia, to be a very accurate instrument. It acts on the principle of the steel-yard; the arms being at equipoise, when unloaded; see fig. III. C is the body whose specific gravity is to be weighed, and it is suspended to the short arm of the instrument. On the longer arm A , the movable weight D indicates its weight in air or water. When greater accuracy is required, a second weight may be added on the long arm, which ought to be some determinate portion of D . Then, the division marked by the larger weight, will be units, and that of the smaller tenths, or 100ths as it may be contrived.

COATES'S HYDROSTATIC BALANCE is also an instrument of American invention, upon the same principles, but differing in the mode of graduation: this being adapted to the purposes of finding the specific gravity of minerals; and therefore, instead of pointing out the actual and relative weights, it shows at once their specific gravity. The instrument is accurately balanced when unloaded, by making the shorter arm much larger than the longer one; and the latter is graduated and marked with numbers, which everywhere show the quotient of the entire length of the longer arm, divided by the distance of the mark from the end: thus, at half the length, is marked the number 2; at one-third the number 3, and so on; which numbers extend on the scale to rather more than twenty, in order to extend the use of the instrument to heavy minerals.

In using it, a weight is suspended by a hook at A , and the body under examination is to be hung by a horse-hair on the shorter arm, and slid along, as on the steel-yard, till an equipoise is obtained, say at D . Then, without altering its situation on the beam, the body is to be immersed in water, and balanced a second time, by sliding the weight C along the graduated arm, till the instrument is found again in equilibrio. The hook of this latter will then at once indicate, by its situation on the scale, the actual specific gravity of the body, water being considered as unity. The instrument being supposed in equilibrio, and $B D$ and the weight of the counterpoise being constant, the weight of the body varies as the distance of the counterpoise from B , by the common principle of the lever.

The BALANCE OF TORSION, fig. V. was invented by M. Coulomb, to estimate minute attracting and repelling forces in electricity, magnetism, &c. It consists of a vertical metallic thread, the upper end of which is attached to a point A , its lower end carrying a small weight w , and a little above it a light horizontal needle, n, n . To ascertain very small forces they are made to act on the extremity of this needle, and their intensity is appreciated by the angle of de-

viation which they cause in it, so that the forces are balanced by the torsion of the wire, and hence the denomination. The needle is enclosed in a glass cylinder, to protect it from the action of the air, and the thread is enclosed in a smaller cylinder fixed into the brass cover thereof. On the upper part of the small cylinder is placed a divided dial-plate, which, with very little friction, turns about the cylinder. The lever which carries the thread that suspends the horizontal needle, traverses this dial, and serves as an indicator, when it is requisite to have the torsion equal to a certain number of degrees. A circular division applied horizontally about the glass cylinder, opposite to the needle, measures the deviations of the latter when under excitation. Mr. Cavendish determined the mean density of the earth by estimating with this instrument the action of two leaden balls of known dimensions and specific gravity; and comparing the effect with that of terrestrial gravity. See *Phil. Trans.* anno. 1798.

The BALANCE, COMMON, OR MODERN, generally used, consists of a lever or beam suspended exactly in the middle, having scales or basins hung to each extremity. The lever is called the jugum or beam; and the two moieties thereof, on each side the axis, the brachia or arms. The line on which the beam turns, or which divides its brachia, is called the axis; and, when considered with regard to the length of the brachia, is esteemed a point only, and called the centre of the balance: the handle whereby it is held, or by which the whole apparatus is suspended, is called trutina; and the slender part perpendicular to the beam, whereby either the equilibrium or preponderancy of bodies is indicated, is called the tongue of the balance.—

Thus, in the diagram annexed, *ab* is the beam, divided into two equal brachia, or arms, by the white spot in the centre, which is the axis or centre of the balance, and *c* is the tongue. The trutina, on which the axis is suspended, is not represented in this figure, in order to render the other parts more conspicuous. It follows from what has been observed, that in the Roman balance, or steel-yard, the weight used for a counterpoise is the same, but the point of application varies; in the common balance the counterpoise is various, and the point of application the same. The principle on which each is founded, may be very easily understood from the general properties of the lever. See LEVER. The beam is a lever of the first kind; but instead of resting on a fulcrum, is suspended by something fastened to its centre of motion: consequently the mechanism of the balance depends on the same theorems as the lever. Hence as the quantity of matter in known weight is to its distance from the centre of motion, so is the distance of the unknown weight to its quantity of matter. The common balance is properly a lever, whose axis of motion is formed with an edge like that of a

knife, and the other two dishes, or scales, at its extremities, are hung upon edges of the same kind, which are first made sharp, and then rounded with a fine bone, or a piece of buff leather. Of the regular formation of this part, the excellence of the instrument essentially depends. When the lever, or beam of the balance, is considered as a mere line, the two outer edges are called points of suspension, and the inner the fulcrum. The points of suspension are supposed to be at equal distances from the fulcrum, and to be pressed with equal weights when loaded.

And now, observe, 1. If the fulcrum be placed in the centre of gravity of the beam, and the three edges be all in the same right line, the beam of the balance will have no tendency to one position more than another, but will rest in any position in which it may be placed, whether the scales be on or off, empty or loaded. 2. If the centre of gravity of the beam, when level, be immediately above the fulcrum, it will overset by the smallest action; that is, the end which is lowest will descend; and it will do this with the greater velocity, in proportion as the centre of gravity is higher, and the points of suspension are less loaded. 3. But if the centre of gravity of the beam be immediately below the fulcrum, the beam will not rest in any position but when level; and, if disturbed from that position, and then left at liberty, it will vibrate, and at last come to rest in an horizontal position. Its vibrations will be quicker, and its horizontal tendency stronger, the lower the centre of gravity, and the less the weight upon the points of suspension. 4. If the fulcrum be below the line joining the points of suspension, and these be loaded, the beam will overset, unless prevented by the weight of the beam tending to produce an horizontal position, as in the third-case. In this case small weights will equilibrate, as in the former; a certain exact weight will rest in any position of the beam, as in the first case; and all greater weights will cause the beam to overset, as in the second. Money scales are often made this way, and will overset with any considerable load. 5. If the fulcrum be above the line joining the points of suspension, the beam will come to the horizontal position, unless prevented by its own weight, as in the second case. If the centre of gravity be nearly in the fulcrum, all the vibrations of the loaded beam will be made in times nearly equal, unless the weights be very small, when they will be slower. The vibrations of balances are quicker, and the horizontal tendency stronger, the higher the fulcrum. Finally, in the proper construction of the common balance, observe, that the points of suspension must be exactly in the same line as the centre of the balance; that they must be precisely equidistant from that centre on either side; and that the brachia must be as long as conveniently they may, in relation to their thickness, and the weight which they are intended to support; that there must be as little friction as possible in the motion of the beam and scales; and, lastly, that the centre of gravity of the beam must be placed a little below the centre of motion.

The equality of the arms of a balance is of use, in scientific pursuits, says Dr. Ure, chiefly in

making weights by bisection. A balance with unequal arms will weigh as accurately as another of the same workmanship with equal arms, provided the standard weight itself be first counterpoised, then taken out of the scale, and the thing to be weighed be put into the scale and adjusted against the counterpoise; or when proportional quantities only are considered, as in chemical and in other philosophical experiments, the bodies and products under examination may be weighed against the weights, taking care always to put the weights into the same scale. For then, though the bodies may not be really equal to the weights, yet their proportions among each other may be the same as if they had been accurately so. But though the equality of the arms may be well dispensed with, yet it is indispensably necessary that their relative lengths, whatever they may be, should continue invariable. For this purpose, it is necessary, either that the three edges be all truly parallel, or that the points of suspension and support should be always in the same part of the edge. This last requisite is the most easily obtained. The balances made in London are usually constructed in such a manner, that the bearing parts form notches in the other parts of the edges; so that the scales being set to vibrate, all the parts naturally fall into the same bearing. The balances made in the country have the fulcrum end straight, and confined to one constant bearing by two side plates. But the points of suspension are referred to notches in the edges, like the London balances.

Very delicate balances (continues this able writer) are not only useful in nice experiments, but are likewise much more expeditious than others in common weighing. If a pair of scales with a certain load be barely sensible to one-tenth of a grain, it will require a considerable time to ascertain the weight to that degree of accuracy, because the turn must be observed several times over, and is very small. But if no greater accuracy were required, and scales were used which would turn with the hundredth of a grain, a tenth of a grain, more or less, would make so great a difference in the turn, that it would be seen immediately.

If a balance be found to turn with a certain addition, and is not moved by any smaller weight, a greater sensibility may be given to that balance, by producing a tremulous motion in its parts. Thus, if the edge of a blunt saw, a file, or other similar instrument, be drawn along any part of the case or support of a balance, it will produce a jarring, which will diminish the friction on the moving parts so much, that the turn will be evident with one-tenth or one-fourth of the addition that would else have been required. In this way, a beam which would barely turn by the addition of one-tenth of a grain, will turn with one-thirtieth or fortieth of a grain.

Muschendorf, in his *Cours de Physique*, (French translation, Paris, 1769) tom. ii. p. 247, says, he used a circular balance of great accuracy, which turned (trebuchoit) with $\frac{1}{40}$ of a grain. The substance he weighed were between 200 and 300 grains. His balance, therefore, weighed to the $\frac{1}{12000}$ part of the whole; and would

ascertain such weights truly to four places of figures.

In the *Philosophical Transactions*, vol. lxxi. p. 509, mention is made of two accurate balances of Mr. Bolton; and it is said that one would weigh a pound, and turn with one-tenth of a grain. This, if the pound be avoirdupois, is $\frac{1}{70000}$ of the weight; and shows that the balance could be well depended on to four places of figures, and probably to five. The other weighed half an ounce, and turned with $\frac{1}{100}$ of a grain. This is $\frac{1}{24000}$ of the weight.

In the same volume, p. 511, a balance of Mr. Read's is mentioned, which readily turned with less than one pennyweight when loaded with fifty-five pounds, before the Royal Society; but very distinctly turned with four grains, when tried more patiently. This is about $\frac{1}{96000}$ part of the weight; and therefore this balance may be depended on to five places of figures.

Also, page 576, a balance of Mr. Whitehurst's weighs one pennyweight, and is sensibly affected with $\frac{1}{2000}$ of a grain. This is $\frac{1}{48000}$ part of the weight.

A balance belonging to Mr. Alchorne of the Mint in London, is mentioned, vol. lxxvii. p. 205 of the *Philosophical Transactions*. It is true to three grains with 15lb. an end. If these were avoirdupois pounds, the weight is known to $\frac{1}{50000}$ part, or to four places of figures, or barely five.

A balance (made by Ramsden, and turning on points instead of edges,) in the possession of Dr. George Fordyce, is mentioned in the seventy-fifth volume of the *Philosophical Transactions*. With a load of four or five ounces, a difference of one division in the index was made by $\frac{1}{1600}$ of a grain. This is $\frac{1}{384000}$ part of the weight,

and consequently this beam will ascertain such weights to five places of figures, beside an estimate figure.

The Royal Society's balance, which was lately made by Ramsden, turns on steel edges, upon planes of polished crystal. 'I was assured,' says Dr. Ure, 'that it ascertained a weight to the seven-millionth part. I was not present at this trial, which must have required great care and patience, as the point of suspension could not have moved over much more than the $\frac{2}{1000}$ of an inch in the first half minute; but, from some trials which I saw, I think it probable that it may be used in general practice to determine weights to five places and better.'

BALANCE, in ichthyology, or the balance fish. See SQUALUS.

BALANCE, in the woollen manufacture, is a machine invented by the Rev. W. Ludlam. The thread is made into skeins of the same length; and the fineness of it is denominated from the

number of skeins which go to a pound; the coarsest being about twelve to the pound, and the finest nearly sixty. This machine is designed for weighing skeins, in order to determine their respective fineness. It resembles the beam of a common pair of scales; at one end of it is fixed a weight, called the counterpoise, and at the other end a hook; in sorting, the skein to be examined is put upon the hook, and sinks down more or less, according to its weight, till the counterpoise, by rising, balances it: and then the index or cock of the beam, points out on a gradual arch, the number of skeins of that sort which go to the pound.

The BALANCE OF A CLOCK or WATCH, is that part which regulates the beats. The circular part of the balance is called the rim, and its spindle the verge; there belong to it also two pallets or nuts, that play in the fangs of the crown-wheel: in pocket watches, that strong stud in which the lower pivot of the verge plays, and in the middle of which one pivot of the crown-wheel runs, is called the potence: the wrought piece which covers the balance, and in which the upper pivot of the balance plays, is the cock; and the small spring in the new pocket watches is called the regulator. The motion of a balance, as well as that of a pendulum, being alternate, while the pressure of the wheels is constantly in one direction, it is obvious that some art must be used to accommodate the one to the other. When the tooth of the wheel has given the balance a motion in one direction, it must quit it, that it may get an impulsion in the opposite direction. The balance or pendulum thus escaping from the tooth of the wheel, or the tooth escaping from the balance, has given to the general construction the name of scapement.

Before the invention of the pendulum, clocks were regulated by an horizontal balance, having a vertical axis, that passed through two holes, with liberty to play up and down; and that suspended by means of a string passed through a hole in the axis and fastened at both ends, so as to form equal angles with the axis itself. Consequently, when the balance revolved in one direction, the string was wound upon the verge, and being thus shortened, raised it up until the weight of the balance had overcome the force of rotation: after which it revolved the contrary way, and descended to perform a similar ascent by winding the string the opposite way.

A supposed *BALANCE OF POWER*, in the political system, originates from, and is maintained by, the alliances of different nations, as their circumstances and interest may require. The preservation of the balance of power has generally implied the maintaining of such a degree of equality among the powers of Europe, in general, as may prevent any enormous accumulation of power, or any attempt at universal monarchy, on the part of any one of them. To preserve this balance, much blood has been shed, and money spent, since the revolution of 1688; but the revolution of France, and the wars arising out of it, have hopelessly deranged all former theorems and calculations upon this subject. Robertson and other historians have said, that the principle of the balance of power was a discovery of the

fifteenth century, made by the Italian politicians on the invasion of Charles VIII. Against such statements we might adduce the arguments of Hume and others, who have traced in ancient times vastly more refined notions of policy than any that dictated the Italian defensive league. It was not, in truth, to any such single event that the balancing system owed either its origin, or its refinement; but to the progress of society, which placed the whole states of Europe in the same relative situation in which the states of Italy were at that period; and taught them not to wait for an actual invasion, but to see a Charles at all times in every prince or commonwealth that should manifest the least desire of change. See *Edinburgh Review*, vol. I. p. 354.

BALANCE OF TRADE. That which is commonly meant by the balance of trade, is the relative quantity of foreign commodities compared with the exportation of home productions or manufactures. And it has been reckoned that the nation which exports most of its own commodities, has the advantage of the balance of trade. The reason is, that, if its own commodities be of a greater value than are imported, the balance of that account must be made up in bullion or money; and the nation grows so much richer, as the balance of that account amounts to. But this reasoning admits of many qualifications. See *COMMERCE and ECONOMY, POLITICAL*.

BALANCERS, or *POIZERS*, in entomology, (in French, *balanciers*, and the halteres of Linnæus), denoting those little filamentous bodies which terminate in a round, truncated, or oval capitulum, or knob; and of which one is placed on each side of all the dipterous or two-winged insects, under a small scale below the wing. In different genera these vary a little in respect of situation, and are also of larger or smaller size, in proportion to the other parts of the insect, in different kinds.

BALANCIER, a machine used in the striking of coins, medals, counters, and the like. See *COINAGE*.

BALANCING, among seamen, the contracting a sail into a narrower compass, in a storm, by retrenching or folding up a part of it at one corner: this method is used in contradistinction to reefing, which is common to all the principal sails; whereas balancing is peculiar to few, such as the mizen of a ship, and the main-sail of those vessels wherein it is extended by a boom. See *BOOM and REEF*. The balance of the mizen is thus performed: the mizen yard is lowered a little, then a small portion of sail is rolled up at the peek or upper corner, and fastened to the yard about one-fifth inward from the outer end or yard-arm, toward the mast. See *MIZEN*. A boom main-sail is balanced, after all its reefs are taken in, by rolling up a similar portion of the hindmost or aftmost lower corner, called the clue, and fastening it strongly to the boom, having previously wrapped a piece of old canvass round the part (which is done in both cases) to prevent the sail from being fretted by the cord which fastens it.

BALANITES, in natural history, a name given by the ancients to a stone, seeming to have been of the semipellucid gems. They describe two species of it; the one yellow, and the other

green, but each having veins of a flame color. Their descriptions are too short for us to ascertain what stone, among those known at this time, they meant. Some suppose it to have been the lapis judaicus, on account of its acorn-like figure and taste.

BALANOIDES, in conchology, a species of *lepas*, with a conic truncated smooth shell, and obtuse operculum. Linn. Fn. Suec. Donovan. &c. This is *balanus parvus vulgaris* of Petiver; and a variety of it with a long tubular stalk is described by Da Costa, Pennant, and Donovan. Brit. Shells, Dr. Leach includes the whole of this species, with additional ones, in his class corrhipedes.

BALANUS, *βαλανος*, in anatomy, is used for the glans penis, and sometimes for the clitoris.

BALANUS MYREPSICA, in the *materia medica*, the oily acorn. The whole nut is of a purging quality; and the dry pressing or powder, after the oil is taken out is of a cleansing and drying nature.

BALAO, a river of the province of Guayaquil, in the kingdom of Quito, which runs into the sea, in the gulf of that name.

BALASFALVA, or **BLASENBURG**, a town of Transylvania, in the county of Kockelburg, at the conflux of the Great and Little Kockel, having a castle, and being the residence of a bishop of the united Greek church of Wallachians.

BALASORE, a sea-port of Asia, on the north-west of the bay of Bengal, four miles from the sea by land, but twenty by the windings of its river, the Booree Bellaun, which produces plenty of fish. It is navigable for vessels of 100 tons. Here the pilot of Calcutta waits the arrival of vessels: and the English, Dutch, and Portuguese all had factories here in the seventeenth century; it was ceded to the Mahrattas in 1751, but in 1803 given up by the Nagpore Rajah to the English. Balasore is in the province of Orissa, 110 miles south-west from Calcutta.

BALATITI, in natural history, a name given by the people of the Philippine islands to a species of birds, by the flight of which they divine the event of things.

BALATON, a lake of Hungary, between the counties of Szalad, Wesprim, and Schumeg, five miles south of Stuhl-Weissenburg. It is nearly 40 miles long, and from one to four broad, formed originally by the river Szala, and augmented by a number of other streams. The water, it is said, may be preserved for nearly two years without putrefaction. It contains some fish as well as birds of rare occurrence, which are bought up for exportation. The Austrian government have lately projected an union between this lake and the Danube, by a canal, but the works proceed slowly.

BALATOV, or **BARASCHEV**, the capital of a circle in the government of Saratov, in European Russia. To the north are extensive forests, and to the south almost interminable heaths, or steppes. It is situated on the Khoper, which falls into the Don. Ninety miles west of Saratov, and 134 south-east of St. Petersburg.

BALAUSTIA, or **BALAUSTENSIS**: from *βαλωστικα* a simple remedy, the flowers of the wild pomegranate, which are very rough to the tongue and

palate, and very astringent; on that account they are frequently used in diarrhoeas, hernias, &c.

BALAUSTINES in botany. See **PUNICA**.

BALAYAN, a province of Manilla, next to the city of Manilla, and extending along the coast on the east side of the island, a little beyond the bay of Batangas. There were formerly gold mines in it, but they have been long since abandoned.

BALBASTRO, a town of Arragon, in Spain, near the junction of the Vero and Cinca, having a population of 5000, and a dependent jurisdiction of 170 parishes. Tanning is the chief pursuit here. Thirty miles E. N. E. of Saragossa, and 47 north-west of Barcelona.

BALBEC, or **BALBECK**, a city of Asia, in Syria, anciently Heliopolis, and called by the Arabians, The Wonder of Syria. It is situated at the foot of Anti-Libanus, on the ground where the mountain terminates in the plain, thirty-seven miles north of Damascus. In travelling to it from the south, it is seen only at the distance of a league and a half, behind a hedge of walnut-trees, over the verdant tops of which appears a white edging of domes and minarets. It has a ruined wall, flanked with square towers, which ascends the declivity to the right. This low wall permits a view of those void spaces and heaps of ruins which are the invariable appendages of every Turkish city; but what principally attracts attention is a large edifice on the left, whose lofty walls and rich columns designate it as having been amongst the most splendid of ancient temples. The apparent length of this edifice was about 900 feet, and its width 450. The entrance to the pronaos, or portico, was by a row of twelve columns, flanked by wings ornamented with pilasters. It was approached by a magnificent flight of steps, of which there are but few remains. The interior of the portico is choked up with heaps of ruins, but these, when surmounted, lead to an hexagonal court of 180 feet diameter, strewn with broken shafts of columns, mutilated capitals, wrecks of pilasters, bases, and other architectural and sculptural fragments. The buildings in this and the adjoining court appear to have been appropriated for academies and lodgings for the priests. Through an opening at the end of this court is a vast perspective of ruins, which are best viewed from the top of a slope that was formerly a staircase, which communicates with a rectangular court, 350 feet long and 346 wide. At the end of the court are six enormous columns; and to the left is another row of columns which formed the peristyle to the body of the temple. The buildings to the right and left form a sort of gallery, which is divided into seven parts, to each of the great wings or lateral buildings. At the extremity of this court is the cell or body of the temple itself, where are the before-mentioned six colossal columns. Their shafts measure twenty-two feet in circumference, and fifty-eight in height; and the whole height of the order (the Corinthian) nearly seventy-two feet. On examining the circumjacent site, a row of bases was discovered, arranged in a parallelogrammatic form of 270 feet in length, and 150 in width. This belt of columns encompassed the

cell or body of the temple, which was decastyle (ten columned) in front, with nineteen columns in flank, and of the fourth or peripteral order of temples; but its intercolumniations do not accord with any of the five species described in the system of Vitruvius. These buildings are all of the Corinthian order, with the exception of some pilastral elevations, which are of the Composite. A second temple is situated near the southmost part of the city, upon an irregular site. It is pseudodipteral, and does not appear to have been surrounded by a peristyle and court like the former. It is, however, in a better state of preservation, having very lately eight columns in front, and thirteen in flank, of the Corinthian order. Their shafts are about sixteen feet in circumference, and forty-four in height.

Balbec also possesses, in the southern part of the city, a circular temple, differing in every respect from the precepts of Vitruvius: its lower story is used for a Greek church. Its plan is extremely whimsical, and all its details present a mass of architectural anomalies.

Few architectural remains of the ancient world are more rich in decoration than those of Balbec. The soffites and ceilings of the peristyle are panelled in lozenge forms, with representations of Jupiter and his eagle, Leda and the swan, Diana with her bow and crescent, and various busts in the costume of emperors and empresses. All the members of the interior entablatures are loaded with a profusion of ornaments. The archivolts, the heads of the niches, the frieze of the principal order, are covered with the most sumptuous embellishments of sculpture. The interior columns are all fluted, and those of the exterior plain. Dr. Pococke conceives that nothing can be finer than the entrance to the great temple. Almost all the members are enriched with sculptural representations of flowers and fruit, and the frieze with ears of corn, of admirable execution. According to Volney, the walls of the smaller temple suffered much from the earthquake of 1759; which is confirmed by our countryman, who, in 1784, found but six columns of the great temple standing out of the nine, which were erect in 1751; and twenty only out of twenty-nine belonging to the smaller temple. The rapacity of the Turks has also contributed to their destruction, from their desire of possessing the iron pins and cramps with which the huge blocks of masonry are joined.

The massiveness, indeed, of the stones and blocks of marble is not the least remarkable feature of these ruins. No modern mechanical contrivance, it is said, could convey such masses from any distance into their present positions. Stones, from twenty-eight to thirty-five feet long, and nine in depth, form the second layer of the great temple. One is even fifty-nine feet long and twelve deep.

The period of the erection of these edifices seems to be a question lost in entire obscurity. The age of Aurelian, from the similarity of their style with that of the Palmyra edifices, would seem to be the most probable. Here is the same compound of Grecian forms with Asiatic ornament and luxuriant display, the same fantas-

tical ornaments, united with occasional grandeur of design and boldness of execution.

The town now inhabited is small and mean, but about four miles in circuit. The population has been for a long period gradually decreasing. The town was computed, in 1751, to contain 5000, and in 1784, to contain only 1200 poor and indolent inhabitants, cultivating a little cotton, maize, and water-melons, for their subsistence. History has preserved but few traces of this place. About 140 years before the time of Antoninus Pius, it was garrisoned by Roman troops. Some writers state that he erected the principal part of the present edifice on the site of one more ancient. Under Constantine it was neglected, and the great temple soon after converted into a church: thus it was appropriated until the irruption of the Arabs, when it fell rapidly into decay. After a vigorous defence, the town was taken by that nation, under Abu Obeidah, a commander of the caliph Omar. In 1401 it was taken by Tamerlane. An earthquake, in 1759, nearly completed its destruction. Distant forty miles N. N. W. of Damascus, and 110 S. of Aleppo.

BALBINUS, Decimus Cælius, emperor of Rome, was elected by the senate, A. D. 237, but massacred, along with his colleague, Maximus, soldiers.

BALBO (Vasco Nuñez de), a Castilian; a celebrated navigator, and one of the first discoverers of South America. He was beheaded by the Spanish governor of St Mary, through jealousy of his growing reputation, in 1517, aged forty-two.

BALBU'CINATE, *v. n.* From Lat. *balbutio*, to stammer in speaking. *Dict.*

BALBUL, in ornithology, a species of *Anas*, or duck having a black beak, and spot on the wing, above obliquely green, beneath obliquely black. Forsk. Fn. Arab.

BALBUS (Lucius Cornelius Theophanes), was born at Cadiz, and distinguished himself by his valor in the war carried on by the Romans in Spain against Sertorius and the Lusitanians, on which account Pompey gave him the privileges of a Roman citizen. He was consul in the 714th year of Rome, and was the first foreigner on whom that dignity was conferred. He was the friend of Pompey, Cæsar, Crassus, and Cicero.

BALBUSARDUS, in ornithology, the name used by authors, for the bird called in English the bald buzzard. It is of the long-winged hawk kind, and has been described by Aldrovandus and some other authors, under the name of the *Haliætus* and *Morphnus*, two species of the eagle. It frequents the shores of ponds and rivers, and sometimes of the sea, where it preys on fish. It builds on the ground among reeds, and lays three or four large white eggs, nearly as big as hens' eggs.

BALBU'TIATE, *v. n.* The same with *balbutinate*.

BALCAIRN, a place in Perthshire, in the parish of Clunie, which some antiquarians suppose to have been the scene of the decisive battle between Agricola and Galgacus.

BALCANQUAL (Walter), an eminent Scottish divine, who attended James I. to England, and at Oxford took the degree of D.D. He

became his majesty's chaplain, master of the Savoy, and representative of the church of Scotland, at the synod of Dort. He was appointed dean of Rochester in 1625, and of Durham in 1639. During the rebellion he underwent many hardships, being obliged to fly from place to place. He died on Christmas day, 1645, at Chirk castle in Denbighshire; he wrote, Epistles concerning the Synod of Dort, and the Declaration of King Charles I. concerning the late tumults in Scotland, folio, 1630.

BALCARRA, a town of Ireland, in the county of Mayo, 115 miles from Dublin.

BALCARRY, a free port on the west coast of Scotland, in the Stewartry of Galloway, and parish of Rerwick. It is naturally a safe and commodious harbour.

BALCHRISTIE; Gael. *i. e.* the town of Christian; a village of Fifeshire, in the parish of Newburn, anciently given to the Culdees, by king Malcolm III. and his queen St. Margaret. Tradition reports that the first Christian church in Scotland was built in this village.

BALCK, a town of Usbeck Tartary, on the frontiers of Persia, 200 miles south of Bokhara.

BALCLUTHA, a settlement in the south part of Kentucky, on the west side of Big Sandy river.

BALCONY, *n. s.* Fr. *balcon*; Ital. *balcone*, a frame of iron, wood, or stone, before the window of a room.

Then pleasure came, who, liking not the fashion,
Began to make balconies, terraces,
Till she had weaken'd all by alteration. *Herbert.*

When dirty waters from balconies drop,
And dextrous damsels twirl the sprinkling mop. *Gay.*

BALCONY in a ship, denotes a gallery either covered or open, made abaft, either for ornament or convenience of the captain's cabin.

BALD, *adj.* } Welch *bal*, wanting hair.

BALDLY, *adv.* } A bare surface which is

BALDNESS, *n. s.* } usually covered or fledged by nature. In the human species this is usually the effect of time, vexation, fever, or cutaneous disease of the parts, or, as some say, the dryness of the brain. It is figuratively employed to denote whatever is inelegant and meagre of thought, in literary composition or verbal discourse; whatever is mean, undignified and valueless, in character and disposition.

Come hither goodman *bald* pate. Do you know me?
Shakspeare.

Why you *bald* pated lying rascal, you must be hooded must you!
Id.

Under an oak, whose boughs were moss'd with age,
And high top *bald* with dry antiquity. *Id.*

This *bald* unmounted chat of his, my lord,
I answered indifferently. *Id.*

What should the people do with these *bald* tribunes?
On whom depending, their obedience fails
To th' greater bench. *Id.*

He should imitate Caesar, who, because his head was *bald*, covered that defect with laurels. *Addison.*

Baldness, in the preface to his own *bald* translation, begins the praise of Homer where he should have ended it.
Dryden's Fables, Preface.

And that, though labour'd, line, must *bald* appear,
That brings ungrateful music to the ear. *Creech.*

BALDNESS occurs chiefly on the sinciput. It differs from alopecia, acia, ophiasis, and tinea, as these all arise from some vices in the nutritious humor; baldness, from the defect of it. When the eye-lids shed their hair, it is called a ptilosis. Among the causes of baldness, immoderate venery is reputed one of the chief: old age usually brings it on of course; and it frequently results from violent fevers. Eunuchs and women are almost always free from it, and Aristotle says that it never can precede the age of puberty. Herodotus, iii. 12, says the Egyptians seldom went bald, because they shaved their heads from childhood, and thus hardened them in the sun! Calvus (bald), among the Romans, was a term of reproach. Thus Juvenal calls Domitian, calvus Nero. The later Romans, however, seem to have been reconciled to baldness; for we find among them a kind of officers, or servants, called glabratores or glabrari, whose business was to take off the hair from all parts, even from the head. In an ancient inscription there is mention made of one Diophantus, TI. CÆSARIS ORNATOR GLABR. that is, Ornator Glabrarius. We have seen it somewhere observed that the majority of Englishmen, above forty, are more or less bald. Buffon observes that the crown of the head, and the space immediately above the temples, are the parts which first become bald; but that the hair below the temples, and on the inferior part of the back of the head, seldom falls off. He also adds, that baldness is peculiar to men. In its early stages nutritives, particularly a tea made of abrotonum, southernwood, have been advised to be applied to the roots of the hair.

BALDACANIFER, or **BALCANIFER**, a standard-bearer; chiefly in the ancient order of knights Templars.

BALDACHIN, *n. s.* Ital. *baldachino*, a piece of architecture, in form of a canopy, supported with columns, and serving as a covering to an altar. It properly signifies a rich silk, *Du Cange*, and was a canopy carried over the host.

BALDACHIN, **BALDAKIN**, **BALDEKIN**, or **BAULDEKIN**, in middle-age writers, a rich kind of cloth made of gold warp and silk woof, variously figured. It took the denomination from its being formerly brought into these countries from Baldacio, or Babylon.

BALD-BUZZARD, in ornithology, the name given by Willoughby and others to the Falco Haliæctos, or Osprey. It is the balbuzzard of Buffon. See **BALBUSARDUS**.

BALD EAGLE, or Sinking-Spring Valley, lies upon the frontiers of Bedford county, in Pennsylvania, about 200 miles west of Philadelphia. It is bounded on the east by a chain of high rugged mountains, called the Canoe ridge; and on the west by the Bald Eagle, or Warrior mountains, and is a pleasant vale, having a limestone bottom, about five miles wide; its vicinity abounds with lead-ore, and shows signs of pit coal. The curiosity of this place is the swallows, which absorb several of the largest streams of the valley, and after conveying them several miles under ground, return them again to the surface. Hence its name of Sinking-Spring Valley. The most remarkable of these is called the Arch

Springs, which run close upon the road from the town to the fort; being a deep hollow formed in the lime-stone rock, about thirty feet wide, covered with a stony arch, and giving passage to a fine stream of water, which enters the mouth of a spacious cave, whose exterior aperture is sufficient to admit a shallop with her sails full spread. In the midst of this cave, from eighteen to twenty feet wide, are timber, bodies and branches of trees, &c. which, being lodged up to the roof of the passage, show that the water rises to the top during freshes. The cave, extending about forty yards, widens into a large kind of room, at the bottom of which is a vortex, where the water forms a whirlpool, and absorbs pieces of floating timber, which are instantly conveyed out of sight. From the top of the Bald-eagle mountains is a fine prospect of those of the Alleghany.

BALD EAGLE, a river of the United States which runs forty-four miles north-west, and falls into the Susquehanna.

BALD EAGLE CREEK, a head water of the Huron.

BAL'DERDASH, *n. s. & v. a.* Probably of Sax. *balb*, bold, and *dash*, to mingle; any thing jumbled together without judgment; rude mixture; a confused discourse. The verb is derived from the noun, and signifies to mix or adulterate any liquor. *Balderdash*, in its primary sense, probably signified the froth or foam made by barbers in dashing their balls backwards and forwards in hot water.

They would no more live under the yoke of the sea, or have their heads washed with his bubbly sump or barbers *balderdash*. *Nashe, Lenten stuffe.*

It is against my freehold, my inheritance,
To drink such *balderdash*, or bonny clabber!

Ben Jonson.

Mine is such a drench of *balderdash*.
Beaumont and Fletcher.

BALD HEAD, an island at the mouth of Cape Fear river, North Carolina. A light-house was erected here in December 1794; four miles N. N. W. of Cape Fear.

BALD HEAD, the south-west part of West Bay, in the district of Maine.

BALD HEAD, a point on the north-western shore of America, in Norton sound. Long. $198^{\circ} 18'$ E., lat. $64^{\circ} 43'$ N.

BALD HEAD, a promontory of New Holland, about 400 feet high, on the south-west coast, at the mouth of King George's sound. Branches of coral appearing through the surface of the top, have given rise to a conjecture that this promontory emerged from the sea. Long. 118° E., lat. $35^{\circ} 6'$ S.

BALDI (Bernard), an Italian mathematician and poet, born at Urbino in 1553. He studied at Padua and afterwards became mathematician to the duke of Guastalla. He wrote several excellent poems in the Italian language, and translated the works of various ancient mathematicians into that language. He died in 1617. His Lives of Mathematicians were printed in 1707.

BALDINI (John Anthony), an Italian nobleman, born at Placentia, in 1654. He was a man

of great learning, and employed as ambassador at different courts of Europe. He was also at the congress of Utrecht. He made a large collection of curiosities and books; a catalogue of which was printed in the Italian Literary Journal. He died in 1725.

BALDINUCCI (Philip), of Florence; a connoisseur in the polite arts, and the continuator of Vasari's lives of the painters. He died in 1696, aged seventy-two.

BALD ISLAND, an island off Mount Gardner, on the south-west coast of New Holland, about two miles long. Long. $18^{\circ} 29'$ E., lat. $34^{\circ} 55'$ S.

BALDIVIA, or **VALDIVIA**, a sea-port town of Chili in South America. It is situated between the rivers Callaculles and Portero, where they fall into the South Sea, and was built in 1551 by the Spanish general Valdivia, from whom it takes its name. In 1643 it was taken by the Dutch, who would probably have maintained their conquest against all the power of the Spanish viceroy, had they not been obliged to relinquish it through sickness and famine.

BALDMONY, *n. s.* Gentian; a plant.

BALDO MONTE, a mountain of Italy, the highest in the Veronese. It is situated at the head of lake Garda, and is famous for its rare plants. Sea shells are found upon the top of it.

BALDOCK, a market-town and parish of Herts, eight miles south from Biggleswade, and thirty-seven north from London; containing 1600 inhabitants. It is a neat, pleasant place, originally built by the knights-templars, in the reign of Stephen, and stands on the old Roman road, Ikening street, and the present great north road. The church is large and handsome, with three chancels. There is a well-endowed alms-house, and several excellent charities in this parish. Market on Thursday. The chief articles of trade are corn and malt.

BALDOCK (Ralph de), bishop of London under Edward I. and II., was educated at Mertons college in Oxford; became dean of St. Paul's; was afterwards promoted to the see of London; and at last was made lord high chancellor of England. He had a very amiable character both for morals and learning; and wrote *Historia Anglica*, or an history of the British affairs, down to his own time, and a Collection of the Statutes and Constitutions of the church of St. Paul. He died at Stepney, July 24, 1313.

BALD-PATE, in zoology, a name given by Ray to the columba leucocephala.

BALDRED; Sax. from *bal*, bold, and *rede*, counsel; the last king of Kent.

BALDRICK, *n. s.* It was formerly written *baudrick*, and signified a belt of leather, from the old French *baudrier*, derived from the verb *baudroyer*, to dress skins. It is now used to signify a girdle, a bracelet, and has been applied to the zodiac.

Athwart his breast a *baldrick* braue he ware,
That shin'd like twinkling stars, with stones most
precious rare. *Spenser.*

That like the twins of Jove, they seem'd in sight,
Which deck the *baldrick* of the heavens bright. *Id.*
That a woman conceived me, I thank her; that
she brought me up, I likewise give her most humble

thanks: but that I will have a recheat winded in my forehead, or hang my bugle in an invisible *baldrick*, all women shall pardon me. *Shakspeare.*

A radiant *baldrick* o'er his shoulders ty'd,

Sustain'd the sword that glitter'd at his side. *Pope.*

BALDRICK was a belt worn by the Saxons, hanging from the shoulder across the breast, on which the sword was hung.

BALDWIN, archbishop of Canterbury, was born of obscure parents at Exeter, where, in the early part of his life, he taught a grammar school; after which he took orders and was made archdeacon of Exeter; but resigned and became a Cistercian monk in the monastery of Ford in Devonshire, of which in a few years he was made abbot. In 1180 he was consecrated bishop of Worcester. In 1184 he was promoted to the see of Canterbury by pope Lucius III., and by his successor Urban III. was appointed legate. In 1189 he crowned king Richard I. at Westminster; and soon after followed that prince to the holy land, where he died at the siege of Ptolemais. He wrote various tracts on religious subjects, which were collected and published by Bertrand Tissier in 1662.

BALDWIN I. earl of Flanders, was proclaimed emperor of Constantinople, A. D. 1204, in opposition to Theodore Lascaris, but enjoyed his new dignity little more than a year. He was succeeded by his brother Henry, who took Constantinople in 1206.

BALDWIN II., emperor of Constantinople, succeeded Robert the fourth Latin emperor A. D. 1229, and reigned thirty-three years; but was expelled by Michael VIII., who recovered Constantinople, and thus put an end to the empire of the Latins in the east, A. D. 1261.

BALDWIN (Francis), a learned civilian, born at Arris, in 1520. He is said to have changed his religion four different times, from the Protestant to the Catholic faith, and vice versa. He however obtained successively the patronage of the emperor Charles V. Anthony king of Navarre, and Henry III. king of Poland; the latter of whom having invited him to his court, he was making preparations for his journey, when he was seized with a fever, of which he died in 1572. He wrote *Leges de Rusticia*; *Novella Constitutio prima*; *de Hæredibus et Lege Flacidia*; and other works.

BALDWIN I. king of Jerusalem, was the son of Eustace, count of Boulogne. Having accompanied his brother Godfrey into Palestine, he there obtained the country of Edessa. He ascended the throne of Jerusalem as his brother's successor in 1100, and next year took Antipatris, Cesarea, and Azotus; and Acre, after a long siege, in 1104. He died in 1118, and was interred on Mount Calvary. He was an active and enterprising prince.

BALDWIN II. son of Hugh, count of Rethel, succeeded to the throne in 1118, after Eustace, the brother of Baldwin I. had given up all claim to it. In 1120 he gained a great victory over the Saracens, but was made prisoner by them in 1124; and gave up the city of Tyre to obtain his liberty. He died in 1131.

BALDWIN III. IV, and V. were also kings of Jerusalem in the latter part of the twelfth cen-

tury; the last of this name being poisoned, it was thought, by his mother, in 1186.

BALE, *n. s. v. n. & v. a.* *Fr. emballar*; *Ital. imballare*, a bundle or parcel packed up for carriage; a pair of dice. To make up into a parcel. As used by sailors, it is distinguished from pumping, and signifies to lave out water from hand to hand; from the French *bailler*.

One hired an ass in the dog-days, to carry certain *bales* of goods to such a town. *L'Étrange.*

It is part of the *bales* in which bohea tea was brought over from China. *Woodward.*

It is a false dice of the same *bale*, but not the same cut. *Ocebury. Charac. sign. Q. 2.*

For exercise of arms a *bale* of dice.

Ben Jonson, New Inn.

BALE', *n. s.*

BALE'FUL, *adj.*

BALE'FULLY, *adv.*

Sax. bæl; *Dan. bale*; *Icelandic bal, bol*; *Cimb. baul*; *Sax. bealopull*. Misery, calamity, mischief, poison, its genuine meaning.

And I sally telle that tale, or I ferrer go,
Now falsnes brewes *bale* with him, and many mo.

R. Brunne, p. 55.

She look'd about, and seeing one in mail

Armed to point, sought back to turn again;

For light she hated as the deadly *bale*.

Faerie Queene.

But when he saw his threath'ning was but vain,
He turn'd about, and search'd his *baleful* books again.

Id.

Thenceforth they playne, and make full piteous
mone

Unto the author of their *balefull* bane.

Spenser.

Such stormie stoures do breed my *balefull* smart,

As if my yeare were wast and woxen old. *Id.*

Boiling choler chokes,

By sight of these, our *baleful* enemies.

Shakspeare.

Round he throws his *baleful* eyes,

That witness'd huge affliction and dismay,

Mix'd with obdurate pride and stedfast hate.

Milton

Unseen, unfelt, the fiery serpent skims

Betwixt her linen and her naked limbs,

His *baleful* breath inspiring as he glides.

Dryden.

Happy Ierne, whose most wholesome air

Poisons envenom'd spiders, and forbids

The *baleful* toad and vipers from her shore.

Philips.

BALE, in commerce, is particularly applied to a quantity of packed up merchandise, well secured for carriage or voyages. To sell goods in the bale is to sell them in the lump, on showing a specimen, without unpacking or taking off the cordage. Thus the East India Company and others sell their goods. In the East India trade, the bulky goods are salt-petre, pepper, red earth, tea, &c. Bale goods stand opposed to piece goods.

A **BALE** of camlet, at Smyrna, is called a table, on account of its flat square.

A **BALE** of cotton yarn is from 300 to 400 weight.

A **BALE** of dice denotes a little packet, or paper, containing some dozens of dice.

A **BALE** of dowlas, or of lockram, consists of either three, three and a half, or four pieces.

A **BALE** of paper denotes a certain, or rather uncertain number of reams packed together in

a bundle. Those sent from Marseilles to Constantinople usually contain twelve reams. A bale or ballon of crown paper, manufactured in the departments of the Var, the Lower Alps, and the mouths of the Rhone, consists of fourteen reams.

A BALE of raw silk contains from 100 to 400 weight.

BALE (John), bishop of Ossory in Ireland, was born at Cove, in Suffolk, in 1495. At twelve years of age he was entered in the monastery of the Carmelites, Norwich. He was educated a Roman Catholic; but, being converted to the Protestant religion by Thomas Lord Wentworth, on the death of Lord Cromwell, who protected him from the Romish clergy, he was obliged to retire into the Low Countries, where he continued eight years. Soon after the accession of Edward VI. he was recalled; and being first presented to the living of Bishop's Stoke in Hampshire, in 1552, was nominated to the see of Ossory. During his residence in Ireland he was remarkably assiduous in propagating the protestant doctrines; but frequently at the hazard of his life. Once five of his domestics were murdered, as he would probably have been, had not the sovereign of Kilkenny come to his assistance with 100 horse and 300 foot. On the accession of queen Mary, the tide of opposition became so powerful, that he embarked for Holland, but was very unfortunate in his escape. First he was taken by a Dutch man of war, and robbed of all his effects. Then, being forced by stress of weather into St. Ives's in Cornwall, he was confined on suspicion of treason. Being released after a few days confinement, the ship anchored in a Dover road, where he was again seized on a false accusation. After his arrival in Holland he was kept prisoner for three weeks, and at length obtained his liberty on paying £30. From Holland he travelled to Basil in Switzerland, where he continued till queen Elizabeth ascended the throne. After his return to England he was, in 1560, made prebendary of Canterbury, not choosing to return to his former flock of wolves. He died in November 1563, at Canterbury, aged sixty-eight. He was so severe a writer against the church of Rome, that his books are particularly prohibited in the expurgatory index, published at Madrid in 1667. Most of his writings are attacks upon the religion he had abandoned. His Brief Chronicle concerning Sir John Oldcastle was republished in 1729; and he is also the author of many strange productions in English metre, among which are several plays on sacred subjects, a specimen of which may be seen in the Harleian Miscellany. To modern readers they would appear strange burlesques; but, as the author himself informs us, they were gravely and piously represented in his own days by young men at the market-cross of Kilkenny. The principal work of bishop Bale is his *Scriptorum Illustrium Majoris Britannie Catalogus*; or, An Account of the Lives of eminent Writers of Britain; which, according to the title, commences with Japhet the son of Noah, and reaches to the year 1557! It formed the foundation of all the large subsequent compilations of this kind.

BALE, BASLE or BASIL. See BASLE.

BALEARES INSULÆ, or BALEARIC ISLANDS, islands in the Mediterranean, so called from *Bαλαρι*, because the inhabitants were excellent slingers. But Bochart makes the name of Punic or Phœnician original, as were the people: Baal-jare, signifying a master, or skilful at throwing; the Phœnicians and Hebrews being dexterous at the use of the sling. The Greeks called these islands *Gymnasia*, because, in summer, the inhabitants went naked, or rather because they were only armed with a sling in war. There are two principal ones called Major and Minor; and hence the modern names Majorca and Minorca. The Major is distant from the Minor thirty miles to the west; in length 40 miles, and in circuit 150. They were subdued by Quintus Metellus, A. A. C. 120. The Baleares, together with the adjacent islands, were a part of the Provincia Citerior or *Tarraconensis*, and of the resort of the *Coventus Carthaginiensis*, or New Carthage. These islands are called *Cheorades*, by Apollonius, and *Choeradades*, by Strabo, i. e. rocky. See MAJORCA and MINORCA.

BALEARICUS, a surname obtained by Metellus upon his conquest of the Baleares.

BALECHOU (John Joseph), a celebrated French engraver, born at Arles, in 1719. He died at Avignon, in 1765. This extraordinary artist wrought entirely with the graver, of which he was fully master. The clearness of his strokes, and the depth of color which he produced, are far beyond any production prior to his own. His two large plates from Vernet, the one representing a storm, the other a calm, must ever be considered as astonishing exertions. They are too well known, and too much admired, to need any further eulogium: and were never equalled, until they were perhaps surpassed by our countryman Woollet.

BALEN (Hendrick Van), history and portrait painter, was born at Antwerp, in 1560; was a disciple of Adam Van Oort, and resided at Rome a considerable time. He copied the antiques; and at his return to his own country, the visible improvement of his taste procured him the esteem of the ablest judges. He gave to his figures so much truth, roundness, and correctness of outline, that few of his contemporaries could enter into competition with him. Several fine portraits of his remain. He died in 1632.

BALEN (John Van), painter of history, landscapes, and boys, was born at Antwerp, in 1611; and derived his knowledge of the art, and his fine taste of drawing and design, from his father Hendrick; but, as soon as he had made a competent progress, he travelled to Rome, and lived for several years in that and other cities of Italy. There he acquired a good gusto of design, though he was sometimes incorrect. His particular merit was in his figures of naked boys, cupids, and nymphs bathing or hunting, of which subjects he painted a considerable number; and he procured both praise and riches by his landscapes and histories. The carnations of his figures were clear and fresh; his coloring in general transparent; the airs of his heads were in the manner of Albano.

BALENGARIA, BALENGER, in writers of the

middle age, a kind of vessel of war, but of what particular construction seems not well known. Blount says, that by the stat. 28 Hen. VI. cap. 5, balenger seems to have been a kind of barge.

BALES (Peter), a famous master in the art of penmanship, or fair writing; and one of the first inventors of short hand. He was born in 1547, and is styled, by Anthony Wood, 'a most dexterous person in his profession.' Wood adds, that 'he spent several years in sciences among the Oxonians, particularly in Gloucester-hall; but that study, which he used for a diversion only, proved at length an employment of profit.' He is mentioned in Hollinshed's Chronicle, A. D. 1525; and Mr. Evelyn has celebrated his delicate execution of a piece of writing, containing the Lord's Prayer, the Creed, Decalogue, with two short prayers in Latin, his own name, motto, day of the month, year of the Lord, and reign of the Queen (Elizabeth), to whom he presented it at Hampton Court, all 'written within the circle of a single penny, inclosed in a ring and borders of gold; and covered with a crystal, so accurately wrought as to be very plainly legible, to the great admiration of her Majesty, the whole Privy Council, and several ambassadors then at Court?' He was also dexterous in imitating hand-writing, and, about 1586, was employed by Secretary Walsingham in certain political manoeuvres. In 1590, we find him at the head of a school, near the Old Bailey, London; in which year he published his Writing Schoolmaster, in three parts: the first teaching swift writing, the second true writing, the third fair writing. In 1595, he had a great trial of skill in Blackfriars with one Daniel Johnson, for a golden pen of £20 value, and won it. He had also the arms of Calligraphy given him, which are Azure, a Pen, Or, as a prize, at a trial of skill in this art among the best penmen in London. In 1597, he republished his Writing Schoolmaster, which was in such high reputation, that no less than eighteen copies of commendatory verses, composed by learned men of that time, were printed before it. Wood says, that he was engaged in Essex's treasons in 1600; but he was only engaged, and very innocently so, in serving the treacherous purposes of one of that Earl's mercenary dependents.

BALESSAN, the eastern name for that species of the *Amyris* which produces the celebrated balsam of Mecca, the ancient balm of Gilead. This plant grows to the height of fourteen feet, flourishing in a hot climate, and in a stony barren soil. In general it is lower, and Mr. Bruce describes a specimen five feet and a half in height, and five inches across the stem where thickest. The wood is white, light, and of open texture, covered with a smooth bark, reddish or of bluish white, resembling that of a healthy standard cherry-tree, green within, and emitting a very fragrant odor. That of the branches, which are very flexible and resinous, is equally agreeable. The leaves, which are evergreen and scanty, bear some resemblance to those of rue; and the flowers, which are leguminous and of a purplish color, resemble those of the acacia. The fruit consists of small pointed ovoidal berries,

containing a yellowish fluid similar to honey, of a bitterish taste, and exhaling a pleasing perfume, approaching the odor of balm.

It has been in modern times maintained that the plants producing the balsam of Mecca are restricted to a plantation of a little more than thirty acres, at Beder Hunein, a station for pilgrims in Arabia, between Mecca and Medina. Yet it cannot be positively affirmed if this be one species, that Abyssinia, the country ascribed to the other, is deprived of it; or that the balm of Gilead grows in Abyssinia exclusively. These are facts which require elucidation from future botanical research. The plantation belongs to a noble family of Arabs, of the tribe Beni K'oreish, from which Mahomet originated, unless the Wahabees, who interrupted the wored pilgrimages, have dispossessed them of their inheritance. The balsam is a resinous matter, exuding, like ordinary resin from incisions in the bark, in July, August, and September. It is received in an earthen bottle, and the most productive trees do not yield more than sixty drops a day, we are told. At this time it emits a very strong and pungent odor, and is of a rough, acrid taste, a pale yellow turbid color, and it dissolves in oils readily. Afterwards it acquires a deeper color, as well as greater consistency and clearness, and is not unlike honey in its appearance. It sinks in clear water to the bottom, and, if dropped on hot iron, collects itself into a globule. It is said to be frequently adulterated with honey, wax, and oil. The best kind is called opobalsamum; there are two other kinds, the carpopalsamum, and xylobalsamum; they are obtained from an expression of the fruit of the *amyris*, the other from a decoction of the twigs.

Prosper Alpinus ascribes many properties to the balsam of Mecca, esteemed the most precious of all that bear the appellation of balsam, and which, in ordinary description, we must consider synonymous with the balm of Gilead; and the modern Arabs, Turks, and Egyptians, entertain great confidence in its efficacy. It is a powerful vulnerary: Mahomet affirmed, that a grove of the trees sprung up from the blood of his own tribe killed in battle, the juice of which cured the wounds of the faithful, however deadly, nay, that it recovered some of them from death itself. It is also taken for complaints in the breast, in fevers, and rheumatism. Hasselquist says, it is useful as a stomachic in doses of three grains. Its repute as an antiseptic is very great; and it is esteemed so effectual an antidote against the plague, that when this distemper makes its appearance, the Egyptians take a certain quantity daily. Its principal use, however, is as a cosmetic by the eastern females of rank: after being kept in a very warm bath, the face and breast are anointed with it, and the same process is continued every third day for a month. Oil of almonds and other cosmetics are then rubbed over the parts, whereby the skin and complexion are beautifully renovated. Lady Mary Wortley Montague relates, that she was induced to try the experiment, by which her face became swelled and red for three days, during which she suffered much pain, but her complexion was greatly improved. She adds

that the ladies of Constantinople, by whom it is used, have the finest bloom. As yielding the virtues of the balm of Gilead, this plant has been celebrated from very remote antiquity. When Joseph was confined by his brethren in a pit, it is said, 'they sat down to eat bread; and they lifted up their eyes and looked, and behold a company of Ishmaelites came from Gilead, with their camels bearing spicery, and balm, and myrrh, going to carry it down to Egypt.' Jeremiah particularly alludes to its virtues; and Josephus states, the queen of Sheba, or Saba, 'who was inquisitive into philosophy, and on that and other accounts was also to be admired,' brought the balm of Gilead as a present to Solomon, on her visit to Jerusalem.

'They say also,' he adds, 'that we possess the root of this balsam, which our country still bears, from that woman's gift.' It appears from the writings of the ancients, nearly contemporary with Josephus, that Judea was generally believed to be possessed of it exclusively. Pliny says, 'To all other odors whatsoever is to be preferred that balsam, which is produced in no other part of the world than the land of Judea, and there in two gardens only, both belonging to the king, one not exceeding twenty acres in size, and the second still smaller.' Strabo partly confirms the above accounts, ascribing it to that country, over or near to which the queen of Sheba reigned. 'Near to this,' he says, 'is the most favored land of the Sabeans, a very great people. Frankincense, myrrh, and cinnamon, grow among them, and in the coast that is about Saba, the balsam also.' Whence Bruce observes, that 'among the myrrh-trees behind Asab, all along the coast to the Straits of Babelmandel, is its native country. It grows to a tree about fourteen feet high spontaneously, and without culture, like the myrrh, the coffee, and frankincense-tree; they are all equally the wood of the country, and occasionally cut down for fuel.' Diodorus Siculus affirms that this balsam grew in a valley of Arabia Felix. Ali Bey says, that there is no balsam made now at Mecca: that, on the contrary, it is very scarce, and is obtained principally in the territory of Medina; as also that it was called *belsan*, for whose history see our article *BADIA*.

Galen travelled into Syria and Palestine, purposely to obtain a knowledge of this substance: in 1516 we find the emperor Selim levying a tax of three pounds weight of it annually on Arabia and Egypt; which is said to be levied to this day.

Part of the governor of Cairo's appointments include a right to receive a pound of balsam; the like quantity is due to an officer who conducts the caravan of pilgrims to Mecca; and half a pound to the pacha of Damascus.

BALESTRA (Antonio), an excellent historical painter, born at Verona in 1666. At the age of twenty-one he went to Venice, where he continued for three years, under the direction of Ant. Bellucci. He next visited Bologna and Rome, and at the latter became the disciple of Maratti. Under him he exerted himself in designing after Raphael, Corregio, Annibal Caracci, &c. by which he so effectually confirmed his

talent, that he obtained the prize of merit in the academy of St. Luke, in 1694, when he was only twenty-eight. From that time his reputation was established, and he was engaged to work for most of the churches and the nobility, and his paintings were universally admired. His style is like that of Maratti; and his works have a certain mixture of the manners of Raphael, Corregio, and Caracci. He died in 1740. In the church of Santa Maria Mater Domini, at Venice, there is one of his most capital performances, representing the nativity of our Saviour. In a chapel belonging to the church of S. Geminiano, in the same city, there is another capital picture of his, representing our Saviour dead, in the arms of the virgin.

BALESTRA, in ichthyology, a name by which Sylvian and others have called the fish more usually known by the name of *Capricus*.

BALETCHENCK, a town of Turkey in Asia, on the Kurasis, twenty-one miles from Hazahan, and twenty-seven miles from Kati-bounou. It consists of 260 houses, and carries on a considerable traffic in horses, cattle, and goats' hair, made into bags.

BALEY (Walter), the son of Henry Baley of Warnwell in Dorsetshire, was born at Portsham, and educated at Winchester. From thence he was sent to Oxford; and, after two years probation, was admitted perpetual fellow of New College, in 1550. Having taken his degree of M. A. he practised physic, and in 1558 was proctor of the university. About this time he obtained the prebend of Wells, which he resigned in 1559. In 1561 he was appointed queen's professor of physic, in 1563 proceeded M. D. and afterwards became one of her majesty's physicians in ordinary. He was thought skilful in his profession, and had considerable practice. He died in 1592, aged sixty-three; and was buried in the inner chapel of New College. His works are, 1. A Discourse of three kinds of Pepper in common use, 1588, 8vo. 2. Brief Treatise of the Preservation of the Eye-sight; first printed at Oxford in 1616 and 1645, 8vo. 3. Directions for Health, natural and artificial; with medicines for all diseases of the eyes, 1626, 4to. 4. *Explicatio Galeni de potu Convalescentium et Senum*, &c. MS. formerly in Lord Aylesbury's library.

BALFROSH, a town of Persia, in the province of Mazendaran, consisting of one principal street, occupied almost wholly by a bazaar, and divided into seventeen wards. Here are eight caravansaries, three of which are devoted to the use of the Russians and Armenians. It is the second town of the province, distant twenty miles west of Fehrabad.

BALGA, a bailiwick, castle, and town of Brandenburg, in East Prussia, opposite Pillau, and twenty-four miles south-west of Königsberg. The celebrated fortress of Storeda is in this vicinity.

BALGAVIES, a lake of Scotland, in the parish of Aberlemno, in Angusshire, through which the Lunan runs. It furnishes much marl for manuring the adjacent grounds.

BALGILLO, a hill of Scotland, in the parish of Monyfeith in Angusshire, about half a mile

north of Broughty Castle; on which there are still to be seen remains of those fortifications that were erected by the English, under Henry VIII. when they ravaged Dundee and most of the county during the regency of the earl of Arran, in 1548.

BALGONIE, a district in Fifeshire, the property of the Earl of Leven, and from which his eldest son takes his title. It produces excellent coals, and is said to have been wrought for that mineral upwards of 300, some say 500, years ago.

BALGONIE CASTLE, one of the earl of Leven's seats, in the parish of Markinch, in Fifeshire, a fabric of great antiquity, supposed to have been built in the twelfth century.

BALGUY (John), an eminent divine of the church of England, was born in 1686, at Sheffield, and studied at Cambridge, where he took the degrees of A. B. and M. A. In 1708 he was appointed tutor to Joseph Banks, esq. grandfather to the celebrated Sir Joseph. In 1710 he was ordained a deacon, and in 1711 a priest, when Sir H. Liddel bestowed on him the donative of Lamesly and Tanfield. In this small cure he composed a new sermon every week, 250 of which he afterwards burnt, that his son, Dr. Thomas Balguy, archdeacon of Winchester, might exercise his own genius, instead of trusting to his father's labors. In 1727 he was collated by hishop Hoally to a prebend in Salisbury, with the right of presenting to four livings; of which he gave one to his son, and another to his brother-in-law, Mr. Robinson. He published 1. *Silvius's Examination of certain Doctrines taught by the Reverend Mr. Stebbing*, in 1718; 2. *Silvius's Letter to the Rev. Dr. Sherlock*, in 1719; both anonymously, in vindication of Bp. Hoally. Mr. Stebbing having replied to these works, Mr. Balguy published, 3. *Silvius's Defence of a dialogue between a Papist and a Protestant*, in answer to the Rev. Mr. Stebbing; with remarks on that author's manner of writing; 4. *A Letter to a Deist concerning the Beauty and Excellence of Moral Virtue, and the support which it receives from the Christian Revelation*, in 1726. In this treatise he attacked Lord Shaftesbury's principles, with equal politeness and strength of reasoning. 5. *The Foundation of Moral Goodness, or an Enquiry into the Original of our Ideas of Virtue*; in two parts, in 1723. 6. *Divine Rectitude, or a brief Enquiry concerning the Moral Perfections of the Deity*, &c. 7. *A second Letter to a Deist*. 8. *The Law of Truth*. 9. *Essay on Redemption*: and, 10. *A Volume of Sermons*. He died in 1748, aged 62 years.

BALI, or **BALIX**, sometimes called also *Little Java*, one of the *Sunda* or *Sumatran* islands, situated in the eastern extremity of Java by the southern of Bali, about five or six leagues wide and of very intricate navigation. Its length according to the late S. B. Co's, to whom we are indebted for the greater part of our information respecting the East Indies is about eighty miles, and its breadth about twenty miles, the whole surface being about 1600 square miles. He that is desirous of a more exact description of a little island of this name, which is about a square mile, which is situated in the bay of the number

of its inhabitants. The country is mountainous, rising into the interior; the ravines and beds of rivers are deep, and the rivers rapid.

Bali is well cultivated and thickly planted with cocoa-nut and other fruit-trees: the uncultivated parts are crowned with deep forests.

Its productions consist chiefly of rice, maize, yams, and sweet potatoes; rice yields from thirty to forty fold, and the maize often more than a hundred. The Balinese also grow cotton on the dry land, of a superior kind; some opium, nutmegs, dyeing drugs and tobacco, are also objects of culture. On the whole, the Balinese may be considered, we are told, as the most civilised islanders in this archipelago, not excepting even the Javanese. The women manufacture a considerable quantity of cotton cloth for exportation; and are not so much in the field as those of Java: the men manufacture their own fire-arms. On the eastern coast at a place called Pejan a gold mine has been opened. They import chintz and other piece goods, iron, and china ware. Iron, in particular, is in great request. The religion is that of Budh, but not divided into castes; and the priesthood, at least in general, is hereditary. The priests live secluded in separate societies, among the mountains, having lands assigned for the support of themselves and their temples. Justice is administered by distinct civil magistrates, who very intelligently expound the law from written authorities, which is a decided proof that civilisation has had a powerful influence even upon the body of the people.

Bali is governed by seven native and independent princes, each absolute in his own dominion; though their despotism appears to be of a much milder character than among the native governments of Java. A right of private property in the soil is said to be established, and the claims of the government to be confined to a regular tax in kind on the rice. The language presents the singular distinction of one class of words to be used by the privileged orders, and another for the people in general. A sort of feudal service in war is maintained; slavery, we regret to add, though unknown among them, is encouraged by the sale of their prisoners of war to other nations. They are also said to use poisoned arrows in war.

Historically it seems only to be known that this island was visited by Sir Francis Drake in 1597, and that the conversion of the natives to Buddhism took place about 1750 years since. The east peak of the island is in lat. 8° 24' long. 115° 24' E.

Their language is written in the same character as that of Java, and the Javan is said to be spoken at the courts of their princes, but it is considered as a foreign tongue. The Kawi, the learned language of all these islands, is well understood at Bali. The Balinese are represented as mild and inoffensive in their manners; they readily associate with strangers, and are altogether divested of those bigoted prejudices of caste, nation and religion, with which the people of continental Asia are generally imbued. On the other hand they are said to be the only people of this archipelago who possess either courage or tractability for receiving the regular discipline of European troops. Their food consists princi-

pally of the flesh of hogs and buffaloes, with which ships touching here are readily and reasonably supplied. Nor is the use of spirituous liquors or opium unknown, both of which have been introduced by Europeans. Their houses, like those of Java, are built upon the ground, and not raised upon posts as amongst the Malays. They are generally clothed in cotton of their own manufacture, and of a good fabric. Until they are married, indeed, the females go nearly naked, then the bridegroom wraps a selendang or cloth round the bosom of his chosen fair. There is said to be great general prudence and fidelity in their marriages.

BALIO. See **BALLO.**

BALIO, **BALLIO**, or **BAILLIOL** (John), king of Scotland. On the death of queen Margaret, in her passage from Norway, being at the head of the English interest in Scotland, he claimed the vacant throne, by virtue of his descent from David earl of Huntingdon, brother to William the Lion, king of Scotland. Robert Bruce opposed Baliol, but having submitted to the arbitration of Edward I. it was decided in favor of Baliol, who did homage to him for the kingdom on the 12th of November, 1292. Baliol, however, did not long enjoy the crown, for having remonstrated against the power which Edward assumed over Scotland, he summoned him to his tribunal as a vassal. Irritated at this, Baliol concluded a treaty with France, on which a war with England immediately commenced; and after the battle of Dunbar he surrendered his crown into the hands of the English monarch, who sent him and his son to London to be imprisoned in the Tower. The pope interceded for them, and they were liberated, and committed to his legate in 1297. Baliol retired to his estate in France, where he died in 1314.

BALIO (Edward), the son of John Baliol, king of Scotland. Notwithstanding the manner in which his father was degraded, and obliged to give up his crown, he laid claim to the kingdom of Scotland, and, assisted by France, invaded and recovered it; but it was soon again wrested from him; and dying afterwards without issue the family became extinct.

BALIO, or **BALLIO** (Sir John de), founder of Baliol college, in Oxford, was son of Hugh Baliol, of Bernard's castle in the diocese of Durham, and eminent for his power and riches. He was appointed governor of Carlisle in 1248; and when Margaret, daughter of Henry III., was married to Alexander III., king of Scotland, the guardianship of the royal pair, and also of the kingdom, was committed to him and another lord; but in about three years they were charged with abusing their trust, and the English monarch marched towards Scotland, on purpose to punish them. Baliol, however, pacified him by advancing a sum of money. During the wars between Henry III. and the barons he adhered to the king, on which account the barons seized his lands. In 1263 he began the foundation and endowment of Baliol college, which was afterwards completed by his widow. He died in 1269.

BALISTES, in ichthyology, a genus of fishes belonging to the order of amphibia nantes. The

characters are, the head is flat; eight teeth in each side, the two anterior ones are longest; in the place of gills an aperture immediately above the pectoral fins; the body flat; the scales joined together by the skin, and the belly keeled. There are eight species of this genus:—viz. *B. aculeatus*, with a triradiated back fin, and the spines of the tail lean upon each other. It is a native of India. 2. *B. hispidus* with the head-fin uniradiated, and a round black spot in the tail-fin; the body rough, and bristly towards the tail; the spine or horn situated between the eyes; the snout subulated, and instead of a belly-fin a jagged sharp spine. This is a native of Carolina. 3. *B. monoceros*, whose head-fin consists of but one ray, and the tail-rays carinated. It is called the unicorn-fish by Catesby. This fish has been accounted poisonous. They mostly frequent those seas, amongst the Bahama islands, where the corals are in great plenty. 4. *B. papillosus*, with a biradiated back-fin, and a papillous body. 5. *B. ringens*, with a triradiated back-fin; three folds in each side of the head, and the tail-fin forked. It is found at Ascension island. 6. *B. tomentosus*, whose head-fin is biradiated, and the body of it, towards the hind part, hairy. It is a native of America. 7. *B. verrucosus*, has a triradiated back-fin, and the tail full of little warts. In the place of a belly-fin this species has a large, thick, warty ray, and twenty-five small reversed sharp spines at the side of the tail, disposed in four rows. It is a native of India. 8. *B. vetula*, or old wife, with a triradiated back-fin; the belly-fin longitudinal and somewhat carinated; and the tail-fin forked. It is found at Ascension island.

The fishes of this genus are remarkable for their splendid colors. The species mentioned by Linnæus and Gmelin are the following:—*monoceros*, *scriptus*, *hispidus*, *tomentosus*, *papillosus*, *verrucosus*, *biaculeatus*, *aculeatus*, *vetula*, *maculatus*, *ringens*, *sinensis*, *assassi*, *capricus*, *forcipatus*, *punctatus*, *Kleinii*, *curassavicus*, and *Americanus*. Lacepede has described twenty-four species of balistes, in his work on fishes, and which he divides into four sections:—*Le baliste mamelonné*, *le baliste pralin*, *le baliste verdatre*, *le baliste Mungo-Parck* (Park); *le baliste métallique*, &c. are new or interesting species described by Lacepede.

BALISTER, *n. s.* Lat. *balista*; Fr. *balesta*, a cross bow.

A spindle full of raw thread to make a false string for the king's balister or cross bow.

Blount's *Tenures*, p. 92.

BALIZE, a river in the peninsula of Yucatan, South America, which falls into the bay of Honduras, in lat. 14° 59' N. On its banks, and to the extent of 200 miles up the stream, the English cut mahogany, and by the treaty of 1783 a right was guaranteed to British subjects of cutting and carrying away logwood, in the district between this river and the Rio Hondo. Beyond the scene of their operation the Balize is very imperfectly known.

BALIZE, a sea-port town of Yucatan, South America, is an establishment chiefly composed of English settlers, at the mouth of the above river. The houses are mostly built of the wood

of the neighbourhood, amongst which the graceful mahogany frequently furnishes pillars of eight or ten feet high, on which they stand, surrounded by piazzas. The cocoa tree and tamarind, largely interspersed among the buildings, which are also frequently thatched with leaves of the palmetto, give the whole place a very picturesque appearance. But the better sort of houses have of late been shingled. The neighbourhood is low and swampy.

BALK, *n. s. v. a. & v. n.* Dutch and Germ. *balk*; Sax. and Wech balc, derived by Skinner from Ital. *vulicare*, to pass over. A great beam such as is used in building; a rafter over an out-house or barn; a ridge of land left unploughed, between the furrows, or at the end of the field; land over which the plough slips without turning it up; figuratively any thing overpassed, untouched. A disappointment; to frustrate, to elude, to omit, or refuse any thing; to heap together; to turn aside, to deal in cross purposes; to speak differently from the intention. The two last meanings are arbitrary, and rest on the authority of Spenser only.

His own hand than made he ladders three
To climb by the rings and the stalks
Unto the tubbes hanging in the *balkes*. *Chaucer.*

BALKAN (anciently called *Hæmus*), a lofty and rugged chain of mountains, extending from Cape Eminch Burun, on the Black Sea, in European Turkey, to Cape San Stefano, in the Adriatic Sea, from 23° to 27° E. lon. Near Sulu Derbent (Porta Trajani), this mountain, called by the Turks, Eminch Slag, separates from Rhodope, and divides the valley of the Danube, which constitutes Bulgaria (inhabited mostly by wandering tribes), from Romania, or Rumeia. A branch extends from north to south (Mount Athos); another runs through ancient Greece, and comprehends the mountains Olympus, Cit, Pindus, Parnassus, Helicon. The highest peak, Orbelus, rises 9660 feet above the surface of the sea. After the overthrow of the empire in Constantinople, only the Greeks of the plains and the sea-coast submitted to the Mussulmans. The warriors, and those who had no landed property, fled into the mountains, into the armatoles, and have, in general, maintained a continual contest with the pachas of the plain: some have paid a small tribute to the Turkish pacha, and some have become Mohammedans. The districts where the Catholic is the prevailing church, contain the wildest inhabitants, and have never been subjected to the emperors of Constantinople for any length of time. In 1829 a Russian army crossed the Balkan, advanced nearly to the gates of Constantinople, and dictated a peace to the sultan.

BALKTERS. In fishery. Men who stand on a cliff or high place on the shore, and give a sign to the men in the fishing boats, which way the passage or shoal of herrings is.—*Cowell*.

The palfards are pursued by a bigger fish, called a plusher, who leapth above water, and bewrayeth them to the *balkter*. *Cæsar's Sur. of Corn.*

BALKH, a province of Turkistan, bounded on the north by the Amu, on the east by Badakhshan, on the south by the Hindú-cush, and on the west by the deserts of Khwarezm, the ancient Sactian. Its present extent is about 250 miles

from east to west, and about 110 from north to south. The southern and eastern districts are comparatively cool for the climate, and the valleys towards the Amu are well watered and fertile. The rivers from the Hindú-cush, we learn from Mr. Elphinstone, flow in a direction almost due north, into the Amu: the Koksha, or Badakhshán, is the easternmost; next comes the Ak-serái; and the last and most westerly, the Relhás, loses itself in the sands before it reaches Balkh. Balkh is divided into the districts of Maïmench, Andekhúd, Shilbúrkán, or Shibberg-hán, Balkh Proper, Kulum, Hazeret Imám, Kundus Khost, Inderáb, and Talikan. The three first border on the deserts, and are occupied by wandering hordes of Uzbegs and Turcomans.

BALKH, a city of Turkistán, the capital of the above province, stands in lat. 36° 45' N., long. 65° 20' E.; it is now in ruins; but is surrounded by 360 fertile villages. The districts Kulum and Hazeret Imám are barren, but those on the north side of the Hindú-cush, are productive and well peopled. The population of the whole province amounts probably to a million. Balkh was originally built by Kayúmaras, and was the favorite residence of the Persian kings of the Caianian dynasty. It was once esteemed the chief Mussulman city in the north, and called Kubbatul islám, (the holy shrine of Islamism). Jengiz Khán took it in 1221, and the last of his family was driven out of it by Tamerlane. In the beginning of the sixteenth century the house of Taimúr was expelled by the Uzbegs, who have ever since maintained a precarious dominion over these provinces. Kilij Ali Bey was the reigning prince when Mr. Elphinstone visited Afghánistán, nominally acknowledging the authority of the king of Cábul; but in all the internal government entirely independent.

BALKY, a large decayed old town of Hindostan, in the province of Beeder, surrounded by a wall. It is distant fifteen miles W. N. W. of Beeder, and forty-five north-east of Kalberghah. Long. 77° 29' E., lat. 17° 49' N.

BALL, a small place in the county of Mayo, 107 miles from Dublin. Here is a celebrated holy well and a round tower; also at Moat in the neighbourhood the ruins of an ancient abbey. This place is sometimes called Ballagh. The living is a prebend in the archdiocese of Tuam.

BALL (John), a puritan divine, born in Oxfordshire in 1585. He had a curacy of £20 per annum in Staffordshire, and kept a school. He wrote strongly against such as separated from the church, as disapproving of the ceremonies and government, though he was far from being satisfied with these in some respects himself. He died in 1640.

BALL. Germ. and Dutch *bollen-bol*, to roll, turn, round; any thing round, or roundly, as a cricket ball, a billiard ball, the eye ball, the globe, any thing globular.

Ball, diminutively *Belin*, the sun, or Apollo, of the Celts, was called by the ancient Gauls *Abellio*. Whatever was round, and in particular the head, was called by the ancients either *Bál*, or *Bel*, and likewise *Ból* and *Bil*. Among the modern Persians, the head is called *Pole*; and the Flem-

ings do still call the head *Boule*. Πολος is the head or poll; and πολεω is to turn. Βολος likewise signifies a round ball, whence *bowle*, and *bell*, and *ball*, which the Welsh term *bél*. By the Scotch also the head is named *bhél*; whence the English *bill* is derived, signifying the beak of a bird. Figuratively, the Phrygians and Thurians by βαλλων understood a king. Hence also, in the Syriac dialects, βααλ, βηλ, and likewise βωλ, signifies lord, and by this name also the sun; and in some dialects, Ηλ and Ιλ, whence Ιλος and Ηλιος, Γηλιος and Βηλιος, and also, in the Celtic diminutive way of expression, Ελενος, Γελενος, and Βελενος, signified the sun; and Ελενη, Γελενη, and Βελενη, the moon. Among the Teutonic, *hol* and *heil* have the same meaning; whence the adjective *holog*, or *heilig*, is derived, and signifies divine or holy; and the aspiration being changed into *s*, the Romans form their *Sol*.

Barter.

For where as God hath shewed unto us certain tokens of his Godhead, in the heavenly *balles* and circles above, and on the yearthe beneath, in the sea, and in all lyuing creatures on the yearthe, yet hath he wrought in none of thym more wonderfully than in manne.

Udall. Acts, ch. xvii.

The palme play, where spoiled for the game,
With dased eyes oft we by gleams of love
Have missed the *ball*, and got sight of our dame,
To bait her eyes which kept the leads above.

Earl of Surrey.

Be subject to no sight but mine; invisible
To every eye-*ball* else.

Shakspeare.

Balls to the stars, and thralls to fortune reign,
Turn'd from themselves, infected with their cage,
Where death is fear'd, and life is held with pain.

Sidney.

Those I have seen play at *ball*, grow extremely earnest who should have the *ball*.

Id.

What, though in solemn silence, all
Move round the dark terrestrial *ball*!
What tho' nor real voice nor sound
Amid their radiant orbs be found!
In reason's ear they all rejoice,
And utter forth a glorious voice;
For ever singing, as they shine,
'The hand that made us is divine.'

Andrew Marvell.

* * * This, with the other sublime and beautiful hymns in the Spectator, were meanly withheld from their genuine author, and falsely ascribed to Addison and Tickell.

Nor arms they wear, nor swords and bucklers wield,
But whirl from leathern strings huge *balls* of lead.

Dryden.

Thus nothing to her genius was deny'd;
But, like a *ball* of fire, the further thrown,
Still with a greater blaze she shone;
And her bright soul broke out on ev'ry side. *Id.*
Like a *ball* of snow tumbling down a hill, he gathered strength as he passed.

Howell.

Ye gods, what justice rules the *ball*?
Freedom and arts together fall.

Pope.

'Tis but a *ball* bandied to and fro, and every man carries a racket about him to strike it from himself among the rest of the company.

Swift.

BALL, *n. s.* Fr. *bal*, from *balare*, low Lat. from βαλλειζεν. To throw or cast about the legs and feet, from βαλλω, to throw. An entertainment of dancing; a fashionable amusement, either public or private; in the former case it is

conducted and controlled by a master of the ceremonies; and in the latter it is given by individuals, and is select, because none are admitted but persons specially invited. At public balls, or dancing assemblies, the expenses are defrayed by the company; at private entertainments of this description, the guests are gratuitous participants.

He would make no extraordinary figure at a *ball*; but I can assure the ladies, for their consolation, that he has written better verses on the sex than any man.

Swift.

Have you not been in pain even at a *ball*, because another has been taken out to dance before you.

Tatler, No. 253.

There's nothing in the world like etiquette;
In kingly chambers, or imperial halls,
As also at the race and county *balls*.

Byron.

BALL, among Cornish miners, a tin mine.

BALL, in antiquity, a species of game frequent among the ancients. The Romans had four kinds of pile, or balls; the first called trigon or trigonalis, because the three gamesters were placed in a triangle: these caught and tossed the ball, taking great care not to let it fall to the ground. The second and third, called follis, made of leather, blown up like our foot-balls: the largest sort of these were struck with the arm, the smaller with the fist: the former seem to have been distinguished by the appellation, paganica, as being much used in country villages: the fourth was the harpast, a kind of small ball, so called because the gamesters endeavoured to snatch it from each other. Galen has an entire treatise on the exercise of the lesser ball.

BALL, HERO'S, pila Heronis, a kind of artificial fountain, wherein the water is made to spout out of a hollow ball or globe; so named from the inventor, Hero of Alexandria, who has left the description of it in his Spiritalia.

THE *BALL* OF A DOG'S FOOT is the prominent part of the middle of the foot, called by Latin writers of the middle age, pelota.

BALL OF A PENDULUM, the weight at the bottom. In shorter pendulums, it is called the bob.

BALL PUFF, in botany, the English name of the lycoperdon. See LYCOPERDON.

BALL VEIN, in mineralogy, a name sometimes given by miners to a sort of iron ore, common in Suffolk, and wrought to a considerable advantage. It yields not any great quantity of metal, but what it has runs freely in the fire, and is usually found in loose masses, covered with one or more crusts. It contains some sparkling particles; and is usually of a circular form in the perfect masses, thickest in the middle, and gradually thinner as it approaches the sides.

BALL, French, balle, in the military art, comprehends all sorts of bullets for fire-arms, from the cannon to the pistol; also a composition of divers ingredients, generally of the combustible kinds, serving to burn, give light, smoke, stench, or the like; as fire-balls, light-balls, smoke-balls, stink-balls, land-balls, &c. Cannon-balls are made of iron, musket-balls, pistol-balls, &c. are of lead. The experiment has been tried of iron balls for pistols and fuses, but they are justly rejected, not only on account of their lightness,

which prevents them from flying straight, but because they are apt to furrow the barrel of the pistol, &c.

Cannon-balls are distinguished by their respective calibres: thus

For a	}	pound ball the diameter is	}
	42		6.68
	32		6.10
	24		5.54
	18		5.04
	12		4.40
	9		4.00
	6		3.49
	3		2.77
	2		2.42
	1		1.92

A new description of inflammable balls, applicable for besieging a town, and peculiar for its small weight, by which means it may be thrown to a great distance, and takes fire on a very curious plan, has been invented by Captain Thomas Dundas, of the royal navy. It spreads a flame in three distinct openings, which is so strong that the fire extends a full yard in length from the ball itself, and is so powerful that any thing under, over, or near, cannot escape its effects. See the article Snor.

BALLS, ANCHOR, are made in the same way as the light-balls hereafter described, and filled with the same composition, only with this addition, that these are made with an iron bar two-thirds of the ball's diameter in length, and three or four inches square. One-half is fixed within the ball, and the other half remains without; the exterior end is made with a grapple hook. Anchor-balls are very useful to set fire to wooden bridges, or any thing made of wood, or even the rigging of ships, &c. for the pile end being the heaviest, flies foremost, and wherever it touches, fustons, and sets all on fire about it.

BALLS, CHAIN, are two balls linked together by a chain of eight or ten inches long, and some have been made with a chain of three or four feet long; they are used to destroy the palisades, wooden bridges, and chevaux-de-frizes of a fortification. They are also very destructive to the rigging of a ship.

BALLS, FIRE AND LIGHT; the Greeks had various kinds of fire-balls, or *Πυροβολαι λιθοι*; one kind called, more particularly, *σκραλια*, or *σκραλιε*, made of wood, sometimes a foot, or even a cubit long; their head armed with spikes of iron, beneath which were hemp, pitch, and other combustibles, which being set on fire, they were cast among the enemy. Also composed of sulphur powder two, saltpetre one and a half, sulphur one, resin one, turpentine two and a half parts. Sometimes they are made of an iron shell, sometimes a stone, filled and covered with various coats of the above composition, till it conglomerates to a proper size, the last coat being of grained powder. But the best method of making them is to take thick brown paper, make a shell the size of the mortar, and fill it with a composition of an equal quantity of sulphur, pitch, resin, and mealed powder; which being well mixed, and put in warm, will give a soft texture, and burn a considerable time. When they are intended to fire machines, buildings,

&c. the composition must be mealed powder, ten, saltpetre two, sulphur four, and resin one; or rather mealed powder forty-eight, saltpetre thirty-two, sulphur sixteen, resin four, steel or iron filings two, fir tree saw-dust boiled in saltpetre ley two, birch-wood charcoal one, well rammed into a shell for that purpose, having various holes filled with small barrels, loaded with musket-balls; and lastly, the whole immersed in melted pitch, resin, and turpentine oil.

BALLS, POISONED; the Indian and African nations have always been ingenious at poisoning several sorts of warlike stores and instruments. Their composition is generally mealed powder four, pitch six, resin three, sulphur five, assa-fœtida eight, extract of animal poison twelve, other poisonous substances twelve, made into balls as above directed. At the commencement of the French revolution, poisoned balls were exhibited to the people, pretended to have been fired by the Austrians, particularly at the siege of Lisle. Major James says he has seen some of this sort. They contained glass, small pieces of iron, &c. and were said to be concocted together by means of a greasy composition, which was impregnated with poisonous matter. In 1792 they were deposited in the archives of Paris.

BALLS, RED-HOT, are heated red-hot upon a large coal fire in a square hole made in the ground, six feet every way, and four or five feet deep. Some make the fire under an iron grate, on which the shell or ball is laid; but the best method is to put the ball into the middle of a clear burning fire, and when red-hot, all the fiery particles must be swept off. Whatever machine you use to throw the red-hot ball out of, it must be elevated according to the distance you intend it shall range, and the charge of powder must be put into a flannel cartridge, and a good wad upon that; then a piece of wood of the exact diameter of the piece, and about three inches and a half thick, to prevent the ball from setting fire to the powder; then place the ball on the edge of the mortar, &c. with an instrument for that purpose, and let it roll off itself against the wood, and instantly fire it off. Should there be a ditch or parallel before such a battery, with soldiers, the wood must not be used, as the blast of powder will break it to pieces, and its own elasticity prevent it from flying far; it would in that case either kill or wound your own people. On this account the wad must be double, the second being damp. If the gun lies at a depression, there must be a wad over the shot, which may be rammed home.

BALLS, SMOKE, are prepared similarly to other fire-balls, and they contain five to one of pitch, resin, and saw-dust. This composition is put into shells made for that purpose, having four holes to let out the smoke. Smoke-balls are thrown out of mortars, and continue to smoke from twenty-five to thirty minutes.

BALLS, STANG, are generally termed bar-shot, and by some called balls of two-heads; they are sometimes made of two half-balls, joined together by a bar of iron from eight to fourteen inches long; they are likewise made of two entire balls; they answer the same purpose as the before-mentioned.

BALLS, STINK, are prepared by a composition of mealed powder, resin, saltpetre, pitch, sulphur, rasped horses and asses hoofs, burnt in the fire, assa-fetida, seraphim gum or ferula, and bug or stinking herbs, made up into balls, as mentioned in light-balls, agreeable to the size of the mortar out of which they are to be thrown.

BALLS, in electricity, are two pieces of cork, or pith of elder, nicely turned in a lathe to the size of a small pea, and suspended by fine linen threads; intended as electrometers, and of excellent use to discover small degrees of electricity, to observe the changes of it from positive to negative, and vice versa; and to estimate the force of a shock before the discharge, so that the operator should always be able to tell very nearly before the discharge, by knowing how high he has charged his jars, what the explosion will be.

BALLS, in heraldry. See **BALLETS**.

BALLS, CRYSTALLINE. There are two sorts of fossil bodies mentioned in authors by this name, and distinguished into the echinated, and concave. The first are roundish nodules of stony matter, covered over with points of crystal; and the other flints, and other stones, having cavities in their middles, which are lined, or crusted over with these crystals.

BALLS, HORSE, among farriers. Horses have a very nice taste; it is therefore proper to give the most disagreeable drugs, in the form of balls, and to make drenches of the more palatable. Balls should be of an oval shape, not exceeding the size of a pullet's egg; and should be dipped in sweet oil to make them slip down the easier. Some horses have a strait gullet, which makes them very averse to a ball being thrust down their throats; such horses had better have drenches given them, or their medicines may be mixed with bran, or in their mashes. See **FARRIERY**, *Index*.

BALLS, MERCURIAL, in pharmacy, are an amalgam of mercury and tin, sufficiently solid to be moulded, and to preserve a given form. The method of making them is by adding mercury to melted tin, and pouring the fluid mass into a round hollow mould: These balls are sometimes employed to purify water, in which they are boiled.

BALLS OF FIRE, in meteorology, a kind of luminous bodies, commonly appearing at a great height above the earth, with a splendor surpassing that of the moon; and even occasionally equalling her apparent size. They generally proceed with great velocity in this hemisphere, from north to south, frequently breaking into several smaller ones, sometimes vanishing with a report, and sometimes not. These luminous appearances no doubt constitute one branch of the ancient prodigies, or blazing stars. They sometimes resemble comets, in being attended with a train, but frequently they appear with a round and well defined disk. The first of which we have any accurate account, was observed by Dr. Halley and others at different places, in 1719. From the slight observations they could take of its course among the stars, its perpendicular height was computed at about seventy miles from the surface of the earth. The height of others has also been computed, and found to be various;

though in general it is supposed to be beyond the limits assigned to our atmosphere, or where it loses its refractive power. The most remarkable on record appeared on the 18th of August 1783, about nine o'clock in the evening. It was seen to the northward of Shepland, and took a southerly direction for an immense space, being observed as far as the southern provinces of France and Rome. During its course it appears frequently to have changed its shape, sometimes appearing in the form of one ball, sometimes two or more; sometimes with a train, sometimes without one. It passed over Edinburgh nearly in the zenith, and had then the appearance of a well defined, round body, extremely luminous, and of a greenish color; the light which it diffused on the ground giving likewise a greenish cast to objects. After passing the zenith, it was attended by a train of considerable length, which continually augmenting, at last obliterated the head entirely, so that it looked like a wedge, flying with the obtuse end foremost. The motion was not apparently swift, by reason of its great height; though in reality it must have moved with great rapidity, on account of the vast space it travelled over in a short time. In other places its appearance was very different. At Greenwich, we are told, that two bright balls parallel to each other led the way, the diameter of which appeared to be about two feet; and were followed by an expulsion of eight others, not elliptical, seeming gradually to mutilate, for the last was small. Between each two balls a luminous serrated body extended, and at the last a blaze issued which terminated in a point. Minute particles dilated from the whole. The balls were tinted first by a pure bright light, then followed by a delicate yellow, mixed with azure, red, green, &c. which, with a coalition of bolder tints, and a reflection from the other balls, gave the most beautiful rotundity and variation of colors that the human eye could be charmed with. The sudden illumination of the atmosphere, and the form and singular transition of this bright luminary, tended much to make it awful: nevertheless the amazing vivid appearance of the different balls, and other rich connective parts not very easy to delineate, gave an effect equal to the rainbow in the zenith of its glory. Dr. Blagden, in a paper on this subject in the seventy-fourth volume of the Philosophical Transactions, has not only given a particular account of this and other meteors of the kind, but added several conjectures relating to the probable causes of them. The opinion which he finally adopts, as the most probable, is, that these fire-balls are great bodies of electric matter moving from one part of the heavens, where to our conception it is superabundant, to another where it is deficient.

Other fireballs have appeared much smaller and nearer the surface of the earth, and sometimes rolling or falling upon it, and exploding with violence; as is the case with those which appear in the time of thunder, and frequently produce mischievous effects. One of these is mentioned by some authors as falling in a serene evening in the island of Jamaica; exploding as soon as it touched the surface of the ground, and making a considerable hole in it. Another is

mentioned by Dr. Priestley, as rolling along the surface of the sea, then rising and striking the top-mast of a man of war, exploding and damaging the ship. In like manner we hear of an electrified cloud at Java, whence, without any thunder storm, there issued a vast number of fireballs which did incredible mischief. All these point out the true origin of balls of this kind, viz. an extensive accumulation of electricity bursting from one part of the atmosphere to another.

This is confirmed by an experiment related at the end of Dr. Priestley's fifth volume on air. He states that a gentleman having charged with a very powerful machine, a jar, which had the wire supporting the knob of a considerable length, and passed through a glass tube, a globe of fire was seen to issue out of it. This globe gradually ascended up the glass tube till it came to the top of the knob, where it settled, turning swiftly on its axis and appearing like a red-hot iron ball of three quarters of an inch diameter. On continuing to turn the machine, it gradually descended into the jar, which it had no sooner done, than there ensued a most violent explosion and flash, the jar being discharged and broken at the same time. We may yet gather from these experiments, that a fireball will be the consequence of a very violent electrification of any substance, provided at the same time that the air be in a very non-conducting state, so that the electricity may not evaporate into it as fast as it is collected; for this would produce only lucid streams and flashes, as in the common experiments with the Leyden phial, and it is probably an inattention to this circumstance which has hitherto prevented the repetition of the experiment above mentioned. The case is the same in thunder-storms, where an excessive accumulation of electric matter always produces fireballs, the most mischievous kind of lightning. A philosopher of the last century, it is well known, met his death from a ball of this description in attempting to draw the electric fluid from the clouds.

BALLS OF HAIR and other substances, in natural history, covered over with a smooth, shining coat, or shell, are mentioned by zoologists, as sometimes found in the stomachs of several animals; they occur most frequently in those quadrupeds which lick the surface of their bodies, in which case they are composed of the hair that has been removed by the tongue; the hair, partly by the operation of licking, and still more by the motion of the stomach, becomes mixed and interwoven in a such a manner, that it resembles the texture of a hat, and when moulded into a round figure, receives a smooth, shining coat, or calculeous incrustation. These are the sort of balls usually met with in the cow, sheep, and goat kind, especially the chamois. Every indigestible substance that is swallowed is liable, however, to give origin to these balls, or to form a nucleus for calculeous concretion; hence we meet with them composed of the reedy fibres of vegetables, husks of seeds, feathers, and different animal and vegetable exuvie. When such substances, as stones of fruit, nuts, or inorganic substances, as pebbles, coins, &c. are long detained, and have been covered with a deep in-

crustation, they constitute the bezoardic stones. See **BEZOAR** and **EGAGROPILA**.

According to some writers the human subject is liable to the formation of balls in the intestines, in consequence of indigestible matters not being regularly expelled. Cases have been related of death ensuing from accumulations of gooseberry seeds, which had been rolled into a solid ball in the stomach; and Sir Hans Sloane gives the history of a ball found in the intestines of a man, much afflicted with the colic, six inches in circumference, of a spongy substance, and which, when viewed with a microscope, appeared made up of small transparent hairs or fibres, wrought together like the tophus bovinus; in the middle was a common plumb stone, which made, as it were, the core or nucleus upon which the fibrous matter had collected, stratum super stratum. Phil. Trans. No. 309, p. 2387. Sloane, in Phil. Trans. No. 282, p. 1282.

BALLS OF SILK WORMS, OR BALLS OF SPIDERS, are little cases or cones of silk, wherein those insects deposit their eggs. Spiders are extremely tender in their balls, which they carry about with them, adhering to the papillæ about their anus. Grew mentions balls or bags of a species of silk-worms in Virginia, as big as hen's eggs, and containing each four aurelias.

BALLS, VEGETABLE, in botany a particular plant of a deep green color, of an irregular spherical shape, hollow within, and of different sizes, from an inch and a half to three inches in diameter. It probably belongs to the conservi genus, in the class of mosses; though Dr. Ray has ranged a similar plant under the genus of alcyonium.

BAL'LAD, v. & n. } Fr. *balade*, Ital. *ballata*.
BAL'LADER, }
BAL'LADRY, } a song. It once signi-
BAL'LATED, } fied a solemn and sacred
BAL'LATRY, } song: the Song of Solo-
BAL'LETT. } mon was called the *bal-
 let of ballets*. It is now
 generally employed to designate those popular
 compositions which are sung in simple melodies
 by all classes of the community; and which,
 while true to nature, illustrate the manners, cus-
 toms, and opinions, of the age and country to
 which they belong. In composition, this word
 is used as *ballad-monger*, *ballad-singer*, &c.

At certaine timis gan repaire
 Smalè birdis doune from the aire,
 And on the shipsis bounds aboute,
 Ysate and song with voyce full out,

Chaucer.

And also I have ofte assaide
 Roundel, *balades*, and vereloie
 For her, on whom myn hert laie,
 To make.

Gower.

Alas! I make but repetition,
 Of what is ordinary and ryalte talk,
 And *balletted*, and would be plaid o' the stage,
 But that vice many times finds such loved friends,
 That preachers are charm'd silent.

Webster

And otherwhyles with amourous delights,
 And pleasing toys he would her entertaine;
 Now singing sweetly to surprize her sprights;
 Now making lays of love, and lover's paine,
 Bransles, *ballads*, virelayes, and verses vaine;
 Oft purposes, oft riddles he devys'd,
 And thousands like which flow'd in his braine.

With whiche he led her fancy, and entys'd
To take to his new love, and leave her old despy's'd.

Spenser's Faerie Queene.

Is there not a ballad, boy, of the king and the beggar?
Shakspeare.

The world was very guilty of such ballads some
three ages since. *Id.*

I had rather be a kitten, and cry mew,
Than one of these same metre ballad-mongers. *Id.*
The balladry and the gamut of every municipal fiddle.
Milton.

More solid things do not shew the complexion of
the times so well as ballads and libels. *Selden.*

No sooner 'gan he raise his tuneful song,
But lads and lasses round about him throng,
Not ballad-singer, plac'd above the crowd,
Sings with a note so shrilling, sweet, and loud. *Gay.*

Thither no more the peasant shall repair,
To sweet oblivion of his daily care;
No more the farmer's news, the barber's tale,
No more the woodman's ballad shall prevail.

Goldsmith.

BALLADS are ordinarily amongst the first efforts of a semi-barbarous people in poetry; and a collection of the best and most popular compositions of this kind will throw great light on the manners of a people in any stage of their civilisation. We can only attempt a slight sketch of the history of this kind of poetry in our own country. 'That our ancestors,' says Mr. Turner, (Anglo-Saxons, p. 287, c. ii.) 'had popular songs on the actions of their great or favorite characters, or on such other subjects as interested the vulgar mind, is proved by many instances, which may be traced in the ancient writers. Alfred says, in his manual, that no one had ever appeared before Aldhelm, so competent in English poetry; none had been able to compose so much, or to sing and recite it so appositely. The king mentions a popular ballad of Aldhelm's, which was in his time, (that is, nearly two centuries afterwards) sung in the streets. Malmsbury adds, that Aldhelm, anxious to instruct his countrymen, then semi-barbarous, and inattentive to their religious duties, took his station on the public bridge, as if a singer by profession, and, by mixing sacred with lighter topics, won their attention, and ameliorated their minds. Bede mentions that in a festive company the harp was sent round, that those might sing who could. It was a book of Saxon poems, says the above historian, which first allured Alfred to learn to read; and the fact that he had his children taught to read the Saxon poems, and that he himself visited the Danish camp as a harper, which, in the reign of his grandson, Anlaf imitated, prove the existence of popular songs which instructed both the child and the rude warrior.

The connexion of these compositions with the foundations of our history is clear. When Malmsbury, after narrating the reign of Athelstan, proceeds to describe his origin from Edward's amour with a shepherd's daughter, he says, The following facts I have taken rather from the songs (cantilenio) worn out by the course of time, than from books composed for the instruction of posterity.

A curious fragment of a ballad, composed by Canute the Great, says Mr. Turner, has survived

to us. As this prince was sailing by the abbey, in the isle of Ely, he heard the monks chanting their psalms and anthems, and was so struck with the interesting melody, that he composed a little Saxon ballad on the occasion, which began thus:—

Wene rungen ðe munceþer binnen Ely,
Tha ðut ching newþer by
Ropeð lriter, noer ðe lanb
And hepe þe ðer munceþer ranþ.

Merry sang the monks in Ely
When Canute the king was sailing by;
Row, ye knights, near the land,
And let us hear those monks' song.

In Domesday-book, the Jocolator Regis, who was evidently a minstrel, is mentioned as having lands assigned for his maintenance in Gloucestershire, Du Cange, iii. 1543; and in the battle of Hastings, Tarblesen or Taillefer, an esquire in the conqueror's army, obtained permission, as a sort of forlorn hope, to lead the van, and threw himself upon the English spears, singing the popular ballad, Chanson de Roland, Id. iv. 769. Subsequent to the conquest we meet with many genuine English songs: Horn Child: the Squire of lowe Degree: and a Lytele geste of Robin Hood, have been pointed out as tales without foreign admixture. Richard Cœur de Lion was at once the hero of chivalry and the patron of song: his well known deliverance from captivity in Germany is connected by history with our subject; and the celebrated Scotch novelist has well availed himself of all the romantic truths of the story. Edward IV. incorporated the Minstrels by charter, and they were protected by a corporation under the government of a marshal and two wardens. This charter was renewed by Henry VIII. But by statute 39 Eliz. the profession was visited with the last disgrace, and minstrels were included and made punishable among 'rogues, vagabonds, and sturdy beggars.'

Our older ballads are all in the northern dialect: but singularly enough, on the accession of the Stuarts, we find the whole spirit of these compositions evaporate; and English minstrelsy became extinct. See Percy's Reliques of English Poetry: also Dr. Burney's History of Music: Sir Walter Scott's Minstrelsy of the Scottish Border; and Warton's History.

BALLADUK, a town in the desert of Syria 140 miles E. N. E. from Damascus.

BALLAGHAN POINT, at the south-west entrance of Carlingford Bay, a cape on the east coast of Ireland. Eleven miles S. E. of Newry. Long. 6° 4' W., lat. 53° 58' N.

BALLAGHAN, or BALLAGHY, a town of Ireland, in the county of Sligo, and province of Connaught. Twenty miles south of Sligo, and 105 from Dublin. Long. 9° 50' W., lat. 53° 48' N.

BALLAGHNEED, a village of Ireland, in Tyrone, with a good inn, seventy-eight miles from Dublin.

BALLAGHY, three towns in Ireland, viz. 1. in Londonderry, ninety-two miles from Dublin. 2. in the county of Mayo, ninety-seven miles from Dublin. And 3. in Sligo. See BALLAGHAN.

BALLAMONO, a village in the Isle of Man, near Castletown.

BALLAN, a town of France, in the department of the Sarthe, seated on the Orne. Long. 20' E., lat. 48° 10' N.

BALLANDEN. See **BALLENDEN**.

BALLANI, a species of shell-fish, about a finger's length, which abound in the harbour of Ancona, and lodge among the stones. They are much valued at Rome, whither great quantities are sent.

BALLANTRAE, a small post-town and parish of Scotland, in the county of Ayr. The village stands at the mouth of the Stinchar. It carries on a salmon-fishing and some cotton manufactures. Distant twenty-eight miles S. S. W. of Ayr.

BALLAPATTY, a town of the Carnatic, in Hindostan, twelve miles west of Vencatigherry.

BALLAPILLY, a town of Hindostan, in the ceded Balaghaut district of Commim. Long. 78° 38' E., lat. 15° N.

BALLARAG, *v. a.* A ludicrous and low word, purporting to overpower by word or act; to bully; to threaten. It is still used in the north, and pronounced *bullyrag*.

On Minden's plains, ye meek mounseers;
Remember Kingsley's grenadiers.
You vainly thought to *bullyrag* us,
With your fine squadron off Cape Lagos. *Warton*.

BALLARD (George), one of those occasional geniuses in lower life which shoot up without culture, was born at Campden, in Gloucestershire. Being of a weakly constitution, his parents put him to a habit-maker; and in this situation he mastered the Saxon language. The time he employed in learning it was stolen from sleep, after the labor of the day was over. Lord Chedworth, and the gentlemen of his hunt, who used to spend about a month of the season at Campden, heard of his fame, and generously offered him an annuity of £100, but he modestly told them that £60 was fully sufficient to satisfy both his wants and his wishes. Upon this he retired to Oxford, for the benefit of the Bodleian library; and Dr. Jenner, president, made him one of the eight clerks of Magdalen College. He was afterwards one of the University beadles, but died in June, 1755, rather young; which is supposed to have been owing to too intense application. He left large collections behind him, but published only *Memoirs of British Ladies*, who have been celebrated for their Writings or Skill in the learned Languages, Arts, and Sciences, 1752. 4to. He drew up an account of Campden church, which was read at the Society of Antiquaries, November 21, 1771.

BALLARD, CAPT. a cape of Newfoundland. Long. 52° 26' W., lat. 46° 55' N.

BALLARD'S-POINT, a cape on the west coast of Ireland, in the county of Clare. Longitude 9° 32' W., lat. 52° 42' N.

BALLARE, in middle-age authors, to dance. **BALLARINA**, in ornithology, a name under which Olinia describes the white-wagtail, *motacilla alba*.

BALLAS, a trading place on the left bank of the Nile, Upper Egypt, where a great quantity

of earthen pots of a peculiar kind are manufactured. Ten miles south of Dendera.

BALLASSA-GYARMATHI, a considerable market-town and castle of Hungary, in the county of Neograd. It suffered dreadfully by a conflagration in 1800; when no less than 568 houses were destroyed, and only fifty, with the town-house, left standing.

BALLASEDERE, a town of Ireland, in the county of Sligo, 100 miles from Dublin, near a water-fall.

BAL'LAST, *v. & n.* } Ang.-Sax. hlæstan,
BAL'LASTURY. } be-hlæstan, to lade,
load, or fraught a ship. Past participle hlæsted,
be-hlæsted, loaded or laden. Dut. and Ger
ballast. It is applied to that lading or loading
which is used to steady a vessel in the water, or
to steady any thing in its motion or action. See
NAVIGATION, for the nautical illustration of the
term.

'Mongst friends?

If brothers:—Would it had been so, that they
Had been my father's sons! then had my prize
Been less; and so more equal *ballasting*
To thee, Posthumus. *Shakespeare*.

There must be middle counsellors to keep things
steady; for, without that *ballast*, the ship will roll too
much. *Bacon*.

While thus to *ballast* love I thought,
And so more steadily 't have gone,
I saw I had love's pinnace overfraught. *Donne*.
Now you have given me virtue for my guide,
And with true honour *ballasted* my pride.
Dryden.

Why should he sink where nothing seem'd to press?
His lading little, and his *ballast* less. *Swift*

Those men have not *ballast* enough of humility and
fear. *Hammond's Sermons*.

BALLAST, in navigation. The principal object is to make a vessel sink to a proper depth in the water, that she may steadily carry a sufficient quantity of sail. There is often great difference in the proportion of ballast required to prepare ships of equal burthen for a voyage; the quantity being more or less according to the sharpness or flatness of the ship's bottom, which seamen call the floor.

The properly ballasting of a ship is amongst the most important duties of the skilful mariner; for, although it is known that ships in general will not carry a sufficient quantity of sail, till they are laden so deep that the surface of the water will nearly glance on the extreme breadth amidships, yet there is more than this general knowledge required; since, if she has a great weight of heavy ballast, as lead, iron, &c. in the bottom, it will place the centre of gravity too low in the hold; and, although this will enable her to carry a great sail, she will nevertheless sail heavily, and run, in rolling, the risk of being dismasted.

The ballast, therefore, should be so disposed that she may be duly poised, and maintain a proper equilibrium on the water, so as neither to be too stiff nor too crank: in the first, although the ship may be fitted to carry a great sail, her velocity will not be proportionably increased; whilst her masts are endangered by her sudden jerks and laboring: and, in the last, she

will be incapable of carrying sail without the risk of upsetting. The former is occasioned by disposing too great a quantity of heavy ballast in the bottom, which brings the centre of gravity near the keel; and, that being the centre about which the vibrations are made, the lower it is placed, the more violent will be the motion of rolling. Crankness, on the other hand, is occasioned by disposing the ship's lading so as to raise the centre of gravity too high, which endangers the mast in carrying sail when it blows hard: for when the masts lose their perpendicular, they strain in the nature of a lever on the shrouds, which increases as the sine of their obliquity.

As a general principle, it may, therefore, be observed, that ballast should be placed round and near the centre of gravity of the ship, because it will prevent the pitching being so violent as it

would be if it were carried much fore or aft of that point. When a vessel is passing over a wave, she will be at one time supported below the centre of gravity; and immediately after, her head will incline downwards, or, as it is termed, she will pitch; when it is evident, that the nearer the weight is to the point over which the vessel is supported, the less violent will the motion be. But this rule stands in need of frequent modifications: for which reason, a large quantity of shifting ballast is allowed in the Royal navy. Indeed, throughout the whole practice, as we are finding a remedy for one fault, we are in danger of running into another; and much of the final distribution of ballast depends upon knowing well the peculiarities of the vessel, and observing experimentally, how different winds and calms affect her.

The following was, until lately, the Ballast allowed to our Men of War :

Guns.	Tonnage.	Iron Tons.	Shingle Tons.	Guns.	Tonnage.	Iron Tons.	Shingle Tons.
110	2290	180	370	36	870	65	160

The general practice then was, first, to stow the iron ballast fore and aft, from bulkhead to bulkhead, in the main hold, next to fir cants, nailed on the limber strakes, on each side of the keelson, five or more inches clear of the limber boards; and winged up three or four pigs above the floor-heads in the midships, or bearing part of the ship, with two tiers of pigs in the wake of the main hatchway, &c. The shingle ballast was spread and levelled over the iron ballast, on which was stowed the lower tier of water-casks, with the bungs up, and the bilge clear of the sides. The midship tiers were first laid, and the casks sunk about one quarter of their diameter into the shingle; the sides being filled in with small casks, as half-hogsheads, &c.

Since the introduction of iron tanks, shingle ballast has been altogether laid aside, and iron ballast only employed, the present proportion of which, according to the practice of the navy, is as follows:—

Table of the proportion of Iron Ballast at present allowed in the navy, in proportion to their tonnage.

To all three-deckers, $\frac{1}{8}$ th of computed tonnage.

To two-deckers and oak frigates $\frac{1}{10}$ th ditto.

To fir frigates $\frac{3}{20}$ ths of ditto.

To 22-gun ships and sloops, $\frac{1}{12}$ th ditto.

To brigs, sloops, &c. $\frac{1}{4}$ th ditto.

Smaller vessels are not submitted to these rules; but are ballasted as circumstances may require, according to the judgment of their officers. In ships of the line, sixteen ton of the above, called shingle ballast, is moveable as circumstances require, and half that quantity to frigates.

Additional ballast, to the amount of one-third, and even one-half, of the original quantity is sometimes, however, demanded: and the table only exhibits the official and ordinary allowance.

In the merchant-service, the stowage consists, besides the other ballast, of casks, cases, bales, boxes, &c. all carefully wedged off from the bottom, sides, pump-well, &c. and great attention is paid that the most weighty materials are stowed nearest to the centre of gravity, or bearing of the ship; and higher or lower in the hold agreeably to the form of the vessel. A full low-built vessel requires them to be stowed high up, that the centre of gravity may be raised, to keep her from rolling away her masts, and from being too stiff and laborious; as, on the contrary, a narrow high-built vessel requires the most weighty materials to be stowed low down, nearest the keelson, that the centre of gravity may be kept low, to enable her to carry more sail. To yachts and other small vessels, both in the navy and merchant-service, the ballast is sometimes lead, worked between the timbers.

By the 19 Geo. II. it is enacted, that if any

master or owner, or any person acting as master of any ship or other vessel whatsoever, shall cast, throw out, or unlade, or if there shall be thrown out, &c. of any vessel, being within any haven, port, road, channel, or navigable river within England, any ballast, rubbish, gravel, earth, stone, wreck, or filth, but only upon the land, where the tide and water never flows or runs; any one or more justices for the county or place where, or near which the offence shall be committed, upon the information thereof, shall summon or issue his warrant for bringing the master or owner of the vessel, or other person acting as such, before him; and, upon appearance or default, shall proceed to examine the matter, and upon proof made thereof, either by confession of the party, or on view of the justice, or upon the oath of one or more creditable witnesses, he shall convict the said master, &c. and fine him at his discretion for every such offence, any sum not exceeding £5, nor under 50s. &c.; and for want of sufficient distress, the justice is to commit the master, or person acting as such, and convicted as aforesaid, to the common jail or house of correction, for the space of two months, or until payment of the penalties.

Besides the above general act, there are the 6 Geo. II. c. 29, and the 32 Geo. II. which regulate the ballasting of merchant-vessels in the river Thames, placing it under the direction of the corporation of the Trinity-house.

To trench the ballast, denotes, to divide the ballast into two several parts or more, in the ship's hold, commonly done to find a leak in the bottom of a ship, or to undock her.

Shooting of the ballast is when it runs over from the one side to the other. Hence, it is that corn, and all kinds of grain, is dangerous lading, for that is apt to shoot. To prevent which, they make pouces; that is, bulkheads of boards, to secure it from moving about.

BALLATAR CRAG, a rocky hill in Aberdeenshire, whose tremendous impending rocks seem to threaten the astonished traveller with instant destruction.

BALLATIONES, in middle age writers, dances.

BALLATOONS, large heavy luggage-boats, used for carrying wood by the river from Astrakhan and the Caspian Sea from Moscow. They will carry from 100 to 200 tons, and have from 100 to 120 men employed to row and tow them along.

BALLANTYNE (John), was a native of Kelso, in Roxburghshire; and at an early age entered into business as a printer. He, with his brother, distinguished himself by the great improvement of the art, evinced in the extensive publications which have of late years issued from their press. He was at one time a proprietor of the Kelso Mail; and subsequently ushered into the world the publications known as the Waverley novels. He was possessed of sufficient literary talents to be thought at one time to be their author. He died in 1821.

BALLEBHODAN, the original name of the parish of Ardehatten, Argyleshire.

BALLENA, *PUNYA DELTA*, a point of land on the east coast of the island of Margaritta:

another in Chili, on the coast of the province of Quillota: another in the kingdom of Quito, and on the shore of the South Sea.

BALLENA, a river of Florida, which falls into the Atlantic.

BALLENDE (Sir John), a Scottish poet, in the reign of James V., descended from an ancient family in that kingdom. His father, Mr. Thomas Ballenden, of Auchinoul, was director to the chancery in 1540, and clerk register in 1541. From one of his poems we learn, that in his youth he had some employment at the court to King James V. and that he was in great favor with that prince. Having taken orders, and been created D.D. at the Sorbonne, he was made canon of Ross, archdeacon of Moray, and clerk register; but was afterwards deprived of that employment by the factions of the times. However, in the reign of Mary, he recovered that office, and was one of the lords of session. Being a zealous papist, he, in conjunction with Dr. Laing, was extremely assiduous in retarding the progress of the reformation; till at last, finding the opposition too powerful, he quitted Scotland, and went to Rome, where he died in 1550: He is generally esteemed one of the best Scottish poets of that age. His works are, 1. The History and Chronicles of Scotland of Hector Bôies (Boethius), translated by Mr. John Ballenden, Edinb. 1536. 2. Cosmography to the History of Scotland, with a Poetical Proem. 3. A Description of Albany. 4. Translation of Boethius's Description of Scotland. 5. Epistles to King James V.—Bale says he had seen these letters. 6. Several poems in Carmichael's Collection. 7. Virtue and Vyce, a poem addressed to King James V.

BALLEGARY, a town of Ireland, in the county of Kerry, on the mouth of the Shannon, near Ardferit.

BALLENSTEDT, an ancient county and castle in the principality of Anhalt-Bernburg, Germany, on the confines of Quedlingburg. It is the ordinary residence of the prince of Anhalt, and contains a riding-house, a theatre, and beautiful gardens. At the foot of a hill on the rivulet of Getel. Population 2500. Eighteen miles south-west of Bernburg, twenty-seven north-east of Nordhausen. Long. 11° 25' E., lat. 51° 45' N.

BALLERINI (Peter and Jerome), two brothers, Italian priests, natives of Verona. Peter was born in 1698, and Jerome in 1702. They wrote in conjunction, several learned and ingenious poems, and published various editions of ecclesiastical authors.

BALLEROY, a town and castle of France, in Normandy, with 1180 inhabitants, and several iron mines, and forges. It stands on the Dromme, and is the head of a canton, in the department of Calvados, arrondissement of Bayeux. Seven miles S.S.W. of Bayeux, eighteen south of Caen.

BALLERUS, in ichthyology, a species of fresh water fish of the leather mouthed kind, which appears to be the same with the carcassius, or carcassi tertium genus.

BALLERUS is also a name given by Aris totle to that species of cyprinus called blicca, and pleysta, and pallerus, by modern writers.

BALLET, a dramatic fable represented by action, music and dancing. The origin of the ballet is to be traced to the meretricious taste of the Italian courts, and succeeded the more dangerous but more manly amusement of the tournament. The interview between our Henry VIII. and Francis I. of France, in the field of the cloth of gold, presents us with an early specimen of these entertainments. In the next century they reached the summit of their glory in the splendid pomps of the courts of Tuscany and Lorraine. The genius of Ben Jonson, and even that of Shakspeare, was matured amidst the scenery connected with the Italian ballet: but it found its most zealous patron in Louis XIV.; and probably the most magnificent ballet ever performed, was that which this prince commanded and bore a part in, in the year 1664. In honor of this memorable fête, the name of the Carousel has been given to the spot of its celebration; and the theatres of England, France, and Italy, have been always striving since in amicable warfare, to sustain the public partiality for these spectacles.

BALLETS, or **BALLS**, in heraldry, make a frequent bearing in coats of arms, though never so called; for, according to their several colors they have different names; as besants, when the color is or; plates when argent; hurts when azure; torteaux when gules; pomies when vert; pellets or agrades when sable; golpes when purple; oranges when tanne; and guzes when sanguine.

BALLETTE, *n. s.* Fr. *ballette*. A dance in which some history is represented.

BALLEXARD (*N.*), a citizen of Geneva, born in 1726. He wrote a treatise on the physical education of children, which gained the prize from a society in Holland; and a dissertation on the question, what are the principal causes of the deaths of children? He died at Geneva in 1774.

BALLI (Joseph), a scholastic divine, born at Palermo in Sicily. He was a canon of Bari, in the kingdom of Naples; and author of *De Fæcunditate Dei*, and *De Morte Corporum Naturalium*. He died at Padua in 1640.

BALLIACE, in ancient geography, a town of Illyria, in the vicinity of Apollonia.

BALLIAGE, a duty payable to the city of London, for the goods and merchandise of aliens, according to the charter 16 Car. II.

BALLIANI (John Baptist), a native of Genoa, born in 1586. He rose to be a member of the senate, and wrote a treatise on the Natural Motion of Heavy Bodies, 1646. He died in 1666.

BALLIARDS, *n. s.* From ball and yard, or stick to push it with. A play at which a ball is driven by the end of a stick; now corruptly called billiards, Dr. Johnson says; but *billiards* is not a corruption, being the Fr. *billard*, from *billé*, the term for the ball used in playing.

With dice, with cards, with *balliards* far unfit,
With shuttle-cocks misseeming manly wit.

Spenser.

CLEO. Let it alone; let vs to *billiards*;
Come, Charmian.

Shakspeare. Antony and Cleopatra.

BALLIBAY, a market, fair, and post town in the county of Monaghan, Ireland, seventy-six miles N.N.W. of Dublin. The living is a rectory and vicarage, in the Clogher diocese.

BALLIMORE, a town of Ireland, in the county of Westmeath. It was taken in 1691 by General Gingle; and burnt by the military, in the rebellion of 1798. Distant from Athlone ten miles north, and 72 from Dublin.

BALLIN (Claude), a celebrated French artist, born in 1615. His father was a goldsmith, and under him he learned that business. When about nineteen years of age, he displayed uncommon genius, by making four silver basins, on which were represented the four ages of the world. These were purchased by Cardinal Richelieu, and he was employed to make four vases, after the antique, to match them. He afterwards executed handsome pieces for Louis XIV. and after the death of Varin, he succeeded as director of the mint, for casts and medals. He died in 1678.

BALLINA, or **BELLEEK**, a town of Ireland, in the county of Mayo; fourteen miles north of Castlebar, and 183 from Dublin. It has a considerable salmon fishery; and in 1798 was taken by the French troops who landed in Ireland under General Humbert.

BALLINACARGY, a town of Ireland, in West Meath, about forty-six miles from Dublin.

BALLINACHORA, a town of Ireland, near Middleton, in Cork.

BALLINACOURTY POINT, a cape on the south coast of Ireland, in the county of Waterford, on the north side of Dungarvan Bay. Distant four miles east of Dungarvan.

BALLINAGAR, a town of Ireland, in King's county, Leinster, forty-one miles from Dublin.

BALLINAKIL, a market town of Ireland, in Queen's county; a borough previously to the Union. Here are woollen manufactures, and the ruins of a castle, fourteen miles west of Carlow, fifty-eight from Dublin.

BALLINAKILL HARBOUR is on the west coast of Ireland. Forty miles north-west of Galway. Long. 9° 58' W., lat. 53° 34' N.

BALLINALACK, a town in West Meath, Ireland, about forty-eight miles from Dublin.

BALLINAMORE, a town of Ireland, in the county of Galway, eighty-four miles from Dublin.

BALLINANAGHT, a town of Ireland, in the county of Cavan, fifty-four miles from Dublin.

BALLINASLOE, a town of Ireland, in the county of Roscommon, ninety miles from Dublin. It is noted for its great fairs of cattle, wool, &c. The town is neat and improving; it has two breweries, barracks for cavalry and infantry, and possesses a communication, by still water, with the river Shannon. The fairs are the largest held in Ireland, 100,000 sheep and 10,000 black cattle being annually sold here.

BALLINGARRY, a town of Ireland, in the county of Limerick, 145 miles from Dublin.

BALLINROBE, a town of Ireland, in Mayo, where the assizes were formerly held. It is 147 miles from Dublin. Long. 9° 10' W., lat. 53° 40' N.

BALLINTOGER, a town of Sligo, Ireland.

BALLINTOY, a town of Ireland, on the coast of Antrim. It produces coals. It has a tolerable good harbour, which has been improved by a parliamentary grant. A short distance to the eastward is the small island of Carrick-a-rede, separated from the land by a chasm of sixty feet, of a frightful depth, which is passed by means of two cables stretched across.

BALLINTRA, a village and parish of Ireland, on the coast of Antrim. Several ancient fortifications are within its precincts, and there is a cromlech near the village. Other antiquities are also found here. It is twenty miles north of Ballymena, and 150 from Dublin.

BALLISTA, Lat. from βαλλειν, to shoot, a machine used by the ancients for shooting darts; it resembled in some measure our cross bow. Vegetius informs us, that the ballista discharged darts with such rapidity and violence, that nothing could resist their force: and Athenæus adds, that Agistratus made one of little more than two feet in length, which shot darts 500 paces. See ARTILLERY.

BALLISTA, in practical geometry, the geometrical cross, called also Jacob's staff. See CROSS STAFF.

BALLISTA, or OS BALLISTÆ, is a name given by some anatomists to the first bone of the tarsus, otherwise called talus and astragalus.

BALLISTARI, or BALLISTRARI, in antiquity, slingers or soldiers who fought with the ballista. There are two kinds of ballistarii; the one, called also manuballistarii, or manuballistæ, cast stones and other missive weapons, with the hand. The others, called also carroballistarii, or carroballistæ, made use of a machine. The ballistarii were scarcely heard of before the age of Constantine.

BALLISTARIUS is also used, in writers of the middle age, for a cross bowman, or arbaletier.

BALLISTER. See BOWMASTER.

BALLISTEUM, or BALLISTRÆA; from βαλλω, to toss, to throw, or to shoot; in antiquity, a military song or dance used on occasions of victory. Vopiscus has preserved the ballisteum sung in honor of Aurelian, who, in the Sarmatian war, was said to have killed forty-eight of the enemy in one day with his own hand. The ballistæa were a kind of popular ballads, composed by poets of the lower class, without much regard to the laws of metre.

BALLISTICA, or BALLISTICS the art of throwing heavy bodies. F. Mersennus has published a treatise on the projection of bodies, under this title.

BALLIUM, old law Latin, bail.

BALLIUM, in archæologia, the court of a fortified castle. The outer ballium was immediately within the gates, separated by a wall from the inner ballium, which contained the apartments for the garrison and the keeper. St. Peter, in the Bailey at Oxford, stands in the outer ballium of the castle. The Old Bailey and New Bailey in London were in similar positions in regard to the walls of that city; and hence are their names.

BALLIVUS. See BAILIFF.

BALLOCH, a lake of Perthshire, in the

parish of Muthil, about half a mile in circumference.

BAL'LOON, } Fr. *balon*, a little ball or pack;
BAL'LOON. } also a foot-ball. Dut. *balloen*,
Gerin. *balluyn*, Span. *balon*, Ital. *ballone*. A name given to a certain game played with a ball filled with wind.

Many other sports and recreations there be much in use, as foot-ball, *balloene*, quintan, &c. and many such, which are the common recreations of the country folks.
Burton's Anatomy of Melancholy.

SIR PET. Faith, I was so entertained in the progress with one count Epcrnon, a Welsh knight: we had a match at *baloon*, too, with my lord Wachum, for five crowns.—O, sweet lady, 'tis a strong game with the arm.
Eastward Hoe.

BALLON, or BALLONE, an ancient castle, seated on the sea-coast, in the parish of Tarbat, in Ross-shire; which exhibits a monument of the taste and grandeur of former ages.

BALLON, a town in the province of Maine, France, on the Orne, with 3560 inhabitants. It is the chief place of a canton in the department of the Sarthe, arrondissement of Le Mans; and has manufactures of stamine and other linen cloths. Ten miles north-east of Le Mans, sixteen south of Alençon. Also a town of France, in the department of the Lower Charente, arrondissement of Rochefort; nine miles south-east of La Rochelle.

BAL'LOON, *n. s.* In chemistry, a large globular glass flask, with a short neck, generally used as a receiver in distillations.

In architecture, a ball or globe placed on the top of a pillar.

In fire-works, a ball of pasteboard stuffed with combustible matter, which, when fired, mounts to a considerable height in the air, and then bursts into bright sparks resembling stars.

In aerology, a hollow vessel of silk, which is filled with inflammable air, and ascends with considerable weight annexed to it, into the atmosphere. Though of modern introduction, by the following citation it looks as if the existence of such a machine had been known 150 years since: 'Like *balloones* full of wind, the more they are pressed down, the higher they rise.'—*Hewyt's Sermons* (1658) p. 115. See AERONAUTICS.

BALLOON, in a general sense, signifies any spherical hollow body, of whatever matter it be composed, or for whatever purposes it be designed.

BALLOON, in the French paper trade, is a term for a quantity of paper, containing twenty four reams.

BALLOON likewise denotes a kind of game something resembling tennis. The ballon is played in the open field, with a great round ball of double leather blown up with wind, and thus driven to and fro with the strength of a man's arm, fortified with a brace of wood.

BALLOON, or BALLOEN, is particularly used among voyagers for the state barges of Siam. These balloons are a kind of brigantines, managed with oars, of very odd figures, as serpents, sea-horses, &c.; but, by their sharpness and number of oars, of incredible swiftness. They are said

to be made of a single piece of timber, of uncommon length; they are raised high, and much decorated with carving at head and stern: some are gilt over, and carry 120 or 150 rowers on each side. The oars are either plated over with silver, gilt, or radiated with gold; and the dome or canopy in the middle, where the company is placed, is ornamented with some rich stuff, and furnished with a ballustrade of ivory, or other costly matter, enriched with gilding. The edges of the balloon just touch the water, but the extremities rise with a sweep to a great height. Some are adorned with a variety of figures, made of pieces of mother of pearl inlaid: the richer sort, instead of a dome, carry a kind of steeple in the middle: so that, considering the slenderness of the vessel, which is usually 100 or 120 feet long, and scarcely six broad, the height of two ends, and of the steeple, with the load of decorations, it is a kind of miracle that they are not overset.

BALLOON, or **BALLOT**, in the French glass trade, signifies a certain quantity of glass plates, smaller or greater according to their quality. The balloon of white glass contains twenty-five bundles, of six plates per bundle; but the balloon of colored glass is only twelve bundles and a half, and of three plates to a bundle.

BALLOON, AIR. See **AERONAUTICS**, &c.

BALLOT, *v. & n.* Fr. *ballotter*, Ital. *ballotata*, *v. & n.* Fr. *ballotare*, Ital. *ballotare*, from Gr. *βαλλω*, from *ball*, Skinner. A particular mode of election. This is managed by putting little balls or tickets of different colors, black and white, privately into a box, which has two compartments; by counting the balls it is known what is the result of the poll, without any discovery of the respective voters.

The greatest of the parliament men hated this design of rotation and *balloting*, as being against their power.

Wood's Athenicæ Ozoniensis.

Whereupon eight *ballotins*, or pages, take eight of the boxes, and go four on the one side, and four on the other side of the house; and every magistrate and senator holds up a little pellet of linen as the box passes, between his finger and his thumb, that they may see he has but one, and then puts it into the same.

Harrington's Oceana.

No competition arriving to a sufficient number of balls, they fell to ballot some others.

Wotton.

The election of the duke of Venice is intricate and curious, consisting of ten several *ballotations*.

Id.

Giving their votes by *ballotting*, they lie under no awe.

Swift.

BALLOTA, **WHITE HOREHOUND**: in botany; a genus of the gymnospermia order, and didymia class of plants; ranking, in the natural method, under the forty-second order, verticillatæ. The calyx has five teeth, with ten striæ; and the upper lip of the corolla is crenated. It is a common weed growing on the sides of banks in most parts of England, as also in walks near towns and villages in Scotland; so is seldom admitted into gardens. The flowers are in whorls, upon branched peduncles, and lean on one side of the stalk; they are commonly of a dull red color, but sometimes white. It was formerly used in hys-

teric cases, but is now fallen into disuse. The Swedes reckon it an almost universal remedy in the diseases of their cattle. Horses, cows, sheep, and goats, refuse to eat it.

BALLOTADE. See **BALOTADE**.

BALLRIENAN, a pleasant peninsula of Ireland, in the county of Louth; in which there are relics of a Druid's Grove; supposed to have been the chief seat of the Arch-Druid.

BALL'S BAY, a bay on the east coast of Norfolk island, in the South Pacific.

BALLS, a river of West Greenland, which runs into the sea, in long. 50° 10' W., lat. 64° 30' N.

BALL'S PYRAMID, a small island in the South Pacific, discovered by lieutenant Ball in 1788. Long. 159° E., lat. 31° 35' S.

BALLSTOWN, a thriving town of the state of New York, situated in Saratoga county, thirty miles north of Albany.

Also a town of North America, in Lincoln county, district of Maine, 195 miles north-east of Boston.

BALLUNTEE, a town of Hindostan, in Orissa, thirteen miles south-east of Cuttack.

BALLUSTER. See **BALUSTER**.

BALLUSTRADE. See **BALUSTRADE**, and **ARCHITECTURE**, Index.

BALLY, a small island in the Eastern seas, separated from the west coast of Barchian by a channel about five miles wide. Lat. 0° 30' S.

BALLY, a large town on the east coast of the island of Lombook, about fifteen miles from the entrance of the strait of Alass. The inhabitants trade principally for rice with the Dutch settlements. Long. 116° 28' E., lat. 8° 31' S.

BALLY, a Gaelic word, analogous to *Bal*, which makes part of the names of above 100 places, mostly small towns, or villages, in Ireland; of which we can only notice a few of the principal. The word seems to be a corruption of the term *Ballibetagh*, anciently used to express a town land able to maintain hospitality.

BALLYCASTLE, a sea-port of Antrim, about thirty miles north of Carrickfergus, and 180 from Dublin: noted for its chalybeate spring and collieries.

BALLYCONNEL, a town of Cavan, in Ulster, sixty-seven miles from Dublin, and eleven north-east of Cavan.

BALLYCOTTON BAY, a bay on the north-west coast of Ballycotton island.

BALLYCOTTON ISLAND, an island of St. George's channel, on the south-west coast of Ireland, four miles off Cloyne. Long. 7° 59' W., lat. 51° 50' N. It is a great resort of sea-fowl, and porpoises frequently come ashore here.

BALLYDOVILIN BAY, a bay on the south-west coast of Ireland. Long. 9° 32' W., lat. 51° 27' N.

BALLYELA BAY, a bay on the west coast of Ireland, 128 miles east of the south Arran islands.

BALLYGAMBOON, in Kerry, Munster; noted for producing great quantities of cyder.

BALLYGILLY HEAD, a cape on the east coast of Ireland.

BALLYHAYS, a market town of Ireland, county of Cavan, fifty-seven miles from Dublin, and once a considerable place.

BALLYHOLM BAY, on the coast of Down, between Carrickfergus and Copland islands.

BALLYHOOLY, in Cork, seated on the Blackwater, in a woody country, 114 miles from Dublin.

BALLYLESS BAY, a harbour on the north-west coast of Ireland, due west from Sligo Bay, and east from Broad-haven. Dunsinhead is its eastern limit.

BALLYMAHON, a town in Longford, sixty-eight miles from Dublin. Long. 7° 56' W., lat. 52° 31' N.

BALLYMENA, a market town of Antrim, on the river Maine, Ireland. It has a town-house, in which the quarter-sessions are held; and a linen manufacture is carried on here. Twenty miles north-west of Belfast, and 132 north of Dublin.

BALLYNAHINCH, a market town of Down, in Ireland, ninety-four miles from Dublin. In its neighbourhood is a chalybeate spring. Here, in 1798, the rebels were defeated after a bloody engagement on Lord Moira's estate, and the greater part of the town was at that time destroyed.

BALLYQUINTON POINT, a cape of Ireland, seven miles east of Down-patrick.

BALLYRAGHAN BAY, a bay on the west coast of Ireland, in the north part of the county of Clare. Long. 9° 6' W., lat. 53° 7' N.

BALLYSHANNON, a town of Ireland, in the county of Donegal, situated on a bay at the mouth of a river flowing from Lough Erne, which is here crossed by a bridge of fourteen arches. Here are two fisheries of eels and salmon. Fish and grain are the chief exports. The imports, timber, rock salt, iron, earthenware, and other commodities in small quantities. Distant forty miles south-west of Londonderry, and 127 from Dublin.

BALLYTORE, a beautiful village, on the river Gris, in Kildare, thirty-five miles from Dublin.

BALLYVOGY HEAD, a cape in Cork, opposite to Mizen Head, between which there is a large bay.

BALM, *v. & n.* } Gr. βαλσαμον, Lat. *bal-*
BALMŪ, } *simum*, Fr. *balsarme*, *haulme*,
Ital. *balsamo*, Goth. *balsan*, Ang.-Sax. *baldsame*,
balzame, Germ. and Swed. *balsam*, Dut. *balsem*.
Applied to a fragrant shrub, as balm-mint; the sap of a shrub, as balm of Gilead; to fragrant ointment; to any thing fragrant, sweet-smelling, soothing, lenifying, lulling, mitigating, either literally or metaphorically. To *balm*, is to wash with *balm*, or any thing softening, fragrant, and antiseptic. See **EMBALM**. Of *balm*-mint, the species are 1. garden *balm*; 2. garden *balm*, with yellow variegated flowers; 3. stinking Roman *balm*, with soft hairy leaves.—*Miller*. 'Balm of Gilead is the juice drawn from the balsam-tree, by making incisions in its bark. Its color is first white, soon after green; but when it comes to be old it is of the color of honey. The smell of it is agreeable, and very penetrating; the taste of it bitter, sharp, and astringent. As little issues from the plant by incision, the *balm* sold by the merchants is made of the wood and green branches of the tree, distilled by fire, which is generally adulterated with turpentine.'—*Calmet*. 'It seems to me that the zorn of Gilead, which we render in our Bible by the word *balm*, was not the same with the balsam of Mecca, but only

a better sort of turpentine, then in use for the cure of wounds and other diseases.'—*Prideaux's Connex.*

In May that mother is of monethes glade,
That the freshe flouris all, blew, white, and rede,
Ben quicke ayen, that winter ded had made,
And full of *baume*, is fleting every mede.
Chaucer.

But forbear to speake
Of baths, or *balming*, or of beauty now.
Chapman. Homer's Odyssey.

We saw thee in thy *balmy*-nest,
Bright dawn of our eternal day;
We saw thine eyes break from the east,
And chase the trembling shades away.
Crashaw.

Upon an hill a bright flame I did see,
Waving aloft with triple point to sky,
Which like incense of precious cedar tree,
With *balmy* odours fill'd th' ayre farre and nie.
Spenser.

Where many groomes and squyres ready were,
To take him from his steed full tenderly,
And eke the fayrest Alma mett him there,
With *balm* and wine, and costly spicery,
To comfort him in his infirmity.
Id.

This is most strange;
That she, that even but now was your best object,
The argument of your praise, *balm* of your age,
Most best, most dearest, should, in this trice of time,
Commit a thing so monstrous, to dismantle
So many folds of favour.
Shakespeare. Lear.

As bees
In spring time, when the sun with Taurus rides,
Pour forth their populous youth about the hive
In clusters; they among fresh dews and flowers
Fly to and fro, or on the smoothed plank,
The suburb of their straw-built citadel,
New rubb'd with *balm*, expatiate and confer
Their state-affairs.
Milton.

Now gentle gales
Fanning their odoriferous wings dispense
Native perfumes, and whisper whence they stole
Those *balmy* spoils.
Id.

Publicola, with healing hands shall pour
Balm in their wounds, and shall their life restore;
Greek arts, and Roman arms, in her conjoin'd,
Shall England raise, relieve oppress'd mankind.
Marvell.

So weak are human kind by nature made,
Or to such weakness by their vice betrayed
Almighty vanity! to thee they owe
Their zest of pleasure and their *balm* of woe.
Young

O smile, ye heavens, serene; ye mildews wan,
Ye blighting whirlwinds spare his *balmy* prime,
Nor lessen of his life the little span.
Beattie.

BALM, in botany. See **MELISSA**.
BALM, or **BALSAM**. See **BALSAM**.
BALM MINT. See **BALM**.

BALM OF GILEAD, the English name of the dracocephalum canariense, or canary dragon's head.

BALM OF SULPHUR. See **SULPHUR**.
BALMUREUM, the name given by Leslie to the ancient abbey of Balmerino, which was founded A. D. 1229, by king Alexander II. and his mother Emergarda, widow of William the Lion. That princess lies interred in the abbey church. See **BALMERINO**.

BALMURENACH, the original name of **BALMERINO**.

BALNAGOWN, a small river of Scotland, in Ross-shire, which bounds the parish of Kilmuir Easter, on the east.

BALNAHUAICH, one of the western isles of Scotland, on the coast of Argyllshire, and in the parish of Jura, on the north end of that island. Mr. Stewart, minister of Jura and Colonsay, in his statistical report of these parishes to Sir J. Sinclair, states the population of this island in 1793 at 28 families, and 132 souls. It abounds with excellent slates.

BALNAVES (Henry), a Scottish protestant divine, born in Fife, in the reign of James V., and educated at St. Andrew's. He went to France to finish his studies; and returning to Scotland, was admitted into the family of the earl of Arran, then regent; but in 1542 the earl dismissed him for having embraced the protestant religion. In 1554 he joined, says Mackenzie, the murderers of cardinal Beaton; for which he was declared a traitor, and excommunicated. While that party were besieged in the castle of St. Andrew's, they sent Balnaves to England, who returned with a considerable supply of provisions and money; but being at last obliged to surrender to the French, he was sent with the rest of the garrison to France. He returned to Scotland about 1559; and having joined the congregation, he was appointed one of the commissioners to treat with the duke of Norfolk on the part of queen Elizabeth. In 1563 he was made one of the lords of session, and appointed by the general assembly, with other learned men, to revise the Book of Discipline. Knox, his fellow-laborer, gives him the character of a very learned and pious divine. He died at Edinburgh in 1579. He wrote, 1. A Treatise concerning Justification, Edinburgh, 1530, 8vo. 2. A Catechism, or Confession of Faith, 1584; 8vo.

BALNEAL', *ad.* } These, with *bain* and
BALNEARY, *n. s.* } *bagnio*, are derived from
BALNEATION, } the Lat. *balneum*, which
BALNEATORY, *ad.* } signifies a bath. To wet,
to wash, to bathe.

Others attribute this *balneal* heat to the sun, whose all-scorching beames penetrating the pores of the earth, do heat the waters. *Howell's Letters.*

The *balnearies* and bathing-places he exposeth unto the summer setting. *Brown's Vulgar Errors.*

As the head may be disturbed by the skin, it may the same way be relieved, as is observable in *balneations*, and fomentations of that part. *Id.*

BALNEARI SERVI, in antiquity, servants or attendants belonging to the baths. Some were appointed to heat them, called fornicatores; others were denominated caparii, who kept the clothes of those that went into them; others aliptæ, whose care it was to pull off the hair; others unctuarii, who anointed and perfumed the body.

BALNEARIUS FUR, or **BALNEARIUS FUR**, in antiquity, a kind of thief who practised stealing the clothes of persons in the baths. This crime was reckoned a kind of sacrilege; for the hot baths were sacred; hence they were more severely punished than common thieves, who stole out of private houses. The latter were acquitted with paying double the value of the thing

stolen; whereas the former were punished with death.

BALNEGLERA, a town of Ireland, in the county of Armagh.

BALNEUM, *n.* a vessel used in chemistry.

BALNEUM, a term used by chemists to signify a vessel filled with some matter, as sand, water, or the like, in which another is placed that requires a more gentle heat than the naked fire. See **CHEMISTRY**, Index.

BALNEUM ARENOSUM, a sand bath.

BALNEUM FOENI, a hay bath, is when a body is laid to digest in moist hay, whose heat is likewise directed by the application of water.

BALNEUM MARIE is by some so called, as being supposed to have been first invented by the blessed virgin; but by others, with more propriety, it is called

BALNEUM MARIS, or sea bath, in regard the vessel here floats as it were in a sea. Here the cucurbit is placed in hot water, which warms the matter contained, and disperses it for exhalation.

BALNEUM MINERALE, or mineral bath, is used by some chemists for aqua regia.

BALNEUM RORIS, or **RORITUM**, is a furnace where the cucurbit, or distilling vessel, is only suspended over the vapor of water, and not in contact with the water itself.

BALNEUM SICCCUM, or **ARENOSUM**, a dry or sand heat.

BALNEUM VAPORARIUM, or the vapor bath; the same with *Balneum roris*.

BALOLY, a town of Hindostan, in the district of Dowlatabad, thirty-five miles E. N. E. of Oudghir.

BALONGO, three islands in the bay of Bengal, near the coast of Arracan. Long. 93° to 93° 20' E., lat. 19° 50' to 20° 5' N.

BALONICH, in the ancient *materia medica*, a name given by Avicenna, Averrhoes, and others, to a kind of camphor, which they describe as coarse, brown, and of less value than the other sorts. This is probably the same with our rough camphor, as brought over to us from the East Indies.

BALOOCHISTAN, **BALOOCHASTHAN**, or, according to some, **Belujistan**, a large province west of the Indus, bounded on the north by Seistan in Persia and Candahar, on the south by the sea, on the east by the province of Sinde and Shekarpoor, and on the west by Mekran in Persia. It comprehends all that space of territory lying between the 25° and 30° of north latitude, and the 62° and 69° of east longitude. The political limits are, however, difficult to define with accuracy, from the perpetual fluctuations to which they are subject. The province is extremely mountainous, peopled by warlike semi-barbarous tribes, and was scarcely known to Europeans till the years 1809 and 1810, when it was visited by Mr. Pottinger and a few other officers in the East India Company's service. At that time the whole country of Baloochistan was divided into the following provinces:—1. Those of J'háláwán and Sáráwán, and districts of Kelát. 2. Macrán and Les. 3. Kobistan, the mountainous region west of the desert. 4. The desert. 5. Cach Gandávah and the district of Herrend Dájel. 6. The province of Sind'h.

The principal provinces at present are Jala-wan, Sarawan, Zukree, Mekran, Lus and Mutch, although this includes territories not properly subject to Mahmood Khan, the present Amcer of Kelât, the capital.

To the south Baloochistan Proper commences at Kohineh, twenty-five miles N. E. from Bayla, in lat. $26^{\circ} 35' N.$, and extends to Nooshky, seventy-nine miles N. W. from Kelat, in lat. $30^{\circ} N.$ The country is described generally as a confused heap of mountains, through which the roads lead for the most part in water-courses, and the beds of small rivers.

The principal mountainous range, called by Mr. Pottinger Brahûic, from the Brahûis who inhabit it, rises abruptly out of the sea to a considerable height at cape Mowâri, the Monze of the Maps, in lat. $25^{\circ} N.$, and long. $66^{\circ} 58' E.$ whence it runs in a north-east direction, afterwards to the north, and at last resuming its original course sinks into moderate hills and unites with the lowest ridges of the chain that traverses Afghânistan. Anciently this chain formed the separating boundary between Persia and India. Near the Indian Ocean it is not more than thirty miles in breadth; but about the same distance from the shore it breaks into a variety of branches, and stretches over the whole country, west and north, in which direction it unites itself with the Persian ranges, ending abruptly in the sea, or sinking in the sandy region which divides the cultivable territory from the ocean. The general inclination of the boldest ridges is from the north-east to the south-west, whence it becomes highly probable that the Brahûic range is a prolongation of the Hindû Cush, the Emodus of the ancients, in which the Hezarâh range or Paropamisus, extending as far as the Caspian, has its origin. With this latter chain the western extremity of the Brahûic mountains, extending north beyond the main body of highlands, is thought to be united; a branch which lying between Seistan and Kirman forms the eastern boundary of the Persian empire. Another division of this range extends from their south-western angle, and, running nearly parallel with the main heights in that direction, forms at last a junction with the mountains of Lâristan, in Persia, and sends out many collateral ramifications terminating in headlands on the coast of Macran. In the western parts of that province the mountains recoil on the principal body, and form a complete mass of mountains, irregularly crowded, which the natives denominate Kohistân, or the highlands. The length of this range is stated at 350 miles, and the breadth of the loftiest ridge at nearly 200. The town of Kelât stands upon the highest level; the extraordinary elevation of which is supposed to exceed by one-eighth the highest peaks of the Pyrenées; a fact which is confirmed by the severity of its winters, and by the great height of the bold defiles bending down to the northern desert.

In this mountainous country, filled probably with primitive rocks, the soil is generally barren; but in the upper provinces rich grain crops are gathered in from fields which to the sight exhibit scarcely any thing but pebbles. The lowlands of Cach Gandâvâh, formed by the alluvions of

the Indus, are extremely fertile, producing grain, cotton, indigo, and oil. The valleys of Wudd, Khozdar, and Sohrab, are capable of cultivation. The precious metals, together with lead, iron, copper, tin, and antimony, abound in many parts of the country; as also rock-salt, nitre, and several medicinal minerals of great value.

The whole of this region, though mountainous, is remarkably destitute of water. It has not a single river that is navigable; but on the northern side the hills are a few brooks and mountain torrents; but these, with the exception of the Budar, are frequently dried up by the intense avidity of the lowland climate. The stream, known by different names in different parts of its course, as Budar, Mulidani, B'hagwar, Desti, &c., is supposed to have been formerly much larger and more important than at present; its source is in the district of Garmsail, near the banks of the Helmind, or Hindmind; but has never been traced by Europeans beyond the parallel of 29° from the ocean. At the distance of a hundred yards from the beach it is not more than twenty inches deep; more remote from the shore, however, its magnitude increases; and in the district of Penj-gûr it has a copious and perpetual stream.

The climate, and consequently the seasons, are very different in different parts of the country. In the loftiest regions they resemble those of the southern and middle parts of Europe, whilst, in the maritime provinces and deserts, they approximate to that of the tropics, and are subject only to three changes, introducing the hot, the cold, and the rainy periods. In J'hâlâwân and Sarâwân the spring commences towards the end of February; the summer at the beginning of May; the autumn succeeds and continues through August and September, after which a severe winter concludes the year. The rains in the level sands of Macran continue through February and March, and afterwards return in June and July, the latter being occasioned by a south-west monsoon. The hot season lasts from March till October, including the second rains, after which the cold succeeds and continues from November till February. The aridity and drought in Macran are so extreme in the summer as to render the country scarcely habitable. Kohistân has a climate of medium temperature; and Cach Gandâvâh, where the heat is so intolerable in the summer, has scarcely any winter at all.

So great a variety of climate is capable of producing a great variety of vegetation; and after Nadir Shah, in 1739, granted the whole of this territory to Nasîr Khan, that prince endeavoured to inspire his subjects with the love of agriculture, and gardening. With this view, he not only introduced various fruits from Cabul, but almost all the productions of temperate and tropical climes, numerous kinds of which are still to be found in some part or other of these dominions. All the different kinds of European grain, madder, cotton, indigo, esculent vegetables, &c. are produced in great abundance; wheat is sown in August and reaped the following June; barley is sown in September, and reaped in May. Madder, after lying in the ground three years, is brought to great perfection. Ushpusht, or camel-grass, a large species

of clover (perhaps lucern), produces two crops in a month, and lasts for six or seven years. The provinces of Macrán and Les, or Las, yield a crop of grass in each of the rainy seasons. The palms throughout the whole region give a large quantity of dates, and, the impregnation of the female blossoms being carefully attended to, the varieties are almost innumerable. Rice is also plentiful, and forms a great part of the food of the inhabitants; besides which, they have bajri (holcus spicatus); jowari, (holcus rosghum); mung, (phaseolus mungo); mayz, dal, urad, and matar, (leguminous vegetables); channá, (cicer arietinum); and til, (sesamum). Among the timber trees of Baloochistan may be enumerated, the Bábal, (mimoso famesiana); lai, (tamarix); mulberry, nim, (melia azad lirachta); pipal, (ficus religiosa); sisú, (dalbergia sissoo); chinár, (oriental plane); mango, walnut, and sycamore. The common European forest trees are wanting. The apúrs, a species of the zizyphus, resembles the jujube, and tamarind. The wood of the former has much the appearance of teak, and both are remarkably hard and durable.

The birds and animals are of numerous species, from the great diversity of climate. Most of our domestic fowls are common, with the exception of ducks, geese, and turkies. The magpye, a bird unknown in India, is not uncommon about Kelát. Flamingoes and floricans (otis houbára) are found in the lower districts. Poisonous reptiles are less frequent than in India. Fresh-water fish are exceedingly scarce. The horses of Baloochistan are strong, but very vicious; their sheep are broad tailed, of the description of the Persian dunbah. Camels and dromedaries are the most common beasts of burthen, the latter of which, with only one hump on its back, is remarkable for its strength, swiftness, and power of abstinence. Wild and very fierce dogs are found in the woods: and the breed of those that are tame, especially the shepherd's dog and the greyhound, is an object of particular attention.

The inhabitants have been divided into four classes:—1. The Baloochees; 2. the Brahochees; 3. the Dehwárs; 4. the Hindoos. The two first of these, speaking different languages, are evidently distinct races, forming together the majority of the inhabitants. Mr. Pottinger thinks the upper and inhospitable regions of J'hálawán and Sáráwán were first peopled by the Hindoos, who, in the early part of the eighth century, fled from the victorious armies of Mahmúd Sabuctagin and his son Masúf. The two principal tribes above-named are divided into many different kheils, or tomans, but their actual number has never been ascertained.

2. The Balooches, called Nharroe, or Rukshani, inhabit that part of the country lying west of the desert, and are a tribe containing 1000 fighting men; by whom the judgalls or cultivators have been nearly exterminated out of Northern Mekran. Mr. Pottinger thinks they are descendants of the Turcumán soldiers, who served in the armies of the Seljúk dynasties, and were dispersed when those dynasties were overturned; on which supposition, the first establishment of the Balooches in the mountainous regions

east of Persia, must be referred to the fifth century of the Hegirah, answering to the eleventh of the Christian era, when they begin to be named by the Asiatic historians. But the Lord's prayer in their language, published by the baptist missionaries at Serámpór, affords us evidence of its having been derived from a Tartarian dialect; also, we may observe, that the Belúchikí, or Belúch, commonly spoken, is evidently a corrupt dialect of the Persian, approaching to that of the Curds, on the western side of Persia, as the Brahúikí, or Bráhú, does to the Hinduwe spoken in the Penj-áb.

Whatever be their origin they are found in the greatest numbers in the northern and eastern provinces, and are divided into three leading tribes,—the Nhárúis, Rinds, and Maghsis, of which the first and last are most important; the former on the western side of Baloochistan; the latter on the low lands of Cuch Goodáva, at the eastern foot of the mountains. These tribes are again subdivided, and those of Rind and Mugree, who formerly emigrated from Mekran, and live in villages, retain the appellation of Toomuns,

The Balooches are generally tall and handsome, but not athletic; patient, and full of courage. They delight in predatory excursions called chapaós, greatly resembling the forays of our northern borders in the sixteenth century. On these occasions they are mounted on dromedaries, provided with dates, bread, sour cheese, and water, and march without halting to the place they mean to attack; here they conceal themselves in a wood till night, and when the inhabitants are asleep, hasten forwards, burning, destroying, and carrying off whatever comes in their way. These diversions occasion frequent warfare; but hospitality is nevertheless general, and pilfering despised. Their domestic habits are pastoral, and their subjection to the chiefs voluntary. They reside in tents, or ghedáns of black felt, or coarse blanket, stretched over a frame of wicker-work, formed of twigs of the gaz, or tamarisk; an assemblage of which light habitations forms a túman or village, and its inhabitants a kheil or family. The men are indolent, and great lovers of opium, though not accustomed to any other species of intoxication. They are less jealous of their wives than Mussulmans generally; of which, though their religion allows a plurality, they commonly have only one. Their regard to the sanctity of marriage is exemplary, and many of their customs appear to originate in the law of Moses. A widow must be married by her husband's next brother: adultery is punishable by the death of both parties; incontinence before marriage authorises divorce afterwards, the sang or promise of marriage is inviolable; and a betrothed virgin is considered as having nearly the same rights as a married woman.

Their clothing consists of a long shirt, and trowsers of blue and white calico, together with a quilted cap, round which, when they are in full dress, a shawl is twisted; in winter thick warm surtouts are worn by all classes. The women when young tress their hair, and twist it round their heads, forming the ends into a knob

on the crown, so as to give it the appearance of a cap. Their dress in other respects resembles that of the men, but exposes the bosom as much as the tunic worn by the females of Persia. When out of doors they are completely veiled.

The soldiers, although awkwardly accoutred, are excellent marksmen; to kill a lark or sparrow with a single ball at the distance of fifty or sixty yards is not considered by them as any proof of dexterity; and the *nézah-bázi*, or spear play, their favorite diversion, evinces not only considerable skill, but superior muscular strength. It consists in the rider piercing a wooden stake, driven into the ground, with the point of his spear while his horse is at full speed; and requires the most critical management of both horse and spear at the same instant of time. On the whole, the similarity between the manners of this people and those of the Kurds and wandering Turcumáns, the *Yarúk* of the Turks, found in every part of Anatolia, render the above conjecture as to their origin highly probable.

2. The Brahooses, or *Bráhuís*, are a strong hardy race of men, with uncommonly short and thick bones. Their cast of countenance is different from the Balooches and Asiatics, generally exhibiting a roundness of face, and bluntness of features, somewhat resembling Europeans. They are divided into separate tribes, the principal of which are the following :

	Men.
The Kumburánee, or the tribe of the chief	
Mahmood Khan, estimated at	1,000
The tribe of Mengul	12,000
Zukree	6,000
Pandurani	6,000
Nahari	6,000
Imaum Hossaing	4,000
Begunje	1,000

They are hard-working people, of voracious appetites, devouring their animal food almost raw. When they cure their meat, it is effected by drying it in the sun, and smoking it over a fire; after which it will keep for several months, and in flavor very much resembles rein-deer's tongue. The people generally are less ferocious than their neighbours, for which reason the government of their chiefs assumes a more despotic character. They are disinterested, placable, and humane; the very reverse of the Balooches, and the uncouthness of their manners is to be attributed solely to their want of civilisation. All the Baloochees are excellent workmen, but none are equal to the Brahooses in strength and courage. Broad sword exercise, and shooting at a mark, are their common diversions; in both of which they are said to excel. Their breed of shepherds' dogs is excellent; greyhounds are also trained amongst them with great care, and a single one is frequently exchanged for two camels, or sold for 400 rupees. Their breed of horses is large and hardy, equally accustomed to the heat of Gundáva and the cold of *Kelát*, but they are often vicious.

The Brahooses, in religion, are strict observers of the Sunnah, or the traditional law of the Mussulmans, in which respect they approach nearer to the Turks than the Persians. They are not jealous

of the women, who sometimes assist in out-door work, and are seldom secluded from the society of the men. The common dress used in this part of the province is an under coat, which fits close to the body and is worn over the pyrahun or shirt: their trowsers are gathered up at the ankle, and a small round flat-topped cap of felt silk is the only covering of the head. The shepherds wear a white felt garment above the shirt in winter, with cloth trowsers and a felt cap. The females wear a kind of stays which lace behind, and give them an appearance similar to that of the peasants in Switzerland. It has also been observed that with the exception of the shepherds, the Brahooses never increase their clothing in the severest weather. The common language is the *Koórgalee*.

3. The *Dehwárs*, or *Dehkáns*, i. e. villagers, are exclusively employed in agriculture, and hold their lands by a sort of feudal tenure, being bound to provide the khan's guests with water, fuel, provender, &c.; to attend him in his hunting excursions, and to supply him with couriers when required, in consideration of which they are exempted from all military duties; they are tacit, harmless, and submissive to the other tribes. They differ considerably from all the other inhabitants of the province, being uncomely in appearance, low in stature, coarse in features, with high cheek bones, but possessing a more artless, good humored and honest expression of countenance. They never migrate, and their language is pure Persian. Mr. Pottinger from this latter circumstance concluded that they sprang from the *Gebrs*, or followers of Zoroaster, who fled before the victorious arms of the Mussulmans, but, against this opinion, their dispersion through other parts of Asia, their correspondence with the *tájíes* of Afghánistán, together with their zealous observance of the Sunnah, powerfully militate.

4. The Hindoos are few in number and carry on the miserable traffic of the country, acting as money-changers and agents to the native chiefs. Many of them are not so indigenous as they have been generally represented, but are merchants from *Multán*. The Hindoos are supposed to have been the first settlers in these mountains, and were long tolerated by their Mussulman conquerors, who, according to current traditions, were first admitted into their impregnable retreats as traders, where being indulged with too much lenience, they finally subverted the government. Numerous Hindoo occupiers, however, still remained in the country, till within the last two centuries, when the barbarity of the Mahomedan tribes increased to such a degree that no medium could be observed, and the native Hindoos, with the exception of a few merchants, underwent compulsory conversion, or fled the country. The remaining few have however considerably degenerated from the laws of the *Sháster*; they eat animal food, use leathern bags, and in many other respects violate their religious tenets, and perhaps it is this partial conformity which constitutes the true principle of their toleration.

Of the divisions of Baloochistan generally, *Jháláwán* and *Sáráwán*, with the intermediate

district, extending to the north and north-east, and bounded by that part of the Brahúic mountains which is beyond the twenty-sixth degree of north latitude, come first under our consideration. Jháláwán is the most southerly, containing six thacs or districts, each governed by a different chief. Zehri, the largest town, is surrounded by a mud wall, and contains 2000 houses. There are no streams in the whole province more than ten inches deep in the dry season, and water can be obtained only by digging in the beds of torrents. Kelát properly belongs to Sáráwán, but the usurpations of the khán have rendered it nearly a distinct province. To the north of it, bounded by the Afghán hills and the desert east of Kandahár, lies Sáráwán, divided into inferior districts, and occupied by migratory tribes of the Brahúics. The province is mountainous, not possessing a single level of more than a few miles in circumference, except a naked plain of about thirty miles in extent, called the Deshti-bé-daulat, or Pennyles Desert, forming a remarkable gap in the northern front of the great chain. The southern province is fertile, having frequent rains, but the least populous; Kelát is considered the capital of Baloochistan generally.

Noosky is a small tract of about thirty-six square miles, lying at the base of the Kelat mountains. It is an arid tract, the sand hills of which shift with the winds. A few patches of cultivable land are nevertheless met with occasionally; and a small stream, called the Xysur, issuing from the hills, irrigates the portion of country immediately contiguous. The inhabitants dwell under black felts stretched over a frame of wickerwork made of the guz plant, by which they are sheltered from the heat of the sun. The soil being sandy, the heat is excessive in the summer; the stream fails in the valley, and the inhabitants migrate to the mountains for cool air and water.

The fine valley of Sohrab extends north and south about fifty miles in length by twelve in breadth. The water from the hills runs through its centre, and around it are scattered a few villages.

The two provinces of Les and Macrán are included between the higher ridges of the Brahúic chain and the Indian Ocean, and are varied by intersections of such branches of these hills as diverge towards the sea. On the north lie the regions of Jháláwán, Sáráwán, and Kelát, together with Kehistan and the desert; and on the west the Persian Láristán. Lus or Les, signifying in the Jedgáli language a valley or plain, presents a perfectly level surface for about ninety miles by fifty, enclosed on three sides by lofty mountains passable by only five lekhs, or defiles, two in the eastern and western, and one in the northern branch of this great chain. This is a fertile province, watered by two small rivers, Habb and Puráli (the Arabis of the ancients), and together with Macrán formed a part of the Persian empire. The sovereignty is at present held on a feudal tenure under the khán of Kelát.

Béla, the capital, stands on a rocky eminence on the northern bank of the Puráli. Many of the inhabitants are merchants from Multán and

Shicárpúr, west of the Indus, and their immunities are considerable.

The population of Lus is about 26,000, who are of the same tribe, though distinguished by the different names of Jedgáli, Jókhyá, Jét'h, and Numri. They are an indolent and curious people; the men athletic and middle-sized, the women plain, and dirty. Their manners, appearance, and language, prove that they must have been derived originally from Hindostan; and the latter called Jedgali or Jét'hgáli has a close affinity with that of Sind'h. They are fond of intoxicating drugs, and nearly one third part of them are migratory.

Of Makran there are fourteen districts, several of which are uninhabited. Water is extremely scarce throughout the whole territory, a great part of which consists of barren mountains with here and there a fertile valley, or an island of palms emerging from the waste, similar to those found in the vast deserts of Africa. Many of the streams of this region, now trifling brooks, were formerly navigable. In one of these, namely, Ag'hón Nadi, is a celebrated well called Anilcá Cund, or Fathomless Abyss, the depth of which is not known. The Hindoos attribute the digging of it to Cálí, whose shrine at Hinglatz or Hing-láj, just above it, is the resort of numerous pilgrims. The river Dest waters the district of Kedge, or Kej, which receives its name from the capital of the province. This ancient town carried on formerly a considerable trade with Kandahár and the north of India, but has gone to decay since its governors threw off their allegiance to the khán of Kelát. It has many advantages of site, and covers three sides of the base of a hill, on the summit of which is a castle deemed impregnable.

Kohistan is surrounded on the east, north, and west, by sandy deserts, with the exception of a narrow range of hills which connect it on the north-west with the Paropamisus of the ancients, and on the south it is bounded by the Brahúic chain, of which it forms one of the extremities. It is divided into two districts, the Maidáni or plain, and the Chópaki or hilly country. Water is extremely scarce and the population scanty, consisting chiefly of Belúches. It abounds with salt and chalybeate springs, with numerous mineral productions, and its hills occasionally betray a volcanic origin.

The desert, 300 miles long and 200 broad, is traversed by the Helmind or Hermend, the natural boundary of Baloochistan, and separated on the west by a narrow range of hills from the deserts of Kirmán. Its utmost extent including the latter is about 600 miles diagonally from east to west, and 500 miles from south, and is bounded on the north and east by the mountains of Afghánistán.

This vast ocean of sand is composed of particles so light that when taken up into the hand they are little more than palpable, and when agitated by the winds are thrown into an irregular mass of waves running east and west. Most of these banks rise perpendicularly from ten to twenty feet on the leeward side; and, from the redness of their appearance, might be taken for brick walls, whilst the windward side slopes

off with a gradual declivity to the base of the next bank or wave. The camels are with difficulty driven up the perpendicular or leeward sides of these sandy hills; but on the shelving sides they ascend with laborious perseverance, and, having reached the summit of a wave, drop most expertly on their knees and slide down with the sand to the bottom of the next hollow. These mountains of sand are observed to be succeeded by hard black gravel, without the least appearance of vegetation, and bare stony hills lying at the base of the mountains, are the first ascent towards higher and less barren regions. Throughout the whole desert the sands are extremely hot, and the fine particles, raised by the wind, getting into the eyes, nostrils, and mouth of the traveller, cause an extreme degree of painful irritation and thirst.

The Regency of Sind'h and also Cach Gandávah, east of the Brahúic chain of mountains, between India and Persia, though commonly included in the kingdom of Baloochistan, belong more properly to Hindostan.

With respect to the history of Baloochistan antiquity is almost silent. The mountainous tract, which forms the central and most important part of this territory, appears to have been unknown to the ancients, and was perhaps uninhabited up to the period of the Mahomedan conquests in the seventh and eighth centuries of the christian era. Alexander marched from Pattálá, (Thatt 'lah or Tamár) on the Indus, through the territory of the Arabáta, still indicated by the cape called Arabá by the natives, the Arabah of the maps, thence he advanced into the country of the Orate in his way to Gedrosia or Macrán, where the greater part of his troops are said to have perished from thirst, famine and fatigue. Craterus who commanded, with another part of his army, passed by a circuitous route through Arachosia and Drangiana, the Kandahár and Beristan of modern geography; countries placed in a higher latitude, south of the extreme deserts which separate the Belúches from Persia and Afghanistan. The Mahomedan invaders followed the track of Alexander, whilst the Sultans of Ghuzná, who made themselves masters of the level country to the mouth of the Indus, and the coast as far as the confines of Persia, never descended the hills. The Persian historians say the idolatrous Hindoos were driven into these retreats; but, since the present occupiers betray no affinity with the natives of India in customs, features, or language, the origin already assigned is more probable. They themselves affirm that they are the original natives of the hills, and that their name Bráhuic is derived from Baroh mountains, whilst the inhabitants of the plain are called N'haráns or N'aróhis, Lowlanders. The most ancient traditions do not carry the origin of the Mussulman government further back than seven generations.

About two centuries ago the city of Kelát with the surrounding country was possessed by Sewáh Rajáh a Harloo, and the Balooches tended flocks of sheep in the mountains. To protect the inhabitants from the depredations of a people residing in the low country between Kelát, Sínle, and Shekárpoor, the rajáh sent

for Kumber a Baloochy chief, and took him into his service, allowing him five bundles of grass and wood per day for each man. This auxiliary shortly after seized the government, and raised the tribute to a hundred bundles, besides a contribution of horses, camels, and footrunners. This tribute is still occasionally exacted by the Khan of Kelát, and paid by the detmars or peasants in the immediate vicinity.

Kumber the first usurper was succeeded by his son Sumbar, the father of the next prince, Mahommed Khan, who in his turn was succeeded by his son Abdulla Khan. This prince conquered a considerable part of Cach Gandávah, till then subject to the Nuwábs of Sind'h. About that time the celebrated Nádír Sháh carried his victorious arms into India; and while at Kandahár sent an army into the mountains of the Belúches. Abdu'llah sent his two sons as hostages to the conqueror's camp; after which he was allowed to continue in his government as a feudatory of Persia. Upon the death of Abdu'llah, Nasir Khan his younger son, by the advice of Nádír Sháh, put to death his elder brother, who had succeeded to the sovereignty, and took possession of the Gad'hi or throne; and having performed some important services to his patron, was rewarded by the donation of several provinces, and, being a man of considerable abilities, greatly enlarged his dominions, so that at his death, in 1795, the territories descended to his son and successor Mahmood Khan in a very flourishing and prosperous state. This prince is now about twenty-nine years of age; but his talents being very inferior to those of his father, the dominions of Kelát have been greatly curtailed by the Ameers of Sínde and other neighbouring provinces. His brother Mustapha Khan, who is about one year younger than the sovereign, is, however, of an active martial disposition, and bids fair on his accession to restore the empire and improve the hereditary dominions. The territory at present subject to Mahmood Khan, comprises the high hilly country of Sewistan, and the low lands of Cutch Gundava and Amund, Dajil to the eastward; bounded on the north by Khorassan; on the south by Lus and Sínde; on the west by Mekran; and on the east by Sínde. His clear revenue is about three lacks of rupees, and is collected from Amund Dajil, Cutch Gundava, and the bazaar tolls of Kelát. The Khans of Baloochistan acknowledge the paramount authority of the Cabul sovereigns, to whom they are feudatories; but their obedience is in proportion to the talents of the reigning prince, and the political circumstances of the Cabul government. The present territories of Mahmood Khan are supposed capable of raising an army, infantry and cavalry, of 25,000 men, although formerly the sovereign could raise 60,000. See *Christie, Kinneir, &c.*

It was probably without intention that Nasir Khán laid the foundation of the present government, which is rather a military republic than an absolute monarchy. The Serdárs or chiefs hold their lands on feudal tenure, each tribe chooses its own Serdár, in whose family the office becomes hereditary. The general administration is, however, still vested in the Khán of Kelát. Each

Serdár in time of war attends with his quota of troops, and is bound to obey the orders of the sovereign; but if to his own detriment, receives compensation.

A new code of laws was established by Nasir, of which the Koran is the standard, accompanied however by the following improvements. In cases of murder where the deceased is a foreigner, every one concerned in the crime is immediately executed without commutation. Burglaries and night robberies are punished with death. Adultery may be avenged by the husband; but the clearest testimonials of guilt are required; and if he fails of producing these he is liable to severe punishment. Minor offences are cognizable by the Serdár of the Kheil, or family, with an appeal lying to the Serdár of the whole tribe, and ultimately to the Khán himself, who commonly consults the heads of his family before he decides on any intricate cause. No execution can take place without an order from the sovereign, except in case of the murder of a traveller on his road, when, as a speedy execution is necessary, the nearest chief is empowered to enforce the penalty of the law.

BALOR, a town on the east coast of the island of Luzon. Long. 122° 5' E., lat. 15° 18' N.

BAL'OTADE, *n. s.* The leap of an horse, so that when his fore-feet are in the air, he shows nothing but the shoes of his hinder feet, without jerking out. A *balotade* differs from a capriole; for when a horse works at caprioles, he jerks out his hinder legs with all his force.—*Farrier's Dictionary*.

BALOTE, a town on the east coast of the island of Mindoro. Long. 121° 15' E., lat. 13° 3' N.

BALOU, a town of Armenia, twenty-five miles north-west of Khars.

BALREMIT BAY, a bay on the east coast of the island of Colonsay, one of the Hebrides. Long. 6° 7' W., lat. 56° 6' N.

BALRIE CASTLE, a very ancient fort, now in ruins, situated on an eminence at the west end of the moss of that name, Angusshire, Scotland. It was destroyed by the marquis of Argyll in 1640. The walls are eight feet thick. This castle and the adjacent lands were the property of the last viscount Fenton.

BALROTHERY, or **BALRUDDERY**, a town of Ireland, in the county of Dublin, fourteen miles from the city and one from the sea.

BALSA, an ancient town of Lusitania in the Ager-Cunæus; now called Tavira, in Algarva.

BALSAM, or **NATIVE BALSAM**, an oily, resinous, liquid substance, flowing either spontaneously, or by means of incision, from certain plants. There are a great variety of balsams, particularly distinguished by the names of the substances from which they are obtained; and which will be found explained under their names as they occur.

BAL'SAM,
BALSAM'ATION,
BALSAM'ICAL,
BALSAM'ICK, *n. & adj.*
BALSAM'OUS.

Of the same derivation as *balm*, but more limited in its application. It is almost exclusively used to designate an unctuous or oily mixture, generally attended with fragrance.

Should I sigh out my days in grief,
 And, as my beads, count miseries;
 My mind would meet with no relief,
 For all the *balsam* of my eyes. *Stevenson*.

Brave spirits are a *balsam* to themselves,
 There is a nobleness of mind that heals
 Wounds beyond salves. *Cartwright*.

Is this the *balsam* that the usuring senate
 Pours into captains' wounds? Ha! banishment?
 It comes not ill; I hate not to be banish'd;
 It is a cause worthy my spleen and fury,
 That I may strike at Athens. *Shakespeare*.

Christ's blood our *balsam*; if that cure us here,
 Him, when our judge, we shall not find severe. *Denham*.

That this herb [ros-solis] is the cause thereof, shepherds affirm and deny; whether it hath a cordial virtue by sudden refecation, sensible experiment doth hardly confirm; but that it may have a *balsamical* and resumptive virtue, whereby it becomes a good medicine in catarrhes, and consumptive dispositions, practice and reason conclude. *Brown's Vulgar Errors*.

The Britons squeeze the works
 Of sedulous bees, and mixing odorous herbs,
 Prepare *balsamic* cups, to wheezing lungs
 Medicinal, and short-breath'd ancient sires. *J. Philips*.

Now the radical moisture is not the tallow or fat of animals, but an oily and *balsamous* substance; for the fat or tallow, as also the phlegm or watery parts, are cold; whereas the oily and *balsamous* parts are of a lively heat and spirit. *Sterne*.

BALSAM APPLE. Lat. *momordica*. An annual Indian plant.

BALSAM TREE. This is a shrub which scarce grows taller than the pomegranate-tree; the blossoms are like small stars, very fragrant; whence spring out little pointed pods, enclosing a fruit like an almond, called carpobalsamum, as the wood is called xylobalsamum, and the juice opobalsamum.

BALSAMATION is used by some writers for the art or act of embalming dead bodies. Dr. Hook speaks of an universal balsamation, or method of preserving all kinds of bodies from corruption, invented by Dr. Elshot.

BALSAMELEON, in the materia medica, a name given by some to the balm of Gilead.

BALSAMELEUM, in ecclesiastical writers, the sacred chrysm.

BALSAMINA SCANDENS, a name given to the large fruited white briony of Ceylon.

BALSAMINE, **FEMALE**, in botany, the name given by Tournefort to a genus of plants, called by Linnæus, impatiens, and belonging to the class of syngenesia monogamia.

BALSAMITA, a species of tansy.

BALSAMICA. See **BALSAMICS**.

BALSAMICS, **BALSAMICA**, Latin, *i. e.* mitigating; this term includes medicines of very different qualities, as emollients, detergents, restoratives, &c.; but in all these kinds there are these requisites, that they be soft, yielding, and adhesive; and by their smallness they have a ready disposition to motion. Medicines of this tribe are generally required for complaints whose seat is in the viscera; and as they cannot be conveyed there but by the common road of the circulation, it follows that no great effects can be expected from them but by their long continuation

Hoffman calls by the name of balsamics those medicines which are hot and acrid, also the natural balsams, gums, &c. by which the vital heat is increased.

BALSAMITA, in botany, a genus of plants, of the class syngenesia, and order polygamia æqualis. Its generic character, is receptacle naked, pappus none, calyx imbricate. It contains four species, of which the only one requiring notice is the *B. vulgaris* (tanacetum balsamita of Linnæus) common costmary, or alecost. Its stem is herbaceous, leaves oval, dentate; inferior petiolate; superior sessile, auriculate at the base, flowers corymbose. It is a perennial plant, native of the south of France and Italy; and was formerly prescribed in the pharmacopœias as a carminative.

BALSAS, a town of Peru, in the province of Chachapuyas, on the east shore of the Amazons, forty miles north of Caxamarca. Lat. 6° 16' S.

BALSEY CLIFF, a high land on the east coast of England, between Orford and Harwich.

BALSO, a river of Quito, which, after winding through forests, enters the Bobonasa.

BALSTAL, a well-built market town of Switzerland, in the canton of Solothurn. The inhabitants carry on a great trade between Bale and Solothurn. Ten miles north-east of Solothurn.

BALSAMON (Theodore, patriarch of Antioch in the twelfth century. He wrote a number of works on the canon law, which were printed at Paris, in folio, in 1620.

BALSHAM, or **BELESALE** (Hugh de), the tenth bishop of Ely, in the thirteenth century, was first a monk, and afterwards subprior of the Benedictine monastery at Ely. In 1247 he was chosen bishop by the convent. But king Henry III. who had recommended his chancellor Henry de Wingham, refused to confirm his election; whereupon Balsham went to Rome to be confirmed by the pope; which, however, was not done for ten years, when at last his holiness confirmed his election in 1257. Bishop Balsham then executed what he had long intended; by laying the foundation of St. Peter's College, Cambridge, the first in that University, which has immortalised his name as the patron of literature. He was also very charitable to the poor. He died in 1296, and was buried in the cathedral of Ely.

BALTA, or **BALTO**, a town of European Russia, the capital of a circle in the government of Podolia, situated on the Kadyna, a tributary stream of the Bug. Before the annexation of this part of Poland to Russia, one half of Balta belonged to the palatinate of Braclaw, and the other to Tartary. In 1767, in the war which broke out between the Russians and Turks, the town of Balta was laid in ashes by the former. Sixty-five miles N. N. E. of Bender.

BALTA, one of the smaller Shetland islands, near the east coast of Unst. Long. 4° 2' W., lat. 61. 7' N.

BALTAGI, among the Turks, porters, and hewers of wood, in the court of the grand seignior; who also mount on horseback when the emperor rides out. Part of them, who, for that purpose, must be castrated, keep watch at the gates of the first and second courts of the ser-

aglio. These last are called *capigi*, and their commander *capigi pacha*.

BALTCHUTZKO, a town of Asiatic Russia, in the government of Kolhyvan.

BALTEATUS, in entomology, a species of cimex, inhabiting South America. 2. A species of elater, of a black color; anterior half of the wing cases rufous. Linn. Fn. Suec. A native of Europe.

BALTEUS, in entomology, a species of cerambyx, that inhabits Lusitania. The thorax spinous; body ferruginous; abdomen ovate; wing cases with a blackish band. Linnæus.

BALTHASAR (Christopher) a learned French author of the seventeenth century. He followed the profession of an advocate; but having embraced the protestant religion, from pleading at the bar, he became a champion for the reformed churches; and in 1659 a pension was settled upon him by the national synod at Loudun, in consideration of his services. He displayed great abilities in combating Baronius.

BALTHAZARINI, an Italian musician of the sixteenth century, who was a great favorite at the French court in the reign of Henry III. He composed a ballet, which he called *Ceres and her Nymphs*, in 1531, designed for the marriage of the duke de Joyeuse with *Mademoiselle de Vaudemont*, the queen's sister; and this is thought to have been the origin of the ballet herique, in France.

BALTHEUS ORIONIS, the belt of Orion, in astronomy, a part of the constellation of Orion, consisting of three bright stars of the second magnitude, placed nearly in a right line in Orion's girdle.

BALTHICA, in conchology, a species of tellina that inhabits the Baltic Sea; the shell roundish, smooth outside, carnation color. Linn. Fn. Suec. About the size of a horse-bean, and very rarely larger; extremely thin, pellucid, brittle, and white within. Chemnitz, &c.

BALTHICA, a species of helix, found on the shores of the Baltic; the shell imperforated, ovate, and pointed; with elevated wrinkles; aperture ovate, and very ample. Linn. Fn. Suec. This animal is black, with two tentacula; shell pellucid, and with four whorls.

BALTHICUS, a species of nautilus, of the smaller kind, that is found adhering to the roots of fuci. This shell is sometimes opaque, sometimes glossy, frequently pellucid; and the wreaths either smooth, striated, ribbed, or tuberculated. It is specifically distinguished by being white, convex, aperture linear, and the first wreath much larger than the others. Schroeb.

BALTIA, an island in the Baltic Sea which gives name to it.

BALTIC SEA. A large gulf of the German Ocean, penetrating the upper part of Europe, and surrounded by the coasts of Denmark, Sweden, Russia, Germany, and Prussia. It is 600 miles in length; from eighty to 150 miles in breadth, commencing at the Danish islands of Funen and Zealand; it stretches beyond the sixty-fifth degree of latitude, including an area of surface equal to 10,000 square leagues. The two extreme divisions of this sea are the Gulfs of Bothnia and Finland; the former running

east to the vicinity of Petersburg, the latter extending north till it penetrates the arctic regions.

Its access is through a narrow winding channel, or strait, on the west of the European continent, the northern part of which, communicating with the ocean on the south-west, is called the Scaggerack; the middle consists of the Great and Little Belts, and the southern part of the Categat. This entrance to the Baltic is sometimes called the sound. It is also connected near Pillau and Memel by narrow passages with two large lakes called the Frische Haff and Curische Haff.

The proximity of the coasts and islands, the shallowness of the waters, the flatness of the Prussian shore, the ruggedness of that of Sweden, the frequent and sudden changes of the winds, and the violent storms with which they are attended, render this sea very dangerous for navigators, although the breakers are much less formidable than those in the German Ocean. The general depth of the Baltic is from fifteen to twenty fathoms, although in some places it is much less, and in others much more. Like other inland seas the Baltic has no tides, or, if it has, they are scarcely perceptible; but a strong current generally sets towards the ocean, which, when checked by a west wind forcing the waters in a contrary direction through the straits, causes the Baltic to rise much above its ordinary level. The waters of this sea are colder and less salt than those of the Northern Ocean; from which circumstance, together with the deficiency of tides, it is usually for about three months of the year so completely frozen as to admit in many places of a passage over the ice. The ice in the southern part begins to break up in April, although the two gulfs are not generally cleared before the middle of May.

Numerous rivers, of different degrees of importance, empty themselves into this sea, which greatly contribute to the freshness of its waters, and, together with the diminished evaporation of the northern regions, occasion the current to which we have already referred. The chief of them are the Warnow, the Oder, the Peene, the Persante, the Wipper, the Vistula, the Pregel, the Memel or the Niemen, the Dwina, the Aura-Jocki, the Cano, the Torneo, the Skelleftea, the Pitea, the Lulea, the Umea, the Angermeyn, the Motala, the Luisna, and the Dal. The earthy particles conveyed into the bed of the Baltic by means of streams, rivers, &c. are said to cause the depth of this sea to diminish at the rate of four feet in a century; and Mr. Von Buck, in his Travels in Sweden and Lapland, observes with respect to the Bothnian Gulf, that the sea-bays have become marshes by the continual decrease of the gulf waters; and that we may soon expect to see the site of that aquatic region covered with fields and cottages.

The islands of the Baltic are numerous, one chain of which, reaching from Finland to Sweden, divides the southern part of the sea from the northern, commonly called the Gulf of Bothnia. The chief of the Danish islands forming the immediate seat of the government are Zealand and Funen. Near the shores of Livonia are the islands Dago and Oesel. Gothland and

Oeland belong to Sweden; Rugen to Pomerania; and Moen, Bornholm, Falster, Alsen, Laaland, together with several others, are subject to the Danes.

Considerable fisheries are formed on some of the coasts of the Baltic, and Mr. Fischer, a naturalist of Livonia, enumerates nearly fifty different species of fish in the waters of that province; the principal of which known as articles of commerce are salmon, pike, streamlings, and lampreys.

The general commerce of the Baltic is very considerable, since it washes the shores of Denmark, Sweden, Russia, Prussia, and part of Germany; it has a communication with the Caspian Sea, by means of the canals of Ladoga, Vyschnei-Volotschok, and Maria, thus opening facilities for conveying the commodities of northern Europe into the interior of Asia.

All vessels that pass in or out of the Baltic pay a certain duty to the Danish government, for the maintaining of light-houses, &c. This toll is received at Elsinore, where the vessels are regularly entered in the national register, a view of which for the years 1816 and 1817, will enable the reader to form some idea of the comparative importance of the Baltic commerce. A second entrance into the Baltic, by the canal of Gotha, was opened in 1832.

In 1816 were registered the following vessels:—

	From the North Sea.	From the Baltic.
America	83	85
Bremen	55	56
Danish	408	379
Dutch	473	403
English	942	906
French	8	8
Hamburgh	18	18
Hanover	113	111
Lubeck	23	22
Mecklenburg	126	127
Norwegian	396	398
Oldenburg	16	13
Pappenburg	22	17
Portuguese	25	23
Prussian	525	489
Rostock	65	68
Russian	208	191
Spanish	5	4
Swedish	1097	945
	4608	4263
		4608
Total number that passed the Sound in 1816		8871
Number to and from in 1831	12,938	4778 British
Ditto	1832 12,202	3831 do.

In 1817 were registered the following vessels:—

	From the North Sea.
America	68
Bremen	11
Danish	463
Dutch	695
English	2088
French	22
Hamburgh	42
Hanover	212
Mecklenburgh	169
Norwegian	470
Prussian	917
Russian	197
Swedish	1044
Other nations	360
Total number of vessels from } the North Sea }	6758
From the Baltic the same year	6300
Total number of ships that } passed the Sound in 1817 }	13,148
Total in 1831, 12,938	4778 British
Do. in 1832, 12,209	3871 do.

The winds are extremely variable in the Baltic; but they blow most commonly from the east in the spring, and from the west in autumn; calms are seldom experienced except in the middle of the summer. The irregular variations of the level of the Baltic somewhat resemble tides, and occur generally in autumn, when the weather threatens rain. These sensible swells frequently last for weeks together, and their maximum rise being three feet and a-half, all the low lands are inundated. On these occasions, the fresh-water lakes which communicate with the sea are rendered brackish. In the Gulf of Bothnia, the fall of the water is usually succeeded by north winds, whereas, at Stockholm, these winds follow the elevation. M. Kraft, who was professor of experimental philosophy in the imperial academy at Petersburg, published a treatise on the inundations of the Neva at the autumnal equinox, in which he observes, that three or four days before or after the full or new moon, a violent north-west wind drives the waters of the Northern Ocean, during the influx of the tide, into the Baltic, and is immediately succeeded by a south wind in that sea and the Gulf of Finland, to the concurrent effect of which he attributes the phenomena in question; but Schultens, a learned Swede, who had closely studied the physical geography of the Baltic, attributed all the irregular elevations of this sea to the unequal pressure of the atmosphere on different portions of the water, deranging, in his opinion, their common level. He was led to this conclusion by having observed repeatedly, that when the waters were about to rise, the barometer fell, and that when the waters were about to fall the barometer rose.

The waters of the Baltic are of different degrees of saltness in different places, and in the same places at different seasons, and during different winds. The waves are short and broken,

in consequence of sudden changes of wind, irregular depths, and strong currents, many of which, especially towards the north, rise thrice in the course of a year. The superior and inferior currents of the Sound are remarkable. These were discovered first by some of our own countrymen, who, being in a boat in the middle of the channel, found that they drifted towards the Cattegat; but upon letting down a loaded bucket to the depth of four or five fathoms found that their boat became stationary, and upon sinking the bucket still deeper, the boat drifted in a direction diametrically opposite to the superficial current.

By the transfer of Swedish Pomerania to Prussia, of Swedish Finland to Russia, and of Norway to Sweden, the commerce and resources of the Baltic nations have undergone a considerable change.

The following is a sketch of the staple articles of their commerce at the beginning of the present century.

Danish vessels visit the ports of Mecklenburgh and Pomerania, with horses, bullocks, butter, cheese, fish, fish-oil, colonial produce, &c.; and receive in return, thread, linen, brandy, wool, hardware, paper, &c. To Petersburg, Riga, and Memel, the Danes send herrings and dried fish, woollen manufactures, salt of France, Spain, and Portugal, India and China goods, oysters, and dog-skin gloves; for which they receive potash, planks, fire-wood, flax and hemp, cordage, iron, copper, linens, and corn. To Holland, Denmark exports rape-seed, salted and dried fish, and timber; and receives spices, drugs, corn, pipes, and paper. To England, hides, bar-iron, kelp, furs, tar, timber, &c. The returns are, hardware goods, woollens, cottons, hats, and colonial produce. From the official account of the real value of the imports into Denmark from Great Britain, from the 5th January 1798, to the 5th January 1808, laid before Parliament, in consequence of the attack on Copenhagen, it appears, that from 1798 to 1803, they are rated about half a million; and that from 1803 to 1808, they varied from two to six millions. France receives from Denmark, horses, butter, cheese, fish, &c.; and returns salt, wines, brandy, fruits, silks, &c. The exports to Spain and Portugal are nearly the same as to France; the imports also are the same, with the addition of wool and American produce. To the Mediterranean, Denmark sends fish, salted provisions, butter, iron, &c.; and receives wines, brandy, oils, fruit, and salt. The Danes derive great profit from hiring their vessels to the ports of Italy, as their flag is generally respected by the Barbary States. The exports to the Faroe Islands are wheat, flour, brandy, tea, coffee, sugar, linens, &c.; the imports are dried and salted fish, fish-oil, feathers, hides, tallow, and worsted stockings. The exports to, and imports from, Iceland, are nearly the same; the imports from Greenland are whale-oil and bone, seal-oil and skins, eider down; the exports nearly the same as to the Faroe and Iceland Islands. Denmark has also a trifling trade to the East and West Indies.

In 1807 the Danish fleet consisted of twenty-

six sail of the line; sixteen frigates; nine sloops, and thirty gun-vessels.

The foreign commerce of Sweden is confined to what are called staple towns, which alone have custom-houses; they are Stockholm, Gottenburgh, Warberg, Halmstad, Nordkøping, Landscrona, Carlsrona, Christianstad, Carlshamn, Calmar, Westervic, Uddervalla, Marstrand, Gefle; and Abo and Wasa in Finland, now given up to Russia. The foreign commerce is supposed to be divided among these cities, as follows:

Stockholm $\frac{7}{10}$ ths of exports, and $\frac{1}{2}$ of imports.

Gottenburgh $\frac{2}{10}$ ths $\frac{1}{4}$

The other ports $\frac{1}{10}$ ths $\frac{1}{4}$

To the foreign parts of the Baltic, Sweden exports iron, steel, copper, lime, alum, and herrings, and receives corn, hemp, tallow, and hides. To Holland, iron; and receives spices, tobacco, prepared colors and papers. To England, she exports iron, timber, pitch, tar, potash, and herrings; her imports are lead, tin, leather, bear, butter and cheese; and every kind of manufacture and colonial produce. In France, Spain, and Portugal, the exports are iron, steel, copper and brass, and wines, brandy, fruits; oil and silks are the returns. To Italy and the Levant she exports all her territorial productions; and receives salts, spices, fruits, and cotton. There are from four to six ships of 600 to 1000 tons burden in the East India trade. In 1800 she had above 2000 merchant vessels of twenty tons and upwards; but the rupture with England and cession of Finland reduced them, in 1810, to 1500. In 1809 her navy was reduced, in consequence of her wars with Russia, to thirteen sail of the line, nine or ten frigates, and about 150 vessels of the flotilla.

The Prussian ports, including Dantzic, export almost the whole of the commercial productions of Poland, consisting of corn, fir planks and rafters, masts, hemp, tar, pitch, potash, hides and tallow, leather, honey and wax; besides Pomeranian oak, brandy, woollens, linens, caviar, and amber. The imports are wines, coffee, sugar, tobacco, spices, salt, iron, copper, Spanish wool, herrings, and flax seed from Livonia and Courland. Towards the close of the last century, the merchant marine of the Prussian ports on the Baltic, consisted of between 900 and 1000 ships. Salted and smoked meat, hides, wool, butter, cheese, corn, and fruits, are the exports of that part of Pomerania which belonged to Sweden and Mecklenburgh; the corn of the latter is principally taken off by England; that of Pomerania, as well as the fruits, used to go to Sweden.

The exports and imports of Russia, in the Baltic, in the beginning of this century, were

	Exports. Rubles.	Imports. Rubles.
In 1802 -	47,000,000	33,000,000
1804 -	45,000,000	27,000,000
1805 -	52,000,000	29,000,000

The number of her merchant-vessels that navigate the Baltic and the Ocean, do not exceed fifty; perhaps 100 smaller vessels carry on the coasting-trade here; and about 100 craft of

twenty or thirty tons are employed in loading and discharging these vessels at Cronstadt, that cannot enter the Neva. At the close of 1807, the Russian Baltic fleet consisted of twenty sail of the line, fourteen frigates, six brigs and cutters, and nineteen small craft; and the Baltic flotilla, of twenty galleys, twenty-five floating batteries, eighty-one gun-boats, and sixteen yauls.

BALTIC PORT (formerly Rogerwick, from the island of Roog, on which it is built), a sea-port of European Russia, in Esthonia, now the government of Revel, at the influx of the rivulet of Paddis into the Baltic. The fortifications were begun by Peter I. but discontinued by Catherine II. Were they completed, few harbours would equal it in size, depth, or security. Thirty-eight miles west of Revel, 150 north of Riga, and 220 west by south of St. Petersburg.

BALTIMORA, in botany, a genus of the polygamia necessaria order, and syngenesia class of plants. The receptaculum is chaffy; there is no pappus; the calyx is cylindrical and polyphyllous; and the ray of the corolla is quinqueflorous. There is but one species, viz. *B. recta*, a native of Maryland. It is allied to *Milleria*.

BALTIMORE, a large, populous, and well cultivated county of the western shore of Maryland, is bounded on the east by Harford county and the Chesapeake, north by York county, Pennsylvania, south by Anne-Arundel county, southwest by a small point of Montgomery, and west by Frederick. It is thirty-six miles from north to south, and forty-five from east to west, and contained in 1820, 24,580 white, and 33,463 total population, exclusive of the city of Baltimore. In this county are found vast quantities of iron ore of the best quality, and it is watered by numerous rivers.

BALTIMORE, the largest city in Maryland, the third in population, and the fourth in commercial importance in the United States, is built upon a bay, which opens from the north side of Patapsco river, and affords a spacious and convenient harbour. The strait which connects this bay with the river is scarcely a pistol-shot across, and is well defended by fort M'Henry. A small river, called Jones's Falls, empties into the north side of the harbour, and divides the city into two parts, called the Town and Fell's Point, connected by bridges. At Fell's Point the water is deep enough for vessels of 500 or 600 tons, but none larger than 200 tons can go up to the city. Baltimore is well situated for commerce. It supplies Maryland, and large portions of Pennsylvania and the western states with foreign goods, and is supposed to contain nearly 70,000 inhabitants. Its rapid growth may be thus exhibited:

In 17 ⁵	the population was	300
1790	13,503
1810	46,555
1820	62,627
1830	80,625

In 1790 the tons of shipping trading here were 13,564. In 1830 106,303, in 633 foreign and 501 coasting vessels. Baltimore cannot be considered on the whole a very healthy place, although the atmosphere is said to have become less humid of late: in autumn, the most unfavourable season, the opulent portion of the in-

habitants generally retire to their country seats in the neighbourhood. It is in general well built, most of the houses being of brick, and many lately erected displaying considerable taste. Its general plan is similar to that of Philadelphia, the streets crossing each other at right angles. Some of these are spacious, one in particular is about a mile long, and eighty feet wide, running east and west, nearly parallel to the water. The ground on the north and east of the city rises to a considerable elevation, and with the number of ships in the harbour forms a scene very interesting. The principal public buildings are a court-house, penitentiary, jail, almshouse, hospital, theatre, exchange, museum, a gallery of paintings, and a public library, possessing about 10,000 volumes. Besides these there are ten banks, and thirty-one places for public worship, belonging to nearly all the denominations of religious professors to be found in the United States. The exchange is a vast pile of building, very lately erected, 255 feet in length by 140 in breadth, comprising four wings. The Roman Catholic cathedral, the Unitarian church, St. Paul's church, the Court-house, and the Union bank, are all spacious and elegant structures. The Washington monument is another ornament to this city. It stands in an elevated situation, at a short distance above the compact part of the town. The base is fifty feet square, and twenty-three high, on which is placed another square of about half the same size and elevation. Upon this stands a column of twenty feet diameter at the bottom, and fourteen at the top, on which the statue of Washington is placed, 163 feet from the ground. Its literary and scientific institutions are very respectable. St. Mary's college was incorporated as a university in 1806, and is well endowed. It has a good library with a philosophical and chemical apparatus; and is under the direction of a president, a professor of divinity, one of moral, and one of natural philosophy, one of the belles lettres, four of languages and mathematics, besides eight assistant tutors. The number of students is generally about 140; but they are admitted at a much earlier age than in the universities of England. The medical college was founded in 1807. It received a new charter in 1842, when it was denominated the university of Maryland, and was authorised to annex the other faculties of languages, arts and sciences, law and divinity, to that of physic; but the medical department was the only one lately in operation. The building is spacious and elegant, and the instruction is under the direction of a provost and six professors of anatomy, &c. There is another literary institution, called the Baltimore college. Four daily newspapers are published here. Above sixty flour-mills, besides forges, &c. are placed on the stream, within a few miles of the town, and add greatly to its trade. In 1814 an attack was made on this city by the British troops under General Ross, but they were repulsed and their commander slain: a structure, called the Battle monument, commemorates this circumstance. A rail-road extends from Baltimore to Pittsburg, a distance of 300 miles.

BALTIMORE, a town of Ireland, in the county

of Cork, on a head land, running into the sea, five miles north-east of Cape Clear.

BALTIMORE BIRD. See **ORIOLES**.

BALTINGLASS, a town of Ireland in the county of Wicklow, where are manufactures of woollen, linen, and diaper. It is situated on the Slaney, forty-nine miles south of Dublin.

BALTUS (John Francis), a French Jesuit, born at Mentz in 1627, was librarian at Rheims, and wrote an Answer to Fontenelle's History of Oracles, printed at Strasburg, 8vo.

BALTZAR (Thomas), an eminent musical composer, and the finest performer on the violin of his time, born in Lubec. He came into England in 1658, and lived about two years with Sir Anthony Cope, of Hanwel, in Oxfordshire. He was the great competitor of Davis Mell, who, though a clockmaker, was, till Baltzar came hither, allowed to be the finest performer on the violin in England; and after his arrival he divided with him the public applause, it being agreed that Mell excelled in the fineness of his tone and the sweetness of his manner, but Baltzar in the power of execution and command of the instrument. It is said of the latter that he first taught the English the practice of shifting, and the use of the upper part of the finger-board. Baltzar shortened his days by excessive drinking, and was buried in Westminster abbey, in 1663.

BALVAG, a river of Perthshire, which runs through and connects the lakes, Lochdoine, Lochvoil and Loch-Lubnaig, in the parish of Balquhiddy. It abounds in trout of different species, char, &c. and has occasionally a few salmon.

BALVAIRD, a district of Perthshire, in the parish of Abernethy, memorable for one of those monuments of ancient ingenuity and superstition, called rocking stones. It is mentioned by Buchanan, but has long ago lost its motion; being choked up with earth and gravel. There is another, still movable in the parish of Dron.

BALVAIRD CASTLE, an ancient edifice in Perthshire, among the hills, in the south-west corner of the parish of Abernethy; which belonged originally to the Murrays of Balvaird, and is now, along with the estate, the property of the earl of Mansfield.

BALUE (John), a native of France, born about 1420. His parents were in low circumstances, but by art and servility he obtained several rich preferments, and at last was made bishop of Angers, when his old patron of that see was deposed. He afterwards got a cardinal's hat from Paul II. But a correspondence which he had engaged in with the dukes of Burgundy and Bern, to the disadvantage of Louis, being discovered, he was seized and confined in an iron cage eleven years. After his liberation he went to Rome, from whence he was sent as legate by Sixtus V. to France. He died in 1491.

BALVENIE, or **BALVENY**, a mountainous district of Scotland, in the county of Bamff, on the western side, watered by the Spey, where there is a noted rock, which produces hones and whet-stones sufficient to supply the whole island. Here are also veins of alum-stone, and springs of alum water.

BALVENY CASTLE, an ancient fort; and

BALVENY CRAG, a remarkable hill or rock, in the parish of Mortlach in Banffshire, exhibiting, with the adjacent grounds, a great deal of picturesque rural scenery, and a pleasing mixture of the sweet and the wild.

BALUSTER, *n. s.*

BALUSTRADE, *n. s.*

BALUSTERED, *part. & adj.* } *Fr. ballustre*, Span.
 } *baluaster*, Ital. *ba-*
 } *laustrio*, Gr. *βαλυσ-*
 τριον, the flower in blossom of the pomegranate. Dr. Johnson, however, derives it from the Italian *balestria*, a spike-hole, or loop-hole, to shoot out at. *Baluster* is sometimes corruptly written *banister*. A small column or pilaster from an inch and three quarters to four inches square, or diameter: their dimensions and forms are various. They are frequently adorned with mouldings; they are placed with rails on stairs, and in the fronts of galleries in churches. *Balusters*, when continued form a *balustrade*.

This should first have been planched over, and railed about with *balusters*. *Carew*.
 The terraces and *balustrades* built along the river, are now overgrown with roses. *Swinburne's Travels*.

Here is a vista, there the doors unfold,
 Balconies here are *balustrad* with gold.

Dryden's Art of Poetry.

BALUSTRADE, *n. s.*; from *baluster*; an assemblage of one or more rows of little turned pillars, called ballusters, fixed upon a terrace, or the top of a building, for separating one part from another.

BALUZE, (Stephen) a French writer, born in 1641, and educated at Toulouse, where he was patronised by the archbishop, after whose death he was appointed librarian to M. Colbert. In 1693 the king made him professor of canon law, and gave him a pension, with the post of director of the royal college, for writing the lives of the popes of Avignon; both of which advantages he soon lost in the fluctuation of court parties; having inserted some offensive notes in his Genealogical History of the house of Auvergne. He is much more famed for collecting ancient MSS. and illustrating them with notes, than for his own compositions. He died in 1718.

BALYUR, or **BALIUR**, a sea-port of Africa, in the kingdom of Dancali, about fourteen hours journey west from Babel-Mandel. It is remarkable only for being the landing place of the Abyssinian patriarch, Alphonsus Mendez, with his Jesuits and Portuguese, April 3d, 1724.

BALZAC (John Lewis Guez de), born at Angoulême in 1595. Voltaire allows him the merit of having given numbers and harmony to the French prose, but censures his style as bombastic. Cardinal Richelieu gave him a pension of 2000 livres, with the titles of counsellor of state and historiographer of France. He died in 1654; and was buried in the hospital of Notre Dame des Anges, at Angoulême to which he bequeathed 12,000 livres. Besides his Letters, he wrote a work called *Œuvres Diverses*, i. e. on various subjects; The Prince; The Christian Socrates, &c.; and many other pieces, which have been published in two volumes folio.

BAM, **BEAM**, being initials in the name of any place, usually imply it to have been woody; from the Sax. *beam*, which we use in the same sense to this day.—*Gibson*.

BAMAH, a high place in Jerusalem, where there was an idol temple.

BAMBA, the largest province of the kingdom of Congo, in Africa. It is situated between the rivers Ambriz and Csanza; the last of which parts it from Pemba on the east, as the Ambriz does from the province of Sogno on the north. Along the sea coasts it extends on the north to the river Lelunda; and on the south to the Danda, which parts it from the kingdom of Angola. The governors of this province bear the title of dukes, and are almost independent of the king. The soil is very fertile, and would produce all the necessaries of life in great plenty, were the inhabitants industrious in its cultivation. The sea coasts produce a vast quantity of salt, which could be purified with little trouble. The fishery of the zimbis, or little sea-snail, is here carried on, whose shell is the current coin, not only in this and the neighbouring kingdom, but also in the most distant parts of Africa. Here are also said to be mines of gold, silver, quicksilver, copper, tin, and iron, but the iron mines alone are allowed to be worked. Bamba, the capital, is thirty leagues inland. The other chief towns are, Panza or Penga, in a plain between the rivers Ambriz and Loze, and Mosulla or Marsoula.

BAMBARAH, an ancient city of Sinde, in Hindostan, supposed to have been the ancient Braminabad, a city which, in the tenth century, was the residence of a dynasty of Hindoo princes, when it had regular bastions (and corresponding defences), to the number of 1400, seventy yards distance.

BAMBARRA, one of the largest and most powerful kingdoms of central Africa, bounded on the west by Kaarta and Manding, on the south by Ludamar and Beeroo, on the east by Tombuctoo and Baedoo, and on the south by Kong and Mamana. It is generally placed between 12° & 18° N. lat. and about 20° W. long. The country, though in some parts desert, is in general very fertile, and often reminded Mr. Park, he tells us, of the finest parts of Eng and. Besides the usual productions of this part of Africa, it yields the shea tree, the kernel of which forms a species of vegetable butter. The Niger traverses it from west to east, and is navigable by canoes through the whole extent of Bambarra. The inhabitants tan sheep and goat skins, smelt iron, are pretty good smiths, and make a tolerable sort of beer of durrach, (sorghum vulgare), and the lotus-berries, (zyzophus lotus). The land about Kabba was so well cultivated, as to remind Mr. Park of England. Their language is a dialect of the Mandingo. Their canoes are large, formed of two trunks of trees joined together, but have neither sails nor masts. Mr. Park, in travelling, passed through many populous towns. Sego, the capital, he supposed to have 30,000, Sansanding, 10,000 or 11,000, and Jenne probably more inhabitants. Baedoo is tributary to the king of Bambarra, and some accounts represent Tombuctoo also to have fallen under his dominion. The inhabitants consist of a mixture of Moors and Negroes; and though the sovereign is a Negro, the administration of many of the towns is in the hands of the Moors. That people are the most intelligent, active, and

commercial of the two; but their character is harsh, severe, and intolerant; whereas the Negroes are gentle and kind, the influence of which Mr. Park frequently experienced. The slaves brought from Bambarra are the most valued of any, both on the coast, and in Barbary. The trade with the coast is carried on by slates, or travelling merchants; that with Barbary by the Moors from across the desert, either directly into Bambarra, or through the channel of Tombuctoo; and although Bambarra itself does not produce gold, it is the medium through which that of Manding, Kong, and Bambouk, is transmitted to many other parts of the continent. Mr. Park could form no satisfactory conjecture of the number of the inhabitants altogether. The name of this country was hardly known a few years ago. Its only traces in history are, that Mouette, in his History of Meuly Archy, (Múlái Rashid), tells us, when Sidi Ali, the Morábit, who had reigned at Sús, was obliged to fly into Nigritia, he took refuge with the king of Bambarra, and raised an army of negroes, whom he led into the empire of Morocco. This enabled Múlái Ismail, the successor of Rashid (Archy) to make the conquest of Tombuktú. Thence arose the influence of the Moors over the Negro countries. Their conversion to Mahomedanism is probably of more modern date. Mungo Park's kind reception here, together with the treatment Mr. Docherd experienced, during a residence of several months on the banks of the Joliba, inspires the hope that we might establish a friendly intercourse between Ségó and the coast. Mr. O'Boirne was sent, in March 1820, by the governor of Sierra Leone on a mission to the Almámi (Imám) of Tímbò, and found there an envoy from Dhaa, king of Ségó, sent to apologize to the governor for the detention of Mr. Docherd. Lieutenant Lang of the second West India regiment, offered to accompany this envoy back to Ségó; and the envoy quitted Sierra Leone for Fútah Jallon, in July 1821. Jenne is now under an independent Fel-latah chief.

BAMBERG, a large handsome town and bishopric of Franconia in Germany, now forms part of the circle of the Maine and of Reizatz, in Bavaria. It was formerly imperial, and the Bishop was director of the circle of Franconia. He enjoyed the privileges of an archbishop, immediately under the pope, and was the fourth among the spiritual princes of the empire. In 1007 the emperor Henry II. created his chancellor the first bishop of Bamberg, and the succession was regular until it was secularised and assigned to Bavaria in 1803. The diocese included 1430 square miles, and more than 200,000 inhabitants. The number of towns was nineteen. The bailiwicks exceeded fifty, and the villages and hamlets were estimated at 1200. The whole of Bamberg, including the secularised convents, is supposed to yield about £150,000 a year to the crown of Bavaria. The country produces plenty of corn, fruits, and liquorice, and the manufactures of chintz and iron are flourishing. The town has an university, founded in 1147; and is situated at the confluence of the rivers Maine and Reiznitz. It is in part surrounded by walls and ditches. The cathedral, with its four towers and

rich treasury, the abbey of St. Michaelsberg, the ten monasteries and nunneries (now mostly suppressed), the sixteen churches, the fifteen chapels, the new episcopal residence of Petersburg, built by bishop Lotharius in 1702, the tombs of the emperor Henry II. and his wife, of Conrad III. and pope Clement II., are all worthy of regard. A Carmelite monastery, which is now secularised, contained a library of 14,000 volumes, besides many curious manuscripts; and valuable collections of books exist in the cathedral church and in the abbey of St. Michaelsberg. This last establishment stands on a hill, and commands a delightful prospect. The university was converted into a lyceum in 1802. This place is noted for its abundant vegetable markets; not less than 400 market-gardeners being resident here. It has been laid under several contributions by the Russians and the French. It is supposed to contain 20,000 inhabitants.

BAMBERG, a town of Bohemia, situated at the foot of a mountain, in long. 16° 50' E., lat. 49° 53' N.

BAMBELE, in zoology. See **RUTILUS**.

BAMBO, in commerce, an East Indian measure, containing five English pints.

BAMBOCCIO, a celebrated painter of conversations, landscapes, cattle, &c. was born at Laeren, near Naarden, in 1613. His name was Peter Van Laer; but in Italy they gave him the name of Bamboccio, on account of the uncommon shape of his body, the lower part being one-third part longer than the upper, and his neck so short that it was buried between his shoulders. He had, however, an ample amends for the unseemliness of his limbs, in the superior beauties of his mind; he was endowed with an extensive genius; and, indeed, he had an universal taste for every part of painting. See **VAN LAER**.

BAMBOO, an Indian plant of the reed kind. It has several shoots much larger than our ordinary reeds, which are knotty, and separated from space to space by joints. The importance of this plant to vast regions of the East, may well excuse our dwelling on some modes of its culture, and its peculiarities.

Botanists have generally ranked it with other reeds. Linnæus, in the *Systema Naturæ*, describes two species, under the genus *bambusa*, which is characterised by scales three, covering the spikelets, which are about five flowered; calyx none; corolla, a two valved glume; style bifid; seed one. But Loureiro, who saw it in its own climate, characterises it as having flowers with six stamina; panicle diffused, with imbricate spikelets; branches of the culm spiny; calyx one flowered. We shall not discuss its minute botanical characters, as it is the practical cultivation and great utility of the plant to which we would engage the reader's attention.

A native of the warmer climates only, though often growing luxuriously beyond the tropics, the bamboo rises to the height of forty, sixty, or even eighty feet, with a slender, hollow, shining stem. Many, however, are only twelve or fifteen feet high; and those which attain the greatest height here mentioned are rather to be viewed as overgrown. The stem is extremely slender, sometimes not exceeding the thickness of five inches

in them which are fifty feet high, and in others, being fifteen or eighteen in diameter; the whole divided into joints separated by knots or internodes, between which are distances varying from a few inches to several feet. Alternate branches spring from the base to the top; which, with the pointed leaves of the knots, give the whole tree a most elegant appearance.

It will sometimes vegetate three or four inches in a single day, and it has been seen to rise twenty feet, and as thick as a man's wrist, in five or six weeks. Its full dimensions are frequently, therefore, attained in a year; and the only change afterwards, is greater thickness and induration of the wood. Towards the root it is solid and compact; and the cells of the stem become wider in proportion as they ascend. In Malabar it is said to bear fruit when fifteen years old, and that it then dies.

There seem to be several species which have not yet been recognised by systematic botanists. An observer of the bamboos of China, in general, considers that there are nine species or varieties, and an observer of those in Cochín-China, admits of eight. The former judges the difference to consist, first, in the size and height, for there is here the greatest disparity in those that are full grown; and it has been supposed that some, if not all species, originally spring of their ultimate diameter, which receives no accession. Secondly, the distance of the knots, or length of joint, which, in certain species of full-grown bamboo, is only four inches, while, in others long and slender, they are nine or ten feet asunder. Thirdly, in the color of the wood, which is whitish, yellow, brown, pale blue, or speckled. Fourthly, in the size and form of the knots, some swelling out from the stem above and below; some encircling it like a cord; and those of the most singular kind, which do not penetrate within to interrupt the tubular part of the bamboo. Fifthly, by the surface and figure of the internodes being channelled or covered with tubercles; and a kind is said to exist, called the square bamboo. The varnished surface is also of different quality. Sixthly, the substance and thickness of the wood, which, varying without any relation to the dimensions of the plant, afford sufficient characteristics for constituting a species. The wood is either soft and tender, or very hard and of great strength; and the stem is either very thin and hollow, or almost totally filled up and solid, like other trees. But elsewhere, in Bangalore for example, this solidity is not ascribed to the difference of species, but to the tardiness of its growth in stony-places. Seventhly, it is said that there are bamboos entirely devoid of branches, however old they may be; while others protrude as they spring from the earth. Eighthly, there is a great difference both in the hue and figure of the leaves, as also in their size; they are bluish, ash-color, reddish, or mottled. Some are so large as to make good fans. Ninthly, the roots, though knotty, are found in one species to penetrate into the earth like a tuft of filaments.

This plant is to be found growing wild in most parts of the east, and is resorted to as occasion requires. It is regularly cultivated in plantations in the more genial climates, and preserved in

others in green-houses, &c. It succeeds best in low sheltered spongy grounds, but the immediate contact of the root with water is said to be fatal to it. They propagate it by shoots, deposited in pits at the close of autumn or commencement of winter, eighteen inches or two feet deep; and if it be designed to obtain bamboos of considerable size, the scyons are cut over as they spring up. It flourishes but in large plantations, as the plants yield considerable shelter to each other in their progress. As they run from the ground they are propped up and trained with rods of a proper height; and if complete plants, are cut over, in order to obtain suitable shoots, which are chiefly sought after. This, also, makes the root strike out and take a secure hold of the ground. The plantation, in rainy seasons, is generally drained by a ditch, as it decays very fast in too damp grounds. To obtain good Bamboos, it is not uncommon to take a vigorous root with firm wood, and transplant it, leaving only four or five inches above the joint next the ground. The cavity is then filled with a mixture of horse-litter and sulphur. Sometimes the shoots are destroyed at an early stage during three successive years; and those springing in the fourth are then said to resemble the parent tree.

The earliest shoots of this plant are edible, and are served up at table in autumn like asparagus; in a similar manner with that vegetable, also, they are earthed over to keep them: they are also salted and eaten with rice. A fluid of grateful taste and odour is yielded from the hollow joints as the plant grows up, affording an agreeable beverage. In its further progress this becomes a concrete substance called tabaxir or tabascheer, highly valued for its medicinal properties, and apparently a species of siliceous earth. It resists the impression of acids, is indestructible by fire, and with alkalis forms a transparent glass. A decoction of the leaves of the bamboo is recommended in the east for coughs and sore-throat; the bark for fever and vomiting; the buds as a diuretic; and a compound of the root with tobacco-leaves, betel-nut, and oil, forms an efficacious ointment. Many of the poorer classes in the most populous countries subsist entirely upon it in times of scarcity. The Hindoos eat its seeds roasted, mixed with honey as a delicacy, equal quantities of each being put into a hollow joint, coated externally with clay.

From the copious draught which a joint of the bamboo naturally yields, mankind are taught its use as a vessel for carrying water, and in some places no other bucket is employed. Many eastern nations build their houses solely of the bamboo-wood; entire, it forms their posts or columns; split up, it serves for floors or rafters; or, interwoven in lattice-work, it is employed for the sides of rooms, admitting light and air. The roof is sometimes, also, of bamboo, for which two of its species are described to be specially adapted; and when split, which is accomplished with the greatest ease, it can be formed into lath or planks. Vessels of all kinds are framed out of it likewise, and fitted for sea. The hull is taken from the stem; and some of the strongest plants are selected for masts of boats. In Bengal, a boat of four or five tons may be

furnished with both mast and yard from the same bamboo, at the cost of threepence; and the masts of larger vessels are sometimes formed by the union of several bamboos built up and joined. Those of considerable dimensions are used in the higher yards of larger ships, for which, by their great strength and lightness, they are well adapted.

This important plant is also employed in the construction of agricultural and domestic implements; and in all materials and implements required in fishery, with the exception of hooks and nets. In Tibet bows are made of it, by the union of two pieces with many bands; and in the same country also, it is employed for pipes, in transmitting water, for several miles, to reservoirs or gardens. A single joint is sufficiently capacious to serve as a bucket; and in some places, no other is used. In the south-west of Asia, a species of slender growth supplies writing-pens or reeds. Baskets, cages, hats, and various ornamental articles, are to be added to the catalogue of its extensive uses. By a particular process in bruising and steeping the wood or bark, also, a paste is procured that is made into paper. In short, as it has justly been observed, from its very origin until its decay, it never ceases to produce something beneficial—all that composes a bamboo is profitable, of whatever species it may be. The artists of China have each made their choice, and in the works they produce, show the advantage they have derived from it. Its uses are so numerous, so various, and so beneficial, that it is impossible to conceive how China could now dispense with this precious reed. It is no exaggeration to affirm, that the mines of this vast empire are of less importance to it than the possession of the bamboo.

BAMBOO, in botany, the trivial name of a species of arundo. See ARUNDO.

BAMBOO HABIT, a Chinese contrivance by which a person who does not know how to swim may easily keep himself above water. The following account of it is taken from a letter to the author of the Seaman's Preservative. 'In the year 1730 I was passenger in a ship from Batavia to China, burden about 400 tons, called the *Pridae*. Francisco Xavier, commander, freighted by the English, Chinese, and Portuguese. Near the coast of China, we met with one of those storms called a *tuffoon* (*tau song*), or a great wind, which carried away all our masts, bowsprit and rudder; and in our hold we had six feet of water, expecting every moment the ship would founder. We consequently were consulting our preservation; the English and Portuguese stood in their shirts only, ready to be thrown off; but the Chinese merchants came upon deck, not in a jacket, but I will call it a bamboo habit, which had lain ready in their chests against such dangers; and it was thus constructed; four bamboos two before and two behind their bodies, were placed horizontally, and projected about twenty-eight inches. These were crossed on each side by two others, and the whole properly secured, leaving a space for their body; so that they had only to put it over their heads, and tie the same securely which was done in two minutes, and we were satisfied they could not possibly sink.'

BAMBO'OZLE, v. } A cant word not used,
BAMBO'OZLER, n. } says Johnson, in pure,
BAMBO'OZLING. } or grave writings. To delude, to mislead, to cheat, to cozen, to deceive, to beguile. Synonymous with another cant term, to *humbug*, or to take in.

After Nic had *bamboozled* John awhile, John called for counters. *Swift.*

There are a set of fellows they call *banterers* and *bamboozlers*, that play such tricks. *Arbutnot.*

But, says I, sir, I perceive this is to you all *bamboozling*; why you look as if you were Don Diego to the tune of a thousand pounds. *Tatler*, No. 31.

BAMBRIDGE, or BAINBRIDGE (Christopher), L.L.D. archbishop of York, and cardinal, was born at Hilton in Westmoreland, and educated at Oxford. He rose gradually from being rector of Aller, prebendary of Salisbury, dean of York and Windsor, &c. to one of the highest dignities of the church. In 1495 he was elected provost of Queen's college. In 1507 he was appointed bishop of Windsor, and next year archbishop of York. He was employed in different embassies to foreign princes; particularly to the emperor Maximilian I., Charles VIII. king of France, &c. But he chiefly distinguished himself in the embassy from Henry VIII. to pope Julius II. who created him a cardinal, with the title of St. Praxede, in 1511, and appointed him legate of the ecclesiastical army, then besieging Bastia. In return, our new cardinal prevailed upon Henry VIII. to take part with the pope against the king of France. There are extant in Rymer's *Federa*, two letters; the one from cardinal Bambridge to king Henry VIII. respecting the pope's bull, giving him the title of Defender of the Faith; and the other from cardinal Sinigalli, to that monarch, acquainting him he had delivered the instrument to cardinal Bambridge. He died at Rome in 1514, being poisoned by a domestic, in revenge for his having struck him.

BAMBOROUGH, or BAMBROUGH, a parish and castle of Northumberland, on the sea coast, five miles east from Belford, and 329 north from London. It was once a royal borough, and sent two members to parliament. The castle stands upon a rock, almost perpendicularly to the sea, and 150 feet above its level. It is accessible only on the south-east side. On this spot, according to historians, stood a palace of the Northumbrian kings, built by Ina in 559. In the reign of queen Elizabeth, Sir John Forster, warden of the marches, was made governor of it after the battle of Musselburgh; and subsequently, to his great credit, his relative, Crew, bishop of Durham, purchased and bequeathed it to charitable uses. In 1757 the trustees of this charity repaired the great tower, and formed the upper buildings into granaries, for the sale of corn to the poor, at a cheap rate. A constant watch on the top of the tower is said to be kept, whence signals are made when any vessel is discovered in distress, and boats are able to put off from Holy Island when none from the land can pass the breakers. During a storm horsemen patrol the coast, to the extent of eight miles, from sun-set to sun-rise, to give notice in case of shipwrecks to the castle, and where the unfortunate mariner finds an hospitable asylum. Upwards of thirty

boats are always in readiness for this good work. At the expense of this fund, the last offices are also performed over the bodies of such persons as may be cast on shore. Within the castle walls are to be found a school, a valuable library, an infirmary, which receives more than 1000 patients yearly, and a dispensary.

BAMBOUCH, or **ΒΑΜΒΥΧΗ**, called also **Magog** and **Hierapolis**, an ancient city of Syria, not far from the **Sejour**, and fifty miles distant from **Aleppo**. It is situated in a valley, watered by a stream conveyed by aqueducts to the town from a hill twelve miles south, and in some parts by a channel twenty feet under the earth. The ancient town was surrounded by walls above thirty feet high, and nine feet thick, strengthened by towers at the distance of fifty paces from each other; it was entered by four gates fifteen feet wide, defended by a tower on each side, cased, as they still appear, both externally and internally, by hewn stone; the top was gained by a flight of steps built on arches. Various remains of the structures and sculptures of different nations and dates appear here.

BAMBOUK, or **ΒΑΜΒΟΥΚ**, a country of Africa, which the **Abbe Raynal** states to be situated in the interior, under the twelfth or thirteenth degree of north latitude. It is not subject to a particular king; but governed by village lords, called **farims**. These hereditary and independent chiefs are obliged to unite for the defence of the state, when it is either attacked as a community or only in one of its branches. The territory of this aristocratical state is dry and barren. It produces neither maize, rice, nor pulse. The insupportable heat it is subject to, proceeds in part from its being surrounded by high mountains, which prevent the wind from refreshing the air. The climate is as unwholesome as it is disagreeable; vapors, which continually issue from the bowels of a soil replete with minerals, rendering it unfit to live in, especially to strangers. Its gold has made it an object worthy of notice; gold, which in the eyes of the covetous man seems to compensate for all the evils of nature, though in reality it increases them. Sensible and judicious merchants, adds this author, have chosen to limit themselves to a commerce much more important, which is that of slaves.

Almost all that is known of this state is derived from a Frenchman named **Compagnon**, who passed a year and a half there in the beginning of the last century. **Labat**, *Afrique Occidentale*, iv. 5. He describes it as divided into three provinces, **Bambouk Proper**, **Kincodon**, and **Satadore**, each of which abounds with gold, but the first most particularly. The principal repositories are at **Rakkon**, **Semayla**, **Hambia**, and **Hombadyria**, at each of which appears a conical hill of moderate elevation, every part of which contains gold, combined with earth, sandstone, lapis lazuli, &c. They obtain the metal by digging deep pits, and delivering the earth to the women, who carry it to the streams, and separate the gold by the simple process of agitation in water, after the manner described in **Mr. Park's** second journey. When the other substances are hard, the whole is previously pounded. These pits being only six feet square often fall

in, and bury the workmen. **Bambouk** appears to be the main source of that large quantity of gold which is on one side conveyed down the **Gambia** and **Senegal**, and traverses the desert on the other into **Barbary**. The population is almost entirely of the **Mandingo** race. It is remarkable, however, that although they profess **Mahommedanism**, no marabout or priest is suffered to reside amongst them: it is said they were all expelled some years since, being detected in a conspiracy to seize the government. It is also said that they are very jealous of European visitors; and that the **Portuguese** and **French** have each in vain endeavoured to establish themselves here.

BAMBYCE, an ancient city of **Parthia**, called also **Hierapolis**: famous for the rich and magnificent temple of **Atergatis**, which was plundered by **Crassus**.

BAMEENY, **VAMANI**, an island lying off the coast of **Chittagong**, in the province of **Bengal**, formed by the sediment deposited by the great **River Megna**. It is twelve miles long by about five broad. The **East India** company have here an extensive establishment for the manufacture of salt, of which they retain the monopoly.

BAMFF, or **ΒΑΜΦ**, a county of Scotland, comprehending **Strathdovern**, **Boyn**, **Enzie**, **Strathaven**, **Balvenie**, and part of **Buchan**, extends fifty miles from east to west, and thirty in breadth from north to south. On the south it is separated from part of **Buchan** by the river **Ugie**; on the east it is bounded by the **Deveron** and the **German Ocean**; on the west by the **Spey** and the county of **Moray**; on the south-west by **Badenoch** and the **Braes of Mar**; and on the north by the **Moray Frith**. The face of the country is agreeably diversified with hills and dales, woods and rivers; and exhibits many seats and plantations. The air is pure, the climate healthy, and the soil fertile, producing plentiful crops of corn. The pasture grounds feed sheep, cattle, and horses; the arable lands produce plenty of corn; while the rivers and sea supply great quantities of fish. The manufactures of this county never were considerable; and those of yarn and cloth, as well as the cotton manufacture, have declined of late. Coarse woollen stuffs are made for the use of private families and tan-works; breweries, rope works, &c. have been established on a small scale. The principal exports of **Bamff** are grain, fish, butter, cheese, yarn, and linen; while the imports are flax, hemp, leather, iron, coals, wood, and wine. Various minerals have been found in different parts of the shire; and a piece of amber, as large as a horse, was once cast ashore on the beach. **Gordon castle**, and several other seats of the duke of **Gordon** are situated in this county. It sends a member to parliament. Here are numerous remains of antiquity, consisting of cairns and tumuli, exhibiting the triumphs of our ancestors over the **Danes**, whose skulls they have built into the solid walls of churches. Also the ruins of several forts, castles, and monasteries. The valued rent of the county is £79,200 Scots; and in 1811, according to the assessment of the property tax, the real gross rent of the lands was £79,396 3s. 4d., and of the houses £5514. 2s. sterling.

BAMFF, the capital of the county, is pleasantly

situated on the south side of a hill, at the mouth of the Deveron. A fine bridge of seven arches crosses the river. It has several good streets; of which that with the town-house in it, adorned with a new spire, is very handsome. This place was erected into a borough by a charter from Robert II. dated October 7th, 1372, endowing it with the same privileges, and putting it on the same footing with the burgh of Aberdeen; but tradition says it was founded in the reign of Malcolm III. The harbour is bad, as the entrance at the mouth of the Deveron is very uncertain, being often stopped by the sands, which are continually shifting in great storms; the pier is therefore placed on the outside, and defended by a half-moon battery of eight guns. Manufactories of thread, cotton, and stockings, are carried on to a considerable extent, and great quantities of salmon are annually exported. About Troop-head some kelp is made; and the adventurers pay the lord of the manor £50 yearly for the liberty of collecting the materials. Near the town is a magnificent seat of the earl of Fife. It lies in a beautiful plain washed by the Deveron, the lofty banks of which, clothed with wood on the opposite side, afford a delightful contrast to the soil vale beneath.

Banff has two fairs, on the first Tuesday in February, and the third Tuesday in December, both old style. Long. 2° 15' W., lat. 57° 35' N. The parish is about six miles in length, and two in breadth. The sea coast is bold and rocky. A great part of the parish, though it might be easily converted into arable land, is occupied in pasturage. Population about 3000.

BAMIAN, an ancient city and province of Asia, to the north-west of Cabul, ten days journey from Balkh. It is remarkable alike for having been once the metropolis of Buddhism, and for its dreadful catastrophe, when taken by Jenghiz Khan in 1221. At that time it belonged to Sultan Jahlochin, the last of the famous Mahmud of Gazni's race. Jenghiz was about to attack Gazna, that prince's capital, but was stopped by the garrison of this place, which he had hoped would give him no trouble. In this, however, he was disappointed. The people had for a long time expected an attack, and had therefore ruined the country for five or six leagues round, while the peasants had carried away the stones, and every thing that could be of use to the besiegers. Accordingly Jenghiz Khan having erected wooden towers, and planted his engines upon them, was obliged to suspend his operations, till millstones and other materials could be brought from a great distance. The walls of the city were very strong, so that the engines of the Moguls made little impression, and the garrison, making frequent and furious sallies, cut off whole squadrons of his troops, and frequently overthrew his towers and engines. This so exceedingly chagrined Jenghiz that he swore to be revenged. To exasperate him yet further, by a ruse, his grandson, was accidentally slain in the place. At last, there being a quarrel between the Moguls, who continued the attack without intermission, the city was taken, its walls had been ruined in many places, and the vast numbers and officers of the garrison slain in its defence. The mother of the young prince, who had been killed,

entered with the troops, and caused the throats of every one of the inhabitants to be cut, we are told, without exception, and even gave orders to destroy the women with child, that not an infant might be left alive! Further, to gratify the rage of this inhuman monster, the buildings were all levelled with the ground; the cattle, and every living creature, destroyed; inasmuch that the hardened Moguls themselves gave this place the name of Maubalig, or the unfortunate city. A castle has since been built out of its ruins.

The place now appears surrounded with grottoes, or caverns (several of which are inhabited), excavated from an insulated mountain. Many of these abound with carved work and sculptures, and the remains of ancient paintings. Mr. Wilford (As. Res. vi. 462), says 'it was formerly called Budd'h Vániyan, 'the most beautiful and excellent,' (a name still frequently given it by the followers of Buddha), and maliciously corrupted by the Mussulmans into But-Bámiyan, 'idolatrour Bámiyan.' It has been called by historians the Thebes of the east; and here are two colossal statues, seventy-five feet high, hewn out of the rock, standing in alto relievo against the wall of the niches in which they are enshrined. A third, of less colossal dimensions, being only fifteen cubits high, stands at a small distance. The orthodox say they represent B'hima and his family; the Budd'hists maintain that they are Sháhámá and his disciples Sálsálá; while the Mussulmans affirm that they are no other than Adam and Eve, in the shape of Cayúmans, and his consort. Between these opinions it would be presumptuous for us to decide. A door, between the legs of the largest, opens into a temple still served by a few Brahmins. The province contains several villages, and decent towns.

BAMIER, a plant common in Egypt. It produces a pyramidal husk, with several compartments, of the color of alemon, and filled with musky seeds. The husk dressed with meat is a wholesome food, and of a very agreeable flavor. The Egyptians make great use of it in their ragouts.

BAMMAKOO, a considerable town of Bambarra, in Africa, situated on the Niger, at the point where the navigation higher upwards is interrupted by cataracts. It carries on a great trade in salt. It is 180 miles south-west of Sego. Long. 5° 48' W., lat. 12° 50' N.

BAMOO, a province on the north-east frontier of the kingdom of Ava. Also a town situated on the river Irrawaddy, 170 miles N. N. E. of Unnumerapora, where a considerable trade is carried on with the Chinese.

BAMORI, a village in Northern Hindostan, where an annual fair is held, to exchange the productions of the mountaineers and the inhabitants of the low countries.

BAMOTH-BAAL, one of the towns of the tribe of Reuben, which seems to have had a temple of Baal on an eminence; lying eastward, near the river Arnon, and the territory of Moab. Jerome calls it Bamoth, a city of the Amorites, beyond Jordan, in the possession of the sons of Reuben. Whether it was the same with that mentioned in Numbers xxi. is doubtful, but it appears to have been the place of encampment of the Israelites, and of Balaam's first station

where he had the first view of the rear of the people

BAMPFYLDE (Sir Charles Warwick), a baronet of one of the oldest and most distinguished families in Devonshire. He sat in seven parliaments for the city of Exeter, was well known upon the turf, and moved in the first circles of fashion. He received his death from an assassin named Morland, whose wife had lived in his service. The shocking act was perpetrated almost at his own door in Montague Square, where the murderer waited his approach, and after a short conversation, first discharged a pistol at his victim, and with a second blew out his own brains. April 19th, 1822.

BAMPLASOY, a town of Lower Siam, on the Gulf of Siam. Long. 101° 36' E., lat. 3° 35' N.

BAMPTON, or **BAMPTON IN THE BUSH**, a market town and parish of the county of Oxford, situated on the river Isis. It has a spacious church, a charity school for twenty children, and the remains of an ancient castle. Trade and manufacture are carried on here in leather articles to a considerable extent. Population 1232. Distant ten miles from Oxford, and sixty-nine and a half W.N.W. from London.

BAMPTON, a market town and parish of England, in Devonshire, situated on a branch of the Exe called Batham, or Bathern, where the Romans are supposed to have had artificial hot-baths, and there is still a chalybeate spring in the vicinity. It carries on a small manufacture of serge and pottery. John de Bampton, a Carmelite monk, who first read Aristotle at Cambridge, and died in 1361, was a native of this town. A battle was fought here in 614 or 620, between the West Saxons and the Britons, wherein the latter suffered great loss. Population 1452. Distant from Tiverton five miles north, and 164 west of London.

BAN, *v. & n.* } Germ. *bannen*, *bann*. A word
BAN'NING. } exceedingly various in its applications. Its primary meaning seems to be that of a public proclamation; whether the matter involved were agreeable or otherwise. It generally signifies, however, proclamation with authority; to command, or to forbid; to excommunicate, and to curse.

I bar it in the interest of my wife;
'Tis she is subcontracted to this lord,
And I her husband contradict your *bans*.

Shakspeare.

Ah, Glo'ster, hide thee from their hateful looks;
And in thy closet pent up, rue my shame,
And *ban* thine enemies, both mine and thine. *Id.*

Bold deed to eye
The sacred fruit, sacred to abstinence,
Much more to taste it, under *ban* to touch.

Milton.

To draw her neck into the *bans*. *Hudibras.*

Shall we think that it *baneth* the work which they
leave behind them, or taketh away the use thereof?

Hooker.

Before these Moors went a Numidian priest bellowing
out charms, and casting scrolls of paper on each
side, wherein he cursed and *banned* the Christians.

Knolles.

He proceeded so far by treaty, that he was proffered
to have the imperial *ban* taken off Altapinus, upon
submission. *Howell.*

BAN OF THE EMPIRE, a public censure, by which the privileges of any German prince are suspended.

BAN, in commerce, a sort of smooth fine muslin, which the English import from the East Indies. The piece is almost a yard broad, and runs about twenty yards and a half.

BANNS OF MARRIAGE. The instrument which publishes the bands or obligations of matrimony into which the parties enter, to the end that if any man can say against the intention of the parties, either in respect of kindred or otherwise, they may take their exception in time. And, in the canon law, 'banna sunt proclamationes sponsi et sponsæ in ecclesiis fieri solitæ.' Among the variety of applications, says a writer in the *Encyclopædia Metropolitana*, all deducible from its primary meaning, *ban* signified a solemn assembly of the nobility, to attend the king in arms, summoned by proclamation. To be put under the *ban of the empire*, in the ancient German constitution, was to be interdicted from all intercourse with society. The imperial *ban* was directed against cities, as well as persons, and deprived those who incurred it of all their dignities and privileges.

BANAGHER, a town of Ireland, in King's County, seated on the Shannon, over which there is a bridge of nineteen arches. It is about nineteen miles south of Athlone, and eighty-one from Dublin. This is a permanent military station, has an endowed classical school, and is the termination of the Grand Canal.

BANARES, or **BENARES** (Varanasi), a large district or zemindary in the province of Allahabad, situated principally between the twenty-fourth and twenty-sixth degrees of north latitude. When ceded by Asoph ud Dowlah, the Nabob of Oude, in 1775, it was divided into six and a half pergunnahs, containing an aggregate of 12,000 square miles, of which 10,000 are a fertile and richly cultivated flat, on both sides of the Ganges. The chief districts are Benares, Gazypoor, Jionpoor, and Chunar. In the Institutes of Acher, A. D. 1582, Abul Fazel describes it as follows: 'Sircar Benares, containing eight mahals, measurement 136,663 begahs, revenue 8,169,318 dams.—Seyurghal 338,184 dams. This Sircar furnishes 830 cavalry, and 8100 infantry.' The gross revenue in 1813 amounted to 4,562,707 rupees; £570,338. 7s. 6d. of our money. At Chunar-gur'h, Mirzá-púr, and Gházi-púr, are large stone quarries; at which, on paying a moderate duty, any one may work; and the receipt for such licenses in 1816 amounted to 37,086 rupees, or £4635. 15s.

The atmosphere of this province is severe, and in winter renders fires indispensable; but for three months after March, becomes so heated by the setting in of the hot winds, as to destroy all verdure, and would probably prove destructive to all European artificial grasses, were the cultivation of them introduced. Garden-stuff of different kinds for Europeans, flax for oil, grains, and sugar, are nevertheless produced by the natives during the cold season. The use of flax as

an article of clothing is not here understood. Every field of barley contains a mixture of grain or peas; and at the distance of six or ten feet is planted a beautiful yellow flowering shrub, used in dyeing.

The principal manufactures are plain and flowered muslins, chiefly made in the northern, *baftas* in the western, and *saanes* in the eastern parts of the province. Tissues, brocades, and ornamented gauzes, are articles of general manufacture, from the Ganges and Goomty to the Caranassa and Soane. The apparatus for the sugar manufactory is extremely simple; a stone mortar and wooden pistern, turned by two bullocks, constitute the most expensive part of the operation; the boiling pots are of common earthenware; the whole, in value, not exceeding twelve rupees. Salt is manufactured at Banares. Indigo and opium are annually raised and exported from many parts of the province.

The country is well supplied with water, and washed by several noble rivers and streams; of which the Ganges, the Goomty, the Caranassa, and the Soane, are the most important; the two latter forming the natural boundaries of the province. The space from Patna to Buxar, Gazy-poor, Banares, and Mirzapoor, presents a beautiful and highly fertile country, adorned with numerous clumps of mango-trees, which give the whole region the appearance of a forest, affording a shady retreat for cattle. The territory on both sides of the river, above Mirzapoor, formerly belonged to the Nabob of Oude, and exhibited a stronger contrast to the flourishing state of the Banares districts, which in point of prosperity, perhaps excel all others in India, with the exception of Burdwan in Bengal.

The population of the province, according to the census taken in 1801, under the direction of the Marquis Wellesley, at that time governor-general, amounted to three millions, in the proportion of one Mahomedan to five Hindoos. The code of regulations for Bengal has, with very little alteration, been extended to Banares. The Brahmins, however, from the great veneration in which they are held by the people, are indulged with some peculiar privileges. The punishment of death in capital offences is commuted for transportation, and the process against them in criminal charges is somewhat different from that of Hindoos of a lower caste. Several evil practices of the Brahmins were, nevertheless, at the same time suppressed; as, the holding out the threat of obtaining spiritual vengeance on their adversaries by suicide; the exposure of the life, or actual sacrifice, of their own children, or near relations; occurrences which are now subject to the usual course of criminal law. One tribe of Hindoos, residing in the province, called *Rajoomans*, were accustomed to destroy their female infants, from the difficulty experienced in getting them suitably married. Mr. Duncan, the resident, prevailed on them to desist from this practice; and the observance of it subjects the offender to the ordinary pains of out-murder.

The most remarkable events in the history of this province are the following:—Musuram, the grandfather of Chait Singh, possessed originally but half the village, and was poor; by additions

to which, he laid the foundation of the zemindary, or lordship, of Banares. At his death, in 174C, his son and successor Bulwant Singh ascended the throne; and after a reign of thirty-years, increased the provincial territories to their present dimensions. Chait Singh Rájá received the zemindary in 1780; but from his refractory conduct, was expelled the province by Mr. Hastings, within one year after his accession. He lived at Gwáliyár till 1810, and his lands are still held by a collateral branch of the same family, with an annual profit exceeding ten per cent. on the revenue, derived from them by the government. *Tennant, J. Grant, Colebrooke, fifth Report, Hamilton, &c.*

The chief towns in the Banares zemindary, are Banares, in Sanscrit, Várá Nashi, from the two streams, Várá and Nashi. It lies in lat. 25° 30' N. and long. 83° E., on the northern bank of the Ganges, which here forms a fine sweep of about four miles in length. Its elevation above the water is evident from the G'háts, or landing places, composed of large stones, to the height of thirty feet, and are supposed to have been erected by pious Hindoos, as acts of public charity. The town rises like an amphitheatre from this basis on the external curve of the river, and may be seen at once from the opposite shore, which forms an extensive level.

The great narrowness of the streets gives it the usual appearance of an Asiatic town, and the houses, which are six stories high, close to each other have terraces on their summits, and extremely small windows, to keep them cool and prevent inspection. The opposite sides of the streets in some places approach to each other so closely as to be united by galleries. The number of houses built of stone and brick, are stated at 12,000, those of mud at 16,000. The inhabitants are more than 600,000, of whom one tenth are Mahomedans; and during the great Hindoo festivals, the concourse is immense. *Cási*, or *Cáshí*, the splendid, as the Indians commonly call it, is one of the most sacred places in the whole of India; the country for ten miles round is thought holy land, and the famous lingam, supposed to be Siva, or Mahá-Déó himself, in a state of petrification, attracts the veneration and alms of myriads. The representatives of this invaluable relic in different parts of the city are said to be at least a million, and one pilgrim is reported to have travelled sixteen times from Banares, anciently *Cási*, to Raméswara or Ramisseran, opposite Ceylon. Devout Hindoos come to end their days at Banares, the same as pious Jews go to die at Jerusalem: and so great is the holy sanctity of the place, that to die there is sufficient to preserve even beef-eating Englishmen from the black realms of the Indian Pluto, the Hindoo *Patálá*. One Englishman the Brahmins say did get to heaven by departing this life at Banares, and his meritorious decease is said to have been still further sanctified by the bequest of a large sum of money for the erection of a temple under the direction of his spiritual solicitor. So holy is this celebrated city that many foreign Hindoo Rajahs have *vakeels* or delegates residing here, who perform for them the requisite sacrifices and ablutions.

Cási, the ancient name of this city, is still retained in preference to its modern name Banares, although there are no notices concerning it in the works of ancient geographers. It is remarkable that they should omit this celebrated city, and at the same time specify Mathura or Methora and Clisobara, which are near the Jumna.

Banares is regarded as the ancient seat of Brahminical learning; and within the last century the moon beams of science have in some measure relieved the intellectual gloom which lowered upon the dark hemisphere of the inhabitants. Jaya-Sing'ha, Rájá of Amb'hér, at the close of the seventeenth century erected an observatory in this city. (Philosophical Transactions, vol. lxxvii; and Asiatic Researches.) A college has also been erected by the British government, for the instruction of Hindoos in their own literature; but the influence and prejudices of the Brahmins have prevented any considerable diffusion of learning among the natives. Reading and writing are however taught here, upon a plan strongly resembling that of some modern institutions in our own country. The boys are collected on a smooth flat of sand, on which, with the finger or a small reed, they trace the letters in the sand, and learn to pronounce them at the same time.

The number of pious foundations in Banares is very great. Hindoo temples are scattered all over the city and the surrounding plain. The principal one is called Viswésvar or Bisésar, and is dedicated to Siva, whose sacred relics it contains. Aurengzebe, to mortify the Hindoos, built a splendid mosque on the highest ground of the city, and what was worse than all, on the sacred ruins of a Hindoo temple, which was destroyed to make room for it. The minarets of this edifice command an extensive view of the city, and open some of the finest prospects of the surrounding country.

The handsome houses of the English exhibit an unusual nakedness from the want of trees; but this in India is absolutely necessary, from the swarms of mosquitoes to which they afford a favorite resort. The Rajah resides at Ramnagar on the opposite side of the river, five miles from Banares. In this city are upwards of 8000 houses occupied by mendicant Brahmins, who have nevertheless considerable property of their own. Europeans in this place are few, consisting chiefly of a judge, collector, and registrar, a few other civil servants connected with the company's establishment, together with a few private merchants and planters.

Banares is the chief mart for gems and diamonds, which are brought principally from the Bundelcund country. Merchants and bankers are numerous and wealthy, arising from the great traffic of which this city is the site. The land is extremely high priced, and law suits respecting it are unceasing. The division of the court of circuit comprehends the following districts. 1. Mirzapoor. 2. Allahabad. 3. Bundelcund. 4. Juanpoor. 5. Gooracpoor. 6. City of Banares.

Cási does not appear to have been known to the Greeks, and was probably subject to the Hindoo sovereignty of Canóh. In the year 1017 Sultan Mahmood of Ghizni took possession of it, to-

gether with the town of Casum or Casuma, now Patna, and went as far as the country of Ouganam or Unja, west of the Cossimbazar river. The following year he overran these countries a second time, and penetrated as far as Kisraji, Cach'ha Raja, or Cooch Bahar, from which period the Hindoos in this part of India remained unmolested by the Mahommedans till the close of the twelfth century, when it was finally included within the Mogul empire. In 1775 Banares was ceded by the Nabob of Aud'h or Oude, since which for the most part it has enjoyed uninterrupted tranquillity; and the inhabitants are fully sensible of the advantages they derive from living under the British government, with respect to the security of their persons and property.

On the 14th of January, Mr. Cherry the resident, and three other English gentlemen, were treacherously murdered by Vizier Ali, the deposed Nabob of Oude, and spurious son of the late Asoph ud Dowlah. Mr. Davis would also have fallen a sacrifice had he not, from the top of a narrow winding stair-case, on the flat roof of the house, defended himself and family with a short spear till assistance could be procured.

The travelling distance from Banares to Calcutta by Birbhoom is 460 miles, by Moorshedabad 565, from Buxar seventy, Allahabad eighty-three, Calpy 239, Kanoge 259, Bareilly 345 miles. See *Lord Valentia, third Register, Wilford, and Rennel.*

BANBURY, a borough and market town in the hundred of that name, Oxon, seventy-one miles from London; containing 5400 inhabitants. It stands on the river Charwell, on the road from Buckingham to Bridgenorth, and was first made a borough by queen Mary. Its privileges were afterwards confirmed and enlarged by James I. and George I. It is now governed by a mayor, high steward, recorder, six burgesses, and thirty assistants; has a town-clerk, and two serjeants-at-mace, and returns one member to parliament. The land in this neighbourhood is particularly fine pasture, and the town was noted, in Camden's time, for the excellence of its cheese, as it is now for cakes and ale. When Holland was employed in translating the Britannia, Camden visited the printing-office, and found that to his own observation, that Banbury was famous for cheese, the translator had added cakes and ale. Thinking this remark too trifling, he changed the last word into zeal; and this gave much unintentional offence. In his MS. supplement to the Britannia, in the Bodleian library, is the following note: 'Put out the word zeale in Banbury, where some think it a disgrace, when as zeale with knowledge is the greatest grace among good Christians.' In the adjacent fields Roman coins have often been discovered, and the pyrites aureus, or golden fire-stone. A castle was built here in 1125, which was entirely destroyed in the civil wars of Charles I. Plush is manufactured here, and the trade of the town is greatly enhanced by the proximity of the Thames and Severn canal. Here are held, annually, seven fairs: those for hiring servants are called mop fairs. The church, having been of late rebuilt, is large though not handsome. The market on Thursday is reckoned the best in the

county for corn, cattle, and all kinds of provisions.

BANC, or **BEXCA**, in law, a tribunal, or judgment-seat: Hence,

BANC COMMON, means the Court of Common Pleas; and

BANC KING'S, the Court of King's Bench.

BANCA, an island of the Indian Ocean, between Sumatra and Borneo; from the first of which it is separated only by a narrow channel. It is celebrated for its tin mines, the annual profit of which to the Dutch is estimated at £150,000. It is mountainous and woody. There are seven mines, which give employment to 25,000 men, originally a Chinese colony, and nominally under the direction of the sultan of Palembang, but in reality working for the profit of the Dutch East India company. The metallic sand is said to yield 70 per cent. Very little is sent to Europe; the Chinese are very skilful in adulterating it. This island, which had been captured by our forces during the late war, with the rest of the Dutch possessions in the East Indies, was given up at the peace of 1814. It had been formally ceded to us by Najmu'ddin, sultan of Palembang, in 1812, on condition of his being placed under our protection, but this stipulation was disregarded by the Dutch authorities in Java in 1818; and they have since that period been at war with the sultan. The straits of Banca afford a safe passage with a favorable monsoon; but as shoal water sometimes occurs, and there are occasionally coral reefs, they require great care and attention in navigating them. The Banca islands in 2° 22' S. lat., and 105° 41' E. long., afford shelter from S.W. by S. to N.W. with a good supply of water and fuel.

BANCA, a small island of a cluster still smaller, lying off the north-east extremity of the island of Celebes, which are much frequented by the Malay pirates. Fish, turtle, and fruits, are plentiful. Long. 125° E. lat. 1° 70' N.

BANCAI, an East Indian weight, containing 164 drams Avon poids.

BANCAJIA, of Law, Lat. cushions for benches.

BANCAJIS, a seaport town on the east coast of Sumatra, where the Dutch have a settlement. It is 130 miles west of Malacca.

BANCHE (Geoplam), archbishop of Angoulême. He was at first a priest of the Dominican order in Florence; but in 1593 one Peter Barre, a hot-headed fanatic, having communicated to him the purpose of murdering the king, Bancche immediately revealed the matter to a nobleman, by which the intended design was prevented from being executed. He was rewarded with the bishopric of Angoulême. He afterwards resigned his see, and retired to St. James's monastery at Paris, where he continued till his death.

BANCHIO, or **BANCHO**, thane of Lochaber, the grandfather of Walter, the first lord high chamberlain of Scotland, and the progenitor of the house of Stewart. He gained several great victories over the Highlanders and Danes, in the reign of Donald VII. But his glory was tarnished by his being concerned in the conspiracy against Malcolm III. and he was murdered by the tyrant in the year 1040. A. D. 1040.

BANCHE, the privilege of having a bench

was anciently allowed to the king's judges and summam administrant justitiam. inferior courts, as courts baron, hundred courts, &c. were not allowed that prerogative; and even at this day the hundred court at Freebridge, in Norfolk, is held under an oak at Gey-wood; and that of Woolfry, in Herefordshire, under an oak near Ashton, in that county, called Hundred oak.

BANCK (Peter Vander), an engraver of considerable repute, born at Paris, and bred under the celebrated Francis de Poilly. He came over into England with Gascar, the painter, about 1674; and married the sister of — Forester, Esq. He was a laborious artist: but the pay he received for his plates being by no means adequate to the time he bestowed upon them, he was reduced to want; and, retiring from business, sought an asylum in the house of his brother-in-law. He died at Bradfield, and was buried in the church in 1674; leaving his widow in possession of the chief part of his plates, which she disposed of to Brown, a print-seller, to great advantage, and left an easy fortune. His chief employment was engraving portraits; and according to Virtue's account of him, published by Walpole, he was the first in England who engraved them on so large a scale. Like many of Poilly's disciples, his great merit consists in the neat management of the mechanical part of the art.

BANCO, an Italian word, which signifies bank, and commonly used to signify the bank of Venice.

BANCOOK, a town in the kingdom of Siam, in Asia, with a fort, which was once in the possession of the French, but they were driven from it in 1688. The houses are made of canes, covered with palm leaves, and the inhabitants go almost naked. It is forty miles south of the city of Siam.

BANCROFT (Richard), archbishop of Canterbury, was born at Farnworth, in Lancashire, in 1544, and studied at Cambridge, where he took his degrees of B. A. M. A. and D. D. After passing successively through several gradations in the church, he was, in 1597, appointed bishop of London. In 1600 he was sent by queen Elizabeth to settle some difference between the English and the Danes. He also interposed in the disputes between the secular priests and the Jesuits, and furnished arguments to the former. In 1603 he was at the conference at Hampton Court, between the bishops and the Presbyterian ministers, and was appointed a commissioner for regulating church affairs. In 1604 he was appointed president of the convocation, and soon after elected archbishop of Canterbury, which was confirmed by king James I. His last promotion was in 1610, to be chancellor of the university of Oxford, which he did not long enjoy, for he died in 1612, of the stone, at Lambeth.

BANCROFT (John), bishop of Oxford, a nephew of the above, born in Oxfordshire. In 1592 he was admitted of Christ Church, in Oxford. In 1609 he was chosen master of University College, where he continued above twenty years; during which time he was at a great deal of labor, as well as expense to recover the ancient lands belonging to that foundation. He was made bishop

of Oxford in 1622, and he built the palace of Cuddesden for that see. He died in 1640, and was interred in the church of Cuddesden.

BAND', *v. & n.* } Dut. *bende*, Sax. *band*,
 BAND'AGE, } Goth. *bandi*, Celt. *ban*. A
 BAND'OR, } tie. The noun upon which
 BAND'ER. } the verb to band is formed,
 is the past participle of the verb to bind. To tie,
 fasten, unite, join, yoke together; mutual engage-
 ment; promise; to be in bonds or bondage; to
 confederate for one common purpose. Band, in
 our old writers, is frequently written *bende*.

With a *bend* of gold tasselled,
 And knoppes fine of gold amiled. *Chaucer.*

The botiler is not my friend,
 Whiche hathe the key by the *bende*.
Gower.

Then wrong it were, that any other twaine
 Should in love's gentle *band* combyned bee,
 But those whom heaven did at first ordaine,
 And made out of one mould the more t' agree.

Spenser.

And when it was day, certain of the Jews *banded*
 together, and bound themselves under a curse, that
 they would neither eat nor drink till they had killed
 Paul. *Bible. Acts ch. xxiii. ver. 12.*

Yorke and his *banders* proudly pressed in.

Mirror for Magistrates.

Men's hearts are growne so false, that most are loath
 To trust each other's words, or *bands*, or oath;
 For though we had in every part an eye,
 We could not search out all hypocrisy.

George Wither.

Like Maia's son he stood,
 And shook his plumes, that heav'nly fragrance fill'd
 The circuit wide, strait knew him all the *bands*
 Of angels under watch; and to his state,
 And to his message, high in honour rise. *Milton.*

What multitudes

Were *banded* to oppose his high decree. *Id.*

Now strike the golden lyre again,
 A louder yet, and yet a louder strain,
 Break his *bands* of sleep asunder,
 And rouse him like a rattling peal of thunder.

Dryden.

The queen, in white array, before her *band*,
 Saluting took her rival by the hand. *Id.*

On a sudden, methought, this select *band* sprang
 forward, with a resolution to climb the ascent, and
 follow the call of that heavenly musick. *Tatler.*

Strait the three *bands* prepare in arms to join,
 Each *band* the number of the sacred Nine. *Pope.*

He took his lodging at the mansion-house of a
 taylor's widow, who washes, and can clear-starch his
bands. *Addison.*

Zeal, too, had a place among the rest, with a *ban-*
dage over her eyes; though one would not have ex-
 pected to have seen her represented in snow. *Id.*

Cords were fastened by hooks to my *bandages*, which
 the workmen had girt round my neck. *Swift.*

Pride in their port, defiance in their eye,
 I see the lords of human kind pass by;
 Intent on high designs, a thoughtful *band*,
 By forms unfashioned, fresh from nature's hand.
 Fierce in their native hardness of soul,
 True to imagin'd right, above control;
 While e'en the peasant boasts these rights to scan,
 And learns to venerate himself as man.

Goldsmith's Traveller.

While her snowy hands

From her fair brow, her golden hair unbind,
 And of her zone unloose the silken *bands*,
 More passing bright unveil'd her beauty stands.

Mrs. Topham.

Pirate, thou know'st me not—but I am one
 Grateful for deeds thou hast too rarely done;
 Look on me—and remember her thy hand
 Snatch'd from the flames, and thy more fearful *band*.

Brown.

BAND', in architecture, a low flat moulding,
 otherwise called a *face*, from *fascia*.

BAND is also the denomination of a military or-
 der in Spain, instituted by Alphonsus XI. king of
 Castile, for the younger sons of the nobility, who,
 before their admission, must serve ten years at
 least, either in the army or at court; and are
 bound to take up arms for the catholic faith
 against the infidels.

BAND OF PENSIONERS, a company of 120
 gentlemen, who receive a yearly allowance of
 £100 for attending on his majesty on solemn
 occasions.

BANDS OF A SADDLE are two pieces of iron
 nailed upon the bows of the saddle, to hold
 the bows in the right situation.

BANDA ISLANDS, a group of islands in the
 Eastern ocean, about 130 miles E. S. E. from
 Amboyana. They strictly include ten separ-
 ate isles, Banda Neira, Banda Lantoir, Pulo Ay,
 Pulo Rondo, Pulo Pisang, Rosingen, Craka,
 Capella, Souangy, and Gonong Apee, the last
 being a volcanic islet, rising 2000 feet above the
 level of the sea. They are all small; Banda
 Proper, or Lantoir, one of the largest, is only
 about eight miles long, and not more than three
 broad; Neira, another of the most considerable,
 does not contain much more than two or three
 square miles. Their rich black soil makes them
 generally fertile in tropical fruits; but their chief
 and well known produce is nutmegs, for the cul-
 tivation of which Neira, Lantoir, Pulo Ay, and
 Pulo Rondo, are laid out in parks or plantations.
 The plant attains the size of a pear-tree, with a
 leaf resembling that of the laurel, and the fruit,
 enveloped in a membranaceous covering of mace,
 is contained in a husk. It is of the shape of a
 pear when ripe, and approaches the size of an
 apricot: it is then pulled and put into a drying-
 house or kiln, where it is exposed during three
 months to a slow fire: the husk or shell is now
 broke, and the nutmeg instantly placed among
 lime, to prevent the attack of insects. It is after-
 wards made up into packages of 200 pounds
 each, for exportation. Each tree produces about
 ten pounds yearly, and an oil is extracted from
 the unripe and damaged fruit. Nutmeg-trees
 require incessant care; a great proportion of
 them are barren, a defect which cannot be dis-
 covered before the twelfth or fourteenth year.
 From this period they continue bearing until the
 age of twenty, four years after which they perish.
 The total quantity produced in the four islands
 the Dutch would never suffer to be ascertained.
 When they were captured in 1796, a half year's
 crop was found to amount to 81,618 pounds of
 nutmeg, and 23,885 pounds of mace. Formerly
 the average sales were estimated at 350,000
 pounds of nutmeg annually, and 100,000 pounds

of mace. For many of the necessaries of life these islands depend upon Java. The Dutch having subjected the original inhabitants, were the first European occupiers of the Banda islands. And their most extraordinary policy was to cultivate a portion, and carefully extirpate the trees in all the other islands. This was obviously a check upon the population. By a census taken in 1796, they were found to be 5763; in 1814 they were estimated at little more than 4000; about three-fourths of whom were slaves. The accounts therefore which formerly stated them at 15,000 whites, were most likely exaggerated.

The seat of government is Neira, where there is a good harbour, and two fortresses, public magazines and storehouses, for the produce of the nutmeg plantations. Garrisons have always been maintained in these fortresses; but they were taken possession of by Admiral Rainier in 1796, with little opposition. Being restored to the Dutch by the peace of Amiens, they were again taken by the English in 1810; and reverted to their former masters at the general peace of 1814. The latitude of these islands is between 4° and 5° S. and the longitude about 130° E.

BANDALEER, or **BANDELEER**, in military affairs, a large leathern belt, thrown over the right shoulder, and hanging under the left arm; worn by the ancient musqueteers, both for the sustaining of their fire-arms, and for the carriage of their musket-charges, which being put up in little wooden cases, coated with leather, were hung, to the number of twelve, to each bandaleer.

BANDALUSAN, a small island in the Eastern Indian sea, near the south coast of Mindanao. Long. 122° 53' E. lat. 7° 12' N.

BANDARRA (Gonzales), a Portuguese fanatic of the sixteenth century, who, pretending to be a prophet, raised some disturbance, and in 1541, made a narrow escape from being burnt for heresy, by the inquisition. He died in 1556.

BANDBOX, *n. s.* From band and box. A slight box used for bands, and other things of small weight.

My friends are surprised to find two *bandboxes* among my books, till I let them see that they are lined with deperdition. *Addison.*

With empty *bandbox* she delights to range,
And fulgins a distant errand from the Change.

Gay's Trivia.

BANDELETT, *n. s.* Fr. *bandelet*. In architecture, a small band, flat moulding, or fillet.

BANDELLO (Matthew), bishop of Agen, was born at Castelnovo, in the Milanese, about the end of the fifteenth century. He was first a Dominican monk, and distinguished himself by writing novels in the manner of Boccaccio. When his country was invaded by the Spaniards he went to France, and there, in 1550, obtained the bishopric of Agen, but resigned it in 1555. He died in 1561. The best edition of his novels is that printed at London, in four volumes, 4to. 1749.

BANDEL, a sea-port of Japan, on the north-west coast of the island of Niphon. Long. 131° 44' E. lat. 34° 36' N.

BANDEL D' AGOA, a sea-port on the east coast of Africa, supposed by Dr. Vincent to be the Zergifa of Ptolemy. Long. 49° E., lat. 8 20' N.

BANDEL CAUS, a sea-port on the east coast of Africa, supposed by Vincent to be the Opone of Ptolemy. Lat. 8° 15' N.

BANDEL VELHO, or **OLD PORT**, on the coast of Ajan, supposed by Vincent to be situated on what the Periplus calls the Little Coast. Gosselin imagines it to be the Rhapta of Ptolemy and the Periplus. Fifty miles N. N. E. of Magdasho.

BANDEN, a hill of Scotland, in Fifeshire, which commands an extensive view of the Strath of Eden, from Kinross to St. Andrew's Bay. The remains of an ancient rampart and circumvallation, 200 yards in diameter, and of a circular form, are to be seen upon it.

BANDER-ABASSI. See **GOMBRON**.

BANDERAS, a large bay in the Pacific Ocean, on the west coast of Mexico, between Cape Corientes and Tintoque Point. Lat. 20° 30' N.

BANDER-CONGO, a small sea-port town in Asia, seated on the east side of the Persian Gulf; eighty miles west of Gombron; and 190 of Bander-Abassi.

BANDERET, a general, or one of the commanders in chief of the forces. This appellation is given to the principal commanders of the troops of the canton of Berne, in Switzerland, where there are four banderets, who command all the forces of that canton.

BANDEROLL, a little flag, in form of a gundon, extended more in length than in breadth, used to be hung out on the masts of vessels, &c.

BAND FISH, in zoology, the English name of the cepala rubescens.

BANDI. See **ANGOLA**.

BANDINELLI (Baccio), a celebrated sculptor and painter of Florence, born in 1487. Though he distinguished himself by his skill in both lines, he chiefly excelled in sculpture; and his group of the Laocoon is much admired. He died in 1559.

BAND'IT, *n.*

BAND'ITTO, *n.*

BAND'ITTI (*plural*). } *Ital. ban and ditto. It is the past participle of dicere, united to ban, communicated or banished; and thus signifies one declared to be banished. An exile or outlaw. Banditti are not only outlaws, but robbers, who commit their depredations in concert. Men who place themselves without the pale of society, that they may commit aggressions upon its peace and property.*

A Roman sword, and *banditto* slave,
Murder'd sweet Tully. *Shakspere.*

No savage fierce, *bandit*, or mountaineer,
Will dare to soil her virgin purity. *Milton.*

Just as much fidelity might be expected from them in a common cause, as there is among a troop of honest, murdering, and ravishing *bandits*. *Dryden.*

No *bandit* fierce, no tyrant mad with pride,
No cavern'd hermit, rests self-satisfy'd. *Pope.*

Who are they who can be said to be govern'd by laws of their own making? I know of no such persons; I never heard or read of any such, except, perhaps, among pirates, and other *banditti*, who, trampling

on all laws, divine and human, refuse to be governed in any other way than by their own licentious regulations. *Beattie.*

BANDITTI. Brydone, in his *Tour* through Sicily, informs us, that in the eastern part, called Val Demoni, from the devils that are supposed to inhabit Mount Etna, it was in his time found altogether impracticable to extirpate the banditti; there being numberless caverns and subterraneous passages round that mountain, where no troops could possibly pursue them: besides they were known to be perfectly determined and resolute, never failing to take a dreadful revenge on all who offended them. Hence, the prince of Villa Franca embraced it, as the safest, wisest, and most political scheme, to become their declared patron and protector. Such of them as thought proper to leave their mountains and forests, though perhaps only for a time, met with encouragement, and a certain protection in his service, where they enjoyed his confidence, which in no instance were they found to abuse. They were clothed in the prince's livery, and wore a badge of their order, which entitled them to universal fear and respect from the people. The persons of those whom they accompanied were ever held sacred. For this reason travellers chose to hire a couple of them from town to town; and many thus travelled over the whole island with them in safety.

BANDITTI ISLAND, an island on the eastern Indian sea, at the south entrance of the straits of Lombhook, about twenty miles in circuit. Long. 115° 35' E., lat. 8° 50' N.

BAN DOG. In zoology, a name of the canis molossus, or mastiff. But Dr. Johnson observes, that the original of this word is very doubtful. Caius, De Canibus Britannicis, derives it from *band*, that is, a dog chained up. Skinner inclines to deduce it from *bana*, a murderer. May it not come from *ban*, a curse, as we say a curst cur; or rather from *baund*, swelled or large, a Danish word; from whence, in some counties, they call a great nut a *ban-nut*. A kind of large dog.

Or privy, or pert, if any bin,
We have great *bandogs* will tear their skin.

Spenser.

The time of night when Troy was set on fire,
The time when screech-owls cry, and *bandogs* howl.

Shakespeare. Henry VI.

Then, Somerset says, set the *bandog* on the bull.

Drayton.

BANDON, or **BANDON-BRIDGE,** a considerable borough town of Cork, in Ireland, situated on a river of the same name. It is called by the Irish, Drohed (the bridge), and was founded by the first earl of Cork in 1610. The walls were demolished by the Irish, in 1689, and, in consequence of this violence, papists were long prohibited from residing in the town. Bandon principally belongs to the duke of Devonshire and the earl of Bandon. It returns one member to the imperial parliament. The cotton manufactory used to flourish here, and great numbers of workmen are still employed on linens, camlets, and woollens. The population is 10,179; distance from Cork thirteen miles; from Dublin, 186.

BANDORA, a town of the island of Sal-

sette, on the west coast of the peninsula on this side the Ganges.

BANDORE, a musical instrument with strings, resembling a lute, said to have been invented in the fourth year of queen Elizabeth, by John Rose, a citizen of London.

BANDROL, banderol, Fr. A little flag, or streamer; the little fringed silk flag that hangs on a trumpet.

BANDUM, or **BAND,** is used, in middle age writers, for a flag or banner.

BANDURI (Anselm), a learned Benedictine, born at Ragusa, in Dalmatia. He studied in France, and applied himself principally to antiquities. He published, *The Antiquities of Constantinople*, two volumes, folio; and *Numismata Imperatorum Romanorum*, a Trajano Decio ad Paleologos Augustos, 1718. He died at Paris in 1743.

BANDY, *v., n. s., & adj.* Fr. *bander*, to make crooked. A club turned round at bottom for striking a ball at play; hence to bandy is to beat to and fro from one to another, to agitate, to toss about, to give and take reciprocally, to contend as at some game, in which each strives to drive the ball his own way.

The shooting stars,

Which, in an eye-bright evening, seem'd to fall,
Are nothing but the balls they lose at *bandy*.

Brewer's Lingua, ii. 6.

They do cunningly, from one hand to another,
bandy the service like a tennis-ball. *Spenser.*

Do you *bandy* looks with me, you rascal?

Shakespeare.

No simple man that sees

This factious *bandying* of their favourites,

But that he doth presage some ill event. *Id*

Had she affections and warm youthful blood,

She would be as swift in motion as a ball,

My words would *bandy* her to my sweet love,

And his to me. *Id*

Could set up grandee against grandee,

To squander time away and *bandy*;

Made lords and commoners lay sieges,

To one another's privileges. *Hudibras.*

They now begun

To spur their living engines on;

For as whipp'd tops, and *bandy'd* balls,

The learn'd hold, are animals;

So horses they affirm to be,

Mere engines made by geometry. *Id*

And like a ball, *bandy'd* 'twixt pride and wit,

Rather than yield, both sides the prize will quit.

Denham.

This hath been so *bandied* amongst us, that one can hardly miss books of this kind. *Locke.*

Ever since men have been united into governments, the endeavours after universal monarchy have been *bandied* amongst them. *Swift.*

He that is employed, has no leisure to move in the little disputes and quarrels which trouble the peace of the mind, and which are chiefly kept up and *bandied* to and fro by those who have nothing else to do. *Atterbury.*

What vigorous arm, what repercussive blow,

Bandies the mighty globe still to and fro.

Blackmorc.

She calls it witty to be rude,

And placing rallery in railing,

Will tell aloud your greatest failing;

Nor make a scruple to expose

Your *bandy-leg*, or crooked nose. *Swift.*

The Ethiopians had a one-eyed *bandy-legged* prince; such a person would have made but an odd figure.

Collier.

BANDY LEGS, are legs distorted, turning either inward or outward on either side; arising from some defect in the birth, or imprudence in the nurse, endeavouring to make a child stand or walk before his legs were strong enough to sustain the weight of his body. See **VALGUS**.

BANE, *v. & n.* } Sax. *banu*, a murderer,
BANEFUL, } according to Dr. Johnson;
BANEFULNESS, } but it may be referred to the Goth. *banjos*, ulcers, sores, wounds, or to *bane*, destruction, death. To poison, to render poisonous; to destroy; to cause destruction or ruin.

For in his hunting hathe he swiche delite,

That it is alle his joye and appetite,

To ben himselfe the grate hart's *bane*. *Chaucer.*

Help me, ye *banefull* hyrds! whose shrieking sound
Is signe of dreary death, my deadly cries
Most ruthfully to tune. *Spenser.*

Another righteous doom I saw of greedy gain,
With busy cares such treasures oft preserved,
Are to their *bane*. *Earl of Surrey.*

The country people use kitchen physick, and common experience tells us, that they live freest from all manner of infirmities that make least use of apothecaries' physick. Many are overthrown by preposterous use of it, and thereby get their *bane*, that might otherwise have escaped.

Barton's Anatomy of Melancholy.

Lest Rome herself be *bane* unto herself,

And she whom mighty kingdoms court'sy to,

Like a forlorn and desperate cast away,
Do shameful execution on herself. *Shakspeare.*

Be gone, or else let me. 'Tis *bane* to draw the same
air with thee. *Ben Jonson.*

All good to me becomes
Bane; but in heav'n much worse would be my state.

Milton.

They with speed

Their course through thickest constellations held,
Spreading their *bane*. *Id.*

Insolency must be repressed, or it will be the *bane*
of the Christian religion. *Hooker.*

Who can omit the Gracchi, who declare

The Scipios' worth, those thunderbolts of war,
The double *bane* of Carthage? *Dryden.*

False religion is, in its nature, the greatest *bane*
and destruction to government in the world. *South.*

For voyaging to learn the direful art,

To taint with deadly drugs the barbed dart;
Obs'vant of the gods, and sternly just,
Thus refus'd t' impart the *baneful* trust. *Pope.*

Thus am I doubly arm'd; my death and life,
My *bane* and antidote, are both before me,

'Tis in a moment brings me to my end;
But that informs me I shall never die. *Addison.*

Thy sins are of so *baneful* a nature, that they poison
even the blood of Christ into thee. *Hopkins's Sermons.*

Then would'st thou steer, where fortune spreads
the sails?

Go flatter vice, for seldom flattery fails,
Soft through the ear the pleasing *bane* distils;
Delicious poison! in perfumes it kills! *Broome.*

O *bane* of good, seducing cheat,

Can man, weak man, thy power defeat? *Gay.*

Beneath the gloomy covert of a yew,
That taints the grass with sickly sweats of dew;
No verdant beauty entertains the sight,
But *baneful* hemlock, and cold aconite. *Garth.*

When it is now clear beyond all dispute, that the criminal is no longer fit to live upon the earth, but is to be exterminated as a monster, and a *bane* to human society, the law sets a note of infamy upon him, and puts him out of its protection. *Blackstone.*

So gentle life's descent,

We shut our eyes, and think it is a plain;
We take fair days in winter for the spring;
And turn our blessings into *bane*. *Young.*

But quiet to quick bosoms is a hell,
And there hath been thy *bane*. *Byron.*

BANE BERRIES, a name given to the *actæa spicata*, or herb christopher.

BANEWORT, *n. s.* From *bane* and *wort*. A plant, the same with deadly nightshade.

BANG, *v. & n.* Dut. *bengeler*, to beat with sticks, clubs, &c. Swed. *banu*, to strike. A northern provincialism, to beat. To beat, or strike, to hit hard; to give repeated heavy blows. Figuratively applied to speech; thus to *tongue-bang*, is to scold, and overpower others by virulent noisy abuse.

The desperate tempest hath so *bang'd* the Turks,
That their designment halts. *Shakspeare.*

You should accost her with jests fire-new from
the mint; you should have *bang'd* the youth into
dumbness. *Id.*

I am a bachelor.—That's to say, they are fools that
marry; you'll bear me a *bang* for that. *Id.*

With many a stiff track, many a *bang*,
Hard crab-tree and old iron rang. *Hudibras.*

I heard several *bangs* or buffets, as I thought, given
to the eagle that held the ring of my box in his beak.
Swift's Gulliver.

He having got some iron out of the earth, put it
into his servant's hands to fence with, and *bang* one
another. *Locke.*

Formerly I was to be *bang'd* because I was too
strong, and now, because I am too weak, to resist; I
am to be brought down when too rich, and oppressed
when too poor. *Arbutnot.*

But, dear Mr. Bickerstaff, convince 'em that as
harsh and irregular sound is not harmony; so neither
is *banging* a cushion, oratory. *Tatler.*

BANGALLOOR, or **BANGALORE**, a fortress in the peninsula of Hindostan, seventy-four miles from Seringapatam, the capital of the Mysore. Hyder Ali constructed the fort there, which Tippoo Saib destroyed, as useless against Europeans. Here, however, he built a palace, and laid out extensive gardens. It is a good place for trade, especially in the betel-nut, black-pepper, and sandal wood. Woollen cloths, &c., and a kind of strong silken stuff, are manufactured here. Bangaloor was annexed to the Mysore in 1787, was taken by assault, under lord Cornwallis, and plundered by the army.

BANGASSI, a large fortified town of Foola-doo, in Africa. Long. 6° 45' W., lat. 13° 10' N.

BANGERMOW, a considerable town of Hindostan, in the province of Oude. Long. 80° 25' E., lat. 26° 48' N.

BANGEY, a cluster of small islands in the Molucca passage. Long. 124° 15' E., lat. 1° 45'.

BANGIUS (Peter), a Swedish divine, born at Helsingborg in 1633. He became professor of theology at Abo, where he continued thirty-two years; and in 1682, obtained the bishopric of

Wyborg. He died in 1696, leaving, besides other works, an Ecclesiastical History of Sweden; and a Treatise on Sacred Chronology.

BANGIUS (Thomas), a Danish divine, born in 1660, he was professor of divinity, philosophy, and Hebrew, at Copenhagen; and distinguished himself as an elegant Latin writer, on the origin of languages, and other subjects. He also published a Hebrew lexicon. He died in 1661.

BANGLE, *v. a.* To waste by little and little; to squander carelessly; a word now used only in conversation.

If we *bangle* away the legacy of peace left us by Christ, it is a sign of our want of regard for him.

Duty of Man.

BANGLOR, a town in the Mysore territory, twenty miles south-east of Bangalore.

BANGOR, or BANGOR FAWR, *i. e.* the great, an ancient city and parish, in the hundred of Uwch-Gorffai, county Caernarvon, North Wales, situated near the Menai strait, at the foot of a precipitous rock, and near the embouchure of the Ogwen river, called generally "Aber Cegin." It is 23½ miles from London, nine from Caernarvon, and fifteen from Conway. It is a place of good trade, and has grown up with a rapidity almost unprecedented. It consists of one street, a mile in length, from which several branches issue towards the Menai. The public buildings are the cathedral, bishop's palace, town-hall and market house, spacious chapels erected by the dissenters of various denominations, a free-school, dispensary, and inns, which are on a scale of such magnitude as places them beyond the rank of private edifices. The trade here is considerable; slates, raised and worked at the quarries of Dolawen, form the principal export. They are conveyed a distance of seven miles on a rail-road, and shipped at the quay of Port Penrhyn. A manufacture of writing slates, chimney-pieces, cisterns and other useful articles, all made from the Bangor slate, is carried on at the port, to which may be added an iron foundry, ship-building, and the various trades connected with both, as the most prominent amongst the employments in which the inhabitants are engaged. Since the erection of the Menai bridge, two miles from the city, and the transit of the great road through, it is calculated that upwards of 50,000 strangers have annually visited Bangor. The valuable quarries just mentioned, the port of Penrhyn, the spacious inn, and the noble Saxon castle about a mile from the city, are the property of G. H. Dawkins Pennant, esq., representative and heir of the ancient family of Penrhyn. The see of Bangor was founded by St. Deiniol, A. D. 525. It includes Anglesea, Caernarvonshire, except four parishes, fourteen parishes in Denbighshire, and seven in Montgomery. It is divided into three arch-deaconries, Anglesea, Bangor, Merioneth, the two first being held in commendam with the bishopric. The first cathedral was destroyed by the Saxons, A. D. 1071. King John rebuilt it, A. D. 1212, which was mutilated in the wars of 1247, and burned down in 1402. Bishop Deane erected the present nave, and Dr. Skeffington added the tower in 1532. It was plundered by

bishop Bulkeley about the year 1547, who actually sold the bells for his private advantage. It is now in good repair, the choir handsome, and the fine nave converted into a parish church for the accommodation of the dense population of this prosperous place. Here is an effigiated tomb of Owen Gwynedd, prince of Wales, who was interred here in 1169. The city is governed by the bishop, who is lord of the manor. The free school was founded by Dr. Jefferey Glynn, A. D. 1557, and enjoys an endowment of £400 per annum. The ancient castle of Bangor was erected by Hugh, earl of Chester, in the reign of William II.: no traces of it now remain. Bangor is one of the boroughs contributing with Caernarvon in returning a member to parliament. Population about 4000. Markets are held on Fridays, and there are four fairs holden here in each year. See MENAI BRIDGE.

BANGOR FERRY, see MENAI BRIDGE.

BANGOR, county Down, Ireland; this place gives title of viscount to the family of Ward.

BANGORIAN CONTROVERSY, so called from Dr. Hoadly, bishop of Bangor. It arose from a sermon preached by him before his majesty king George I. at the royal chapel, St. James's, on Sunday, March 31, 1717. Mr. Belsham, in his Memoirs, vol. i. p. 174, gives the following account of this controversy:—"As the foundation of this famous discourse, the bishop chose the declaration of Christ to Pilate: My kingdom is not of this world: and the direct and undisguised object of it was to prove that the kingdom of Christ, and the sanctions by which it is supported, were of a nature wholly intellectual and spiritual; that the church, taking the term in its most unlimited signification, did not, and could not, possess the slightest degree of authority under any commission, or pretended commission, derived from man; that the church of England, and all other national churches, were merely civil or human institutions, established for the purpose of diffusing and perpetuating the knowledge and belief of Christianity, which contained a system of truths, not in their nature differing from other truths, except by their superior weight and importance, and which were to be inculcated in a manner analogous to other truths; demanding only from their more interesting import, proportionably higher degrees of care, attention, and assiduity in the promulgation of them. It is scarcely to be imagined, in these times, with what degree of false and malignant rancor, these plain, simple, and rational principles were attacked by the zealots and champions of the church. See HOADLY. On the meeting of the convocation, a committee was appointed to examine this famous publication, and a representation was quickly drawn up, in which a most heavy charge was passed upon it, as tending to subvert all government and discipline in the church of Christ; to reduce this kingdom to a state of anarchy and confusion; to impugn and impeach the royal supremacy in matters ecclesiastical, and the authority of the legislature to enforce obedience in matters of religion, by severe sanction. A sudden stop, however, was put to these disgraceful proceedings, by royal prorogation; and from that period the convoca-

tion has never been convened, but as a matter of mere form, and for the purpose of being again prorogued. The controversy which then commenced was carried on for several years, with great ability and animation on the part of the bishop, aided by various excellent pens, though opposed by men whose learning and talents gave an artificial lustre to bigotry and absurdity. No controversy, however, upon the whole, ever more fully and completely answered the purpose intended by it. The obscurity in which this subject had been long involved, was dissipated; the public mind was enlightened and convinced; church authority, the chimera vomiting flames, was destroyed; and the name of Hoadly will be transmitted from generation to generation, with increase of honor, of esteem, and grateful veneration.

BANGUE, a species of opiate, much used throughout the east, for drowning cares and inspiring joy. By the Persians it is called beng; by the Arabs, *esscar*, corruptly *asser*, and *assath*; by the Turks, *bengitie*, and vulgarly *mas-tack*; by European naturalists, *bangue* or *bange*. It is the leaf of a kind of wild hemp, growing in the countries of the Levant, and differs little, either as to the leaf or seed, from our hemp, except in size. Some have mistaken it for a species of *Athra*. There are various manners of preparing it; *Olearius* describes the method used in Persia. Mr. *Sade* tells us, that, among the Arabs, the leaf is made into pills or con-serves. But the most distinct account is given by *Alexander Maurocordato*, counsellor and physician of the Ottoman Porte, in a letter to *Wedelius*. According to this author, *bangue* is made of the leaves of wild hemp, dried in the shade, then ground to powder; put into a pot wherein butter has been kept; set in an oven till it begins to torry; then taken out and pulverised again; thus to be used occasionally, as much at a time as will lie on the point of a knife. Such is the Turkish *bangue*. *Bangue* in reality, is a succedaneum to wine, and is therefore much used in those countries where Mahomedanism is established.

BANGUEY, an island in the eastern seas, lying on the north coast of Borneo, and separated by a channel, three miles wide, from the island of *Bahubangan*. It is about twenty-three miles in length, by eleven in breadth, and its shores are frequented by abundance of turtle. Long. 117° 25' E., Lat. 7° 15' N.

BANJAK, an island in the eastern seas, off the west coast of Sumatra, opposite to the mouth of the *Sinkell*. It is one of a cluster, and is about seventeen miles in length, by seven in average breadth. It is known by a peaked hill, resembling a sugar-loaf. No *sluz*, or *in-ho-de-mar* is obtained here. The inhabitants are of the *Maruwi* race, but speak a language peculiar to themselves. Long. 96° 47' E., Lat. 2° 10' N.

BANJALUCH, or **BANJALUKA**, a city of European Turkey, the capital of Bosnia, upon the center of Croatia, on the river *Verbas*. The houses, which amount to 3000, are meanly built, and the suburbs are chiefly inhabited by Greeks. Long. 16° 20' E., Lat. 44° 20' N.

BANIAN DAYS, in marine language, a term

among sailors, for those days in which they have no flesh meat. It seems to be derived from the practice of the people mentioned in the next article.

BANIANS is sometimes taken as a name for a religious sect in the empire of the Mogul, and sometimes extended to all the idolaters of India, as contradistinguished from the Mahomedans: in which sense, Banians include the Brahmins and other castes. At other times it is restrained to a peculiar caste or tribe of Indians, whose office or profession is trade and merchandise; in which sense Banians, signifying bankers, stand contradistinguished from Brahmins, Cut-tery, and Wyse, the three other castes into which the Indians are divided. The four castes are absolutely separate as to occupation, relation, marriage, &c. though all of the same religion; which is more properly denominated the religion of the Brahmins, who make the ecclesiastical tribe, than of the Banians, who make the mercantile. The proper Banians are called, in the *Shaster*, or book of their law, by the name of *Shuddery*; under which are comprehended all who live after the manner of merchants, or that deal and transact for others, as brokers; exclusive of the mechanics or artificers, who make another caste. These Banians have no peculiar sect or religion, unless it be, that two of the eight general precepts given by their legislator, *Bremaw*, to the Indian nation, are, on account of the profession of the Banians, supposed more immediately to relate to them, viz. those which enjoin veracity in their words and dealings, and avoiding all practices of circumvention in buying and selling. Some of the Banians, quitting their profession, and retiring from the world, commence religious, assume a peculiar habit, and devote themselves more immediately to God, under the denomination of *Vertea*. These, though they do not hereby change their caste, are commonly reckoned as Brahmins of a more devout kind; as monks in the Romish church, though frequently not in orders, are reputed as a more sacred order than the regular clergy. *Gemelli Carreri* divides the Banians into twenty-two tribes, all distinct, and not allowed to marry with each other. *Lord* assures us they are divided into eighty-two castes or tribes, correspondent to the castes or divisions of the Brahmins or priests, under whose discipline they are, as to religious matters, though the generality of the Banians choose to be under the direction of the two Brahmin tribes, the *Visalnagranaugers* and *Vulnagranaugers*. The Banians are represented as great factors, by whom most of the trade of India is managed; in this respect equal to the Jews and Armenians, and not behind either, in point of skill and experience, in whatever relates to commerce. Nothing is bought but by their mediation. They seem to claim a kind of *jus divinum* to the administration of the traffic of the nation, grounded on their sacred books, as the Brahmins do to that of religion. They are dispersed, for this purpose, through all parts of Asia, and abound in Persia, particularly at *Ispahan* and *Gombroon*, where many of them are extremely rich, yet never above acting as brokers. But it has been justly said by a late writer, that the name *Banian* was

originally given by Europeans to almost all Hindoos; and that generally what we read of their peculiar tenets, their abhorrence for meat, &c. is, in fact, the practise of all conscientious Hindoos.

BANIAN TREE. See **FIGUS.**

BANICA, a town in the island of Hispaniola, forty miles south-east of Cape François. Also the name of a small river in the same island.

BANJAR MASSIN, or **BAGNAR MESSIN**, a town and district of Borneo, on a river of the same name, which falls into the sea near the southern extremity of the island. The district produces diamonds, gold dust, iron, canes, and pepper, the last of which is its staple commodity. Gold is obtained here in bars, and the country is celebrated for the quality of its steel. The imports are slaves, birds' nests, nutmegs, and tortoise shells, which are all re-exported from Borneo. The rajah, or sovereign, formerly resided at a place called Cagu-Tangie, or Cota-Tengah, but he directed a city to be built at Martapura, whither he transferred his abode in 1771, changing the name of Martapura to Bunire Kintjana. His power is considerable. A Dutch commercial establishment on the banks of the river, at the end of the village of Banjar Massin, called Tatas, consists of an octagonal fort, surrounded by palisades, with bastions towards the river side; it was built in 1709. They had, by a previous treaty in 1648, compelled the king to relinquish for their benefit the whole pepper trade. The king has, in return, been protected by the Dutch from the unsettled predatory tribes in his neighbourhood. In the beginning of the seventeenth century, an establishment was attempted here by the English East India Company, but the settlers were resolved to abandon the place. During the late war, however, the Dutch fort was occupied by the British. The town of Banjar Massin formerly stood eighteen miles up the river, but has been transferred six miles lower down. It consists of about 300 houses. Long. 114° 55' E., lat. 3° S.

BANIASS, or **PANAAS**, anciently Cæsarea Philippi, a village of Syria, near the source of a river, which has been commonly supposed to be the Jordan. This stream rises near a remarkable grotto in a rock, on the declivity of which are seen some ancient Greek inscriptions to Pan and the nymphs of the fountain. The vestiges of a flourishing city are still to be seen; but there are no remains of the temple which Herod the Great erected in honor of Augustus. The fort of Baniass, built in the time of the caliphs, stands on the summit of a lofty mountain. Around is an agreeable country, but panthers, bears, wolves, and hyænas, are numerous. There is also great abundance of game. Distant two leagues west of the lake Phiala, or Birkel-el-Ram.

BANIER (Anthony), licentiate in laws, member of the academy of inscriptions and belles lettres, and ecclesiastic of the diocese of Clermont, in Auvergne; died in November 1741, aged 69. He is principally celebrated for his translation of the *Metamorphoses* of Ovid, with remarks and explanations, which was published in 1732, at Amsterdam, in folio, ornamented with copper-plates, by Picart; and reprinted at Paris,

in 1738, in 2 vols. 4to; and for his *Mythology explained by History*, a work full of the most important information, and printed at London in 1741, in 4 vols. 8vo.

BANILLIA, in the materia medica, a name used by some for the vanilla, or vanilloes, used in making the scented chocolate.

BANISERLIE, the capital of Dentila, in western Africa. It is a Mahommedan town.

BANISH, See **BAN.** Sax. *forbæned*
BANISH'ER, } a banished nan. In Fr. *ban-*
BANISH'MENT, } *nir*, Germ. *bannen*, to put out
BAN'NITION. } of a community by a ban or civil interdiction, which was formerly either ecclesiastical or civil. *Banishment*, *exile*, and *expulsion*, all include the idea of exclusion or coercive removal, but in other respects they differ. *Banishment* follows from a decree of justice; *exile*, either by the necessity of circumstances or an order of authority; *banishment* is a disgraceful punishment inflicted by tribunals upon delinquents; *exile* is a disgrace incurred without dishonor; *exile* removes us from our country; *banishment* drives us from it ignominiously. *Banishment* and *expulsion*, both mark a disgraceful and coercive exclusion. But *banishment* is authoritative, the public act of government; *expulsion* is the act of a private individual, or a small community. *Banishment* always supposes a removal to a distant spot, to another land; *expulsion* never reaches beyond a particular house or society. *Banishment* and *expulsion* are likewise used in a figurative sense, although *exile* is not; in this sense *banishment* marks a distant and entire removal; *expulsion* a violent removal; we *banish* that which it is not prudent to retain; we *expel* that which is noxious. Hoopes are *banished* from the mind when every prospect of success has disappeared; fears are *banished* when they are altogether groundless; envy, hatred, and every evil passion should be *expelled* from the mind as disturbers of its peace; harmony and good-humor are best promoted by *banishing* from conversation all subjects of difference in religion and politics; good morals require that every unseemly word should be *expelled*.

This is thy mortal foe, this is Arcite,
 That frõ thy lond is banished on his hed,
 For which he hath deserved to be ded.

Chaucer.

Plato made it a great signe of an intemperate and corrupt commonwealth, where lawyers and physicians did abound; and the Romans distasted them so much that they were *banished* out of their city, as Pliny and Celsus relate, and for 600 years not admitted.

Burton's *Anatomy of Melancholy*.

Oh, fare thee well!

Those evils thou repeat'st upon thyself
 Have banish'd me from Scotland. Shakespeare.

Marius then fetching a deep sigh from his heart, gave him this answer, 'Thou shalt tell Sextilius, that thou hast seen Caius Marius, *banished* out of his country, sitting amongst the ruins of the city of Carthage.'

North. Plutarch.

They refused to do it (take the oaths), and were upon that condemned to perpetual *banishment*, as men that denied allegiance to the king, and by this an engine was found out to *banish* as many as they pleased.

Bishop Burnet's *Own Times*.

As I have your express orders not to restore any person who has been sentenced to *baniishment*, either by myself or others; so I have no directions with respect to those, who having been *baniished* by some of my predecessors in this government, have by them also been restored.

Melmoth's Pliny

Every professor do continue in his office during life, unless in case of such misbehaviour as shall amount to *bannition* by the university statutes.

Blackstone's Commentaries.

Thus I alone, where all my freedom grew,

In prison pine, with bondage and restraint;

And, with remembrance of the greater grief,

To *baniish* the less, I find my chief relief.

Earl of Surrey.

Then came the autumn, all in yellow clad,

As though he joyed in his plentiful store,

Laden with fruits that made him laugh, full glad

That he had *baniish* hunger, which to fore

Had by the belly oft him pinched sore;

Upon his head a wreath that was enrol'd

With ears of corn of every sort he bore,

And in his hand a sickle he did holde,

To reap the ripen'd fruit the which the earth had yold.

Spenser's Faerie Queene.

If sweet content is *baniish'd* from my soul,

Life grows a burthen and a weight of woe.

Gentleman.

Joy to that happy pair,

Whose hopes united *baniish* our despair.

Marvell.

Baniish business, *baniish* sorrow,

To the gods belongs to-morrow.

Cowley.

It is for wicked men only to dread God, and to endeavour to *baniish* the thoughts of him out of their minds.

Tillotson.

Successless all her soft caresses prove,
To *baniish* from his breast his country's love.

Pope

BANISTER (John), a physician and surgeon in the reign of queen Elizabeth, was educated at Oxford, where, says Anthony Wood, he studied logic for a time; but afterwards applied himself solely to physic and surgery. In 1573 he took the degree of M. B. and, obtaining a licence from the university to practise, settled at Nottingham, where he lived many years in great repute, and wrote several medical treatises. His works were collected and published in 1633, 4to.

BANISTER, the same with BALUSTER.

BANISTERIA, in botany, a genus of the trigynia order, and decandria class of plants, ranking in the natural method under the twenty-third order, trihilatæ. The calyx is quinquepartite, with nectarious pores on the outside of the base; the petals are roundish and unguled; the seeds are three, with membranaceous wings. There are seven species, all natives of warm countries, but possessing no remarkable properties. An American and West Indian genus, containing twenty-four species, has been figured and described in Cavanilles, 'Monadelphicæ classis dissertationes decem.'

B A N K.

BANK, *v. & n.* Junius derives this word from the Dutch *bancke*, which signifies to beat, to strike, as the waves perpetually strike against the shores of the sea, and the current of the river presses against its sides. Skinner is content, as is Johnson, with the Ang.-Sax. *banc*, *tumulus*. Wachter has *banc*, a hill, mound, heap, and any eminence, or rising place. It is transferred, he adds, to all eminent or rising places for sitting or lying, as banks of oars were not on the same level in ancient ships, but seats raised above one another. It may thus be applied to any thing raised to confine a current of water; to any mound or elevation designed as a barrier to protect or defend from the incursions of warriors; or to facilitate the subjugation of forts and cities; and to the raised table or counter of merchants, traders, or money-changers. To *bank* is to confine or surround with *banks*; to throw up embankments. On the authority of Stevens, the commentator on Shakspeare, it has been suggested, that to *bank* may mean to sail along the banks.

They besieged him in Abel of Bethmaachah, and they cast up a *bank* against the city; and it stood in the trench.

Samuel.

When it was day they kn we not the lande, but they spyed a certen harbor with a *bancke*, into which they were minded if it were possible to thrust in the ship.

Bible, 1551.

Have I not heard these islanders shout out

'Vive le roy,' as I have *bank'd* their towns?

Shakspeare.

Have you not made an universal shout,
That Tyber trembled underneath his *bank*? *Id.*

Richmond, in Devonshire, sent out a boat

Unto the shore, to ask those on the *banks*,

If they were his assistants. *Id.*

How sweet the moon-light sleeps upon this *bank*!

Here will we sit, and let the sounds of musick

Creep in our ears; soft stillness, and the night,

Become the touches of sweet harmony. *Id.*

That strain again, it had a dying fall;

O, it came o'er my ear like the sweet south

That breathes upon a *bank* of violets;

Stealing and giving odour. *Id.*

Plac'd on their *banks* the lusty Trojans sweep
Neptune's smooth face, and cleave the yielding deep.

Waller.

Mean time the king with gifts a vessel stores,

Supplies the *banks* with twenty chosen oars.

Dryden.

That *banks* of oars were not in the same plane, but raised above one another, is evident from descriptions of ancient ships.

Arbutnot.

A brook whose stream so great, so good,

Was lov'd, was honour'd as a flood;

Whose *banks* the Muses dwelt upon. *Crashaw.*

'Tis happy when our streams of knowledge flow

To fill their *banks*, but not to overthrow. *Denham.*

O early lost! what tears the river shed,

When the sad pomp along his *banks* was led!

Pope.

Amid the cliffs

And burning sands, that *bank* the shrubby vales.

Thomson.

My banks they are furnished with bees,
Whose murmur invites one to sleep,
My grottos are shaded with trees,
And my hills are white over with sheep.
I seldom have met with a loss,
Such health do my fountains bestow,
My fountains all bordered with moss,
Where the hare-bells and violets grow.

Shenstone.

An intercourse of commerce and language was gradually established between the opposite banks of the Danube, and after Dacia became an independent state, it often proved the firmest barrier of the empire against the invasions of the savages of the north.

Gibbon.

On every bank, and under every shade,
A thousand youths, a thousand damsels play'd;
Some wantonly were tripping in a ring,
On the soft border of a gushing spring.

Sir William Jones.

Is it owing to Christianity, or to the want of it, that the banks of the Nile, whose constantly renewed fertility is not to be impaired by neglect, or destroyed by the ravages of war, serve only for the scene of a ferocious anarchy, or for the supply of unceasing hostilities?

Paley.

BANK, *v. & n.*
BANKER,
BANKRUPT, *v. n. s. & adj.*
BANKRUPTCY,
BANKEROUT, *v. & n.*

A commercial application of the former word. In this sense, bank is a receptacle for money, and to bank is to deposit money in such receptacle. Bankrupt is of more general application, extending to persons who are dealers in any commodity, or who carry on any trade or business. It is derived from the Fr. *banqueroute*, or the Ital. *bancorotto*. It signifies one whose bench or table has been broken; that is, whose debts exceed his means of payment. The Bankrupt laws accurately define this species of offence or misfortune.

But natheless I toke unto our dame,
Your wif at home, the same gold again
Upon your *benche*, she wote it wel certain,
By certain tokens that I can hire tell.

Chaucer.

He hadde openly preached in the temple, he had overthrown the banker's tables, and drieven oute of the temple too.

Sir Thomas More's Works.

Perkin gathered together a power, neither in number nor in hardiness contemptible; but in their fortunes, to be feared, being bankrupts, and many of them felons.

Bacon.

Wherefore do you look
Upon that poor and broken bankrupt there?

Shakspeare. As you Like it.

ROSS. The earl of Wiltshire hath the realm in farm.

WILLOUGHBY. The king's grown bankrupt, like a broken man.

Id. Richard II.

Make rich the ribs, but bankerout the wits.

Id.

Unless we had rather think both moral and judicial, full of malice and deadly purpose, conspired to let the debtor Israelite, the seed of Abraham, run on upon a *bankrout* score, flattered with insufficient and ensnaring discharges.

Milton. Doctrine, &c. of Divorce.

This done, he pens a proclamation stout,
In rescue of the banker's bankerout.
The money of widows and orphans employ'd,
And the bankers quite broke.

Marvell.

Id.

GONZ. There's the quintessence,
The soul and grand elixir of my wit,
For he (according to his noble nature)
Will not be known to want, though he do want,
And will be bankrupted so much the sooner,
And make the subject of our scorn and laughter.

Beaumont and Fletcher.

By powerful charms of gold and silver led,
The Lombard bankers, and the change to waste.

Dryden.

Whole droves of lenders crowd the banker's doors,
To call in money.

Id.

In vain at court the bankrupt pleads his cause,
His thankless country leaves him to her laws.

Pope.

Or at some banker's desk, like many more,
Content to tell that two and two make four,
His name had stood in city annals fair,
And prudent dullness mark'd him for a may'r.

Churchill.

Here is again discovered the inhabitant of Cheapside, whose head cannot keep his poetry unmingled with trade. To hinder that intellectual bankruptcy, which he affects to fear, he will erect a bank for wit.

Johnson's Life of Blackmore.

By an act of insolvency all persons who are in too low a way of dealing to be bankrupts, or not in a mercantile state of life, are discharged from all suits and imprisonments, by delivering up all their estate and effects.

Blackstone.

That bankruptcy, the very apprehension of which is one of the causes assigned for the fall of the monarchy, was the capital on which the French republic opened her traffic with the world.

Burke.

Had every particular banking company always understood, and attended to its own particular interest, the circulation never could have been overstocked with paper money.

Smith's Wealth of Nations.

1. BANK, BANKERS, BANKING. The term bank has two distinct significations; one in reference to commerce, implying a place of deposit or store-house; the other relating to geography and rural economy, implying an elevation of the earth, either natural or artificial; and either below or above the surface of the water, in rivers as well as in the ocean. It is further a technical term in law; the judges of the supreme court of law, when sitting in judgment collectively, are said to sit in bank, banque, or banco. See JURISPRUDENCE. It is also a military term, denoting an elevation of earth within the parapet of a fortification, generally between two and three feet high, or more, according to the height of the parapet; being about four feet and a half lower than the top of the parapet, three feet broad, ascended at intervals by steps, by which the garrison get up to fire on, or to observe the proceedings of, the besiegers.

2. We will now proceed in the endeavour to illustrate the term bank, in conjunction with bankers and banking, as referable to commerce, by showing, 1st, the probable origin or derivation of the term; 2nd, the origin or rise, and nature of banking institutions; 3rd, their progress, practice, and present state, throughout the commercial world; and 4th, their influence and effect on the social and moral relations, and condition of mankind.

3. Bank, in its present application as a commercial term, appears to have had its origin in

Italy, where, in the infancy of European commerce, the Jews were wont to assemble in the market-places of the principal cities and towns, seated on benches, ready to lend money; first on the reputation and written bond or acknowledgment, singly or jointly, of borrowers; but (as will be more fully shown hereafter), as there is in the lending and borrowing of money an immutable tendency to demoralise and derange society, confidence and reputation soon became mere by-words; and, instead of bonds and written obligations, money was only lent upon the security of commodity or produce, by which localised places of deposit or storing became necessary; and hence, banking, in its origin, bore an analogy to our present system of pawnbroking; while the term bank is supposed to have been derived from the benches and tables in the market-places, at which the money-lenders used to transact their business; the Italian word *banco*, signifying a bench, derived probably from the Greek word *τραπεζα*, signifying both a bench and a table, as does also the Spanish word *banco*; in reference to which the money-lenders obtained the name of benchers or bankers; the Jews of Lombardy being among the first people in Western Europe who carried into practice the principle of lending money on the security of commodity: their repositories partially obtained the name of Lombard-houses.

4. The Lombards were a Scandinavian tribe, who first figure in history about the year 378; but it was not till 568 that they established themselves in Italy; at which period they made Pavia the capital of their kingdom. It must have been, therefore, subsequent to this period that banking institutions assumed any thing like a permanent character. Lending and borrowing, however, appear to have prevailed in all ages, or long before the intervention of money, to facilitate the interchange of commodities; and in all ages, as in the present day, appears to have been productive of extortion and social derangement: see the Mosaic code, Exodus, ch. xvii. v. 14 and 22, and Deuteronomy, ch. xxiv, v. 6 and 10, and by the narrative of St. Matthew, ch. xxi, v. 12, it will be seen that tables in the market or public places were in use in his day, for the accommodation of money-lenders.

5. The restless disposition of the Lombards tended to excite a spirit of activity and enterprise throughout all the Italian states; by which the people of those countries became the merchants or distributors of the products of Asia over all the west and northern parts of Europe. It was towards the close of the seventh century, after the Mohammedans had obtained possession of Egypt, that the chief depot of the products of the east was transferred from Alexandria to Constantinople, and afterwards to Venice, that commerce began to resolve itself into a more regular system than it had ever before been practised, and a methodical and demonstrative order of keeping accounts was devised and adopted. See *BOOK-KEEPING*. This, in the progress of time, elicited new ideas on the economy of payment; and about the middle of the twelfth century the bank of Venice, so long celebrated throughout the commercial world, and which may be regard-

ed as the foundation of the present system of banking, was established; and had the operations of the bank of Venice been confined to the legitimate object of facilitating commercial interchange, its socialising capabilities would have rendered it worthy of the celebrity it so long enjoyed; but, whilst the principles of its economy are entitled to the highest admiration, it seems to have been established in tyranny, with a view to political aggrandisement, and throughout the whole course of its career to have been perverted to the worst of purposes.

6. It was the desolating system of the crusades, and not the socialising principle of facilitating commercial interchange, which gave rise to the bank of Venice. The first crusade embarked from the shores of the Adriatic, under the auspices of Pope Urban the Second, in 1095; and from the ascendancy and influence which the Venetians, by their extensive commercial intercourse, had then acquired over every part of Western Asia and Europe, they became the principal agents of the crusaders, as well for the wealthy individuals who embarked in those chivalrous exploits as for the several governments to which they respectively belonged. The fruits of extortion, so likely to result from such a system, excited the cupidity and avarice of the Venetian senate, which led, in 1176, some say in 1157, to the establishment of the bank, under the authority and pretended guarantee of the state, the crusading agency previously having rested exclusively with individuals.

7. The original subscription fund of the bank of Venice was 2,000,000 Venetian ducats, equal to £433,333; but, by a solemn edict of the senate, the whole trading community of the republic were compelled to deposit their money in the bank, with which a credit was opened equal to the deposit made, which could only be made available for transfer, so that not only the subscribed capital but also the aggregate amount of the deposits resolved themselves into a national debt. The whole amount of the intrinsic money, subscribed and deposited, having been applied by the senate towards aiding the views of the crusaders, and other external purposes, an ideal capital, or mere denomination of amount was thus created to adjust the operations of commercial interchange.

8. Whether the transfers at the bank in the early period of its establishment required personal attendance, as is the case in transferring the national debt-stock at the bank of England in the present day; or whether effected, on written orders corresponding to the checks in the present English practice of banking; does not appear; but, be that as it might, derangements in the social economy of the state soon ensued; the agio or difference between the current money, and transferable amounts at the bank, attained the rate of thirty per cent. Yet such was the insidious and illusive nature of the bank system, that the bank increased in popularity in proportion to the extent of the derangement which ensued; the inconvenience frequently occasioned in the minor transactions of commerce, as well as on occasions of citizens or strangers requiring money to defray the expenses of foreign journeys,

ted in the course of time to the bank paying out money. Yet such was the influx of money, which the crusading armaments brought from all parts of western Europe, that after the system of making payments in money was practised, the deposits always exceeded the demands.

9. At a later period, when the Venetians themselves turned crusaders against the Turks, the subscription-fund of the bank was increased to 5,000,000 of ducats; the whole of which was made use of by the senate, to aid them in their operations of warfare; and, as previously stated, throughout the whole period of its career, it was made an instrument of aggression in aid of political aggrandisement: yet such was the fortuity of circumstances, and, for several centuries having no rivalry, its integrity does not appear ever to have been questioned; the derangements occasioned by the fluctuation of the agio led ultimately to an edict of the senate, fixing it at twenty per cent., at which rate it continued up to the period of the extinction of the republic in 1797, see VENICE.

10. In the fourteenth century the Genoese began to rival the Venetians in their commerce, and in 1345 a bank was established at Genoa; but the more favorable local position of Venice retained for it an undiminished political importance, and although the Genoese were very successful in their commercial career, their bank, relatively to that of Venice, was an insignificant establishment; it nevertheless was enabled, in the fifteenth century, to advance considerable sums to Spain, and other governments; but in 1751 it was deemed insolvent to a very considerable amount, and in 1798 the establishment was finally dissolved and broken up by Buonaparte.

11. No further progress appears to have been made in the formation of banking institutions, until after the discovery by the Portuguese, in 1497, of the passage to Asia by the Cape of Good Hope; and even then, more than a century elapsed before another bank was established. It was at the commencement of the seventeenth century, when Amsterdam had become the chief mart of European commerce, that a bank was established in that city in 1609; and, as the circumstances which led to, and the conduct which dictated, the formation of this bank, appear to have been purely commercial and social, void of all speculative and political influence, and its economy essentially different from either those of Venice or London, it merits the most ample elucidation of the details of its system on our part, and the utmost attention on the part of the enquiring reader.

12. Banking, in its economy, resolves itself into three distinct orders of practice, viz. 1. of deposit, transfer, and agency; 2. of discount, simply; and, 3. of discount and circulation: a banking establishment may, therefore, be formed for carrying on either any one of these orders of practice separately, or two, or all collectively; and either, and all of them are liable to be made instruments of oppression by partial application, or by perversion to impolitic and bad purposes: a more ample elucidation of the details of each order of practice will appear hereafter (see section 14.), the analysis being exhibited in this

place, that the distinctive character of the bank of Amsterdam may be the better understood.

13. The circumstances which gave rise to the establishing of the bank of Amsterdam, were the great variety of clipped and debased coins which its extensive commerce, at the close of the sixteenth and commencement of the seventeenth century, brought into that city. The constant variations of value of these coins occasioned continual disputes and inconveniences in the adjustment of payments, more especially so in the payment of foreign bills of exchange; to obviate these disputes and inconveniences, it was, that the bank was established in 1607, on the legitimate and social principle of deposit, transfer, and agency; the security of the deposits being guaranteed by the corporation of the city, by whom its managers were appointed, and who thereby constituted themselves the agents of the establishment; the expenses of which, and its management, being defrayed by fees on opening of accounts, transfers, &c. This system or practice of banking, it will be seen, requires no subscribed or fixed capital.

14. The bank of Amsterdam received coins of all descriptions at a fixed value, according to their weight and fineness, deducting an amount equal to the expense of coinage into the standard coin of Holland; not that the various coins so paid in should be converted into standard coins, but that a credit should be placed on the bank books to such an amount, after the seignorage and fees had been deducted; the amount so credited then constituted bank-money. It was in the next place enacted, that all payments of 600 guilders, = to £52. 10s., in amount, and upwards, whether on internal or foreign account, should be made in bank money; and as these regulations immediately occasioned an agio or difference of value between bank-money and current money, it as immediately became compulsory on the part of every man of business either to open an account at the bank, or to subject himself to the caprice of a fluctuating agio, to enable him to make his payment through the medium of those who had an account.

15. The distinction between the practice of the bank of Amsterdam and the bank of Venice, is this, viz. That the bank of Venice appropriated its subscribed capital, as well as part of its deposits, to external purposes, and created an ideal sum by means of transfers to a corresponding amount, whereby to adjust the internal payments of the public; whilst the bank of Amsterdam retains its deposits within the walls of its own establishment; and when we come to treat of the practice of the bank of England, that will be found to present additional features of practice deserving the utmost possible attention, as well in reference to a comparison with the practice of the banks of Venice and of Amsterdam, as for the influence and effects of its own operations upon the general interests of the country at large.

16. In addition to the transactions of the bank of Amsterdam, as detailed in sect. 14, the bank also gives credit on its books upon deposits of gold and silver bullion, at the rate of five per cent. below the mint price of the bullion. In making these deposits, which are made more for

safe keeping, and the view of reserving them for articles of merchandise, than for conversion into coin, the bank grants a receipt, receipt, or warrant, entitling the holder to take out the bullion again at any time within six months, upon transferring to the bank an amount of bank money equal to that for which credit had been given in its books when the deposit was made, and upon paying one-fourth per cent. for the keeping, if the deposit was in silver, and one-half per cent. if it was in gold; the receipt expressing, that in default of such payment, upon the expiration of the term of six months, the benefit of the receipt becomes forfeited to the bank, while the amount credited against the deposit resolves into bank-money; leaving a profit to the bank proportionate to the difference between five per cent. below the mint price, and the value of the bullion in the market.

17. This species of deposits are, in the first instance, more generally made when the mercantile price of bullion is so far below the mint price as to become an article of speculation, and the profits to the bank upon this branch of its business are considerable, by the forfeiture of some of the receipts; but more particularly so from the frequent renewals. The creditors of the bank, in bank-money, and the holders of receipts, are regarded by the bank as two distinct classes of creditors: hence the creditor in bank-money, having no receipt, cannot draw out bullion without first going to market to buy a receipt, nor can the holder of a receipt draw out his bullion, in the event of his having sold the bank-money assigned to him on making the deposit, without first going into the market to repurchase bank money, and reassigning the same to the bank.

18. In a city of extensive and complicated commercial interchange, like Amsterdam, these regulations of the bank necessarily occasion continued demands for both bank-money and bullion, and gave rise to a system of jobbing and trick, precisely similar to the jobbing and tricking in time bargains upon the stock exchange in London; and at one period the agio was wont to fluctuate from eight to ten per cent. To keep it within certain bounds, however, the bank of Amsterdam resolved at all times to grant 100 of bank for 105 of current money; or rather to sell bank-money at an agio of 5 per cent. In consequence of this resolution, the agio was prevented ever exceeding that rate; and the fluctuation now seldom exceeds $2\frac{1}{2}$ per cent. between $1\frac{1}{2}$ and 4.

19. In addition to the seignorage deducted on first opening an account with the bank in money, see sect. 14, a fee of ten guilders, = to 17s. 6d., is also charged; and for every renewed account, 3 guilders 3 stivers; for every transfer, 5 stivers, = $2\frac{1}{4}$ of a penny, and in order to discourage a multiplicity of small transactions, if the transfer is for less than 300 guilders, the charge is six stivers; for neglecting to balance accounts regularly twice a year, a fine of twenty-five guilders is exacted; and in case of attempting to overdraw an account, a fine of 3 per cent. on the sum so attempted to be overdrawn is also levied, in addition to setting aside the order. These several fees, fines, and deductions for seignorage, together with the profits which occasionally arise by the sale of bank-money, to

maintain an equilibrium in the agio, and the forfeiture of bullion receipts, produce a considerable revenue to the city, over and above what suffices to defray the expenses of the establishment. Public utility, however, and not revenue, was the original, and up to this time, has continued the ruling object of the establishment, and the revenue derived from it is the natural result of its invariable rule of practice, which, whether the best that can be devised or not, its certainty and impartiality has obtained for it the sanction and confidence of all who have been concerned in it.

20. How far the system or practice of the bank of Amsterdam approximates to perfection or utility will more fully appear as we proceed to illustrate the various practices of banking in England, and in other parts of the world. The direction of the bank of Amsterdam is vested in four reigning burgo-masters (aldermen), who are changed every year. Each new set of burgo-masters, on induction to their charge, are conducted to the bank, inspect the deposits, compare them with the books, and acknowledge the same upon oath, delivering it over at the end of the year with the same formal solemnity to the set which succeeds; and highly to the credit of the corporate body of the city of Amsterdam, both in its collective, and in its individual capacity, in reference to the direction of the bank, not only has no malversation been proved, but no imputation ever brought against them; nor have the political convulsions, by which Holland has at times been surrounded, and in which it has been involved, ever induced the bank to swerve from the strict rule of its established regulations; and such has ever been the confidence in the integrity of its director, that it has at times been the depositary of the money treasure of the opulent individuals of surrounding states.

21. Of the extent of the deposits of the bank of Amsterdam at different periods, the information is very imperfect; it may, at times, probably, have amounted to a sum equal to five, six, or seven millions sterling, and probably more, but on an average they probably have not, at past periods, nor do not at the present time, exceed three to four millions, or from forty to fifty millions of guilders.

22. As commerce extended itself over the north of Europe, banking institutions were established in different parts of Germany, but there were none that obtained any great celebrity, except those of Hamburg and Nuremberg. That of Hamburg was established in 1619, on principles, and for objects, not very dissimilar to those of Amsterdam, viz. those of deposit, transfer-agency and public utility. Instead of coin the deposits are made in silver bullion of a given fineness, against which credits are opened, either for transfer, or for withdrawing the bullion at pleasure, subject only to a trifling charge for deposit, or safe-keeping. The general practice of the bank of Hamburg is less formal, and more simple, than that of Amsterdam; and has been productive of great advantage to the city, and has maintained an unsullied integrity. The expenses of its management have been, and still continue to be, defrayed by fees, or transfers, &c. similar to those of Amsterdam. It was plundered of a considerable portion of its deposits by the

French general, Davoust, in 1813, a part of which were restored by the Bourbon government at the peace of 1815.

23. In 1635 the bank of Rotterdam was established, under regulations somewhat different in detail from those of either Amsterdam or Hamburg, but upon the principle of deposits, transfer, and agency.

24. About the sixth or seventh decenary of the seventeenth century, an individual of the name of Palmshut, in Stockholm, established a bank for the purposes of exchange, discount, and circulation; that is, he bought and sold bills of exchange, lent money at interest, and issued notes, which became a circulating medium, or token of interchange, for the amount they represented; naturally enough, although Palmshut originally possessed, relatively, great resources, derangement and embarrassment soon overtook him, but inflated with his notions of ideal wealth, he applied to the king, Charles XI., whom he induced to become his patron in the formation of a royal bank, which, under Palmshut's directions, soon obtained a general confidence; and, in 1688, the direction was transferred to the assembly of the states of the kingdom, the king declaring himself, and his successors, protectors of the bank, but renouncing all interference in the disposal of the money. The states being thus declared guaranties, proprietors, and directors, under the regulations which they established, the bank became a bank of deposit, discount, and circulation. Depositors were allowed interest at the rate of 6 per cent.; and the deposits, together with notes of circulation, appropriated to discounts, on collateral securities, at the rate of 8 per cent. The king's revenues were also deposited at the bank free of interest. The institution immediately became popular, and all who had surplus money, in every part of the kingdom, poured it into the bank, so that, by the close of the century, the interest on deposits had been progressively reduced from 6 to 2 per cent., and on discounts from 8 to 3 per cent.

25. Like all institutions founded on speculative principles, the bank of Stockholm was soon destined to experience a reverse of fortune, and to become an instrument of political perversion. The chivalrous exploits of Charles XII. led to such a drain of the intrinsic resources of the bank, during the four years, 1714—1717, the period of the king's residence in Turkey, after the battle of Pultowa, and when the corrupt and profligate Goertz was minister of finance, that the revenues usually deposited with the bank, were unequal to discharge even the interest, much less contribute towards any repayments. This dilapidation of the resources, and credit of the bank, led to the mortgaging of other revenues of the crown, and a declaration on the part of the king, that no further drain should be made upon the bank until its resources and credit were fully restored: these measures produced a partial reaction in favor of the credit of the bank; but it proved only temporary, until an expedient of the minister Goertz unexpectedly diverted all the disposable wealth of the kingdom into the bank.

26. Whilst the declaration and resolve of the

king to restore the resources and credit of the bank were adhered to, it deprived Goertz of the adequate funds to carry on his political intrigues, and to supply the king with sufficient means to maintain his regal importance; under these circumstances, he resorted first to fines and penalties, and ultimately to a species of confiscation, by demanding all the plate, jewels, and coin in the kingdom to be placed at his disposal, for which he gave copper tokens, representing ninety-six times the intrinsic value of the metal, (paper money in effect.) This measure led all those who possessed such disposable means to confide in the royal pledge, rather than yield to the exaction of Goertz. And they consequently in secret conveyed all their treasure to the bank. Goertz, chagrined at being thus disappointed, applied to the king and advised him to seize all the treasure deposited in the bank; but the king refused to comply, and prohibited Goertz from even making any proposal on the subject, contrary to the pledge which he had solemnly made.

27. This decision of the king reinstated confidence in, and fully re-established, the resources and credit of the bank, so that on the declaration of war against Russia, in 1741, the bank presented the king with a donation of 100,000 Swedish silver dollars, equal to about 7600, and supplied another 500,000 dollars, as a loan without interest, and subsequently to that period it frequently advanced considerable sums to the crown, and to the board of manufactures under the guarantee of the states.

28. The resources and credit of the bank being thus re-established, it was divided into two departments, *lane* and *wexel*, or loan, and exchange banks; the former corresponding in its practice with the practice originally established in Lombardy, (see sect. 3.) and precisely similar in principle to the practice of pawnbroking in England at the present day. Whilst the practice of the *wexel* or exchange bank, is that of deposit, discount, and circulation. The loan bank lends money on gold and silver bullion, copper, and its own stock, to their full value, at the rate of three per cent. and on three-fourths of the value of iron, at the same rate of interest; and on lands and houses at the rate of six per cent. four for interest, and two as a sinking fund, until the whole sum advanced is repaid. Jewels were at one time advanced upon, but the bank having once been defrauded to a considerable extent by them, resolved never again to make advances on those articles.

29. The *wexel* or exchange bank receives money on deposit, for which it allows two per cent. and issues notes, with which, together with its deposits, it discounts bills of exchange; this practice, which is the one originally pursued by Palmshut, (see sect. 24.) involves risk, and leads to certain loss; the issuing of notes, having no intrinsic value, sustains the loss as long as the notes retain confidence; but when that fails, derangement necessarily ensues, all this befell the *wexel* or exchange bank of Stockholm, within the short space of twenty-five years; and in 1766 the bank was on the verge of bankruptcy and final dissolution, when, by the interference of the

states, a loan of three millions of rix dollars, equal to about £700,000, was raised to liquidate the excess of notes in circulation; since the period of 1766 successive regulations have been resorted to, to preserve the credit of the bank, and a committee, composed of a certain number of persons from each of the three states of the kingdom, viz. the nobles, clergy and burghers, has been appointed, to inspect triennially the general state of the bank and its accounts.

30. Under the guardianship of the States, the wexel bank of Stockholm retains its place among the other institutions of the kingdom, but it has no importance externally, nor does the extent of its operations equal the operations of several private banking establishments in some of the provincial towns in England; it is the various kinds of practice of banking, however, and not the extent of the operations, which most demand attention; and on that ground it is, that the bank of Stockholm has here been enlarged upon, much beyond what the extent of its operations would otherwise have rendered necessary.

31. **BANK OF ENGLAND.**—We now come, in order of time, to treat of the bank of England; an establishment, whether considered with respect to the magnitude of its operations, or its influence upon the social relations of mankind, without a parallel in history; and from the period of its foundation, but more especially since the period of 1793, it has become so interwoven with the government, and the collective interests of the nation, as to render it difficult to treat of one, without entering largely into the details of the other. We will endeavour, however, to confine our elucidation of the bank, as far as it is connected with the government and the nation, as much as possible within the limits of those circumstances of the nation, in which the character and interests of the bank have been more immediately involved.

32. Although by its peculiar constitution, and terms of its charter, as well as in all the details of its practice, the bank of England appears to be an independent trading company, and although its operations combine all the various kinds of practice in banking (except the original one, of lending money on pledges, viz. exchange, deposit, transfer, discount, agency, and circulation, and each and all of these, on a more extended scale than ever was, or perhaps ever will be, practised in any other establishment, it is, and ever has been, from its foundation, materially connected with all the financial operations of the government, and partakes therefore far more of a political than of a commercial character. This indeed has been considered by some writers and financiers an alarming encroachment on both our commercial and political systems. But we proceed to illustrate the progress of its career.

33. It appears to the writer of this paper that instead of desirableness and necessity denoting its origin, and instead of being founded like the bank of Amsterdam (see sect. 11) on the broad and solid basis of public convenience and public utility, the origin of the bank of England was a mere project, which fortuitous circumstances alone have hitherto protected in an unexpected manner. The original

projector of this memorable institution was a Mr. W. Paterson, who, after numerous applications on the subject to the privy council, at length succeeded in the year 1693, in obtaining its consent to the project, and an act, 5th and 6th William and Mary, c. 20, for granting to their Majesties several rates and duties upon tonnage of ships and vessels, and upon beer, ale, and other liquors, for securing certain recompences and advantages in the said act, mentioned to such persons as shall voluntarily advance the sum of £1,500,000 towards carrying on the war against France! Section 19th of the said act, enacts that 'Their Majesties may make commissioners take subscriptions for £1,200,000. The sum of £100,000 to be annually appropriated to the subscribers;' and by section 20th it was further enacted that, 'Their Majesties may appoint rules for transferring, and make the subscribers a corporation by the name of 'The governor and company of the bank of England.'

34. Under the authority of the aforesaid act, subscriptions were immediately entered into, and before the 1st of Jan. 1694, the whole sum was subscribed, and on the 27th of July, in that year, the charter of incorporation was executed, its duration being limited to eleven years, viz. from the 1st of August, 1694, to the 1st of August, 1705, after which date the corporation was determinable upon twelve months notice, and repayment of the £1,200,000 advanced. At this time (1694), the rate of interest was 6 per cent. per annum; but by the terms of the contract for the above £1,200,000, the corporation were to receive 8 per cent. per annum, and £4000 per annum for management, or trouble of transferring and apportioning the interest among the numerous subscribers.

35. Such were the circumstances, and such the origin of the bank of England, neither of which it will be seen bear any analogy to the circumstances and origin of the banks of Venice, Amsterdam, Hamburg, or Stockholm; but before we proceed further in exhibiting the progress of the bank of England, it may be well to show what the state and practice of banking in England was, prior to the formation of that establishment; and when the circulating medium of the country was exclusively metallic. At an early period of England carrying on an external commerce, when she received from Holland and Germany almost every species of manufacture in exchange for grain and wool, and other productions of the soil and mines, England then had her loan banks, or Lombard houses, for lending money on pledges (see sect. 3), hence the etymology of Lombard-street, in the vicinity of the Royal Exchange, in London. At a more recent period the goldsmiths became the bankers, first, merely as places of deposit or safe keeping, and afterwards for discount; and for more than a century prior to the establishment of the bank of England, and circulation of paper money, the goldsmiths held the same rank and importance in commerce, and exercised similar functions, as the private bankers do at the present day. But the establishment of the bank of England did not merely divert the transactions of private deposit and discount into new channels, but it will be

seen, as we proceed, that it had the effect of changing the whole social economy of the state

36. The Bank of England being established, the charter directed that its management should be vested in a governor, deputy governor, and twenty-four directors, to be elected by the holders of the stock, a clear possession of £500 of which for six months constitutes a qualification to vote, the qualification of a director being the possession of £2000 of the stock, of a deputy governor, £3000 of do. and of a governor £4000 of do. So far as we have here described the transactions of the Bank of England, it seems confined to the mere raising of a loan of £1,200,000, for the use of government, at 8 per cent. per annum, and which was in fact, the foundation of the FUNDING SYSTEM, or NATIONAL DEBT; to prevent enlarging upon which here, see each of those subjects under their respective heads, and in conjunction with them see also CIRCULATING MEDIUM, EXCHANGE, BILLS OF, EXCHEQUER BILLS, MONEY, PAPER MONEY, and TALLIES. Of the nature and extent of the practice of the Bank of England, in deposit, transfer, discount, and circulation, during the early period of its establishment, but little seems to be known; and, indeed, for some time, its transactions seem to have been very much confined to trading in the government securities, and notes of its own circulation. At the Exchequer, then, as is still the case, accounts were kept by tallies, similar to accounts of bakers in those parts of the country where the weight of the loaf varies, and the money price remains fixed; notches are cut in a piece of stick, to denote so many loaves of bread, the stick is split, the buyer holding one part and the seller the other, so with the accounts of money at the Exchequer of enlightened England, at the period of establishing the Bank of England, and so the practice continued in 1826.

37. The first and second years after the establishment of the Bank, these Tallies were a trading and speculating commodity, as stock and exchequer bills are at the present day, and such was the state of the credit of the nation at that time that the tallies were at a discount of 20 to 40 per cent. against the sealed notes of the Bank, and the notes of the bank at a discount of 20 per cent. against the standard coin of the realm. With the view of equalising these disparities of value between the bank and national securities, and the standard coin of the realm, an act was passed in 1697, 8 and 9 Will. 3 cap. 20, empowering the Bank to receive subscriptions for the enlargement of their stock, four-fifths in tallies, and the remaining fifth in Bank notes. The amount of tallies ingrafted under this act was £1,001,171. 10s. subject, like the original subscription to an interest of 8 per cent. per annum, and the charter was extended to the 1st of Aug. 1710. In 1708, another act was passed, 7 Ann. cap. 7, under which the bank further lent the government the sum of £400,000 without interest; thereby reducing the interest on £1,600,000 to 6 per cent. The Bank at this time held Exchequer bills to the amount of £1,500,000, which, with an arrear of interest of £275,027. 17s. 10½d., were cancelled (funded) at the rate of 6 per

cent. per annum. For these acts of condescension, the charter of the Bank was extended to Aug. 1, 1732, and the company authorised to take in subscriptions, to double their capital. In 1709 a call of 15, and in 1710 a further call of 10 per cent. was made, and in 1713 another act was passed, 12 Ann. cap. 11, extending the charter to Aug. 1, 1742, then, as before, determinable after twelve months notice, and repayment by the government, of all sums borrowed.

38. In 1717 another act was passed, 3 Geo. I. ch. 8, authorising the funding of a further amount of exchequer bills of £2,000,000, at five per cent. per annum; to which rate the interest on £1,775,027 was also reduced after midsummer 1718. In 1722, by another act, 8 Geo. I, cap. 21, the bank was authorised to purchase stock of the South Sea Company to the amount of £4,000,000, which stock bore an interest of five per cent. per an. but was reduced to four per cent. after midsummer 1729. To effect this purchase the capital was increased £3,400,000; and in 1727, pursuant to the act of 1 Geo. II, cap. 8, £1,000,000 of the £1,775,027. 17s. 10½d. funded in 1708, at six per cent, was paid off, and the interest on the £2,000,000, funded in 1717, reduced from five to four per cent. and under the authority of the same act; in 1728, £1,750,000 was further advanced to government at an interest of 4 per cent.; and, in the following year, pursuant to the act of 2 Geo. II, cap. 3, the remainder of the £1,775,027. 17s. 10½d. funded in 1708, together with £500,000 of the amount funded in 1717, was paid off by the government; who borrowed, under the authority of the said act, the sum of £1,250,000, at an interest of 4 per cent. per annum from midsummer 1729.

39. In 1738 another act was passed, 11 Geo. II, cap. 27, authorising the paying off a further portion of the bills funded in 1717, to the amount of £1,000,000; and in 1742, by the act of 15 Geo. II, cap. 13, £1,600,000 was advanced to government without interest, on condition of the bank being authorised to increase their capital stock, and the charter being extended to Aug. 1 1764. The capital stock was accordingly increased £340,004. 5s. 4d. The pretension set up in reference to this £1,600,000, was the reduction of the rate of interest on the original £1,200,000, and the £400,000 advanced in 1708; by the receipt of which latter sum the interest on the £1,600,000 was reduced to 6 per cent.; and, by the receipt of a corresponding sum without interest, it made the interest on the £3,200,000 equivalent to 3 per cent. But this seeming reduction in the rate of interest is a delusion; for, however anomalous it may at first seem, as the rate of interest progressively became reduced from 8 to 3 per cent, the pressure of the exaction on the people, as will clearly appear hereafter, progressively and virtually increased. So far, therefore, from the £1,600,000 being entitled to be regarded as a boon to the public, it appears to us as neither more nor less than a bribe to reconcile an unsuspecting people to an extension of the charter.

40. In 1746 another act was passed, 19 Geo. II, cap. 6, authorising the funding of exchequer bills, issued in anticipation of the tax on licences

for retailing spirituous liquors, to the amount of £936,800, at the rate of 4 per cent. per annum, and for authorising the bank to increase their capital stock 10 per cent. which was done in pursuance thereof. The total sum advanced by the bank to the government, now amounted to £11,686,800, and the capital on which the stockholders divided was £10,780,000. Of the amount advanced to government £3,200,000, (see preceding section) was at an interest of 3 per cent.; part of the bills funded in 1717 remained at 5 per cent. and the remainder at 4 per cent.; in reference to which, in 1749 an act was passed, 28 Geo. II, cap. 1, determining that from Christmas 1750 the interest on the whole £8,486,800 should be reduced to 3½ per cent., and from Christmas 1757 it should further be reduced to the same rate as the £3,200,000, viz. 3 per cent. Fifteen years now elapsed without any change in the terms of the charter, or accounts with the government, when in 1764, pursuant to the act of 4 Geo. III, cap. 25, the bank advanced £1,000,000 for two years without interest, and gave bounties to the

exchequer of £110,000, for the extension of their charter to the 1st of August 1786.

41. In 1781, pursuant to an act passed that year, the charter was further extended to the 1st of August 1812, and £862,400 more added to the capital stock, in return for the loan of £2,000,000 for three years at 3 per cent.; and in 1800, pursuant to an act of 48 Geo. III, the charter was further extended to the 1st of August, 1833, on condition of advancing £3,000,000, for the service of the year 1800, on exchequer bills, to be discharged without interest in 1806. Such was the state of the bank of England in 1800 in reference to its permanent advances to the government and extent of its permanent capital, which we will here briefly recapitulate. In the session of parliament, 1822, an account of the total amount of debt due to the bank of England, distinguishing funded from unfunded, the periods when contracted for, &c. &c. was laid before the house (paper No. 190), which, up to the period of 1746, will be seen to correspond with the amounts previously enumerated, viz:

Anno.	Acts.		Amount.	
1694	5 W. & M. c. 20	Original Subscription	£1,200,000	
1697	8 & 9 Wm. c. 19	Ingrafted Tallies	1,001,171	
1703	7 Anne, c. 7	Exchequer-Bills cancelled	1,775,028	
		Advanced without interest	400,000	
1717	3 Geo. I. c. 3	Exchequer-Bills cancelled	2,000,000	
1722	8 ——— c. 21	Transfer from South-Sea Company	4,000,000	
1723	1 Geo. II. c. 3	Advanced	1,750,000	
1729	2 ——— c. 3	Ditto	1,250,000	
1742	15 ——— c. 13	Ditto	1,600,000	
1746	19 ——— c. 6	Exchequer-Bills cancelled	986,800	
		Total Sum advanced		£15,962,999
Parl. in				
1707		Ingrafted Tallies	£1,001,171	
1723		Part of £1,775,028	1,000,000	
1724		Rem. ind. of ditto	775,028	
—		And part of £2,000,000 of 1717	500,000	
1733		Further part of £2,000,000 of 1717	1,000,000	
				4,276,199
		Net amount of permanent Debt in 1746, and as it stood up to 1816		£11,686,800

42. In 1810 a further advance was made of £2,000,000; and in 1823 a contract was entered into for the bank to advance the government the sum of £1,500,000, in thirteen irregular instalments, between the 4th of April, 1823, and the 6th of July, 1824, in consideration of an annuity of £55,710 for 11 years, from the 10th of Oct. 1823. The first of these transactions resolves itself into a loan to the bank equivalent to from £7,000,000 to £8,000,000; the latter being to a certain extent a contingent transaction, may prove disadvantageous to the public to the extent of from five to ten or twelve millions, and under any circumstances that can possibly occur is equivalent to another loan to the bank of at least

£2,000,000. The first transaction is simple and conclusive, and will be seen to involve moral as well as pecuniary features, demanding the very serious consideration of the public. The other is one of the most complex and equivocal transactions which the whole history of British financing, with all its profligacy and tortuosity, exhibits since the commencement of war in 1793. A more circumstantial account of the nature of both transactions will be found in their order of time further on.

In the mean time, the following is a recapitulation of the augmentations of capital, on which dividends were made to the proprietors of stock, viz.

Anno.		Augmentation.	Aggregate.
1694	Original Subscription	£1,200,000	£1,200,000
1697	Ingrafted Tallies	1,001,171	2,201,171
1708	Doubled	2,201,172	4,402,343
1709	Call of 15 per cent.	656,204	5,058,547
1710	Ditto of 10 per cent.	501,449	5,559,996
1722	Additional Subscriptions	3,400,000	8,959,996
1742	Ditto Ditto	840,004	9,800,000
1746	Call of 10 per Cent.	980,000	10,780,000
1781	Augmented	862,400	11,642,400

43. And the following shows the rate and amount of dividends, per annum, at different periods, up to 1807, viz.

Anno.	Rate per cent.		Amount annually divided.
1694—1696	3 years 8	(actual)	£96,000
1697—1707	11 — 9	—	198,105
1708—1729	22 — 9 to 5½	(estimated)	450,000
1730—1741	12 — 6 & 5½	(actual)	520,200
1742—1746	5 — 6 & 5½	—	563,000.
1747—1752	6 — 5	—	539,000
1753—	1 — 4½ & 5	—	512,050
1754—1763	10 — 4½	—	485,100
1764—1766	3 — 5	—	539,000
1767—1780	14 — 5½	—	592,900
1781—1787	7 — 6	—	698,544
1788—1806	19 — 7	—	814,968
1807—1815	9 — 10	—	1,164,240
1816—1823	8 — —	—	1,455,300
1824—1826	3 — 8	—	1,164,240

44. Thus, as stated in sect. 39, it is seen, that whilst the bank affects to lend the public its money at 3 per cent. per annum, the public, since 1807, have virtually been taxed at the rate of 10 per cent. to the extent of £1,164,240 per annum; nor is this all, for, by a return made to parliament in the session of 1819 (Paper, No.

347), in addition to the above exorbitant exaction, resulting from the illusive and peculiarly involved nature of the transactions of the government with the bank, it appears that the following sums were divided among the stock-holders as bonuses, viz.

Anno.		Amount.
June, 1799	10 per cent. on the £11,642,400	£1,164,240
May, 1801	5 — on ditto	582,120
Nov. 1802	2½ — on ditto	291,060
Oct. 1804	5 — on ditto	582,120
— 1805	5 — on ditto	582,120
— 1806	5 — on ditto	582,120
Total as Bonus		£3,783,780

And profuse as all this may seem in favor of the holders of bank-stock, and oppressive as it must be to the public, it sinks into comparative insignificance when compared with the transactions of 1816 and 1823, the nature of which shall be elucidated by and by; it seeming first desirable to take a retrospective view of the transactions of the bank, independent of its permanent advances and augmentation of its permanent capital.

enacted, 'for securing the credit of the Bank of England, that no other banking company in England should consist of more than six persons, empowered to issue bills or notes payable on demand, or for any time less than six months.' And the act of 15 Geo. II. cap. 13, which extended the privileges of the charter to 1764, also enacted, that the acts of 7 and 12 Anne, and all other acts for determining the corporation, should be void; and that the governor and company of the bank should remain a body corpo-

45. By the stat. of 6 Anne, cap. 22, it was

rate and politic for ever, subject to such restrictions and regulations as were contained in the acts and charters then in force, and by the same statute it was also further enacted, 'that persons forging, counterfeiting, or altering, any bank-note, bill of exchange, dividend, warrant, or any bond or obligation, under the company's seal, or any indorsement upon it, or knowingly uttering the same, shall suffer death, without benefit of clergy;' and further, 'that the company's servants breaking their trust to the company, shall also suffer death, as a felon, without benefit of clergy.' The same statute also further enacts, 'that when at a court of directors of the bank, neither the governor nor deputy shall attend in two hours after the time appointed for business, when any thirteen or more of the directors may choose a chairman for the time for the despatch of business, and that such court shall be as valid as if either the governor or deputy-governor had duly attended.'

46. As stated in sect. 36, the information is imperfect as to the extent of the transactions of

the Bank of England in deposit, transfer, discount, and circulation, during the earlier period of its establishment; nor does it appear that the notes of the bank were ever at a discount against the standard coin of the realm after 1697, until 1798. In addition to the monies permanently advanced to the government, it was the practice of the bank to advance money in anticipation of the land and malt taxes; and to make other temporary advances on exchequer-bills and other floating securities; we have not been able to obtain any circumstantial account of the extent of these advances at an earlier date than 1777; from which period an account of advances by the bank to government on land, malt, exchequer-bills, and other securities, on the 25th of February on each of the twenty years preceding the 25th of February, 1797, was laid before parliament, vide Appendix, second Report of the Select Committee on the Expediency of the Bank resuming Cash Payments, 1819. Commons reprinted, fol. 315, of which the following is a copy viz.

On the 25th Feb.	Land and Malt.	Exchequer-Bills.	Treasury-Bills.	Total.
1777	£4,912,000	£2,500,000	—	£7,412,000
1778	5,251,000	2,500,000	£2760	7,753,760
1779	5,682,000	2,769,000	15,664	8,466,664
1780	5,613,000	3,104,400	33,582	8,750,982
1781	5,517,000	262,230	49,541	8,188,841
1782	5,653,000	4,283,050	43,628	9,991,678
1783	4,962,000	4,662,200	4871	9,629,071
1784	3,901,000	3,641,000	23,853	7,565,853
1785	3,102,000	3,900,000	28,200	7,030,200
1786	2,307,000	4,303,200	24,672	6,634,872
1787	2,309,000	4,334,200	1696	7,144,896
1788	2,636,000	4,707,400	4299	7,347,699
1789	2,928,000	5,000,200	20,235	7,948,435
1790	2,382,000	5,006,500	20,468	7,908,968
1791	3,331,000	6,247,100	22,878	9,603,978
1792	2,802,000	6,636,600	26,999	*9,839,338
1793	2,608,000	5,939,600	52,359	9,066,698
1794	2,915,000	4,777,600	717,175	8,786,514
1795	4,201,000	4,329,000	2,117,491	11,114,230
1796	5,536,000	5,265,000	540,991	11,718,730

* The totals in each of the five last years include £376,739 lent out of the unclaimed dividends, without interest.

47. The earliest account of the amount of bank-notes in circulation which we have been able to obtain is the following, which was delivered to the House of Commons on the 18th of March, 1797, and exhibits the amount of notes in circulation on the 25th of February, in each of the ten years, 1797—1796, viz.

1797	£8,688,570
1796	9,370,350
1795	9,905,210
1794	10,217,360
1793	11,699,140
1792	11,319,810
1791	11,403,125

1794	10,699,520
1795	13,539,160
1796	11,030,110

As we are now approaching a most important period in the history of the transactions of the Bank of England, it will be well for the earnest enquirer after truth to bear in mind, that the notes in circulation up to the period of 1797, were convertible into gold on demand, at the rate of 77s. 10½d. per oz.; and when the above statement is compared with the preceding one, of the amount of the temporary advances to the government, and the following one, of the amount of cash and bullion in hand, and bills

discounted, it will be seen that the issue of notes appears to have been regulated more in reference to the amount of the temporary advances to the government, than to the means of paying them in gold on demand, as will be seen by the following statement of the amount of cash and bullion

on hand, notes in circulation, bills discounted and advances to government, on an average in the months of March, June, September, and December, in each of the five years, 1793—1796, viz.

	Cash and Bullion on hand.	Bills Discounted.	Average of Notes in Circulation.	Average of Advances to Government.
1793				
March . . .	£3,508,000	£4,817,000	£11,963,820	£8,735,200
June . . .	4,412,000	5,128,000	12,100,650	9,434,000
September . .	6,836,000	2,065,000	10,938,620	9,455,700
December . .	7,720,000	1,976,000	10,967,310	8,887,500
1794				
March . . .	8,608,000	2,908,000	11,159,720	8,494,100
June . . .	8,208,000	3,263,000	10,366,450	7,735,800
September . .	8,096,000	2,000,000	10,343,940	6,779,800
December . .	7,768,000	1,887,000	10,927,970	7,545,100
1795				
March . . .	7,940,000	2,287,000	12,432,240	9,773,700
June . . .	7,356,000	3,485,000	10,912,280	10,879,700
September . .	5,792,000	1,887,000	11,034,790	10,197,600
December . .	4,000,000	3,109,000	11,608,670	10,683,100
1796				
March . . .	2,972,000	2,820,000	10,824,150	11,351,000
June . . .	2,582,000	3,730,000	10,770,200	11,269,700
September . .	2,532,000	3,352,000	9,720,440	9,901,100
December . .	2,508,000	3,796,000	9,645,710	9,511,400
1797				
February 26 .	1,272,000	2,905,000	8,640,250	10,672,490

48. By the above statement, it is seen, that with £8,640,250 of notes in circulation on the 25th of February, 1797, £1,272,000 value of gold only remained in the bank, whilst the demand for gold continued daily to increase; under which circumstances, on the 22d of February, a committee was appointed by the privy council to investigate the affairs of the bank, which committee, on the 26th of the same month, reported, that the total assets of the bank, exclusive of the £11,686,800 permanent debt of the government (see sect. 40, 41), was £17,597,298, whilst the whole of the demands upon the bank amounted to only £13,770,390, leaving a clear balance in its favor of £3,826,903, exclusive of the permanent debt due from the government. Upon this report, the privy council instantly issued an order prohibiting the directors of the bank from issuing any more cash (specie) in payment, until the sense of parliament on the subject was obtained. From the statement of £13,770,390 being the amount of demands upon the bank, and £8,640,250 being the amount of notes in circulation, as per statement in the preceding section, it appears that the demands of depositors and other creditors must have amounted to £5,130,140; and in like manner, £17,597,298 being the whole of the assets, and £10,672,490 thereof consisting of claims on the government, £2,905,000 in bills discounted, and £1,272,000 in specie, it leaves £2,727,808 to be assigned to some specified items; including, no doubt the bank premises and probably some

other property in fief, in houses or lands, &c. &c. The transactions and state of the Bank of England, as detailed in this section, bring its history down to that eventful and important period when the peculiar nature of its connexion with the government first openly develops itself. To obtain a more comprehensive and distinct view of the subject, the reader will do well to refer to the journals and proceedings of parliament for the year 1797, and to examine the subject attentively, in relation to the nature and amount of the loans, and extent of the revenue and expenditure of the government at that period, as exhibited in Mr. Marshall's Statistical Illustrations of the Finances, Revenues, &c. &c. of the British Empire. See also the articles FUNDING, LOANS, SINKING FUND, and REVENUE, in the subsequent parts of this work.

49. It was on a Sunday evening that the order of the privy council, adverted to in the preceding section, was transmitted to the bank, and on Monday morning the following notice was published by the directors of that establishment, viz.

' Bank of England, February 27, 1797.

' In consequence of an order of his majesty's privy council, notified to the bank last night, a copy of which is hereunto annexed,

' The governor, deputy-governor, and directors of the Bank of England, think it their duty to inform the proprietors of the bank-stock, as well as the public at large, that the general concerns of the bank are in the most affluent and flourish

ing situation, and such as to preclude every doubt as to the security of its notes.

'The directors mean to continue their usual discount for the accommodation of the commercial interest, paying the amount in bank notes; and the dividend warrants will be paid in the same manner.

(Signed) 'FRANCIS MARTIN, Sec.'

50. The consternation of the public at this notification was extreme, but as a proof of the secret workings and illusive nature of the system, a meeting was held the same day at the mansion house, at which the lord mayor (Watson), presided, when the following resolution was unanimously agreed to, viz. 'That we the undersigned, being highly sensible how necessary the preservation of public credit is at this time, do most readily hereby declare, that we will not refuse to receive bank notes in payment of any sum of money to be paid to us; and we will use our utmost endeavours to make all our payments in the same manner.' This singular specimen of subserviency to speculative expediency was signed by the lord mayor and all present, and ultimately obtained upwards of 3000 signatures. We will not here enquire what portion of their names have since been exhibited on the bankrupt or other lists of insolvency; but we must regard the consequences to have been the degradation of an alarming portion of the total population of the kingdom to the rank of paupers, with all the consecutive concomitants of demoralisation and crime.

51. On the same day (27th Feb.), a message was delivered from the king to both houses of parliament, to the following effect, viz. 'That an unusual demand of specie having been made from different parts of the country, on the metropolis, it had been found necessary to make an order of council to the directors of the bank, prohibiting the issuing of any cash in payment, till the sense of parliament could be taken on the subject.' In the upper house, Lord Grenville, who was then secretary of state for the foreign department, moved, 'That the communication from his Majesty should be taken into consideration the following day,' when in pursuance of the motion, after much circumlocution, Lord Grenville stated that he had two motions to submit to the consideration of their Lordships, first, 'That a humble address be presented to his Majesty, to return thanks for his gracious communication, and to assure his Majesty that he might rely with the utmost confidence on the wisdom of parliament, to call forth, in case of necessity, the extensive resources of the kingdom.' This was agreed to, *nonne contradicente*. The other motion was for 'The appointment of a select committee of nine lords, to examine and report on the outstanding debts against the bank, the state of the funds for discharging the same; the cause that rendered the order of council necessary, and which might justify the members of that house for taking the proper steps for the confirmation and continuance of that measure.' This motion gave rise to considerable discussion, in which the Duke of Bedford moved as an amendment, 'To leave out all that part which

related to the committee reporting their opinion on the continuance of the measure.' In support of which amendment, the Marquis of Lansdowne said, 'That noble Lords would do him the justice to recollect, that not one session had passed over, since the fatal commencement of the war in 1793, in which he had not, to use a vulgar but strong expression, bored their Lordships with his prophetic admonitions, and proceeded to illustrate the nature of public credit, by saying, that it was to the people of Great Britain, what the soul of man was to his body. It was pure soul: it was immaterial in itself, and yet it was that which gave to substance its functions. It was not property, for no branch of the body could call it its own. It was not the king's credit, nor was it the credit of parliament; it was public credit, which did not look to security alone as its basis, but which always connected security with punctuality.'

52. The shock which had been given to public credit, the noble marquis stated, proceeded from deep, progressive, and accumulated causes; causes which all thinking, all honest men, had long deplored, and which had grown to a head under the unhappy and ill-requited confidence which had so fatally been placed in the king's ministers. In endeavouring to ascertain the causes that had brought on the dilemma, one cause was manifest; the inordinate increase of expenses, of places, and establishments, in every corner of the empire, which had grown to a height beyond every thing that the mind could previously have conceived; it was, said the noble marquis, incredible and scandalous; the increase of fees, of salaries, of places and pensions, of new boards of commission, and new appointments of all kinds, had not only served to open all the gates of waste and profusion, but to beat down and destroy all the checks of control, and all the means of correction. Waste and extravagance had been systematised; one scene of abuse countenanced and protected another, and all the corners of the earth were witnesses to the ruinous waste of the treasures of the British people. In this strain, with unabated ardor, did the noble marquis continue to depict the fatal consequences which must inevitably ensue from the continuance of such a system, and concluded a most patriotic appeal to the British parliament, by calling upon his compeers to mark his prophecy, and not to disdain his counsel, while yet in time, for said his Lordship, if you attempt to make bank notes a legal tender, then credit will perish. They may go on for a time, but their end is certain ruin. The earnestness and force of this appeal drew the Lord Chancellor from his seat, to state, 'That he had deprecated the idea of forcing bank paper into circulation, by making it a legal tender, and he would take upon himself to say, that it then had never been conceived, that it would be wise or prudent to make bank notes a legal tender. After which, their lordships divided on the amendment of the duke of Bedford; twelve for, and seventy-eight against it. After which the original motion for a committee of enquiry was carried without a division,

53. Similar proceedings took place in the commons on the same day, where, in reply to

some observations by Mr. Fox, Mr. Pitt stated that perceiving some suspicions were entertained that the measure adopted for succouring public credit, was designed to be permanent, he assured the house, 'That nothing could be farther from his intention.' An amendment similar to that of the duke of Bedford, in the lords, was moved in the commons by Mr. Sheridan, which was rejected by 244 against eighty-six, when the original motion for a committee was carried without a division. On the 6th of March the lords' committee reported to the house that it was necessary to 'continue and confirm the measures already taken, for such time, and under such limitations and restrictions, and with such power of discontinuing the same, as to the wisdom of parliament might seem expedient.' And thus a system of paper money, without reference to any standard, either of value or quantity, was established, the duration and progress of which will appear, as the elucidation of the transactions of the bank is here further proceeded in.

54. On the re-assembling of parliament in November of the same year (1797), the committee of secrecy, appointed to enquire into the expediency of continuing the restriction on the bank, reported, that the total assets of the bank, exclusive of the £11,686,800 of permanent debt due from the government on the 11th of November, was £21,418,640 (see sect. 48 for the amount on the 25th February preceding), and that the total amount of outstanding demands was £17,578,910, leaving a balance on that date in

favor of the bank of £3,839,730. The report further stated that the advances of government had been reduced to £4,258,140, and that the cash and bullion in the bank had increased to nearly £6,500,000 or upwards, or five times its amount on the February preceding; all this being true, it will be seen that the discounts of commercial bills must have been increased in the proportion of about £8,000,000 against £2,905,000, the amount in February, but it will seem, on reflection, and on comparison with the advances to the government, as exhibited in the appendix at the conclusion of this article, that the whole report was a singular misrepresentation of the facts of the case, to answer the purposes of the moment; at all events, it will be seen that both the temporary advances to the government, and issue of notes, progressively increased from the close of the year 1797 up to the peace of Amiens in 1802-3, and the following statement exhibits the progress and duration of that restriction, which the Lord Chancellor in the Lords, and the finance minister in the Commons, so solemnly declared was to be only temporary.

55. The first act passed, relating to the subject was dated the 3d March, 1797, 37 Geo. III, cap. 28, authorising the issuing of notes for £1 and £2 each; the amount of such notes in circulation on the 26th August of that year was £934,015; for the progressive increase of their circulation see appendix.

ACTS RELATING TO RESTRICTION.

Year of Reign.	Date of Act.	Purport and Duration.
37 Geo. III. cap. 45.	3d May, 1797.	Indemnity for order in council, and to continue during the following month of June.
— — — 91.	22d June, —	
38 — — 1.	30th Nov. —	Extended to one month after the meeting of the next session of parliament.
42 — — 40.	30th April, 1802.	
43 — — 18.	28th Feb. 1803.	Further extended to one month after the ratification of a definitive treaty of peace, which took place on the 25th March, 1802.
44 — — 1.	15th Dec. —	
		Further extended to 1st March, 1803.
		Still further, to six weeks after the meeting of the next session of parliament.
		Again, to six months after the ratification of a definitive treaty of peace.

This brings the history of the restriction down to a most interesting and important period of its operation; so far, it is important to understand, that notwithstanding the introduction of paper as a circulating medium, gold at the rate of 77s. 10½d. per ounce continued to be the legal standard of value, and such was the incongruity of British legislation at this period, that whilst landlords and other creditors were authorised by law to enforce payment in gold, the acts previously enumerated precluded the gold from being had, wherewith either to pay rents, or make any other payments; such however was the insidious working of the system, that up to the period of 1809 no derangement in the social economy of the state, resulting from such incongruity of legislation was perceptible.

56. In 1800 foreign gold coin commanded about 5s. to 7s. per ounce more than its equivalent value to British coin; but the short peace of 1801-2 occasioned a cessation of demand, and the price again became merely nominal. From March, 1804, to October, 1805, standard gold sold at £4 per ounce; and from October, 1805, to February, 1809, no price was quoted; in the meantime, however, all the gold coin of the realm had gradually disappeared (for the quantity coined in each year since the restoration of Charles II. in 1663, see Statistical Illustrations, folio 47, and the article MINT in a subsequent part of this work), partly for internal purposes of manufacture and ornament, and partly in aid of the external purposes of the war; not directly and openly for that purpose but the excess of

bills drawn by the commissariat and other agents of the government, on account of the expenses of the war in different parts of the world, occasioned the bills to be drawn at a discount of 10 to 15 or 20 per cent. and at such depreciation, instead of being left to operate as mere extraneous equivalents of commercial exchange, they became an object of speculation against bullion, in reference to the standard price of gold in England.

57. To render the circumstances of this very interesting and important period of the bank restriction act somewhat more intelligible to such readers as are not practically familiar with the complicated involutions of exchanges, it may not be irrelevant to state (taking the mint of France as the means of illustration), that according to the mint regulations of England and France, twenty-five francs, twenty centimes in France are equal to £1 in England; but, in consequence of the excess of bills above adverted to, in May, 1809, the £1 English in France would not obtain more than twenty francs; consequently, as long as gold could be obtained in England at the mint price of 77s. 10½d. per ounce, it yielded a profit in France of upwards of 20 per cent. against that rate of exchange, but such a disparity of value, as might naturally be expected, excited a spirit of speculation and competition, which raised the price of gold to a premium equal to the discount on the bills. So that in May, 1809, gold commanded £4. 11s. per ounce; this disparity between the mint and trading price of gold excited an universal hubbub in every part of the country, and in February, 1810, a committee of parliament was appointed to enquire into the cause of the high price of bullion, and to take into consideration the state of the circulating medium, and of the exchanges between Great Britain and foreign parts. This committee sat from the 22d of February to the 25th of May, during which time it took the opinions of thirty different persons, whose trading transactions and influence were thought to be such as qualified them to throw much light on the subject; but whether ignorant of the combination of causes that did in reality produce the disparity of value, or whether selfish motives led them to conceal their better judgment, certain it is, that although much interesting matter-of-fact information is here and there interspersed through different parts of the evidence, as a whole, it is completely destitute of every thing like a solution to the question proposed. In proof of this conclusion see article EXCHANGE, in a subsequent part of this work; and in proof of the futility of the labors of the committee, and of the frivolousness of the evidence in a general sense, bullion continued gradually to advance, and the exchanges progressively to depreciate, until on the 18th September, 1812, gold commanded £5. 11s. per ounce.

58. Such an extreme disparity of value had previously excited every species of contrivance to collect gold, and was beginning to lead to such general derangements in the internal economy of the state, as selfish and avaricious individuals availing themselves of the point of law, which authorised them to demand and enforce payment in gold, in cases where by the nature of the obli-

gation, payment in current money only was implied, that on the 24th July, 1811, an act was passed, 51 Geo. III. cap. 127, to make the bank of England notes a legal tender in all payments, which by the act of the 38 Geo. III. cap. 1. (30th Nov. 1797), were only so in private transactions, after having been accepted as such, but which were ordered to be received as cash by all the collectors of taxes and duties. The title of the act for making the bank of England notes a legal tender, in conjunction with a consideration of the circumstances which led to it, is curious, and deserves attention. It is as follows, viz. 'For making a more effectual provision for preventing the current gold coin of the realm from being paid or accepted for a greater value than the current value of such coin; and for preventing any note or bill of the governor and company of the bank of England from being received for any smaller sum than the sum therein specified; and for staying proceedings upon any distress by tender of such notes.' To continue in force till the 25th of March, 1812, and no longer.

59. By another act in the following session, 52 Geo. III. cap. 50. dated 5th May, 1812, the preceding act was extended to three months after the commencement of the next session of parliament, and no longer; and by 53 Geo. III. cap. 5, 22d Dec. 1812, further extended to 25th March, 1814; and by 54 Geo. III. cap. 52, 4th May, 1814, to as long as restriction continues; 54 Geo. III. cap. 19, 18th July, 1814, restriction extended to 25th March, 1815; 55 Geo. III. cap. 28, 23d March, 1815, further extended to 5th of July, 1816; 56 Geo. III. cap. 40, 21st May, 1816, still further to 5th of July, 1818; 58 Geo. III. cap. 37, 28th May, 1818, again to 5th of July, 1819; 59 Geo. III. cap. 23, 6th April, 1819, restriction extended indefinitely; 59 Geo. III. cap. 49, 2d July, 1819, restriction limited to 1st of May, 1823; and in the interim the bank empowered to exchange bullion in quantities of not less than sixty ounces for their notes, between the 1st of February and 1st of October, 1820, at any rate between 81s. and 79s. 6d. per ounce; and from the 1st of October, 1820, to the 1st of May, 1821, at any rate between 79s. 6d. and 77s. 10½d. per ounce; and from the 1st of May, 1821, to 1st of May, 1823, at 77s. 10½d. per ounce; when gold coin again became a general circulating medium, and, as will be seen by the statement at the conclusion of this article, the £1 and £2 notes of the bank of England were withdrawn from circulation, and to meet this change in the circulating medium in the years 1821 and 1822, gold to the amount of £14,877,547 was coined at the mint. Such is the history of the bank restriction act, which in February, 1797, was in both houses of parliament so solemnly declared to be only a temporary measure, but which continued through a period of twenty-six years.

60. Preparatory to returning again to a gold circulating medium, a committee was appointed in each house of parliament, in 1819, to enquire into the state and affairs of the bank, with reference to the expediency of the resumption of cash payments, when, after taking the opinion of about thirty persons, the act of 2d July, 1819, 59 Geo.

III. cap. 49. was resolved upon, and in the course of the enquiry on the 31st of March, 1819, the bank exhibited the following account of the state of their affairs, viz. 'That the whole of the claims upon them on that date amounted to £33,948,560, of which £24,710,770 was notes in circulation, and £9,237,790 in deposits and other debts, against which their assets in cash and bullion, bills discounted, and government securities, amounted to £39,179,750, leaving a balance in favor of the bank to the amount of £5,231,190, exclusive of the £11,686,800, permanent debt of the government, as exhibited in sect. 41, and £3,000,000 added in 1816.' Flattering as all this may seem on a superficial view of the subject, and confident as opinion generally was, of the country having escaped the peril, so earnestly warned of by Lord Lansdowne, in sect. 51, a short period only elapsed before the effects of the system, spectre-like, returned in a more terrific form than ever. Preparatory to the return to cash payments in 1823, through the years 1821 and 1822, the bank had progressively diminished the issue of its notes from an average of £22,550,000 in December, 1820, to an average of £16,393,000 in December, 1822; a depression in the money value of all the products of industry, without any parallel since the commencement of the war in 1793, followed this diminution of circulating medium. But the ordeal of the experiment of paying gold on demand having been got over, the cupidity of avarice again began to operate, and notwithstanding the accession to the circulating medium of the £14,877,547 of gold coined in the years 1821 and 1822, the bank again showed a disposition to force its notes into circulation, so far, that instead of gold supplying the place of paper for six weeks preceding the 5th of January, 1825, the bank of England notes in circulation again exceeded an average of £20,000,000; and those of country bankers had increased from £4,293,164 in 1822, to £6,724,069 in 1824, and £8,755,307 in 1825.

61. The facility of raising money among individuals, which this redundancy of circulating medium afforded, gave rise to an extent of speculation, far, very far, exceeding the notable South Sea and other adventures at the commencement of the preceding century. (See the article COMPANY, in a subsequent part of this work, for an elucidation of the extent and consequences of the folly at both periods.) Towards the month of September, however, the speculations generally began to be considered equivocal in their results; the first perceptible shock to what is technically termed credit, was experienced on the 24th of October, in the suspension of payment of one of the most eminent commercial establishments in London, or the commercial world (Mr. S. Williams, an American). After this, a month passed away in gloomy suspense, till on the 25th of November an extensive banking establishment at Plymouth (Sir W. Elford, Bart. and Co.) was the next evidence of the unsoundness and impolicy of the paper money system. This failure strengthened the doubts of the stability of others, and suspicion falling on all the banking establish-

ments in the west of England, it produced in London such a demand for gold, as excited apprehensions for the consequences to which it might lead; in the meantime the bank of England had been progressively narrowing its issues, till the amount at the end of November was reduced again to £17,500,000. On the 9th of December the suspension of payment was announced of an extensive banking establishment at York (Messrs. Wentworth, Chaloner and Co.), having branches at three or four other towns in the county, and their own house of agency in London; consternation now became general, and the directors of the bank of England, who had, as we contend, contributed to bring on the derangement, by the facility which they afforded to get their notes into circulation, in discounting three and four months bills at 4 per cent. per annum, now as suddenly took steps which accelerated the derangement. On the 13th of December the following notice was issued, viz. :—

Bank of England.

'Resolved—That from and after the 13th instant, no bills or notes will be discounted under 5 per cent. per annum.'

62. This notification added considerably to the consternation: an extensive private banking establishment, deemed one of the most reputable in London, had previously suspended its payments, and on the following morning two others were reduced to the same alternative; it would be difficult, and at all events it would exceed due limits here, to describe the dismay and confusion that now prevailed; and with the view of endeavouring to allay the ferment, a public meeting at the Mansion House, as on the memorable 27th of February, 1797, took place on the 13th of December, 1825, when about 700 signatures were obtained to the following resolutions: viz.

'1. That the unprecedented embarrassments and difficulties under which the circulation of the country at present labors are mainly to be attributed to a general panic, for which there are no reasonable grounds; that this meeting has the fullest confidence in the means and substance of the banking establishments of the capital and the country, and they believe that the acting generally upon that confidence would relieve all those symptoms of distress which now show themselves in a shape so alarming to the timid, and so fatal to those who are forced to sacrifice their property to meet sudden demands upon them, which it is no imputation upon their judgment and prudence not to have expected.

'2. That it having been stated to this meeting, that the directors of the bank of England are occupied with the remedy for a state of things so extraordinary, this meeting will refrain from any interference with the measures of the directors of the bank, who, they are satisfied, will do their duty towards the public.

'3. That having the firmest confidence in the stability of the public credit of the country, we declare our determination to support it to the utmost of our power.

'4. That it is the opinion of the meeting that declarations of a similar description with the

present, in the country towns, where the banking establishments may appear to deserve them, may be productive of much benefit in restoring general confidence.'

63. Although it was generally believed that the bank of England had been drained of nearly the whole of its stock of gold, during the memorable week between the 10th and 18th of December; yet on an average of the five weeks between the latter date and the 22d of January, 1826, the issue of bank of England notes had been increased to £25,310,000.; and that this lavish experimental issue did not lead to the necessity of again resorting to a restriction Act, was owing entirely to circumstances not at all contemplated in the deliberations which led to the increased issue of notes, and which, in fact, seem to have been issued with very little calculation on the consequences to which they might lead.

64. Notwithstanding the declaration at the Mansion House, on the 13th of December, that the embarrassments and difficulties under which the circulation of the country then labored, were mainly to be attributed to a general panic, for which there were no reasonable grounds; according to a return laid before the House of Commons on the 27th of February, 1826; in the interval of the end of October, 1825, and that date, fifty-nine banking establishments, comprising 141 partners, had been declared bankrupt, about twenty others insolvent, and every succeeding week continued to add from seventy to 100 merchants, manufacturers, and traders, to the bankrupt list, and thousands to the lists of insolvency; whilst half a million of families in the several manufacturing districts were driven to the verge of starvation, in consequence of the destruction of confidence, and suspension of commercial operations, which the uncertain issue and uncertainty in value of the circulating medium in great part occasioned.

65. Having now brought the history of the bank of England from the time of its foundation down to the period of this sheet going to press, viz. by 1826, in reference to its circulation, we will now proceed to bring down its history from sect. 41, in reference to its agency and connexion with the government. Sect. 34 shows that it originated in the raising of a loan of £1,200,000 for the use of the government, at an interest of 3 per cent. per annum, and £4000 per annum for agency; and that that transaction was, in fact, the foundation of the funding system, which has led to an extent and pressure of taxation without any parallel in the history of society, and which the bank of England has been the main instrument in occasioning. Sect. 42 shows the progress of the advances made by the bank to the government up to 1781; which advances, in addition to the interest, were all subject to a charge for agency; as was also all other sums raised by lottery, or borrowed by the government from individuals during the war, from 1792 to 1715, the total sum then amounting to £92,418,000. The terms of agency up to 1726 had varied according to circumstances, at which time it was fixed at £300 per million, afterwards increased to £502. 10s. per million; after the peace of Versailles in 17 2, when the total sum

amounted to £249,000,000, the terms were reduced to £450 per million, at which rate it continued up to 1807, when it was reduced to £340 per million, on £600,000,000., and £300 for every million above that sum; during the exaction of the property tax, the bank received at the rate of £1250 per million, on such portions of the tax as were paid in to the bank direct, and £805. 15s. 10d. per million on about £600,000,000 paid in on account of loans between the 1st of February, 1793, and the 5th of January, 1823; these several charges (including £4000 to £6000 per annum for management of lotteries), and most of which charges are likely to continue, at all events up to the period of the continuance of the charter in 1833, since the commencement of the present century, have averaged about £275,000 per annum.

66. Independently of the above species of agency, subject to specific charges, the whole receipt of taxes of Great Britain passes through the Bank of England, which, since 1803, have averaged upwards of £50,000,000 per annum; upon this branch of its agency the bank makes no direct charge, but as each separate department, paymaster, or accountant of the government, upwards of fifty in number, has its separate account at the bank, and each holding a provision for the progress of its payments, it leaves a permanent balance in the hands of the bank of from four to seven millions per annum, and during several of the last years of the war, from ten to fifteen millions per annum. The following is a statement of the amount in each of the eight years 1818—1825 according to returns made annually to parliament, viz.

Years.	Maximum.	Minimum.	Average of the Year.
1818	8,852,078	5,709,487	7,019,071
1820	5,861,631	2,246,598	3,713,442
1	7,096,874	2,302,591	3,920,157
2	7,690,046	2,867,851	4,107,853
3	8,305,174	3,698,764	5,526,635
4	10,359,773	5,000,127	7,222,187
5	9,239,024	3,197,190	5,347,314

67. By means of these balances, deposits of individuals, and the circulation of its notes (and the circulation of its notes, be it remembered, creates the means of the balances and deposits), the bank discounts the bills of individuals, makes the temporary advances to government on interest, and buys exchequer bills and other government securities, bearing interest; all these it is, in addition to the specific charge of £275,000 per annum specified in sect. 65, and 3 per cent. on the £14,686,800 specified in sect. 41, that enables the directors of the bank to divide the enormous amount of £1,455,300 per annum among the holders of the £14,553,000 of stock, as specified in sect. 43. This profuse dividend occasions the nominal £100 of stock on the bank books, to be saleable for transfer proportionate to the current rate of interest, be it 3, 4, or 5 per cent. per annum. Hence, on the

10th of May, 1816, £100 of stock commanded £262, and this leads us to an elucidation of the transaction adverted to in sect. 42. In 1816 the directors of the bank offered to lend the government a further sum of £3,000,000 during the continuance of their charter, at the moderate rate of interest of 3 per cent. per annum, the current rate then being about £4. 5s. per cent.; and such was the blindness, as the writer of this paper regards it, of the government at that time, that the Chancellor of the Exchequer actually held it up in parliament as one of the most disinterested acts of kindness and generosity of a public body that he had ever known: but the reader should mark the sequel.

68. There was another proposition connected with the transaction on the part of the directors of the bank, to the following purport, viz. That they should be empowered to add 25 per cent. to their then permanent capital of £11,453,330. This being complied with, what did the transaction amount to? Certainly to empower the then holders of bank stock to levy a contribution of from £7,000,000 to £8,000,000 on the public for their own exclusive benefit, because no new subscription was called for, nor was the £3,000,000 purported to be lent, the property of the bank, but simply a reduction of the balances of the public money, which the bank held as the agent of the public; which by this act they were empowered to convert either into a marketable commodity at from £262 to £220 for every £100, or to retain it as a permanent accession of capital equivalent thereto.

69. Another transaction between the bank and the government, equally disadvantageous to the public, took place in 1823, act of 4 Geo. IV. cap. 22. This act, which, under the title of Military and Naval Pension Bill, was virtually an act to raise money for the purpose of sustaining a sinking fund, granted an annuity to the bank

of £585,740 for forty-four years, from the 5th of April, 1823, in consideration of the bank paying to the government the sum of £13,089,419 in thirteen irregular instalments between the 5th of April, 1823, and the 5th of July, 1828. As the actual result of this transaction depends upon the rate or terms at which the £13,089,419 or a corresponding sum, may be expended in the purchase of 3 per cent. stock, prior to the payment of the last instalment, we are of course (in May, 1826) precluded from stating with accuracy the precise extent of its disadvantage to the public. But, according to one (the eighteenth) of a series of resolutions on the state of the nation, submitted to the consideration of parliament, by Mr. Hume, on the 4th of May, 1826, it appears that £6,917,569 of the amount received up to the 6th of January, 1826, had been expended at a rate equivalent to £7,858,188 of 3 per cent. stock, whilst the equivalent of 3 per cent. stock given for that portion of the amount was £9,476,110, consequently a bonus to the bank equal to £1,617,922 of 3 per cent. stock; but, by mathematically correct working of the transaction in 1824, when the 3 per cent. stock was at 95, and assuming that rate for the expenditure of the remainder of the instalments then to be paid, the result would have been on the 10th of October, 1828, a cancelling of perpetual annuity to the amount of £365,880, leaving an excess of £219,852 per annum, payable for 38½ years, equivalent to an annuity in perpetuity of £146,962; and supposing from the date of the last instalment in 1823, 3 per cent. stock should recede to 60, or the rate of interest become permanent at 5 per cent. per annum, the excess of the annuity of £219,852 for 38½ years, would, at the expiration of that period, be equal to £29,381,900 of 3 per cent. stock, or an annuity in perpetuity of £881,457, consequently a disadvantage to the public to that extent for ever.

70. The following is a Statement of the Income of the Bank at the period of this article going to press.

Interest on the £14,686,800 permanent Debt of the Government, at 3 per cent.	£440,604
Annuity for 44 years, from 5th of April, 1823	585,740
Charge for transfer of the Public Funds, and Payment of the Annuities, about	275,000
Interest on Notes in circulation, say £20,000,000, at an average of 4 per cent.	800,000
Total	£2,101,344
From which the following charges and liabilities must be deducted, viz.	
Salaries of about 1000 Clerks	£250,000
Stationary, Coals, Candles, and House Expenses	50,000
Repair of Buildings, Taxes, &c.	20,000
Composition for Stamps	50,000
Loss on Bills Discounted	50,000
Law Expenses, Gratuities, &c.	20,000
Net Income	£1,661,344

Being upwards of 11 per cent. on the amount of stock constituting the permanent capital annually divided upon, against which, however, £5,000,000 of the loan of 1823, for which the annuity of £585,740 was obtained, remains to be paid up; but, if the resources of the bank have hitherto been such as to enable it to advance the £8,000,000 without entrenching more than 2 per cent. upon its profuse income, but little doubt remains that it will be able to fulfil the contract without any further entrenchment, and if so, the whole annuity then remains clear income for the remainder of the period, viz. 38½ years. The amounts deducted from the gross income are entirely assumed, there being no authentic data before the public on the subject; they probably exceed the actual expenses.

71. In the preceding view of the total income of the bank, no notice is taken of interest on the temporary advances to the government, nor of profits by discounting, nor of interest that may be derived from the balances held by the bank, due as well to depositors as to the government; because the first, that is, the temporary advances to the government wholly, and the others partially, merge in the aggregate amount of interest derived from the circulation of its notes.

72. Since 1826, when the preceding part of this article was written, great and important changes in the practice and principles of Banking in England have taken place, the particulars and consequences of which, we will now proceed to elucidate. The expiration of the Charter of the Bank of England in the present Year, [1833] occasioned, in 1832, a committee of parliament to be appointed "to inquire into the expediency of renewing the Charter, and into the system on which Banks of issue in England and Wales are conducted, &c. &c." The committee, which was composed of thirty-two members of the House of Commons (five a quorum), called before them twenty-two individuals, considered to be practically well informed men, to whom, collectively, 5973 questions were put, whose answers fill 430 printed pages of large folio, upon which evidence the committee reported, "That on all the points into which they were appointed to inquire, more or less information will be found in the minutes of evidence, but on no one of them is it so complete as to justify the committee in giving a decided opinion." Many of the questions apply to the effect which the Foreign Exchanges have upon the price of Gold, and their consequent influence on the internal circulating medium; and a classification of these subjects belongs to the articles *Circulating medium*, or *Currency*, and *Foreign*, rather than to Banking; they are, however, so intimately connected with it as to render reference to them necessary to a complete elucidation thereof; we shall, therefore, hereafter again refer to them in continuation of the present article. Inapplicable as many of the questions put by the committee were, and insufficient and unsatisfactory as its labors have been, as far as the question of a development of the just principles of Currency and Banking is concerned, there are several accounts annexed to the evidence that contain information

of the most important kind, and from which many just conclusions may be drawn; all of the most interesting and material of these accounts will be found exhibited in four statements at the conclusion of this article, and they will be adverted to in detail as we proceed in the further elucidation of the subject.

73. Independent of the Bank of England, which constitutes so prominent and important an adjunct to the great trading transactions of the Metropolis, there are also at this time [1833] about sixty other Banking establishments of deposit, discount, and agency in the Metropolis, and about 650 others in different parts of Great Britain, which are also banks of issue, as well as of deposit and agency. Previous to 1797, while all notes payable on demand were convertible into gold at the standard price of £3. 17s. 10½d. per oz., or into silver at 5s. 2d. the oz., the practice of most of the provincial or country bankers was, to issue notes of £5 and £10 each, and partially of £20, £30, and £50 payable on demand, at some one of the most accredited of the sixty-five to seventy banking establishments in the metropolis. These notes it was the practice to advance, on interest, to the trading and agricultural producers of their respective districts; but as these notes, being payable on demand, were, within a week of their being issued, even from the most distant part of the country, liable to be presented for payment, the issuer was, in all cases, required to deposit with his agent in the metropolis an adequate sum or security for their amount, as well as being provided to pay them on demand at the place from whence issued; whereby it appears that two protecting capitals are required to keep one in circulation; and hence the difficulty, on a partial view of the subject, of discovering how the advantage to the issuer of the notes arises. This will be explained by supposing the total amount of promissory notes issued by any one country banker to be £20,000; a protecting capital of £5000 in the Metropolis, and £1000 or £2000 at the place of issue, will suffice; the interest upon the difference will be profit, less the expense of stamps, paper, and management; three-fourths of the amount issued, on an average, keeping permanently in circulation or dormant in the drawers of the traders and farmers; but, independent of the profit derived from circulation, some country bankers charge a commission of one-fourth per cent. upon all accounts which are allowed to be occasionally overdrawn; and to such of his connexions who become his creditors he generally allows interest only at the rate of two or three per cent. per annum., while he charges all his debtors four or five per cent., or some such difference. The great epoch, however, of advantage to the provincial banker commenced with the suspension of cash payments in 1797, when notes under £5 were allowed by law to be issued; the small notes, chiefly of £1, sometimes of £2, were generally payable only at the place where issued, and consequently required no protecting capital in the metropolis, or elsewhere, to sustain them; their circulation was maintained entirely by the credit and character of the party issuing them. Columns number

3 and 4, of the Statement number IV., will show the estimated annual amount of country bank notes in circulation, about three-fifths of the amount being in notes of £1 and £2, as well as the number of establishments licensed to issue the same.

74. Payment in cash being suspended (see section 55) until six months after the ratification of a definitive treaty of peace, the small note circulation received its first check after the peace of Paris in 1814; but re-attained its wonted vigour again in 1817-18, see columns 3 and 4 of statement IV. From the close of the latter year, when the return to gold payments at the standard of 1797 was determined upon, the small note circulation experienced a second check, from which an effort was made to recover it in 1822-3, but in the year 1825, in consequence of circumstances detailed in sections 60 and 64, their circulation was entirely prohibited, the Bank of England having voluntarily withdrawn their small notes in 1821. * Up to the period of 1826, the practice of provincial banking in England and Wales had been carried on principally by individuals, or by partnerships of two or three; and here and there, but very partially, of four or five members; but the discredit which fell upon individual country bankers in 1825-6, as detailed in section sixty-four, and the disinclination of many to afford any accommodation on credit, has led since that date to the formation of Joint Stock Banking Establishments, at each of the under-mentioned places, viz.—

Liverpool.	York.
Manchester, 2.	Darlington.
Manchester and	Lancaster, 3.
Liverpool, 9.	Whitehaven.
Birmingham, 1.	Carlisle 7.
Wolverhampton.	Leicester.
Sheffield.	Norwich, 9.
Barnesley.	Stamford & Spalding.
Bradford.	Gloucester.
Halifax.	Langport, 14.
Huddersfield.	Plymouth and
Knaresborough.	Devonport.

The figures following certain of the places denote the number of branches respectively established by those banks. The Bank of England has also established branches at each of the eleven following places, viz.—Liverpool, Manchester, Leeds, Birmingham, Bristol, Gloucester, Swansea, Exeter, Norwich, Hull, and Newcastle.

75. In Scotland there are about thirty-five banking establishments, all, except three, issuing notes of £1 and £2, as well as for larger amounts. The commercial banking company of Scotland, at Edinburgh, has thirty-one branches; the bank of the British linen company, twenty-seven branches; and the bank of Scotland, sixteen; and eighteen other establishments have together fifty-nine branches, so that altogether there is in Scotland between 160 and 170 offices of discount, deposit, and agency. Of these about fifteen may be regarded as private establishments, and the remainder joint stock partnerships; their total issues of promissory notes amount to about £3,500,000, in the proportion of three-fifths of £1 and £2. In Ireland, subsequent to its union

with Great Britain in 1801, banking establishments became numerous, increasing during the war to sixty or seventy; but, on the return to payment in gold in 1823, about ten only remained solvent and in practice. In 1783, the Bank of Ireland was established with a capital of £600,000, afterwards increased to £3,000,000, with exclusive privileges, corresponding with those of the Bank of England; the circulation of the Bank of Ireland, on an average of five years preceding 1826, amounted to about £5,000,000, in the proportion of about one-third of small notes under £5; and the circulation of all the other banks at the same time amounted to about £1,200,000. In 1825, a company was formed in London with a subscribed capital of £2,000,000, under the title of the "Provincial Banking Company of Ireland," which has established branches at eighteen of the principal towns in that country, at a greater distance than fifty miles from Dublin, within which limits it was precluded by the privileges of the Bank of Ireland from issuing of notes. The provincial Bank of Ireland, as well as all the banks of Scotland, like the country banks of England and Wales, charge a commission on all the amounts which pass through their hands, and allow and charge interest in like manner.

76. In the three preceding sections we have exhibited, in brief outline, the nature and extent of the provincial banks of issue in the three several parts of the United Kingdom, preparatory to showing the way in which they are connected with the transactions of the metropolis. To the American reader of our work to whom the practice of banking (in a way to which we shall hereafter advert) is so familiar, it may be interesting to know that, not only does the whole receipt of revenue of the United Kingdom pass through the metropolis for redistribution, but that the payments of all the great transactions of the kingdom are also there equalized or balanced; this general concentration of the whole money transactions of the kingdom, gives to the private banking establishments of the metropolis, a character peculiar to themselves; they neither issue notes, nor, on the transactions of the metropolis, do they charge any commission, yet several of them employ from forty to sixty clerks, while their contingent expences are on a proportionate scale. Since 1824, eleven of these establishments have suspended their payments, and the greater number of them proved great defaulters; at the present time (1833) there are fifty-nine in operation, of which, thirty-five are located within two or three minutes' distance of the Bank of England and Royal Exchange, ten in the more western part of the city, and the remainder in Westminster. The transactions of ten of those located contiguous to the Bank of England are on a very extended scale, and among whom the agency of the country banks is principally divided; the transactions of ten or twelve others may be regarded as inconsiderable, and each of the remainder as giving employment to from fifteen to twenty-five clerks.

77. The private banking establishments of the metropolis are formed of two, three, or more partners, in very few instances exceeding five;

the requisite qualifications, either for commencing a new banking establishment or for being admitted a partner in an existing one, are, 1st. a money property of from £30,000 to £50,000, 2nd. prudent habits, and 3rd. a general good moral character. The practice of the metropolis being for every merchant, trader, and professional practitioner to deposit his daily or weekly receipts of money with some one of the banking establishments, the total number of depositors probably amount to about 30,000; this gives an average of about 500 accounts to each bank, supposing them equally divided; upon these deposits no interest is given, nor, on the other hand, is any commission charged on their being withdrawn; but, as many deposits thus made form collectively a large sum, the banker obtains his advantage by using it in the discounting of bills, it being understood between the depositor and the banker that, as a compensation for managing his account, the depositor will keep a permanent balance with his banker of £200, £500, or £5,000, as the case may be, according to the nature and extent of his transactions: thus, supposing a banker to have only 500 accounts, and the standing deposit of each to average only £500, this would afford a discounting capital to the banker of £250,000; this will serve as an example, but the deposits in each of about twenty of the principal establishments will probably average five or ten times that sum.

73. It is not what may be considered the permanent balance of the deposits, which alone constitutes the means of advantage to the economical banker. The respectable merchant and trader does not confine his balance to a specific sum; but he provides by anticipation for his payments some days previous to their being due, and at other times his receipts come in without any immediate demands being made upon him: all these contingencies tend to augment the banker's balances, and means of discount; and thus a thousand sums, which remaining in the hands of individuals would be useless, by being concentrated in banks of deposit become available for being made constantly active and profitable. It was with these deposits so concentrated that the Exchange bills exhibited in col. 13 of statement III. were kept in circulation; during the war from 1792 to 1816 those bills carried an interest of 3*d.* to 3½*d.* per £100 per day, and, by being daily convertible, they enabled the metropolitan banker at all times to convert his depositors' balances to a profit; but, since the termination of the war, the interest on those bills has been progressively reduced to 1½*d.* per £100 per day, and at that reduced rate they command a premium of from 5*d.* to 3*s.* per £100, which renders them of very precarious advantage as absorbents of temporary balances, and confines the application of the deposits more exclusively to the discounting of bills of exchange. Previous to 1725, with the exception of the Government account and that of the East India Company, the transactions of the Bank of England, as a bank of deposit, were comparatively inconsiderable; but, in consequence of the devastation at the close of that year, as detailed in sect. 61, when six of the private bank-

ing houses of the metropolis were involved in the general wreck; the distrust thereby occasioned led to the transfer of a number of accounts from the private bankers to the Bank of England, as may be seen by the increase of deposits, as exhibited in col. 7 of statement IV.

79. It having been shown that the interest derived from the deposits is the only source of emolument of the private bankers of the metropolis upon the metropolitan part of their transactions, if the extent of the deposits was ascertained, their aggregate emolument might be pretty accurately determined; but, in the absence of all authentic data, the best that can be done here is to assume some basis whereby an approximation to the amount may be arrived at; the expenses of about fifteen of the principal establishments, ten in the city and five in Westminster, will approximate to £8000 per annum each, in clerks' salaries, rent, taxes, and contingencies; of thirty others about £5000 each, and the remaining fifteen about £2000 each,—making a total of £300,000 per annum; if to this we add £2000 per annum each, as the personal expenses of 240 principals, being an average of four partners to each establishment, £480,000 per annum more is required to meet those expenses, making together a total of £780,000. To meet this amount, at the present prevailing rate of interest, deposits to the amount of about £25,000,000 are required, and to be constantly employed, leaving nothing for defalcations and such like contingencies; £25,000,000, divided among sixty establishments, gives an average of £416,600; when a second-rate establishment has been suspended in its operations the claims upon it have run from £300,000 to £400,000; but with from ten to fifteen of the principal houses the deposits will doubtless amount to £1,000,000 or £1,500,000, and the aggregate probably approximates to £30,000,000, in the following proportions, viz. with the

15 principal establishments	£1,200,000 each,	
30 second class	do.	300,000
15 minor	do.	150,000

These give a total of £29,250,000, and require 30,000 depositors, in the following proportions, viz.

1000 averaging £5000 each	£5,000,000
1000 do. 3000	3,000,000
4000 do. 2000	8,000,000
4000 do. 1000	4,000,000
10,000 do. 750	7,500,000
5000 do. 200	1,000,000
5000 do. 150	750,000

30,000	£975	£29,250,000
--------	------	-------------

80. As all what are termed first-rate bills, that is, bills of unquestionable validity, have for the last four or five years been discountable at the rate of 3, to 3½, or, as an extreme case, 3½ per cent. per annum, £30,000,000, allowing £5,000,000 as a necessary rest or reserve, to meet daily contingencies (to which we shall again advert), will barely provide for the current expenses, in addition to which the personal expenses of several of the individual principals engaged in banking are stated to amount to £20,000 per annum, and a number of them to

£10,000 and 5000 each; and, at the present time, the personal expenses of the collective partners of one of the principal establishments are stated to amount to £80,000 per annum, whose fortunes at the commencement of the war in 1793 were inconsiderable, not exceeding £60,000; the profits of another establishment, it is pretty well understood, for two or three years previous to the termination of the war, exceeded £100,000 per annum, while the personal expenses of the principal partner did not exceed £2000 per annum; but from 1798 down to 1819, in addition to the emoluments derived from the metropolitan deposits, the emoluments derived from the agency of the country banks, as exhibited in col. 4 of statement IV., was very considerable, and equal probably to that derived from the metropolitan deposits. The emoluments of the London bankers by the agencies of the banks of Liverpool, Manchester, and Leeds, are supposed, at one time, to have amounted to a very considerable sum, and that one of the Manchester establishments alone is stated to have been equal to £10,000. It will not be out of place here to state that the practice of the banks in Liverpool and Manchester was and still is an exception to the practice of all the other provincial banks; those of Liverpool and Manchester never having been banks of issue, but exclusively of agency, charging $\frac{1}{4}$ per cent. upon all transactions: the nature of their practice is, to take the bills drawn and received in payment for the produce and manufactures sold in the respective places, and supply the merchants and manufacturers with Bank of England notes and cash for their current demands; in addition to which the bills so drawn in themselves constitute an important feature in the circulation of that district of the kingdom; and, as the practice is peculiar to the district, and is as interesting and important as it is peculiar, it merits more than an ordinary share of attention from the legislative as well as general inquirer, not merely in comparison with the practice in other parts of Great Britain, but as having no comparison with the circulation and practice of banking in any other part of the world; we shall therefore endeavour to show its extent and practice.

81. The imports into Liverpool, including those from Ireland, have averaged, during the last fifteen years, about £20,000,000 per annum; and the annual value of the manufactures of the district of which Manchester is the centre have averaged about £50,000,000 per annum; for, although the quantity has doubled during the period, the reduction in value has been in a ratio corresponding as near as possible with the increase of quantity. Upon these transactions but few bills, comparatively speaking, are created in Liverpool; while about £35,000,000 on London are created in Manchester, in the proportion of about £17,000,000 for the proportion of cottons and yarn exported, and £18,000,000 for the consumption and re-distribution of the metropolis; the remaining £15,000,000 are paid for by other bills carried in or remitted by the country shopkeeper. (Draper.) Hence bills, as here described, to the amount of about £50,000,000, annually pass through the hands of the Manchester bank-

ers, at present (1833) eight in number. In Liverpool the prevailing condition of all contracts is 'payment in *approved bills*, not exceeding three or four months' date;' then, as the bulk of the imports into Liverpool are worked up or consumed in the district; the cotton dealer, or spinner, the grocer, provision dealer, &c. obtain from their bankers in Manchester such portion of the bills previously mentioned as their transactions require; hence it will be seen that these bills constitute the chief circulating medium or means of exchange between the place of import and distribution. The remainder of the bills created and received in Manchester are in due course remitted to the metropolis, in exchange for such foreign produce and productions thereof as are supplied from thence into Lancashire; and then, as all the produce imported into Liverpool is drawn for at the places of export in bills payable in London, all the bills carried into Liverpool from the Manchester district are ultimately remitted to the metropolis, to meet the payment of the bills so drawn, on account of the imports; and, as the bills made payable in London are generally addressed to some accredited banking house, the remittances from Liverpool are commonly made through the banking houses of that place.

82. By the preceding section it will be seen that the practice of the Liverpool and Manchester bankers consists more of endorsing and rendering valid, or *approved*, the bills created and received for the manufactures of the district than in receiving and disbursing of cash deposits, and that it is consequently a practice requiring the utmost discretion and judgment, and differing essentially from the practice of the metropolis. The risks and liabilities of the Liverpool and Manchester bankers are exceedingly involved, inasmuch as their transactions are not confined to the bare passing through their hands the £50,000,000 per annum which the manufactures of the district give rise to, but they exchange bills of large amount for smaller, and *vice versa*, as the wants and conveniences of their connexions require; and, although these transactions do not add to the aggregate liability, they add to their complication. The practice of the bankers of Leeds, of Sheffield, of Birmingham, and of all the other manufacturing districts, as well as of the provincial banks in general, is similar to that of the bankers of Liverpool and Manchester, in regard to their endorsing and exchanging of bills, but differed from them in their practice, during the small note circulation, of issuing their own promissory notes to supply the current cash demands of their respective districts, which their £5 and £10 notes at present in part supply; but, as in the case of Liverpool and Manchester, the bills created in all the other manufacturing districts are all drawn upon or made payable in the metropolis, they consequently give rise to daily exchanges between about thirty-five of the metropolitan bankers to an extent incredible to persons unacquainted in some degree with the practice of banking transactions.

83. The aggregate transactions of the metropolitan bankers, exclusive of the Bank of

England, are stated to amount to from £3,000,000 to £4,000,000 daily, and occasionally to exceed the latter sum. The economical means devised for the daily liquidation and settlement of the claims of the bankers upon each other is the nearest approximation to perfection in social arrangement ever arrived at: some of the principal Westminster establishments have accounts with those in the city in a way not dissimilar to the provincial bankers; then, about thirty of the principal houses each send a clerk to a common rendezvous, where they exchange the claims of their respective houses upon each other. The place where this exchange takes place is in Lombard Street, in the immediate vicinity of all the principal banking houses, and is termed the *Clearing House*; the first meeting takes place at one, and the last at four o'clock in the day; and by this arrangement claims of millions are settled in an hour, with a very inconsiderable sum. To the uninitiated it may be proper still further to explain that when the merchant or

trader of the metropolis accepts a bill he usually accepts it payable at his bankers; and in like manner, in making cash payments, they give a *cheque*, or *order*, on their banker, and at the same time write across it the name of the banker to whom it will be paid, which practice serves at once as a receipt on one side and security on the other, because, when so written upon or crossed, in the event of being lost, no injury can accrue to either party, inasmuch as the crossing implies that it must pass the *Clearing House*, and therefore prevents its being paid to any undue person. It must be understood, however, that the payment in cheques is not usually made for amounts less than £5; at one time the Bank of England would not pay or recognize cheques of less than £10, and some houses of business make it a rule not to draw for a less sum; but this depends entirely on circumstances, and occasionally, as an exception to the general rule, a cheque may be given for as small an amount as 30s. or even 25s.

84. The following statement will suffice to show the way in which the daily transactions of those bankers who associate at the *Clearing House* are equalized:

	A	B	C	D	E	F	G	H	Totals.
	£	£	£	£	£	£	£	£	£

To pay	7,474		2,605	7,869		2,030			19,978
To receive		380			5,172		12,718	1,708	19,978

85. Suppose the letters A to H here to represent so many banking concerns. The lines of the first division of the statement show the amounts which each respectively claims, or has to receive, of the other, and the columns the amounts which each has respectively to pay; while in the second division the amounts are reversed, viz. the lines show the amounts claimed, and the columns the amounts which each has to receive of the other. The total amount carried in is £643,249, which amount, without some such mutual arrangement, would have to be paid in

money twice over. It is true an exchange might take place at the counters of the respective houses, and the balances only paid or received; but this would be attended with great loss of time and considerable payments, while, by the arrangement adopted, no money payment is necessary if the bankers have confidence in each other; because, with the exception of an occasional very large amount, the *balance notes* given one day would probably equalize themselves the next, so that if each banker was to deposit Exchequer bills for mutual security, according to the extent

of their respective transactions and probable occasional balances at the clearing house, their exchanges might continue, *ad infinitum*, without a shilling of money ever being required, and the banking of the metropolis resolve itself, by this practice, into a joint stock security, with the superior advantage resulting from individual confidence; while a daily account, made up in the form as exhibited above, would show the working of the money transactions of the metropolis, in a way to enable just and important conclusions to be drawn from them.

86. According to the previous statement the aggregate balance arising out of an exchange of £643,249 is £19,978, or about 3 per cent.; this, however, does not show the extent of money requisite to equalize each day's transaction, as will be seen by the account of B, which in the aggregate, balances within the trifling sum of £380, but which, when exhibited in detail, shows a balance of £9,471, viz.

	B claims. £	Claimed of B. £	B has to receive. £	B has to pay. £
A	12,682	9,872	2810	
C	7,641	7,157	484	
D	4,627	5,117		490
E	23,219	27,689		4470
F	9,760	13,891		4131
G	26,541	23,814	2727	
H	18,322	14,872	3450	
	102,792	102,412	9471	9091
		Balance to receive	380	

It will be seen by these statements that, however irregular the claims of the respective bankers may be on each other, in the aggregate the balances to be received or paid exactly correspond with each other, and thereby it may be seen how advantageously the use of money may be economised by mutual arrangement; and it is by such arrangements that the half-yearly payment of the dividends in January and July, to the amount of £8,000,000, are effected with about £2,000,000 of money, as may be seen by the statement No. 1 of the weekly circulation of bank notes, at p. 474*. To make this more intelligible to the uninitiated it may be proper to state, that at the National Debt department of the Bank of England an order, termed a *warrant*, is given for the amount of the dividend, which warrant is convertible into money on demand, at another department of the Bank; but when the warrant is received by such persons as keep banking accounts, it is not converted into money, but carried to their banker, and it then enters into the general exchange with the Bank of England at the *Clearing House*, or in account with the respective private bankers, and thus the considerable sum with which the payment of £8,000,000 in amount is half-yearly effected.

87. Having thus far traced the progress of banking in Europe, from the earliest period of its practice, and shown its nature and extent in the United Kingdom at the present time, before

we proceed to show its nature and extent in France and America, we will offer a few observations on the prevailing excitement in England in regard to its expected future practice. That it is destined to an important change is certain, from more than one cause: the expiration of the charter, and the present ascendancy of the Bank of England, with its claim of about £33,000,000 on the government, coupled with the imaginary difficulties and certainly prevailing extensive distress of the nation, strong prepossession in favor of joint stock banks, and vulgar prejudice against private banks, are all circumstances which imply that an important change must take place. It is not, however, the question of banking, so much as of currency, that claims consideration; whether the energies of the people shall be bound in chains, and fettered with logs of gold, or whether some means as elastic as their energies shall be applied, that those energies may produce their proper force and effect, is still more immediately the question which ought soon to be decided; and without stopping to show the relative advantage or disadvantage of national, compared with joint stock or private, banks, we will first proceed to show the basis upon which the currency, or circulating medium of the country, now ought to be founded: this, however, unavoidably leads us to refer to the account commonly called the National Debt, but which term is a solecism, inasmuch as it is quite as much a credit, as it is a debt.

88. It will be seen, on reference to col. 2, of statement II. p. 476*, that on an average of seven years preceding the war declared against France in February 1793, the expenditure of the government did not amount to £18,000,000, including the charges of collection of the revenue, from which amount it progressively increased to upwards of £130,000,000, in 1815, more than seven-fold; the revenue, however, was increased only from £18,000,000 to £71,000,000, or about four-fold, the difference being effected, first, by the creation of bills, as shown in col. 13, of statement III., then funding them, and by the raising of loans, as shown in col. 3, of statement II. The most remarkable feature displayed in statement II. is, that during the first five years of the war, while the expenditure was increased from £18,000,000 to £50,000,000, no increase of taxation, comparatively speaking, took place; but when the operations of the war had absorbed the £18,000,000 value of gold, which had been coined during the eight previous years (see col. 14), and placed the country in a situation the most peculiar, a paper circulation was resorted to (see cols. 4, 5, of statement II., col. 3 of No. IV., and sect. 73); then it was, for the first time, shown what society, when unfettered, is capable of; it enabled England to advance her revenue with increasing facility from less than £20,000,000 to more than £70,000,000 per annum, in the course of eighteen years, and not only to contend single-handed for the supremacy of the world, but to advance at the same time all the means of social enjoyment in a corresponding degree; and, in 1815, to attain the object for which she had for twenty-three years contended,

not exhausted of, or diminished in, her resources, but, on the contrary, surrounded by an extent of scientific and mechanical power, a facility of interchange, and a moral force, without a parallel in the history of human action.

89. But what is the situation of the country now? (1833) An accursed delusion in respect to gold, like an *ignis fatuus*, has dazzled the understandings of men, and, with one or two alternations, led to eighteen years of prostration as deplorable as the previous eighteen years of advancement is even now delightful to look back upon. This declaration will doubtless induce the sciolist to exclaim, Oh! here's a paper money advocate for you! Simpletons, who do not seem to know the distinction between use and abuse, or, at all events, if they do know it, seem never to have entertained it. We will therefore show the distinction; but we must previously show the state of the annuity account, called the National Debt, in 1793, compared with its amount at the present time, and the state of the account between the Bank of England and the Government at the same two periods; and we shall then, in our development of an entirely new principle of currency, clearly show the distinction between the use and abuse of a paper circulating medium. The amount of government annuities, at the commencement of the war in 1793, was £9,200,000, reduced by the extinction of certain life and other terminable annuities, and by redemption of land tax, &c. to about £7,200,000; the total amount now payable being £28,340,000, leaves £21,140,000 created since 1792. Now, on reference to the statement of loans raised, and bills issued and funded, cols. 3 and 13 of statements II. and III. it will be seen that every pound of these annuities was created, not for gold received, but for paper; and for paper, if convertible at all into gold, a great part of it was at the rate of £5. 7s. to £5. 11s. per ounce. Mark, then, the injustice, as well as the folly, of endeavouring to enforce the payment of these annuities, as well as all other proportionally increased amounts, in gold at the fixed rate of 77s. 10½d. per ounce. Next, with regard to the Bank of England, sect. 42 shows the progressive increase of the subscribed capital of the Bank, from its foundation in 1694 down to 1781, at which sum it remained fixed down to the close of the war in 1815; the two following sections show the rate of dividends and amount of bonuses derived therefrom, during the same period, and down to the present time (1833); sect. 67 shows that an augmentation of £3,000,000 to the capital took place in 1816; and col. 8, of statement III., shows the amount of a further sum of between £18,000,000 and £19,000,000, which the Bank now claims of the Government, making together a total claim, as stated in sect. 67, of about £33,000,000. The amount advanced, as explained in sect. 69, is included in the amount exhibited in col. 8.

90. The total nominal value of the annuities, or, in other words, the capital of the National Debt, as it stood at the commencement of the present year (1833), was £755,000,000, for £24,100,000 of the annuities, the remainder being life and other terminable annuities, except

about £650,000 for interest on the Exchequer Bills, as exhibited in col. 13, of statement III. The £755,000,000 of capital above stated stands under twenty or more denominations of 3, 3½, and 4 per cents., distinctions as unnecessary as they are elusive; therefore, preparatory to the adoption of the measure we are about to propose, it is necessary that all the various descriptions of stock should be consolidated into one denomination, a measure as desirable for its own sake, as it is in reference to the proposition we are about to advance; in reference to which it is desirable that they should be converted wholly into a 3 per cent. stock; that being done, the amount of the account will somewhat exceed £800,000,000, which account is now, instead of gold, to be made the basis of the circulating medium of the country. Suggestions have been frequently and repeatedly offered for liquidating the National Debt, by converting it into currency; but the suggestions have invariably been vague and irrational, bespeaking an entire destitution of all knowledge of the exact relation either of the debt or of currency with the aggregately combined interests of the nation. In the first place the extinction, or even diminution, of the debt is neither necessary nor desirable; but, were it otherwise, there is no means of either extinguishing or reducing it without producing a diminution of power in the body politic, like the loss of a leg or an arm to the body physical: from the manner in which it has grown up it has become an essential and indispensable part of the aggregate combination; and, if it can at all be considered a grievance, it is more than compensated for by the scientific and mechanical power, now in operation, which the funding system has mainly been the means of creating.

91. The £800,000,000 nominal value of the annuities being made the basis of the currency, to make the currency invariable, the nominal value of the annuities must be made invariable; and this is to be effected by means at once simple, and as important to the aggregate interests of the nation as they will prove effectual for the purpose of affording an invariable currency. The government henceforward must be the only manufacturers of the currency in £1 and £2 notes, as well as of larger amounts; £100 of such notes to be always exchangeable for £100 of the consolidated stock, and, *vice versa*, the stock in like manner always exchangeable for £100 of notes. The established rate of interest being 5 per cent., the difference between 3 and 5 per cent. will be the means of profit to the bankers and agents of distribution. By the adoption of such a measure, gold, like any other metal or commodity, will find its level of value as an article of merchandize, and the energies of the country will be at once relieved from the golden fetters with which (heavier than iron or lead) they have for eighteen years been bound. This measure being resolved upon, the first step to be taken, after the consolidation of the stock, will be to provide notes for all applicants, and then settle the claim of £33,000,000 with the Bank of England. The directors of that establishment, doubtless, imagine that they are entitled to claim £33,000,000 in gold, at

77s. 10½d. per ounce; but £11,642,400 is all they are entitled to receive in gold, all beyond that amount has been created in paper, and in paper only ought it to be paid; let, then, the claim of the Bank be settled by paying the subscribed capital back in gold, at the rate at which it was received, and the remainder in the national paper proposed as the only future circulating medium of the country, which gold and paper would form the future capital of the Bank of England.

92. Under the arrangement proposed in the preceding section all obligation between the Government and the Bank is dissolved; the Bank stands on its own bottom, with means and in a condition to pursue the occupation of bankers, like any other establishment, with the difference in their favor of a larger capital; if they should prefer funding their notes, or any part of them, let them do so: another establishment upon an equal scale of efficiency would doubtless be formed; the government business is open to the existing establishment, or to any other which may be formed; in either case it will be the duty of the government to take care that it is transacted on the most economical terms for the public; by economical we do not mean the lowest rate of terms, but those which afford the greatest security and facility. As the proposed currency is totally unconnected with gold, the £11,642,400, which the Bank will be entitled to receive at 77s. 10½d. per ounce, in its settlement with the government, will be at the disposal of the Bank as merchandise, like any other metal; should a demand ensue either to facilitate the transfer of capital from British to foreign security, or for procuring corn or any other article of production, the price of gold will rise in proportion to the demand for it, and a due equilibrium be thereby maintained. If it should be imagined that our silver currency may be exposed to derangement, by circulating in conjunction with paper, we do not apprehend an inconvenience as likely to arise; but, as it is a possible case, it may not here be irrelevant to state that the present attainment in the arts affords a substitute even for silver, more beautiful and equally convenient, whether in sixpences, shillings, half crowns, or crowns, and at the same time as non-intrinsic or valueless as the notes, except for their legitimate purpose of currency.

93. We have stated in a previous section that the present prevailing rate of interest does not exceed 3 to 3½ per cent.; it may therefore be supposed that, if the government rate of interest is fixed permanently at 3 per cent., there will be no inducement for bankers to risk the circulation of national notes; but the very circumstance of the government being always open to receive the surplus money capital at that rate, in itself would tend to enhance the rate for trading purposes; while the increased energies which a rational and compatible system of currency would tend to excite, and the progressively increasing consumption which would necessarily ensue, would enable 5 per cent. interest per annum to be readily paid on all money borrowed for manufacturing and trading

purposes. A currency based as we have here proposed, on the capital of the national annuities, would not merely suffice for all purposes of internal interchange far more conveniently and preferably than gold, but it is susceptible of such an order of management as to serve at all times as an indicator of the activities and condition of the country.

94. The present circulation of the United Kingdom may be stated as follows: viz.

Bank of England notes about	18,000,000
Country Banks:	
England and Wales	7,500,000
Scotland	3,500,000
Ireland	5,000,000
Gold	26,000,000
Total	£60,000,000

Exclusive of about £7,000,000 of silver, the circulation of which would not at present be altered by the adoption of the measure we have here proposed. The total of gold coined since the termination of the war in 1815, up to this time (1833), amounts to about £50,000,000; but the large transfers of capital from British to foreign securities, which took place more particularly in 1817-18, and more or less since that date, have led to the export of about £20,000,000 of gold, and three to five millions more has probably been absorbed for manufacturing purposes; the proportion left for the purposes of circulation may therefore be estimated as stated above, and £60,000,000 as the aggregate amount of circulating medium; but it does not circulate, and hence the embarrassment which so extensively pervades the productive interests of the empire. It will be seen by col. 10, of statement III., that from £7,000,000 to £10,000,000 of gold is constantly dormant in the coffers of the Bank of England; £3,000,000 to £5,000,000 more will in like manner be dormant in the drawers of the other bankers of the kingdom; while an equal amount of the Bank of England notes will be dormant in the hands of the private bankers of the metropolis, to meet sudden and unexpected demands; so that in reality the proportion of active circulating medium is less than £40,000,000.

95. We have shown in sect. 81 that, independent of the circulating medium exhibited above, bills of exchange in the manufacturing districts constitute the chief circulating medium; there is also another description of bills which are intimately connected with the question of circulation, viz. the Exchequer bills, as exhibited in col. 13, of statement III.: the function of these bills is, they are held principally by the metropolitan bankers, as an immediately convertible means of meeting any sudden or unusual demand upon them; being a legal tender for duties of customs, excise, &c., they are always convertible into current money within twenty-four hours; the Bank of England hold a considerable amount of these bills, for which they receive interest, giving in exchange their own notes, bearing no interest. We shall offer no observation here on the improvidence of such a system, but proceed to show the amount of national notes likely to be required for facilitating the most ex

tensive interchange of productions, the way in which they would at once be put into circulation, and the consequences which would necessarily follow the adoption of such a measure. To withdraw suddenly such an amount as £26,000,000 of gold from its function as currency, and throw it at once on the market as metal, or an article of merchandize, might lead to embarrassment; the government might therefore take all that offered, at some fixed rate to be agreed upon, in exchange for national notes; this we will suppose to call for £15,000,000, or perhaps £20,000,000, of notes: the Exchequer bills outstanding will be seen by col. 13, of statement III. to amount to £27,000,000; the whole of these would at once be converted into currency or national notes; and the claim of the Bank, beyond their subscribed capital, being about £23,000,000, in which, however, about £8,000,000 of Exchequer bills is included, leaving about £15,000,000 to be liquidated in currency or national notes; and, in addition to these, it is probable that from £5,000,000 to £10,000,000 more of notes would be almost immediately demanded for legitimate banking purposes in different parts of the United Kingdom. Thus the entire issue of national notes in the first instance may be estimated as follows, viz.

Against gold	15,000,000
Do. Exchequer bills held by private bankers, &c.	19,000,000
Do. do. by the Bank of England	8,000,000
In final settlement with do.	15,000,000
Demanded by provincial banks	7,500,000
Total	£64,500,000

96. It is probable, however, that a portion of the amount issued against gold, as well as to the Bank, would seek to be funded, say to the amount of about £14,500,000, leaving £50,000,000 for active circulation. Proceeding upon these premises, let us, in the next place, see how the government and the public will then stand in relation to each other. The government will gain on behalf of the public, on one side, the interest on the Exchequer bills to the amount of about £700,000 per annum, and incur, on the other side, an obligation on the new stock to be created of £435,000 per annum, and be liable to the expense of manufacture and issue of the notes, equal probably to £200,000 per annum more; but then the government will be in possession of from £15,000,000 to £20,000,000 value in gold, which may either be disposed of gradually, as occasion may require, in purchase of beneficial arrangements of intercourse with the several nations of the world, or held in whole, or in part, as a reserve for war, failure of harvests, or other contingencies: at all events an important object will be gained for all parties, by withdrawing it from fettering the circulation, and cramping the productive energies of the country.

97. The two objections to a paper circulating medium are its liability to excess of issue, and mutation. The first of these objections is valid enough, when issued as it was by country bankers, or on their individual credit, or as it might be issued indefinitely by a government: but

the objection does not apply to the proposition here advanced, based, as here proposed, on the £800,000,000 of national obligation; inasmuch as no more will be converted into currency than will be necessary for its legitimate purpose of facilitating the exchange of commodities, aiding the means of production, and advancing those improvements which the spirit of the age invites, and which such an order of currency is in itself calculated to promote and encourage: when it ceases to be required, and to find active and profitable employment for such purposes, it will revert back for conversion into stock, and thereby serve at all times as an indicator of the state of the activities of the nation; and if, from any temporary current of feeling which caprice or any other cause may engender, the notes should press in, for fixed investment, to an extent indicative of an undue contraction, the quarterly payments of the government will lead to a re-issue, whereby a uniform and just equilibrium may always be maintained. The objection in regard to imitation is one which cannot be entirely overcome; but the objection lies equally strong against a metallic currency, and it is questionable if recent improvements in the arts will not afford greater protection against the imitation of paper than can be obtained against the admixture, or debasement, and abrasion of metal; against which, for the purposes of currency, we might proceed to point out various other objections, while none other of a valid nature can be brought against paper.

98. To fix permanently the rate of interest for the £800,000,000 capital stock of England at 3 per cent., while the rate of interest on the public securities or stock of all other countries rates from 5 to 6 per cent., may seem to be a measure calculated to induce a transfer of the capital of England to other countries; we will therefore now show how the attempt at a transfer of property would operate. A stockholder in England is desirous to transfer a given sum, say £5,000, of stock from England to France, or any other country; the stock in England being convertible on demand into currency notes at pound for pound, if the transfer is attempted to be made in gold, gold will be sought after as an article of merchandize, and a price demanded for it accordingly. A demand for such a sum as £5,000 would not probably produce any effect on the price; but, in proportion as the amount is attempted to be increased, a price will be demanded for gold calculated to check the operation; so that, whatever may be the nominal rate of interest in the different countries of the world, a due equilibrium will be maintained through the medium of a fair market price for that metal. To a certain extent, transfers of capital may continue to be made, as they have hitherto been, through the medium of the export of the products of British labour; and the demand for gold will not show itself until a difficulty ensues in the disposal of British productions to an additional extent, corresponding with the amount desired or attempted to be transferred. In like manner, on occasions of a sudden demand for supplies of foreign grain, derangements in the circulating medium will be prevented, and the exchange for

grain be more confined than heretofore to productions of British labor, inasmuch as gold will experience the effect of a rise in price more immediately than any other article.

99. A circulating medium founded on the basis we have here proposed, while it would free the energies of the country from the chains in which they have for eighteen years past been enthrall'd, would at the same time render the practice of banking more simple and intelligible, and thereby render it likely to be more extensively carried on, and more generally useful, than it has hitherto been. The government, on behalf of the public, being the only issuers of circulating medium, the only security required from bankers will then be for the deposits made with them; this must at all times, and under all circumstances, be an affair more or less of risk, whether banking be conducted by individuals, by partnerships of two, three, or more members, or by an extended joint-stock proprietary, inasmuch as all are equally exposed to chances, which no reasonable amount of capital, nor prudence, can absolutely prove a protection against. Joint-stock companies, with a capital avowedly subscribed and actually paid up for the purpose of aiding the productive industry of the districts in which they may be formed, afford, generally speaking, a more ample security than individuals; while, on the other hand, the individual or more private establishments afford the greatest facility: joint-stock, or public companies, are too apt to be governed by fixed rules of practice, while with the individual banker a strong mutual confidence generally prevails between him and the parties with whom he is connected in business transactions; and he more readily yields to the exigencies of particular circumstances, which the forms or fixed rules of public companies prevent.

100. The scheme we have here proposed will be seen not in the slightest degree to alter the practice of banking in regard to deposit, discount, and agency, but effectually separates from them the practice of issue; and, as it was the issue of notes, and not the advantages derived from deposit, discount, and agency, which more particularly constituted the exciting principle of provincial bankers in the United Kingdom from 1798 down to 1819, and which still constitutes the leading feature of banking in Scotland, and with the provincial bankers of Ireland, as well as of several of those of England and Wales, as far as their reissuable notes of £5 and £10, &c., are concerned, and as we propose the extinction of all provincial reissuable notes on demand of larger amounts, as well as of £1 and £2, we have to show how the provincial banker is likely to be affected by the suppression of his £5 and £10 notes. We have shown in § 73, that while these notes are issued at the rate of five per cent. per annum, the issuer is obliged to provide two protecting capitals to a certain extent to meet them, which, with the stamp, probably amounts to little less than three per cent. on his whole circulation; so that the circulation of the national notes at the rate of five per cent. per annum, which will cost him only three per cent., will afford him an equal if not greater advantage

than that derived from the issue of his own notes. There is, however, another species of circulating medium, and a practice in provincial banking which we have not yet described; in the development of which we shall suggest an alteration that will more than compensate the provincial banker for the suppression of his reissuable notes.

101. A prominent feature in the practice of the provincial banker is taking in deposits from the traders of his town and district; if it is a manufacturing district, the cash or money deposits which the banker receives from the shopkeeper and trader, suffice to supply the manufacturer with the necessary funds or means for paying his wages, &c., while the deposits of the shopkeeper or trader are liquidated by the banker drawing in their favour on his house of agency in the metropolis, in bills at forty-five days' or two months' date, in such amounts as the demands of the shopkeepers require for their purchases in the metropolis or elsewhere. These bills, being drawn upon, and accepted by, the metropolitan banker, require, like the provincial bankers' promissory notes on demand, a protecting capital in the hands of the metropolitan agent. Now, if in future these bills are drawn payable at, instead of upon, and to be accepted by, the metropolitan agent, no protecting capital will be requisite until within a day or two of their becoming due. By such a change of practice as this, the provincial banker will be enabled to extend his accommodation in his district as effectually, and more advantageously to himself, than by the circulation of his own notes, which are always liable to revert back upon him without any previous notice, while the drafts, as here proposed, will give him a definite time for providing for them.

102. We have so far described all the various modes of banking, as practised in the United Kingdom, as well as the nature and amount of the circulating medium, and shown the extent to which banking transactions have been carried on, as far as the internal transactions of the kingdom are concerned; its external transactions, however, independent of its exports and imports, tend greatly to augment the aggregate of banking operations, and, in some degree, to augment the amount and vary the character of the circulating medium. During the war from 1793 to 1815, bills, to the amount of from £5,000,000 to £25,000,000 annually, were drawn in different parts of the world on account of the British government, for subsidies and supplies to the fleets and troops of England every where distributed; these bills were generally drawn payable at thirty or sixty days' after sight, and were remitted in payment of British products exported; and, when accepted by the department of government to which they were addressed, entered more or less into the circulating medium of the country.

103. Since the termination of the war, the transfer of capital from British to Foreign security has given rise to a drawing of bills on England to the amount of £5,000,000 to 7,000,000 annually; British and Irish absentees, and travellers in different parts of Europe, give rise

to nearly a corresponding amount of bills; and, in addition to these and such bills as are legitimately drawn on account of foreign products imported, mercantile houses of established reputation give rise to other bills to the amount of several millions annually, based merely on the credit of the respective drawers. In addition to the sixty banking establishments of the metropolis, as described in § 79, there are about twenty other establishments, through whom most of the bills here described pass, and whose transactions partake as much of banking as they do of a mercantile character. They draw bills for any amount on any part of the world, and give money for those drawn by others; and accommodate, in that way, the commercial transactions of the world at large, as the bankers of Manchester and Liverpool (see § 81) do the transactions of their respective districts; these foreign transactions are designated exchange operations.

104. Having now explained all the modes of banking and exchange of the United Kingdom, in regard to its external transactions as well as its internal, we will now proceed to show the nature and extent of banking in France. By the law of 24 Germinal, year xi. (14th April, 1803), the bank of France was established with a capital of 45,000,000 francs, afterwards doubled, with an exclusive privilege of issuing of notes for 40 years. The operations of this establishment consist, 1st, of discounting bills of exchange, not exceeding three months' date, and with the signatures of three parties, undeniably (*notoirement*) solvent, or with two undeniably solvent signatures, if guaranteed by a deposit of any public stock or other readily convertible security.

2nd. To advance money on bullion and foreign coins, not less than 10,000 francs in amount, at the prevailing rate of interest for 45 days.

3rd. To afford security of deposit for bullion, coin, diamonds, and deeds, for a charge of one-eighth per cent. for six months.

4th. To open accounts, current or drawing accounts, for public establishments and private persons, demanded under proper regulations.

5th. To furnish all persons with *récépissés* for all amounts payable at sight. These correspond with the post bills of the bank of England.

This establishment from its commencement has maintained a high and deserved reputation. Its capital is divided into 90,000 shares (actions) of 1000 francs each, 67,900 of which are in circulation. The emolument of the establishment arises chiefly from the discount of commercial bills, which amounts to about 3,600,000 francs per annum; the amount discounted averaging about 560,000,000 francs per annum. The interest on treasury bonds does not exceed 250,000 francs per annum, and the emoluments derived from interest on bullion and coins, and commission on deposits, does not exceed 150,000 francs per annum; the remaining portion of the income consists of about 2,300,000 francs of *rentes*. The charges of the establishment for clerks' salaries, &c., amount to about 900,000 francs per annum.

105. Although this is the only bank of paper circulation in all France, the amount does not exceed 200 to 250 millions of francs (£8 to 10,000,000) in notes of 1000 francs and 500 francs, against which the bank holds a reserve of specie of from 180 to 200 millions of francs; hence it would appear that the notes are circulated more for the convenience of the public than with a view to profit. This establishment is under the direction of a governor and two deputy governors appointed by the king—the first must possess 150, and the latter 50 shares each; a general council of fifteen members; three *censeurs*; a council of accounts, consisting of twelve members; nine chiefs of department, and six cashiers; under whom are employed about 200 clerks, porters, &c. A clear and circumstantial account and report of the proceedings and state of the establishment is published half-yearly.

106. The *Almanack du Commerce de Paris* enumerates, under the head of *banquiers*, about 160 establishments in that city; and, to a certain extent, these establishments take in deposits and discount bills in a way not dissimilar to the bankers of London, while their general business is essentially different. In the first place, with the exception of the 200 to 250 million francs of notes of the bank of France, the circulating medium of France is composed entirely of silver: since 1816, she has raised upwards of 3,500,000,000 of francs on annuities, (*rentes*), and coined upwards of 200,000,000 francs of circulating medium. These operations have given rise to an active correspondence and exchange with the capitalists of all Europe, and have been participated in, more or less, by all of the 160 establishments adverted to above; but, on the whole, the transactions of the greater part of them partake more of the character of mercantile agency than of bankers. The cities of Bourdeaux, Lyons, Lisle, &c. have each several similar establishments denominated bankers, who facilitate payments in Paris and other distant parts of France, and different parts of Europe; but France has no establishment for economising and rendering active and profitable the deposits of the public; this is a principle which she has yet to learn and reduce to practice.

107. All the capitals and several other of the principal cities of Europe have now their banking establishments. Next to the bank of France, the *Imperial Commercial Bank of Russia* holds the highest place. At the close of the war in 1817, Russia had a paper circulation amounting to upwards of 830 millions of roubles, about £40,000,000. Since 1817 a considerable portion of the paper roubles have been converted into annuity stock, and loans have been raised in foreign countries to enable a further part to be exchanged for specie; and, in 1821, the paper roubles were reduced to 639 millions. The paper rouble, however, in notes some as low as one rouble, forms the bulk of the circulating medium of Russia; and with such a circulation the *Imperial Commercial bank* was established in 1818, with a capital of 17,295,345 roubles; and the following report of the finance

minister, Count Gourieff, in May, 1821, will best show its progress up to that time; since when it has been gradually advancing in activity and usefulness, merely as a bank of deposit, discount, and agency; the government being the only issuer of the circulating medium.

108. "The increasing transactions of the Imperial commercial bank, which afford such great facilities to merchants, are not of less advantage to the other classes of society. The considerable sums which it throws into circulation cannot fail in moderating the general rate of interest. In order to be of still greater service to commerce and industry, in conformity with the intentions of the law of the 7th May, 1817, the bank, besides the one it had opened at Moscow, has established new ones at Archangel, Odessa, and at Niginovgorod, during the time that the annual fair is held in that city; it has also now a branch bank at Riga, and will establish one in future in all the principal cities of the empire. Pursuing all the same objects, and strictly conforming to the same principles, they have, in a very short space of time, given great extension to the circulations of trade, and afforded them considerable facilities. The account rendered of the operations of the bank in 1820 will convince you, gentlemen, that, if on the one hand the resources of this establishment have been augmented with large additional capitals, deposited in its coffers by private persons, merchants on the other hand, sensible of the advantages it offered them, have entrusted it with a large proportion of their business, and have in a manner turned over to the bank and its branch establishments the whole of their financial circulations. With what remained over of the preceding year, the bank and its various provincial branches have, in the course of the year 1820, received and transferred more than 68 millions; 33 millions of which has been transmitted from one city to the other by means of drafts upon each other. The deposits upon interest confided to the bank here, and its office at Odessa, have amounted to 86 millions of paper roubles, and three millions metallic ditto. Deducting what has been drawn out, there remained on the 1st of January, 1821, 58,156,935 roubles, 69 copecks in bank notes, and 555,822 " 55 " specie.

"At the commencement of the year 1820, these deposits only amounted to 33,304,000 roubles in notes, and 1,933 roubles in specie. This augmentation proves that the capital and credit of the bank are increasing; by which it will acquire additional means of extending its discounts, by employing to that effect a part of the sums confided to it at interest. With the above amounts added to what remained over of 1819, the bank discounted in 1820 effects to the amount of 182 millions; and what proves the circumspection of the bank in the choice of these effects, is, that only 69,459 roubles 83 copecks have been protested; for the payment of which, actions at law have been instituted. The bank only advanced 5,200,000 roubles upon merchandize, and, deducting what it has received back, there did not remain due more

than 2,317,687 roubles; the re-payments have all been made with punctuality. The discounts have greatly exceeded the advances upon merchandize, which evinces the progress individual credit has experienced. The fund, or capital of the bank, amounted, at the beginning of 1820, to 20,910,173 roubles, 14 copecks: it accumulated in the course of the year to 24,889,950 roubles, 11 copecks. The nett profits of the bank, over and above the interest paid and remaining due upon the deposits confided to it, after deducting the charges of its establishment, amount to 1,946,825 roubles, 45 copecks, being about 7 per cent. on its capital. Altogether the bank and its offices have transacted business during the last year, 1820, for 955,561,231 paper roubles, and 12,052,842 metallic ditto."

109. The Bank of Issue was established in St. Petersburg, in 1768, when 40,000,000 of roubles in paper were first put in circulation, afterwards increased to 100,000,000; it was during the war from 1802-3 to 1810 that the issue became so extended. In February of the latter year, when the amount in circulation exceeded, as before stated, 830,000,000 of roubles, an *Ukase* was issued, declaring all the property of the state a guarantee for the validity of all the notes then in circulation, and that no further increase should take place. After the termination of the war, in 1815, the Bank of Issue established in 1768 was converted into an *Assignment Bank* for the exchange of new notes for old, and between the 1st of Jan. 1817, and the 1st of Jan. 1821, in addition to 191,109,420 roubles withdrawn from circulation, 632,603,115 roubles in new notes had been issued for the same amount of old issued previous to 1817; in this amount 6,857,155 roubles of *forged notes* were included as a loss to the state, against which 12,287,465 roubles of legitimate notes are assumed as gained by the state, old notes to that amount never having been presented for exchange. In addition to the assignment and commercial banks, the capital of Russia has another establishment denominated a *Loan bank*, which takes in deposits from one class of individuals, and lends out on security to public bodies or individuals engaged in works of public utility. This establishment bears some analogy to the exchequer bill loan office of the British government, the difference being, that in Russia the loans are made out of deposits, and in England the government issues bills which are converted into money on the Stock Exchange.

110. Calcutta, and the other principal cities of the Peninsula of India, Rio-Janeiro, Buenos Ayres, New South Wales, the Cape of Good Hope, and Canada, have now all their banks, founded chiefly on the principles of the provincial banks of England, and therefore requiring no especial elucidation. It is in the United States of North America where, next to Great Britain, banking has made the most rapid progress, and produced the most extraordinary results. The capital of all the banks in the Union, in 1790, did not exceed 2,000,000 dollars. In 1791 a national bank was chartered for twenty years, with a capital of 10,000,000 of

dollars; and, previous to the expiration of its charter in 1810, eighty-eight other banks had been established in different parts of the Union, with a capital of 42,610,000 dollars, in addition to the capital of the national bank. The dissolution of the Bank of the United States in 1810 gave rise to no less than 120 new establishments during the four years 1811-14. In August and September, 1814, all those below Connecticut in the statement in § 113, suspended payment in specie, consequent on the effects of the war declared in June, 1812; and the following depreciation ensued on the notes of the several banks of New York, Philadelphia, and Baltimore:—

141. The derangement in social affairs inseparable from such a variation in the circulating medium led to the proposal of the secretary of the treasury in December, 1815, for a new national bank, founded, as the report avowed, "on the necessity of restoring specie payments and the national currency." The charter was confirmed by Congress in April, 1816, and organised for business in Jan. 1817, with a capital of 35,000,000 of dollars; and by Jan. 1820, the number of other banking establishments had increased to 307.

The following statement shows the appropriation of the shares of the Bank of the United States in Jan. 1832; the amount of notes in circulation at each of its branches in Sept. 1829; and amount of specie on hand at each branch in Jan. 1832.

112. The statement A, at page 474*, shows the situation of this bank in each of the twelve years 1819-30, according to which it appears that, at the close of the latter year, its assets exceeded its liabilities by 2,766,129 dollars; at the same time, its specie amounted to only 7,175,274, while the amount due to foreign shareholders was 8,405,500 dollars; and while, in the event of the dissolution of the bank, 28,000,000 dollars in specie would be due to shareholders, independent of 7,000,000 to the United States Government, the specie in all the banks of the Union (the bank of the United States included), was only 22,114,967 dollars; yet, under such circumstances, the president of the United States in 1832 refused to ratify an act of Congress for the extension or renewal of its charter.

113. The following statement shows the number of banks in operation in each state of the union in June 1830, and the aggregate amount of capital in each state, and also of the number of banks which failed between the 1st of Jan. 1811, and the 1st of July 1830, with the amount for which failed in each state.

circulating medium of that extensive and rapidly improving territory.

115. While in the act of writing the preceding sections [on the 31st May, 1833] the chancellor of the exchequer of Great Britain and Ireland was developing to parliament, in committee of the whole house, propositions for the extension of the charter of the Bank of England for a period of twenty-one years, subject "to the contingency, that, if at the end of ten years the then government should think proper to alter the system, it should have the power to give a year's notice to the Bank; and, in that case, if the government so desired, that the charter would expire at the end of the eleventh year:" subject to this condition the chancellor of the exchequer proposed "to continue the *monopoly* to the Bank of England as far as regarded the metropolis—that was, that no bank with more than six partners should be allowed to issue notes in London, or within sixty-five miles of it." It was next proposed that the Bank should make a weekly return to the treasury of the amount of bills and notes in circulation, and also of deposits, and that the average of such issues and deposits should be published quarterly. The chancellor of the exchequer then said, "that the *convertibility of bank notes to bullion was essential to a sound system of banking!!!* but having a bank secured by a ready check, such as that which he had stated, he did not think there would be any danger in securing banks against sudden internal drains of gold. He proposed, therefore, to make Bank of England paper a *legal tender* in every place except at the Bank of England itself, or at its branch banks."

114. Statement B, at page 474*, shows the progress of banking institutions in the United States of North America since 1811, and the situation of all the banks of the Union in 1830, in regard to their capital, notes in circulation, specie, and deposits. The states are there exhibited in five districts, for the purpose of showing the inequality of specie in different parts of the Union. In the western states 2,686,396 dollars in specie are held to sustain a circulation of 4,684,860 dollars in notes; while in the state of New York, and the adjoining states of Connecticut on the north, and New Jersey on the south, the centre of all the activities of the Union, the circulation of 12,737,539 dollars in notes is sustained by only 2,841,746 dollars in specie. This statement is further interesting in showing the very limited amount of specie in the aggregate, with which all the exchanges between a population of 13,000,000 to 14,000,000 of people, maintaining an active and extensive intercourse with all the nations of the world, are facilitated and effected; 22,000,000 dollars in specie, less than £5,000,000, sustains the operations of 350 banks of circulation, including the branches of the national bank, diffusing life and energy over 100,000,000 square miles of territory; we say sustains the operations of the banks, inasmuch as it forms no part of the circulation, but is held as a protection to the 61,000,000 of notes which, with about 10,000,000 of dollars in small coins, forms the exclusive

116. It was next proposed to diminish the capital of the Bank from its present amount of £14,600,000 to about £11,000,000, and that the Bank should give the fixed sum of £120,000 per annum out of the amount now allowed by law for the management of the public banking account and transfers of the national annuity account. So far in regard to the Bank of England; when it was next proposed that every banking company of more than six partners should be a joint stock company, such company to be established by charter; and if using the paper of the Bank of England, may be established within the limits of the Bank of England's monopoly, viz. sixty-five miles of the metropolis: the conditions on which charters are granted to be, that when issuing their own notes half the subscribed capital shall be paid up and deposited either in the government funds, or some equally good securities, and the partners to be liable to an unlimited responsibility; but if using the paper of the Bank of England, then only one quarter of the subscribed capital to be paid up, and the partners only liable to the amount of their shares. The government to have the power of deciding on the propriety of granting the charters; and with the view of enabling the government to know at all times the exact amount of country bankers' notes in circulation, a duty of 7s. to be charged on every £100 of notes which they issue. A statement of the accounts of each individual bank should be

sent to the government, as a strictly confidential paper, not to be published separately, but to enable a general result of the banking operations of the kingdom to be given to the public periodically.

117. The following is a recapitulation of the propositions in the official form, *verbatim*, in which they were submitted to the committee.

1. That it is expedient to continue, for a limited period, to the Bank of England, certain of the privileges now vested by law in that corporation, subject to such conditions as may be provided by any act to be passed for the purpose.
2. That, provided the Bank of England shall be bound by law to discharge, in the legal coin of the realm, all such of its debts and liabilities as shall be demanded at the Bank of England, or at any of the branch banks thereof, it is expedient that the promissory notes of the said corporation be made a legal tender for all sums of £5 and upwards.
3. That provision be made by law during the present session of parliament, for the repayment to the Bank of England of one-fourth part of the amount of the debt now due by the public to that corporation.
4. That the rate of allowance and remuneration now secured by law to the Bank of England for the management of the public debt, and services rendered to the public, be continued to that corporation for the limited period to be fixed as aforesaid, subject to an annual reduction of £120,000.
5. That the laws restricting the interest of money to 5 per cent. shall be repealed, so far as they relate to bills of exchange not having more than three months to run before they become due.
6. That it is expedient to give facilities, by the grant of royal charters, for the establishment of joint stock banks, at a certain distance from London; but that every such royal charter shall contain certain stipulations to be enforced with respect to all such chartered banks.
7. That all banks issuing promissory notes payable on demand, shall enter into a composition in lieu of stamp duty, at the rate of 7s. for every £100 on the notes which such banks shall have in circulation.
8. That it is expedient to make provision with regard to joint stock banking companies.

118. It will be seen by the three preceding sections, 115-117, that the object aimed at by the propositions submitted by the chancellor of exchequer to parliament, is, to establish a uniform order of paper currency, based on gold at £3. 17s. 10½d. per ounce; and to vest the control of the circulation and the profit thereof in the hands of the Bank for a limited term of years, thereby continuing a monopoly (as we shall show hereafter) of the most objectionable kind, in opposition to the general voice and feelings of the bulk of the people, as well as to the prevailing tenets of the government itself. One point to which we have not yet adverted is contained in

the fifth paragraph of the official propositions above; holding this in view, we will now proceed to show the objections to the scheme in general as well as in detail on one side, and the advantages which it promises on the other. Making the notes a *legal tender* convertible into gold only at the Bank of England itself, or its branches, is a part of the scheme which tends to an enlargement of the circulation, and, as such, promises to facilitate the operations of industry; and the scheme is so devised as to enable the Bank to withdraw all its branches for the purpose of concentrating the convertibility into gold in the metropolis alone; it doubtless being the intention of the Bank of England to withdraw its branches wherever joint stock banks are established to circulate its paper. As far as making the notes a legal tender, the scheme is good: nor is there any objection to be offered to the general principle on which joint stock banks are proposed to be established; and the return of their circulation, liabilities, and assets, is proper and commendable.

119. But the scheme is exceedingly objectionable on the three following grounds, viz.

1st. As being based on gold at a low fixed price, instead of on the £800,000,000 capital of public annuities, as proposed in section 96.

2nd. For the fluctuation and variation in the rate of interest which it so strongly tends to give rise to.

3rd. For the arbitrariness, and tendency to caprice, which it establishes, and threatens to cherish.

It is shown to demonstration in Mr. Marshall's digest of the accounts and papers presented to parliament since 1799, that the cause of the depreciated value in all our manufactured productions, and consequent diminution of profits and wages, has arisen from the large transfer of capital from British to foreign securities which has taken place since 1816. It is shown that, while since that date the British government have been instrumental in causing about £70,000,000 to be applied to the purchase of 3 per cent. stock, at rates varying from 78 to 94, equal to upwards of twenty ounces of gold, for which they received less than eleven ounces in 1813-15, a corresponding amount of capital has been vested in the public stocks of the different nations of Europe, at an average rate of interest of about 6 per cent. Thus, while about £2,800,000 of annual interest has been cancelled in England, and the country at large relieved from an annual taxation to a corresponding amount, about £4,500,000 of annual interest has been created abroad; and it is in consequence of the way in which these transfers of capital and payment of interest become involved with the commercial transactions of Europe, that the whole of the interest on the capital so transferred, be it more, or be it less, falls wholly and exclusively on the manufacturing and productive classes of England, inasmuch as the interest is paid out of those means which otherwise would remain to augment the means of payment for the products of British industry exported.

120. It is the facility which the low price of gold affords for the transfer of capital, as de

scribed in the preceding section, that renders it so objectionable as the basis of the circulating medium. Had the circulating medium at the termination of the war been based on the £600,000,000 of stock which the war had created, or indeed on any other internal means, and gold like any other commodity been left to find its own level in price, a converse effect would have been produced to that which has, so fatally for the productive interest of England, been produced: the transfer of capital might have taken place, but it would have confined the demand more to productions of industry at remunerating prices, inasmuch as the predilection for bullion would have enhanced its price proportionate to the demand for it, and thereby have operated beneficially to the importer of bullion on one side, as well as to the exporter of the products of British industry to Europe on the other. In the first instance bullion is obtained in exchange for the products of British industry, being the *only* commodity which a great portion of the western world yet has to give in exchange: and on this commodity the British government fixes a *maximum*. How palpably ridiculous, and how palpably unjust to the commercial operator to that part of the world! He brings his bullion to a focus of operations which would probably afford him 30 to 50 per cent. more than a perverse law allows him to obtain; and this, not to benefit the party imposing or retaining the force of that law, but to facilitate another course of operations, which portend the ruin of all the productive interests of the empire.

121. It is not, however, the commercial disadvantage which a low fixed price of gold inflicts on the activities of the community, that constitutes exclusively its objection as the basis of the circulating medium. The objections are numerous; to allow the article to be demanded for one, when one and a half, or any other price would be readily given, is an absurdity too palpable to need further observation. The greatest objection, however, lies against the constant fluctuation to which it subjects the circulation at large, and constant uncertainty to which it exposes all the rewards of industry. A considerable time, it is true, may pass away without any very sensible derangement being manifest; but so long as the disproportionate rate of interest in England and the other nations of the world continues, so long will the tendency to the transfer of capital continue, and consequently so long will continue sudden and unexpected demands for bullion; and, should there be another such a harvest season as that of 1816, (and we are, from year to year, liable to a succession of such harvests, while an enlarged circulating medium would be required to sustain the enhancement of price consequent thereon), the increased demand for gold which would inevitably ensue would lead to precisely the opposite effect. We might

pursue the subject to a much greater length, but we trust enough has been said to prove the folly of such a basis as gold, for the circulating medium of a community so constituted as that of England.

122. The space assigned for this article precludes us from entering into any further elucidation of this interesting and important subject; except a few observations on the subject of SAVINGS BANKS, institutions for the deposits of small sums.—Schemes for this purpose were first suggested at the close of the last century; but it was subsequent to the termination of the war in 1815 when they were made a government measure, by a fixed rate of interest being guaranteed to the depositors. Between January 1815, and November 1830, 402 banks had been established in England and Wales; at the latter date the number of depositors amounted to 378,316, exclusive of 4278 Friendly Societies, and 1826 charitable institutions, and the total sum deposited £13,420,976; at the same date there were 73 banks in Ireland, the total number of depositors 34,638, and the sum deposited £945,991. The deposits in these institutions have been considered by some as evincing growing prudential habits, and consequently increasing comfort and independence of the working classes; but this is fallacious: during the earlier years of these institutions, the rate of interest guaranteed to the depositors considerably exceeded the interest yielded by the public Annuity Stocks; the more crafty, therefore, of the monied fraternity, sold 3 per cent. stock and vested it in the Savings Banks; and to obviate the obstacle which the limitation of deposits in Savings Banks prescribed, being not more than £20 at any one time nor exceeding £200 per ann., the sums transferred from the 3 per cents., were deposited in the savings banks in the names of the wife, children, and relations of the parties so transferring, and by this artifice, instead of £200, from £1000 to £2000 has been annually transferred. The rate of interest on the deposits in savings banks having been lowered, the inducement to transfer from the 3 per cents. is diminished, and the transactions of the savings banks are now more confined than heretofore to the class of persons for whom they were intended. The principle on which the Saving Banks are founded, and their economy of management, are unexceptionable enough, but they have, nevertheless, up to this time, had a most baneful effect. The deposits are vested in the 3 and 3½ per cents. by the commissioners of the sinking fund, as the trustees of the depositors; the total sum deposited has therefore aided the transfer of a corresponding amount of capital from British to foreign security. For a more complete elucidation of the working and effect of these transactions, see the article SAVINGS, in the further part of this work.

Statement A, showing the situation or condition of the Bank of the United States, in each of the twelve years 1819-30. The amount of the total liabilities in column No. 7 is made up of the 35,000,000 dollars, due equally in each year to the shareholders, in addition to the amounts due to depositors, and holders of notes, as exhibited in cols. 8 and 9.

* Salem, Boston, New York, Philadelphia, Baltimore, Charlestown, and New Orleans.

STATEMENT showing the Weekly Circulation of Bank of England notes, in each of the seven years which follow, viz. 1792, being the year preceding the declaration of war in February, 1793, 1797, being the year preceding their nonconvertibility into gold, at a fixed standard; 1817, as the year of maximum of circulation, the increase from 1797 to 1817 having been progressive; 1822, as the minimum, on the return to convertibility into gold, at the previous standard of 1797; 1825-6, as years of great commercial activity; and 1832, as the year previous to this sheet going to press. The blank lines are drawn to show the periods when the National Debt, Dividends, or Annuities are payable. On the fifth of January and July they amount to about £8,000,000 at each period, while an increased issue of about £2,000,000 of notes is seen to suffice. The April and October payments are about £5,500,000 each.

STATEMENT showing the liabilities and assets of the Bank of England, at the annual settling day, on the 28th of February, in each of the fifty-five years, 1778—1832, as laid by the Directors of the Bank before the Parliamentary Committee on the Bank of England Charter, in the session of 1832; to which is here added a statement of the Income and Expenditure of the Government in

Years.	On the 5th of January, 1817, the Exchequer of Ireland was united with that of Great Britain; and, since that date, no separate account of the expenditure of Ireland has been kept: the Revenue, since 1817, has averaged about 4,000,000 <i>l.</i> per annum, included, since 1816, in col. No. 1. Previous to 1817 cols. 1 and 2 exhibit the income and expenditure of Great Britain only. In 1815 the Revenue of Ireland was 7,304,786 <i>l.</i> ; and, since that year, taxes have been repealed and reduced in the United Kingdom equal to 34,000,000 <i>l.</i> per annum.			Circulation. STATEMENT IV., containing Ten of the Appendices, Nos. 24, 32, 59, 70, 75, 81, 85, 98, 99, and 101, to the Report of the Committee on the Bank of England Charter, in the session of parliament 1832; to which is added the gross receipts of Stamp Duty on Bills of Exchange, see col. 1; the estimated annual amount of the circulation of Country Bankers' Notes, see col. 3; the Coinage in Dollars of all the legal mints of Mexico, and the proportion thereof exported in each of the twenty-three years, 1807-29, see cols. 10 and 11; and of the amount of Gold and Silver Bullion which passed through the Bank of England, on account of individuals, in each of the twenty-five years, 1807-31, see cols. 12, 13.

B A N K.

Years.	Gross Receipts of Stamp Duty on Bills of Exchange.	Proportion of Re-issuable Notes.	Estimated Annual Circulation of Country Bankers' Notes.	Number of Licenses granted to Country Bankers, No. 101.	Commis-sions of Bank-ruptcy issued against do. No. 101.	Commercial Bills Discounted, No. 59.	Deposits, Nos. 24 and 32.		Annual Average Cir-culation of Bank of England Notes, Nos. 78 and 81.	Coinage in Dollars of all the legal Mints of Mexico.	Proportion in Dollars Exported.	Value of Bullion which passed through the Bullion Office of the Bank of England on account of individuals.		Total of Gold and Silver Bullion, including the Coin in the possession of the Bank of Eng-land, on an average of each of the eighteen years, 1814-1831.

BANKS, SAVINGS'. These admirable institutions form a striking feature in the moral history of modern Britain. In former times every charitable institution was exclusively a subscription of the rich for the benefit of the poor: these, most happily, like their kindred Friendly Societies, are composed of contributions from among the poor, co-operating for their own benefit, and conscious that they are promoting primarily their own interest. The success of these plans has been surprising, considering the peculiar crisis at which they have originated—that of unquestionable distress and pressure on all ranks (especially the middle and lower ranks) of society; to say nothing of the spirit of undue dependence engendered in this country by the poor laws.

The eccentric but philanthropic Jeremy Butham was the first, we believe, who invited the public attention to a distinct banking system for the poor. He proposed to establish what he calls a Frugality Bank, so far back as the year 1797, in Young's *Annals of Agriculture*. The scheme involves more than the mere deposit of money, and has never, as we understand, been acted upon; but, like most of his projects, it contains many useful hints, and may do good by rebound. The wants to which it was by him designed to operate as a remedy were:—

1. Want of physical means of safe custody, such as lock-up places; thence, danger of deprivation, and accidental loss.
2. Difficulty of opposing and never-yielding resistance to the temptations afforded by the instruments of sensual enjoyment, where the means of purchasing them are constantly at hand.
3. Want of the means of obtaining a profit by the savings of the poor, or the use of them in portions adapted to their peculiar exigencies.
4. Want of a set of instructions and mementos constantly at hand, presenting to view the several exigencies, or sources of demand for money in store, and the use of providing it.

He next proceeded to sketch the properties which appeared to him to be desirable in a system of frugality banks, commensurate to the whole population of the self-maintaining poor. These were,

1. Fund, solid and secure.
2. Plan of provision all-comprehensive.
3. Scale of dealing commensurate to the pecuniary faculties of each customer.
4. Terms of dealing sufficiently advantageous to the customer.
5. Places of transacting business suitable; viz. in point of vicinity, and other conveniences.
6. Mode of transacting business accommodating.
7. Mode of operation prompt.
8. Mode of book-keeping clear and satisfactory.

In 1803 the well-known authoress Mrs. Pucilla Wakefield projected the first bank that was ever actually instituted for the benefit of the poor at Tottenham. In the Reports of the Society for Bettering the Condition of the Poor, vol. iv., it is said, 'for the purpose of providing a safe and convenient place of deposit for the savings of laborers, servants, and other poor persons, a charitable establishment has been lately formed at Tottenham in the county of Middlesex. It is

guaranteed by six trustees, who are gentlemen of fortune and responsibility, most of them possessing considerable landed property. This renders it as safe and certain as institutions of this kind can be, and insures it from that fluctuation of value to which the public funds are liable. The books are kept by a lady, and never opened but on the first Monday in every month, either for receipts or payments. Any sum is received above 1s., and five per cent. is given for every 20s. that lies twelve kalender months; every person so depositing money being at liberty to recal it any day the books are opened; but no business is transacted at any other time. The money so collected is divided equally between the six trustees. For every additional £100 a new trustee is to be chosen; so that a trustee can only risk his proportion of £100. None but the laboring classes are admitted to this benefit; and there is no restriction as to place of residence.

Observations.—These few simple rules are all that have hitherto been found necessary for the establishment of this charity. It is not sufficient to stimulate the poor to industry unless they can be persuaded to adopt habits of frugality. The season of plenty should provide for the season of want, and the gains of summer be laid by for the rigors of winter. But it must be obvious how difficult it is for even the sober laborer to save up his money, when it is at hand to supply the wants that occur in his family. For those of intemperate habits, ready money is a very strong temptation to the indulgence of those pernicious propensities. Many would try to make a little hoard for sickness or old age, but they know not where to place it without danger or inconvenience. They do not understand how to put money in, or to take it out of the bank; nor will it answer for small sums, either in point of trouble or of loss of time. The same causes frequently occasion thoughtless servants to spend all their wages in youth, and in consequence to pass their old age in a workhouse.

In 1807 the Rev. Henry Duncan, minister of West Colder, in Scotland, established in his parish a similar institution, which he described in a pamphlet that exhibits his accurate acquaintance with the difficulties and encouragements of these schemes.

'Those who are at all acquainted with the history of friendly societies,' he well observes, 'must be aware that they owe much of their popularity to the interest excited among the lower orders, by the share to which each of the members is admitted in the management of the institution. The love of power is inherent in the human mind, and the constitution of friendly societies is calculated to gratify this natural feeling. The members find, in the exercise of their functions, a certain increase of personal consequence, which interests their self-love in the prosperity of the establishment. Besides, by thus having constantly before their eyes the operation of the scheme, in all its details, they are more forcibly reminded of its advantages; and not only induced to make greater efforts themselves for obtaining these advantages, but also to persuade others to follow their example. Hence

it happens that a great number of active and zealous supporters of the institution are always to be found amongst the members of a friendly society, who do more for the success of the establishment than can possibly be effected by the benevolent exertions of individuals in a higher station.' Mr. Duncan therefore found it expedient to give the contributors themselves a share in the management of the institution; and that share was well chosen. The contributors in a body were not fit to be the acting parties; but they were fit to choose those who should act.

'A general meeting is held once a year, consisting of all the members who have made payments for six months, and whose deposits amount to £1. By this meeting are chosen the court of directors, the committee, the treasurer, and the trustee, the functionaries to whom the executive operations are confined: and by the annual meeting also are reviewed and controlled the transactions of the past year, with power to reverse the decisions of the committee and court of directors; and to make new laws and regulations, or alter those already made. The society consists of two sorts of members, the ordinary, and the extraordinary and honorary. The general meetings alone have the power of electing honorary members; but the bank trustee, the lord- lieutenant and vice- lieutenant of the county, the sheriff- depute and his substitute, the members of parliament for the county and burgh, the ministers of the parish, with certain magistrates of the town, are honorary members *ex officio*; and there are certain regulated subscriptions or donations, of no great amount, which constitute the person paying them, *ipso facto*, an extraordinary or honorary member. From this list of honorary and extraordinary members the choice of functionaries by the general meeting is annually to be made, provided a sufficient number of them should be disposed to accept of the offices designed; if not, from such of the ordinary members as make deposits to the amount of not less than £2 12s. in the year. Deposits are received in sums of 1s., bear interest at the amount of £1; and are always payable at compound interest on a weeks' notice.

In 1814 the first Edinburgh bank for savings was founded on a modification of the above plan.

The bank for savings at Liverpool was established in the year 1813, by the Society for Bettering the Condition and Increasing the Comforts of the Poor, in the Town and Neighbourhood of Liverpool. 'This establishment was suggested,' says one of the managers, 'by the numerous instances which had come to the knowledge of the society, in which the industrious had lost their savings from the failure of the persons in whose hands they were placed. The committee were anxious to hold out every possible inducement to the lower orders, for depositing their surplus earnings, consistent with a proper prudence and caution. Many gentlemen were of opinion that, in such a town as Liverpool, five per cent. might at all times be obtained on good security; and as the society had an office and clerk of their own, where and by whom the deposits might be received, without any additional expense, it was determined that five per cent. should be the rate

of interest given. However no sum was to be entitled to that interest till it had been in the fund for one year at least; if taken out before that period four per cent. only was to be allowed. The bank continued under these regulations till the beginning of 1815, at which period above £900 were deposited in it. We had placed £300 upon mortgage, and the remainder was vested in the navy five per cents. at such prices as to yield more than five per cent. When, however, we found that the fund was likely to increase to a very considerable extent, and that, as we were personally responsible for the money, we should always be liable to the sudden fluctuation of stock, and might, upon any sudden disaster, have a run upon us, which would compel us to sell out, perhaps at a considerable loss, it was determined in future to limit the receipts into the Mechanics Fund to £5 for one individual, and to establish a higher bank, under the name of the Provident Institution, into which the depositors might remove their money when it reached that sum (£5); and where it might be allowed to accumulate to any amount. The principle of the bank is, that every person becomes a proprietor of stock to the amount of his deposit, and shall receive the interest annually, after deducting one-twentieth for the necessary expenses of management. This one-twentieth, together with the farthings, which are not paid, is reserved for the above purpose; and, should any surplus remain at the end of five years, it is to be divided amongst the then existing proprietors. One or more even pounds will be at any time received; but the fractions of pounds must always accumulate in the lower fund. By this means we have reduced the Mechanics' Fund to about £450; the remainder has been transferred to the Provident Institution, and about £1200 have been deposited in addition to it since July last.'

We need not add to these abstracts any account of the almost numberless Saving Banks now existing in the country. Their principle is familiar to all classes, and information on the subject is so easy of access that we do not think it right to occupy our space with any observations of our own. The government have acted the part which became them as to these institutions, and have afforded them the sanction and security which were essential to their permanence and prosperity; and the public mind has caught the impulse to such an extent as is likely to give them a lasting and universal establishment.

We make but two concluding remarks:—1. One of the great advantages of the saving bank over the friendly society is that it has the benefit of survivorship. If the contributor to a saving bank dies, the whole of his contribution remains to his family. If, on the contrary, the member of a benefit society dies, the whole of his property, except the sums ordinarily allowed to the widow, and sometimes to his children, is lost to his family.

2. Another great advantage of saving banks over benefit societies, constituted as these last ordinarily have been, is, that the benefit societies have been the prolific source of contention and immorality; whereas the scheme of saving banks appears liable to no such abuse.

BANKAFALET, a game of cards played thus : after cutting the cards into as many parts as there are players, every man lays what money he chooses on his card ; and according to the value of his card, above or below those of the other gamblers, the dealer wins or loses. The ace of diamonds is the best card ; the ace of hearts next ; the ace of clubs after it ; then the ace of spades ; and so of the rest of these suits in order, according to their rank. The cheat depends on securing an ace, or such other sure winning card ; which are known to the sharper by some secret mark.

BANKERS, in antiquity, were called *argentarii*, and *nummularii* ; by the Greeks *τραπεζιται*, *κολλυβισται*, and *αργυραμοιβοι*. Their chief business was to put out the money of private persons to interest : they had their boards and benches for this purpose in all the markets and public places, where they took in the money from some, to lend it to others. The Romans had two kinds of bankers, though their office was much more extensive than that of the bankers among us, theirs being that of public officers, in whom were united the functions of a broker, agent, banker, and notary ; managing the exchange, taking in money, assisting in buying and selling, and drawing the writings necessary on all these occasions.

BANKERS, in bricklaying, pieces of timber whereon bricks are cut. The banker is six feet long or more, according to the number of men to work at it, and nine or ten inches square ; it is to be laid on two piers of timber, three feet high from the floor.

BANKERS, in the court of Rome, are persons authorised, exclusively, to solicit and procure by their correspondents at Rome, all bulls, dispensations, and other acts despatched at the papal datary, or in the legateship of Avignon. They were common in all the cities of France that had a parliament, or a presidial before the revolution ; and were erected into a regular and hereditary office, by an edict in 1673. They owed their origin to the Guelphs, who took shelter at Avignon, and in other cities within the jurisdiction of the pope, in the time of the civil wars of Italy. But the heavy extortions they practised towards their clients, soon rendered them odious, and occasioned several denominations of reproach, as *coarcini*, *caturcini*, *caursini*, *corcini*, &c. from the city Cahors, the native place of pope John XXII. in whose pontificate they were in their highest power.

BANKERS, in seamens' language, vessels employed in the cod-fishery on the banks of Newfoundland.

BANKING, in architecture, the making of banks to oppose the force of the sea, rivers, or the like, and secure the land from being overflowed thereby. With respect to the water which is to be kept out, this is called banking ; with respect to the land, which is thereby to be defended, embanking.

BANKALA, an island in the eastern seas, off the coast of Celebes, about twenty miles in circumference. Long. 122° 51' E., lat. 2° 30' S.

BANKAPOUR, or **BANCAPOUR**, a fortress of Hindostan, in the Mysore, now dismantled.

Distant 108 miles N. W. of Seringapatam, and sixty S. W. of Bednore.

BANKINSKOL, a town of Siberia, in the environs of Lake Baikal. Long. 117° 14' E., lat. 51° 11' N.

BANKMORE, a sand bank in the Irish Sea, one mile south of Pontaferry harbour, in the county of Down.

BANKODANG, a small island in the Eastern Indian sea. Long. 118° 2' E., lat. 5° 12' S.

BANKOSSEI, a town of Lower Siam, on the west side of the gulf. Distant seventy miles south of Juthia. Long. 100° 38' E., lat. 13° 12' N.

BANKRUPTS, LAWS RESPECTING. The title of the first English statute on this subject, 34 Henry VIII. cap. 4, which is said to be 'against such persons as do make bankrupt,' is a literal translation of the French idiom, *qui font banque route*. The 3d of Elizabeth followed, all of the provisions of which were incorporated in 1 Jac. I.

A bankrupt, according to these statutes, was considered as a criminal or offender, 1. Jac. I. c. 15. sect. 17 ; but at present the laws of bankruptcy are regarded as calculated for the general benefit of trade, and being founded on broader views of humanity and justice, confer some privileges not only on the creditors, but also on the bankrupt himself : on the creditors, by compelling the bankrupt to give up all his effects to their use, without any concealment ;—and on the debtor, by exempting him from the rigor of other parts of the law, whereby his person might be confined at the discretion of his creditor, though in reality he has nothing to satisfy the debt ; and, together with the liberty of his person, affording him, on certain conditions, some pecuniary provision for his future maintenance. In this respect our legislatures seems to have attended to the example of the Roman law. We mean not the terrible law of the XII tables ; whereby creditors might cut the debtor's body into pieces, and each of them take his proportionable share : if indeed that law, *de debitor in partes secando*, is to be understood in so barbarous a light ; nor do we mean those less inhuman laws (if they may be called so, as their meaning is indisputably certain), of imprisoning the debtor's person in chains, subjecting him to stripes and hard labor at the mercy of his creditor ; and sometimes selling him, his wife, and children, to perpetual foreign slavery trans Tiberim ; an oppression which produced so many popular insurrections, and secessions to the *mons sacer*. Laws equally barbarous are quoted by Blackstone, as existing in Pegu, and the adjacent countries of the East, where the creditor is entitled to dispose of the debtor himself, and likewise of, or appropriate, his wife and children : though indeed by doing so, the debt is understood to be discharged. But we mean the law of cession introduced by the Christian emperors ; whereby if a debtor ceded or yielded up all his fortune to his creditors, he was secured from imprisonment, ' *omni quoque corporali cruciatu semoto*.' For, as the emperor justly observes, ' *inhumanum erat spoliatum fortunis suis in solidum damnari*.' Thus far was just and reasonable ; but, as the departing from one extreme is apt to produce its opposite, we find it afterwards enacted, that if the

debtor, by any unforeseen accident, was reduced to low circumstances, and would swear that he had not sufficient left to pay his debts, he should not be compelled to cede or give up even that which he had in his possession; a law which, under a false notion of humanity, seems to be fertile of perjury, absurdity, and injustice. The laws of England, more wisely, have steered between these extremes: providing at once against the inhumanity of the creditor, who is not suffered to confine an honest bankrupt after his effects are delivered up; and at the same time taking care that all his just debts shall be paid, so far as the effects will extend. But still they are cautious of encouraging prodigality and extravagance by this indulgence to debtors: and therefore they allow the benefit of the laws of bankruptcy to none but actual traders; since that set of men are, generally speaking, the only persons liable to accidental losses, and to an inability of paying their debts, without any fault of their own. If persons in other situations of life run in debt without the power of payment, they must take the consequences of their own indiscretion, even though they meet with sudden accidents that may reduce their fortunes; for the law holds it to be an unjustifiable practice, for any person but a trader to encumber himself with debts of any considerable value. If a gentleman, or one in a liberal profession, at the time of contracting his debts, has a sufficient fund to pay them, the delay of payment is a species of dishonesty, and a temporary injustice to his creditor; and if, at such a time, he has not sufficient fund, the dishonesty and injustice is the greater. He cannot, therefore, murmur, if he suffer the punishment which he has voluntarily drawn upon himself. But in mercantile transactions, the case is far otherwise. Trade cannot be carried on without mutual credit on both sides; the contracting of debts is therefore here not only justifiable but necessary. And if by accidental calamities, as by the loss of a ship in a tempest, the failure of brother traders, or by the non-payment of persons out of trade, a merchant or trader becomes incapable of discharging his own debts, it is his misfortune and not his fault. Such is the spirit of our law; which has been rendered more simple in the mode of its execution of late by the comprehensive statute 6 Geo. IV. cap. 16. which, repealing the greater part of the former statutes on this subject, did it as a line of practice which may be conveniently considered under, 1. Who may become bankrupts. 2. What is an act of bankruptcy. 3. Proceedings thereon up to, and including the meetings of creditors. 4. Effects to the bankrupt and his creditors.

1. *Persons who may become bankrupts* are defined to be all house-keepers, brokers, and persons using the trade or profession of a scrivener, receiver of other men's monies or estates into their trust or custody, and persons insuring ships or their cargoes, or other vessels, against perils of the sea, warehousemen, warehousemen, packers, carriers, victuallers, innkeepers, victuallers, dyers, printers, bleachers, tanners, calenderers, cattle or sheep's dealers, and all persons using the trade of merchandise by way of bargaining,

exchange, bartering, commission, consignment, or otherwise, in gross or by retail; and all persons who, either for themselves or as agents or factors for others, seek their living by buying and selling, or by buying and letting for hire, or by the workmanship of goods or commodities, shall be deemed traders liable to become bankrupt: Provided that no farmer, grazier, common laborer, or workman for hire, receiver-general of the taxes, or member of or subscriber to any incorporated commercial or trading companies, established by charter or act of parliament, shall be deemed, as such a trader, liable to become bankrupt.

II. *An act of bankruptcy* is committed. 1. 'If any trader shall depart this realm, or being out of this realm shall remain abroad, or depart from his dwelling-house, or otherwise absent himself, or begin to keep his house, or suffer himself to be arrested for any debt not due, or yield himself to prison, or suffer himself to be outlawed, or procure himself to be arrested, or his goods, money, or chattels, to be attached, sequestered, or taken in execution, or make or cause to be made, either within this realm or elsewhere, any fraudulent grant or conveyance of any of his lands, tenements, goods, or chattels, or make or cause to be made any fraudulent surrender of any of his copyhold lands or tenements, or make or cause to be made any fraudulent gift, delivery, or transfer of any of his goods, or chattels; every such trader doing, suffering, procuring, executing, permitting, making, or causing to be made any of the acts, deeds, or matters aforesaid, with intent to defeat or delay his creditors, shall be deemed to have thereby committed an act of bankruptcy.

2. But where any trader shall execute any conveyance or assignment, by deed, to a trustee or trustees, of all his estate and effects for the benefit of all the creditors of such trader, the execution of such deed shall not be deemed an act of bankruptcy, unless a commission issue against such trader within six calendar months from the execution thereof, provided that such deed shall be executed by every such trustee within fifteen days after the execution thereof by the said trader; and that the execution by such trader and by every such trustee be attested by an attorney or solicitor; and that notice be given within two months after the execution thereof by such trader in the London Gazette, and two London daily newspapers; or in case the trader does not reside within forty miles of London, in the London Gazette and in one London daily newspaper and one provincial newspaper, published near to such trader's residence; such notice containing the date and execution of such deed, and the name and place of abode respectively of every such trustee, and of such attorney or solicitor.

3. Other acts of bankruptcy are lying in prison for debt twenty-one days; escaping out of prison or custody; or, which is the most novel and important feature of this act,—If any trader shall file in the office of the Lord Chancellor's secretary of bankrupts, a declaration in writing, attested by an attorney or solicitor, that he is insolvent, or unable to meet his engagements, the secretary of bankrupts or his deputy is then to sign a memo-

random that such declaration hath been filed, which is authority for the printer of the London Gazette to insert an advertisement of such declaration therein; and every such declaration shall, after the advertisement inserted, become an act of bankruptcy committed by such trader at the time when such declaration was filed: but no commission can issue thereupon, unless it be sued out within two calendar months next after its insertion, nor unless such advertisement shall have been inserted in the London Gazette within eight days after such declaration was filed; and no docket can be struck upon such act of bankruptcy before the expiration of four days next after insertion of such advertisement, in case such commission is to be executed in London, or before the expiration of eight days next after such insertion, in case such commission is to be executed in the country.

A further provision upon this point, and which seems designed to encourage a settlement of insolvents' affairs in this way is, That no commission under which the adjudication shall be grounded on the act of bankruptcy being the filing of such declaration, shall be deemed invalid by reason of such declaration having been concerted or agreed upon between the bankrupt and any creditor or other person.

If any trader having privilege of parliament shall commit any act of bankruptcy, a commission of bankrupt may issue against him, and the commissioners and all other persons acting under such commission, may proceed thereon in like manner as against other bankrupts, only such person shall not be subject to be arrested or imprisoned during his privilege, except in cases made felony by this act.

III. *Proceedings hereupon.* 1. The Lord Chancellor has power upon petition stating to him in writing that any trader has committed any act of bankruptcy, by any creditor or creditors of such trader; if one being a creditor for £100, if two for £150, and if three being creditors for £200; by commission under the great seal, to appoint such persons as to him shall seem fit, to have full power and authority to take such order and direction, with the body of the bankrupt, as herein after mentioned, as also with all his lands, tenements, and hereditaments, both within the realm and abroad, which he shall have in his own right before he became bankrupt, as also with all such interest in any such lands, tenements, and hereditaments as such bankrupt may lawfully depart with all, and with all his money, fees, offices, annuities, goods, chattels, wares, merchandise, and debts, wheresoever they may be found or known, and to make sale thereof, &c. for satisfaction and payment of the creditors.

The petitioning creditor must prosecute a commission at his own costs, until the choice of assignees; or the commissioners may appoint temporary assignees. Any creditor or creditors whose debt or debts is or are sufficient to entitle him or them to petition for a commission against all the partners of any firm, may petition for a commission against one or more partners of such firm, and every commission issued upon such petition shall be valid although it does not in-

clude all the partners of the firm, and in every commission against two or more persons it shall be lawful for the Lord Chancellor to supersede such commission as to one or more of such persons, and the validity of such commission shall not be thereby affected as to any person as to whom such commission is not ordered to be superseded, nor shall any such person's certificate be thereby affected. Auxiliary commissions for the proof of debts or examination of witnesses may also be issued by the chancellor. But the examinations are to be annexed to the original commission.

2. The commissioners take oath impartially and honestly to execute their office; and they take a fee of twenty shillings for every meeting and for the signature of every deed and conveyance, and the bankrupt's certificate. The first duty is, upon proof made before them of the petitioning creditor's debt or debts, and of the trading and act or acts of bankruptcy of the person or persons against whom such commission is issued, to adjudge such person or persons bankrupt. Then the commissioners 'shall forthwith cause notice of such adjudication to be given in the London Gazette, and shall thereby appoint three public meetings for the bankrupt to surrender and conform, the last of which meetings shall be on the forty-second day hereby limited for such surrender.' No commission shall abate by reason of a demise of the crown, and (if by reason of the death of commissioners, or for any other cause, it becomes necessary) any commission may be renewed, but only half the fees usually paid upon obtaining commissions shall be paid for the same; and if any bankrupt shall die after adjudication, the commissioners may proceed in the commission as they might have done if he were living.

3. The messenger of the commissioners may break open the bankrupt's doors, &c. and seize upon his body or property; and if the bankrupt be in prison or in custody, it shall be lawful for the person so appointed as aforesaid to seize any property (his necessary wearing apparel only excepted) in the custody or possession of such bankrupt, or of any other person, in any prison or place where such bankrupt is in custody. But, in ordinary cases, the messenger proceeds quietly to enter on the bankrupt's premises, and take possession of his goods. The commissioners are empowered to summon persons suspected of having bankrupt's property in their hands, &c.; and compel them to produce books, &c. under pain of being committed to prison without bail. They may even summon the bankrupt's wife. And the concealment of his effects subjects other parties to a fine of £100.

4. At the three several meetings appointed by the commissioners, and at every other meeting by them appointed for proof of debts (whereof, and of the purport whereof, ten days notice shall have been given in the London Gazette), every creditor of the bankrupt may prove his debt by his own oath; and all bodies politic and public companies incorporated or authorised to sue or bring actions, either by charter or act of parliament, may prove by an agent, provided such agent shall in his deposition swear that he is such

agent, and that he is authorised to make such proof; and if any creditor shall live remote from the place of the meeting of the commissioners, he may prove by affidavit, sworn before a master in chancery, ordinary or extraordinary; or if such creditor shall live out of England, by affidavit sworn before a magistrate where such creditor shall be residing, and attested by a notary public, British minister, or consul: and no creditor shall pay any contribution on account of any such debt; provided, that it shall be lawful for the said commissioners to examine upon oath, either by word of mouth or by interrogatories in writing, every person claiming to prove a debt under the said commission, or to require such further proof, and to examine such other persons in relation thereto, as they shall think fit. *Bonâ fide* creditors are admitted to prove a debt notwithstanding any secret act of bankruptcy, before it was contracted, and, as special debts, the commissioners may order six months wages of servants or clerks to be paid in full; but of more than six months' wages, the residue must be proved as an ordinary debt; and debts not payable at the time of the bankruptcy may be proved, deducting rebate of interest; and the actual interest due on bills of exchange, &c. at the date of the commission. Sureties and persons liable for the debts of bankrupts can only prove, after having paid such debts. The value of annuities, however, may be calculated and proved; but other debts contingent at the time of the bankruptcy, are provable after the happening of the contingency. The commissioners may convey the personal estate, debts due to the bankrupt, and all his property to the assignees.

5. At the second meeting appointed by the commissioners, or any adjournment thereof, the assignees of the bankrupt's estate and effects are chosen; and all creditors who have proved debts under the commission to the amount of ten pounds and upwards entitled to vote in such choice; and also any person authorised by letter of attorney from any creditor or creditors, upon proof of the execution thereof, either by affidavit sworn before a master in chancery, ordinary or extraordinary, or by oath before the commissioners *viva voce*; and that the commissioners having power to reject any person so chosen who shall appear to them unfit to be such assignee, and upon such rejection a new choice of another assignee or assignees shall be made. And a joint creditor is entitled to prove under a separate commission, for the purpose of voting in the choice of assignees.

6. If any person against whom any commission has been issued, or shall hereafter be issued, whereupon such person hath been or shall be declared bankrupt, shall not, before three of the clock upon the forty-second day after notice thereof in writing to be left at the usual place of abode of such person, or personal notice in case such person be then in prison, and notice given in the London Gazette of the issuing of the commission, and of the meetings of the commissioners, surrender himself to them, and sign or subscribe such surrender, and submit to be examined before them, from time to time, upon oath, or, being a Quaker, upon solemn affirma-

tion; or if any such bankrupt upon such examination shall not discover all his real or personal estate, and how and to whom, upon what consideration, and when he disposed of, assigned, or transferred any of such estate, and all books, papers, and writings relating thereunto (except such part as shall have been really and *bonâ fide* before sold or disposed of in the way of his trade, or laid out in the ordinary expense of his family); or if any such bankrupt shall not upon such examination deliver up to the commissioners all such part of such estate, and all books, papers, and writings relating thereunto, as be in his possession, custody, or power, (except the necessary wearing apparel of himself, his wife and children); or if any such bankrupt shall remove, conceal, or embezzle any part of such estate, to the value of £10 or upwards, or any books of account, papers, or writings relating thereto, with intent to defraud his creditors, every such bankrupt shall be deemed guilty of felony, and be liable to be transported for life, or for such term, not less than seven years, as the court before which he shall be convicted shall adjudge, or shall be liable to be imprisoned only, or imprisoned and kept to hard labor in any common gaol, penitentiary house, or house of correction, for any term not exceeding seven years. But the lord chancellor, or the commissioners have power, as often as they shall think fit, from time to time, to enlarge the time for the bankrupt surrendering himself, so as every such order be made six days at least before the day on which such bankrupt was to surrender himself; and an allowance is to be made to the bankrupt for his maintenance, out of his estate, until he shall have passed his examination. The bankrupt shall also be free from arrest or imprisonment by any creditor in coming to surrender; and after such surrender during the said forty-two days, and such further time as shall be allowed him for finishing his examination, provided he was not in custody at the time of such surrender; and if such bankrupt shall be arrested for debt, or on any escape warrant in coming to surrender, or shall after his surrender be so arrested within the time aforesaid, he shall, on producing the summons under the hands of the commissioners to the officer who shall arrest him, and giving such officer a copy thereof, be immediately discharged; and if any officer shall detain any such bankrupt after he shall have shown his summons to him, so signed as aforesaid, such officer shall forfeit to such bankrupt, for his own use the sum of £5. for every day he shall detain such bankrupt, to be recovered by action of debt in any court of record at Westminster, in the name of such bankrupt, with full costs of suit.

IV. *The effects of these provisions with regard to the bankrupt and his creditors* are, 1. All previous conveyances of property, made while he was insolvent, become void (except upon marriage of his children or for some valuable consideration).

2. He is no longer entitled to leases, or agreements for leases, nor liable for rents or covenants; but his assignees may elect to abide by or abandon a lease or agreement, and execute all powers previously vested in bankrupts. But

all conveyances by, and all contracts and other dealings and transactions by and with any bankrupt, *bonâ fide* made and entered into more than two calendar months before the date and issuing of the commission against him, and all executions and attachments against the lands and tenements or goods and chattels of such bankrupt, *bonâ fide* executed or levied more than two calendar months before the issuing of such commission, shall be valid, notwithstanding any prior act of bankruptcy by him committed; provided the person or persons so dealing with such bankrupt, or at whose suit or on whose account such execution or attachment shall have issued, had not at the time of such conveyance, contract, dealing, or transaction, or at the time of executing or levying such execution or attachment, notice of any prior act of bankruptcy by him committed: payments made by and to the bankrupt without notice, are valid, notwithstanding an act of bankruptcy. And no person or body corporate, or public company, having in his or their possession or custody any money, goods, wares, merchandises, or effects belonging to any bankrupt shall be endangered by reason of the payment or delivery thereof to the bankrupt or his order; provided such person or company had not at the time of such delivery or payment, notice that such bankrupt had committed an act of bankruptcy.

3. Every bankrupt who shall have duly surrendered and conformed himself to the laws in force concerning bankrupts at the time of issuing the commission against him, shall be discharged from all debts due by him when he became bankrupt, and from all claims and demands provable under the commission, in case he shall obtain a certificate of such conformity, so signed and allowed, and subject to such provisions as herein-after directed; but no such certificate shall release or discharge any person who was partner with such bankrupt at the time of his bankruptcy, or who was then jointly bound, or had made any joint contract with such bankrupt. Such certificate shall be signed by four-fifths in number and value of the creditors of the bankrupt, who shall have proved debts under the commission to the amount of twenty pounds or upwards, or after six calendar months from the last examination of the bankrupt, then either by three-fifths in number and value of such creditors, or by nine-tenths in number of such creditors, who shall thereby testify their consent to the said bankrupt's discharge as aforesaid; and no such certificate shall be such discharge, unless the commissioners shall in writing, under their hands and seals, certify to the Lord Chancellor that such bankrupt has made a full discovery of his estate and effects, and in all things conformed as aforesaid, and that there does not appear any reason to doubt the truth or fulness of such discovery, and also that the creditors have signed in manner hereby directed, and unless the bankrupt make oath in writing that such certificate and consent were obtained without fraud, and unless such certificate shall, after such oath, be allowed by the Lord Chancellor, against which allowance any of the creditors of the bankrupt may be heard before the Lord Chancellor. But the commis-

sioners shall not sign any certificate unless they shall have proof, by affidavit in writing, of the signature of the creditors thereto, or of any person thereto authorised by any creditor, and of the authority by which such person shall have so signed the same; and if any creditor reside abroad, the authority of such creditor shall be attested by a notary public, British minister, or consul; and every such affidavit, authority, and attestation, shall be laid before the Lord Chancellor, with the certificate, previous to the allowance thereof.

Any contract or security made or given by any bankrupt or other person unto or in trust for any creditor, or for securing the payment of any money due by such bankrupt at his bankruptcy, as a consideration or with intent to persuade such creditor to consent to, or sign such certificate, shall be void, and the money thereby secured or agreed to be paid shall not be recoverable, and the party sued on such contract or security may plead the general issue, and give this act and the special matter in evidence. And, finally, any bankrupt who shall, after this certificate shall have been allowed, be arrested, or have any action brought against him for any debt, claim, or demand, hereby made provable under the commission against such bankrupt, shall be discharged upon common bail, and may plead in general that the cause of action accrued before he became bankrupt, and may give this act and the special matter in evidence, and such bankrupt's certificate, and the allowance thereof, shall be sufficient evidence of the trading, bankruptcy, commission, and other proceedings precedent to the obtaining such certificate; and if any such bankrupt shall be taken in execution, or detained in prison for such debt, claim, or demand, where judgment has been obtained before the allowance of his certificate, it shall be lawful for any judge of the court wherein judgment has been so obtained, on such bankrupt's producing his certificate, to order any officer who shall have such bankrupt in custody by virtue of such execution, to discharge such bankrupt without exacting any fee, and such officer shall be hereby indemnified for so doing.

It is nevertheless provided that if any person who shall have been so discharged by such certificate as aforesaid, or who shall have compounded with his creditors, or who shall have been discharged by any insolvent act, shall be or become bankrupt, and have obtained or shall hereafter obtain such certificate as aforesaid, unless his estate shall produce (after all charges) sufficient to pay every creditor under the commission fifteen shillings in the pound, such certificate shall only protect his person from arrest and imprisonment, but his future estate and effects (except his tools of trade and necessary household furniture, and the wearing apparel of himself, his wife and children), shall vest in the assignees under the commission.

A scale of allowance on the other hand is made for every bankrupt who shall have obtained his certificate, if the net produce of his estate shall pay the creditors who have proved under the commission ten shillings in the pound; in which case he shall be allowed five per cent.

out of such produce, to be paid him by the assignees, provided such allowance shall not exceed four hundred pounds; and every bankrupt, if such produce shall pay such creditors twelve shillings and sixpence in the pound, shall be allowed and paid as aforesaid seven pounds ten shillings per cent., provided such allowance shall not exceed five hundred pounds; and every bankrupt, if such produce shall pay such creditors fifteen shillings in the pound or upwards, shall be allowed and paid as aforesaid ten pounds per cent., provided such allowance shall not exceed six hundred pounds; but if such produce shall not pay such creditors ten shillings in the pound, such bankrupt shall only be allowed and paid so much as the assignees and commissioners shall think fit, not exceeding three pounds per cent. and three hundred pounds.

As to the important point of making dividends, the commissioners shall, not sooner than four nor later than twelve calendar months from the issuing the commission, appoint a public meeting (whereof, and of the purport whereof, they shall give twenty-one days notice in the London Gazette), to make a dividend of the bankrupt's estate, at which meeting all creditors who have not proved their debts shall be entitled to prove the same; and the said commissioners at such meeting shall order such part of the net produce of the bankrupt's estate in the hands of the assignees, as they shall think fit, to be forthwith divided amongst such creditors as have proved their debts under the commission, in proportion to their respective debts, and shall make an order for a dividend in writing under their hands, and shall cause one part of such order to be filed among the proceedings under the commission, and shall by every other part thereof to the assignees, which order shall contain an account of the time and place of making such order, of the amount of the debts proved, of the money remaining in the hands of the assignees to be divided, and how much in the pound is then ordered to be paid to every creditor, and of the money allowed by the commissioners to be retained by the assignees, with their reasons for allowing the same to be so retained; and the assignees, in pursuance of such order (and without any deed or other instrument made for that purpose), shall forthwith make a dividend, and shall take receipts thereunto to be kept for that purpose from each creditor; and the dividend received by such creditors, and such order, and receipt shall be a discharge to every such assignee for so much as he shall have paid in pursuance of such order; and no dividend shall be declared, unless the accounts of the bankrupt shall have been first so audited as to be certified in a statement delivered by them to the commissioners.

And every creditor having a claim for his debt, or any part thereof, due to him in London, or any other place, by virtue of any custom there used, or any bills and claims of the bankrupt, shall not have any such security or attachment made thereunto, or any part of such debt, except in pursuance of any execution or extent served and returned by some creditor, or any mortgage of or charge upon any part of the property of such bankrupt, made after the bankruptcy; provided that no

creditor, though for a valuable consideration, who shall sue out execution upon any judgment obtained by default, confession, or *nil dicit*, shall avail himself of such execution to the prejudice of other fair creditors, but shall be paid rateable with such creditors.

If the bankrupt's estate shall not have been wholly divided upon the first dividend, the commissioners shall, within eighteen calendar months after the issuing of the commission, appoint a public meeting (whereof, and of the purport whereof, they shall give twenty-one days notice in the London Gazette), to make a second dividend of the bankrupt's estate, when all creditors who have not proved their debts may prove the same; and the commissioners at such meeting, after taking such audit as herein-before directed, shall order the balance in the hands of the assignees to be forthwith divided amongst such of the creditors as shall have proved their debts; and such second dividend shall be final, unless any action at law or suit in equity be depending, or any part of the estate be standing out, not sold or disposed of, or unless some other estate or effects of the bankrupt shall afterwards come to the assignees, in which case they shall, as soon as may be, convert such estate and effects into money, and within two calendar months after the same shall be so converted, divide the same in manner aforesaid.

Lastly, if any assignee, under any commission of bankrupt, shall have, either in his own hands or at any banker's, or otherwise subject to his order or disposition, or to his knowledge in the hands of, or in the order and disposition of himself and any co-assignee or co-assignees, or of any or either of them, any unclaimed dividend or dividends, amounting in the whole to the sum of fifty pounds, and shall not within six months after this act shall have taken effect, or two calendar months after the expiration of one year after the declaration and order of payment of such dividend or dividends made by the commissioners, either pay to the creditor or creditors entitled thereto, or cause a certificate thereof to be filed in the office of the Lord Chancellor's secretary of bankrupts, containing a full and true account of the name or names of the creditor or creditors to whom such unclaimed dividend or dividends is or are respectively due, and of the amount of such dividend or dividends respectively (such account being signed by the assignee or assignees rendering the same, and attested by the solicitor to the commission, or the solicitor to the assignee or assignees signing the same), such assignee or assignees shall be charged, in account with the estate of the bankrupt, interest upon such unclaimed dividend or dividends, to be computed from the time that such certificate is hereby directed to be filed, at the rate of five pounds per centum per annum, for such time as he shall thenceforth retain the same, and also such further sum as the commissioners shall think fit, not exceeding in the whole twenty pounds per centum per annum; and the Lord Chancellor, or the said commissioners, may order the investment of any unclaimed dividends in the public funds, or in any government security, for or on account of the creditors entitled, and

subject to such order as the Lord Chancellor may think fit to make respecting the same, who, if he shall think fit, may, after the same shall have remained unclaimed for the space of three years from the declaration of such dividends by the commissioners, order the same to be divided amongst and paid to the other creditors, and the proof of the creditors to whom such dividends were allotted shall from thenceforth be considered as void as to the same, but renewable as to any future dividends, to place them *pari passu* with the other creditors, but not to disturb any dividends which shall have been previously made.

We have thus fully stated the general provisions of the late act, as useful to all persons connected with trade; more minute provisions will of course engage the attention and require the aid of professional men.

BANKS, CAPE, the north-east point of Botany Bay, on the east coast of New Holland.

BANKS' ISLAND, an island of New Zealand, off the north-east coast of Tavai Poenamoo. It is about sixty miles in circumference, and sufficiently high to be visible at the distance of twelve or fifteen leagues. It is barren but inhabited. Distant fifteen miles from Tavai Poenamoo. The south point lies in long. $186^{\circ} 30' W.$, latitude $43^{\circ} 32' S.$ Also, an island in the North Pacific, near the west coast of North America, about sixty miles long, and five broad. Long. $129^{\circ} 45'$ to $130^{\circ} 10' W.$, lat. $50^{\circ} 30' N.$

BANKS' PORT, a harbour on the north-west coast of America, south-east from Cape Edgecumbe, and north-west from Sea Otter Sound.

BANKS (Sir John), Lord Chief Justice of the Common Pleas, in the reign of Charles I., was born at Keswick, in Cumberland, in 1589. He studied at Oxford, but took no degree: applying to the law, his extraordinary reputation in that profession soon recommended him to the king, who made him attorney to the prince in 1629; knighted him, and appointed him attorney-general in 1634; lord chief justice in 1640; and a member of the privy council in 1642. In these perilous times, he discharged the duties of his important and arduous offices with very general approbation. But at last lost his popularity, by declaring on the bench, in the summer circuit, that the actions of Essex, Manchester, and Waller, were treasonable; and the Commons voted him a traitor. Meantime his lady, being with her family at his seat at Corfe Castle, in the isle of Purbeck, was summoned to surrender by the friends of the parliament; but refused, though she had then only five men in the castle, and sustained a siege, by William Earl, with not more than forty men. At last lady Banks was relieved by the arrival of lord Caernarvon with a body of horse. Sir John continued with the king at Oxford till 1644, when he died.

BANKS (John), an English author, born at Sunning, in Berkshire in 1709. He was bred a weaver at Reading, but gave up that business and went to London, where he became a bookseller. Not succeeding in this, he published various tracts, particularly a Critical Review of the Life of Oliver Cromwell, which met with a favorable reception. He died in 1751.

BANKS (Thomas), an eminent English sculptor,

was born in 1735, and was son of Mr. William Banks, steward of the duke of Beaufort. He was educated with Kent, the well-known architect of that period; but afterwards, showing a preference for sculpture, studied it at the Royal Academy with great success, and was elected to be sent as one of its students to Italy. Here he executed several good pieces, particularly a basso-relievo of Caractacus, in the possession of the duke of Buckingham; and a Cupid catching a butterfly, which was afterwards purchased by the empress Catharine. He went from Italy to Russia, where he staid two years, and returned to his own country to acquire both fame and fortune. Among his works are a colossal statue exhibiting Achilles mourning the loss of Briseïs, in the hall of the British Institution; and the monument of Sir Eyre Coote, in Westminster Abbey. Mr. Banks was elected a member of the Royal Academy not long after his return from Russia, and finished his useful life in February 1805.

BANKS (Sir Joseph), the late celebrated naturalist, was the son of William Banks, Esq. of Revesby Abbey, Lincolnshire, where he was born in 1743. He received his education at Eton and Oxford, where he continued till the death of his father. In 1765 he made a voyage to Newfoundland and Labrador, for the purpose of making researches relative to natural history; and in 1763 embarked with his friend, Dr. Solander, in the first voyage round the world made by the great captain Cook. In the course of this expedition Mr. Banks, in traversing the rocks of Terra del Fuego, narrowly escaped perishing from intense cold. In consequence of a misunderstanding with captain Cook, he did not join, as he intended, in the expedition of 1772; but the same year undertook a voyage to the Western Isles of Scotland and to Iceland, in the course of which he made important additions to our knowledge of those regions. About this time he received the compliment of a diploma of LL. D. from his alma mater. In 1778 he was made a baronet and elected president of the Royal Society. Some unpleasant dissensions, which arose in the society not long after, were almost the only circumstances which occurred to interrupt his tranquillity. These, however, subsided, and the remainder of his life was passed amongst scientific associates, and the prosecution of researches connected with natural history. His house was always open to the learned world. He died June 19, 1820, at his seat at Spring Grove, Middlesex. The published writings of Sir Joseph Banks are neither numerous nor important. They consist of papers in the Philosophical Transactions, the *Archæologia*, the Transactions of the Horticultural Society, and other periodical works; and a small tract, entitled *A Short Account of the Causes of the Diseases in Corn*, called by Farmers the Blight, the Mildew and the Rust, with plates. London, 1803, 4to. This impression was only for private distribution; but an edition in 8vo. was published in 1805. Sir Joseph possessed a noble library of works on natural history, of which an admirable catalogue, in five vols. 8vo. was compiled by his librarian, Mr. Dryander.

BANKS-BRAE, a hill of Scotland, in Renfrewshire, on the south-west border of the parish of Kilbarchan, beautifully adorned with plantations.

BANKSIA, in entomology, a species of papilio, (nymph), with angulated wings; brown above, with a yellowish disk. Fabricius. It is a native of New Holland, and the papilio ismene of Cramer.

BANKSIA, in botany, a genus of the monogynia order, and tetandria class of plants. The amentum is scaly, the corolla consists of four petals. The antheræ are in the cavity of the folds and sessile; the capsule is bivalvular; and the seed is solitary, and bipartite. There are four principal species, viz. 1. *B. dentata*; 2. *B. ericæfolia*; 3. *B. integrifolia*; 4. *B. serrata*; all natives of New Holland. See Mr. Brown's Transactions of the Linnæan Society, vol. x. p. 202; and Commentaries to the Hortus Kewensis, vol. i. p. 213.

BANKSIA ABYSSINICA, a beautiful Abyssinian tree, so named by Bruce.

BANKSII, a species of scarabæus melontha; described by Fabricius, from a specimen in the museum of Sir Joseph Banks. The head and thorax are black; wing-cases villose, and legs testaceous; abdomen short and retuse.

BANKSII, a species of cimex (reduvius), that inhabits India. It is rufous above, with black wings; abdomen deep black; border rufous.

BANKSII, a species of chrysomela that inhabits Calabria. It is brassy above, beneath testaceous.

BANKSII, a species of cerambyx (lamia), that is found at the Cape of Good Hope. It is of a grayish color; thorax slightly spined; wing-cases speckled with ferruginous, and marked with two emarginous bands.

BANLEUGA, **BANLEU**, or **BANNILEUGA**, in writers of the middle age, the territory within which the jurisdiction of municipal magistrates, or ordinary judges of a city, town, or the like, is confined: so called, because within this tract they make their proclamations, prohibitions, and other acts of justice and policy, comprised under the name of ban or bannum.

BANMORE, **ELIAN NAN**, Gael. i. e. the island of great women; the ancient name of the island of Eigg.

BANN, from the Brit. ban, i. e. clamor, a proclamation, public notice, command, or prohibition.

BANN, in ancient jurisprudence, denoted proscription or banishment for a crime proved; because anciently published by sound of trumpet; or, as Vossius thinks, because those who did not appear at the above-mentioned summons, were punished by proscription. Hence, to put a prince under the ban of the empire, is to declare him divested of all his dignities. The sentence denotes an interdict of all intercourse and offices of humanity with the offender; the force of which seems taken from that of the Romans, who banished persons by forbidding them access to the sea and water. Sometimes also cities were put under the imperial ban; that is, stripped of their rights and privileges. The word is likewise a pecuniary mulct, or penalty,

laid on a delinquent for offending against a bann-

BANN, in military affairs, a proclamation made in the army by beat of drum, sound of trumpet, &c. requiring the strict observance of discipline, either for the declaring a new officer, or punishing an offender.

BANN, a river of Ireland, descending from the north of the mountains of Mourne, and flowing north-west into the Lough Neagh: again issuing from the north side of that lake, it passes Coleraine, and enters the sea a few miles east of Lough Foyle. Its course, including the lough, is about seventy miles; and, with the canal of Newry, which joins it to the Irish sea, it makes the north-east portion of Ireland a peninsula.

BANN, or **BANNUS**, a title anciently given to the governor or viceroy of Croatia, Dalmatia, and Slavonia.

BANN, **EPISCOPAL**, *bannus episcopalis*, a mulct paid to the bishop by those guilty of sacrilege and other crimes.

BANN OF HARVEST, or **VINTAGE**, &c. in the ci-devant French customs, imported a prohibition to reap, or gather the grapes, without the leave of the lord.

BANNS OF MARRIAGE are solemn notices of matrimonial contracts, made in the parish-church before marriage; that if there be any objections to either party as to prior engagements, &c. there may be an opportunity of making them.

The publication of banns, popularly called asking in the church, was intended to prevent clandestine marriages: but a licence may be obtained for the marriage, and then this ceremony is omitted: but ministers are not to celebrate matrimony between any persons without a licence, except the banns have been first published three several times upon pain of suspension, &c. The use of matrimonial banns is said to have been first introduced in the Gallican church, though something like it obtained even in the primitive times: and it is this that Tertullian is supposed to mean by *trinundina promulgatio*. The council of Lateran first extended and made the usage general. By the ordinance of Blois, no person could validly contract marriage, without a preceding proclamation of three banns; nor could any person whatever be exempt except for the two last.

BANNS, **PAPAL**, solemn anathemas, or excommunications, attended with curses, &c.

BANNAGHER, or **BANAGHER**, a town of Ireland, in King's county, Leinster, on the Shannon, fifteen miles south of Athlone.

BANNALEC, a town of Brittany, France, department of Finisterre, arrondissement of Quimperlé, the head of a canton; has 4700 inhabitants. It is four miles from Rosrorden and six from Quimperlé.

BANNALIS MOLA, or **BANNAL MILL**, a kind of feudal service, whereby the tenants of a district are obliged to carry their corn to be ground at a certain mill, or to be baked at a certain oven, for the benefit of the lord. This in Scotland is called thirlage.

BANNEC, an island in the English channel, near the coast of France. Long. 4° 55' W., lat. 48° 25' N.

BANNER, Fr. *banniere*, Ital. *banda*, *banda*, *banda*, *banda*, Ger. *banner*, Swed. *baner*, *baner*, *baner*, Dut. *baniere*. In old Sax. *ban*-*banerol*. *segn* is the ensign or banner. From *bandvo*, *signum*; *bandojan*, *significare*. *Bannerol*, or more properly *banderol*, is derived from *banderolle*, Fr. Spenser writes it *bannerall*; and the old Fr. is *banneralle*. The *banner*, *bandroll*, or *bansegn*, is probably the sign of union, which fastened to a pole, may be furled and unfurled at pleasure, like a roll of canvass or silk; and which armies and other bodies of men elevate as a standard, which distinguishes the party and cause which they have espoused, or the common purpose to which they have bound themselves. 'We find (say the writers in the *Encyclopædia Britannica*), a multiplicity of opinions concerning the etymology of the word *banner*; some deriving it from the Latin *bandum*, a band or flag; others from the word *bann*, to summon the vassals to appear in arms; others again from the German *ban*, a field or tenement, because landed men alone were allowed a banner; and finally, there are some who think it is a corruption of *panniere*, from *pannus*, cloth; because banners were originally made of cloth.

Lift ye up a banner upon the high mountains.

Isaiah

Then lo triumph! O great beautie's queen,
Advance the banner of thy conquest here.

Spenser.

From France there comes a power who already
Have secret spies in some of our best ports,
And are at point to shew their open banner.

Shakspeare.

All in a moment through the gloom were seen
Ten thousand banners rise into the air,
With orient colours waving.

Milton.

A gentleman told Henry, that Sir Richard Croftes,
made *banneret* at Stoke, was a wise man; the king
answered, he doubted not that, but marvelled how a
fool could know.

Camden.

King Oswald had a *bannerol* of gold and purple set
over his tomb.

Id.

Philip Augustus, and Richard the First, are the
only kings of France and England who have fought
under the same banners.

Gibbon.

BANNER, in heraldry, such a flag is borne as a charge, in coats of arms, and when open and flying is called 'the banner disveloped,' as 'the field is Jupiter, three banners disveloped, in bend Sol,' which are said to have been the arms of the kingdom of Baldachia.

BANNER OF DENMARK, or the **DANISH BANNER**, was a famous magical standard, taken from the Danes by Alfred the Great, in spite of its miraculous powers and properties, which are thus described by Sir John Spelman. 'It was a banner with the image of a raven magically wrought by the three sisters of Hungar and Hubba, on purpose for their expedition, in revenge of their father Lodebroch's murder, made, they say, almost in an instant, being by them at once begun and finished in a noontide; and believed by the Danes to have carried great fatality with it, for which it was highly esteemed by them. It is pretended, that being carried in

battle, towards good success it would always seem to clap its wings, and make as if it would fly; but towards the approach of mishap, it would hang down and not move!'

The **BANNER OF FRANCE** was the largest and richest of all the flags borne by the ancient kings in their military expeditions. St. Martin's cap was in use 600 years as the banner of France; it was made of tafety, painted with the image of that saint, and laid one or two days on his tomb to prepare it for use. This was succeeded by the famous *auriflamme*, or *oriflamme*. About the year 1100 was introduced a more pompous apparatus; the mode of which was borrowed from Italy. The *banner-royal* was fastened to the top of a mast, or some small tree planted on a scaffold, borne on a chariot drawn by oxen, covered with velvet housings, decorated with devices, or cyphers of the reigning prince. At the foot of the tree was a priest, who said mass early every morning. Ten knights mounted guard on the scaffold night and day, and as many trumpets at the foot of the tree never ceased flourishing to animate the troops. This cumbersome machine continued in use about 130 years. Its post was in the centre of the army. And here the chief feats were performed to carry off and defend the royal banner: for there was no victory without it; nor was an army reputed vanquished till they had lost this banner.

BANNERET, from *banner*. A knight made in the field, with the ceremony of cutting off the point of his standard, and making it a banner. They are next to barons in dignity; and were anciently called by summons to parliament. It is also the name of an officer or magistrate of Rome towards the close of the fourteenth century. The people of that city, and throughout the territory of the church, during the disputes of the antipopes, had formed a kind of republican government, where the whole power was lodged in the hands of a magistrate, called senator, and twelve heads of quarters called *bannerets*, by reason of the banners which each raised in his district.

BANNERETS, an ancient order of knights, or feudal lords; who, possessing several large fees, led their vassals to battle under their own flag or banner, when summoned thereto by the king. They are also called in ancient writers *milites*, *vexilliferi*, and *vexillarii*, *bannerarii*, *bannarii*, *banderisii*, &c. There are two kinds of knights, great and little; the first whereof were called *bannerets*, the second *bachelors*; the first composed the upper, the second the middle nobility. The *banneret* was a dignitary allowed to march under his own flag, whereas the *bachelarius eques* followed that of another. To be qualified for a *banneret*, one must be a gentleman of family, and must have a power to raise a certain number of armed men, with estate enough to subsist at least twenty-eight to thirty men. This must have been very considerable in those days; because each man, besides his servant, had two horsemen to wait on him armed, the one with a crossbow, the other with a bow and hatchet. As he was not allowed to be a baron who had not above thirteen knights' fees, so he was not admitted to be a *banneret* if he had less than ten. The order of *banneret*, according to Spelman, was a middle one, between a baron and a simple knight; called

sometimes also *vexillarius minor*, to distinguish him from the greater, that is from the baron, to whom alone properly belonged the *jus vexilli*, or privilege of the square flag. Hence the banneret was also called *banneretus*, quasi *baro minor*; a word frequently used by English writers in the same sense as banneret was by the French, though neither of them occur before the time of Edward II. Some will have bannerets to have originally been persons who had some portion of a barony assigned them; and enjoyed it under the title of *baro proximus*, and that with the same prerogatives as the baron himself. Some again find the origin of bannerets in France, others in Brittany, others in England. These last attribute the institution of bannerets to Conan, lieutenant of Maximus, who commanded the Roman legions in England under the empire of Gratian in 383. This general, say they, revolting, divided England into forty cantons, and in these cantons distributed forty knights, to whom he gave a power of assembling, on occasion, under their several banners, as many of the effective men as were found in their respective districts: whence they are called bannerets. However this be, it appears from Froissard, &c. that anciently such of the military men as were rich enough to raise and subsist a company of armed men, and had a right to do so, were called bannerets. Not, however, that these qualifications rendered them knights, but only bannerets; the appellation of knight being only added thereto, because they were simple knights before. Bannerets were second to none but knights of the garter. They were reputed the next degree below the nobility, taking precedence next to the knights of the bath, and were allowed to bear arms with supporters, which none else may under the degree of a baron. In France, it is said, the dignity was hereditary, but in England it died with the person who gained it. The order dwindled on the institution of baronets by King James I. Sir John Smith had, so after Edgehill-fight, for rescuing the standard of King Charles I. being the last banneret, until the late Sir William Erskine, on his return from the continent in 1764, was made a knight-banneret in Hyde Park by His Majesty, in consequence of his distinguished conduct at the battle of Emsdorff. But he was not acknowledged as such in this country, although he was invested with the order between the two standards of the fifth regiment of Light dragoons, because the ceremony did not take place where the engagement happened. Captain Trollope of the Royal Navy was another knight-banneret, created by Geo. III. after Lord Duncan's victory at Camperdown, but as this involved some hereditary difficulties on points of precedence, and there was some apprehension or jealousy on the part of baronets, the practice was discontinued. In Switzerland the banneret was a civil officer like the *Confalonier* in some of the Italian republics; and at Lausanne the title was conferred on those magistrates who had the privilege of carrying the banner of that city at the consecration of the cantons.

The honor of creating bannerets was on a day of battle, the candidate presented his flag to the king or general, who cutting off the train or skirt

thereof, and making it a square, returned it again, the proper banner of bannerets, who are hence sometimes called knights of the square flag. There seems to have been bannerets created either in a different manner, or by others than the sovereign; since King James, in the patent of baronets, gives them precedence to all knights bannerets, except such as are created by the king himself in the field; which implies, either that there are some of this order created out of the field, or by inferior persons.

BANNEROL, more properly **BANDEROL**, from *banderole*, Fr. a little flag or streamer.

BANNIAN, *n. s.* 1. A man's undress, or morning gown, such as is worn by the Bannians in the East Indies. 2. A native of India; now usually applied to a Gentoo servant employed in managing the commercial affairs for Englishmen.

BANNIAN-DAY, in common parlance, a day of self-denial; of shifts and expedients; derived probably from sacred or fast-day.

BANNIAN-TREE. A sacred fig-tree, growing in India, called by our old herbalists 'the arched Indian fig-tree;' from the various branches of which grow little sprigs downwards, till they reach the ground, take root, as Milton has observed,

And daughters grow
About the mother tree, a pillar'd shade,
High o'er-arch'd, and echoing walks between.
Paradise Lost

BANNIANS. See **BANTANS**.

BANNIER (John), a Swedish general, born in 1601. He served under Gustavus Adolphus, and on his death became commander-in-chief. After gaining many victories, and taking several important places, fortune favored the Imperialists, and they at last drove him out of Bohemia. He died in 1641, on his retreat from the German dominions.

BANNIMUS, *q. d.* we banish, from the obsolete verb *bannio*, the form of expulsion of any member from the University of Oxford, by affixing the sentence up in some public place, as a promulgation of it.

BANNITUS, an exile or outlaw.

BANNOCK, *n. s.* A kind of oaten or pea-meal cake, mixed with water, and baked upon an iron plate over the fire; used in the northern counties, and in Scotland.

BANNOCKS differ from cakes, in being thicker and softer; and their taste is thought to be improved by being baked in the embers, or on a stone placed before the fire, or a slate above it.

BANNOCK-BURN, a village of Scotland, in Stirlingshire, seated on the Bannock, from whence it is named, famous for the decisive battle fought near it between king Robert Bruce of Scotland, and Edward II. of England. A. D. 1314.

It is to be regretted that to poetical narratives only (that of the Scottish poet Barbour particularly) we must look for the existing detail of the events of this memorable day. They, however, were so important, and have since been so frequently alluded to by poets and historians, that we cannot omit to furnish the reader with the best account we can digest. On Saturday the 22d of June, Bruce having received intelligence that the English had reached Edinburgh,

drew his army out of his encampment to take up a position in the neighbourhood of Stirling. Here he occupied a wood, extending on the right towards the church of St. Ninian, and on the left nearly, it is supposed, in the direction of the road from Edinburgh to Stirling; directing a number of small pits to be dug knee-deep, and covered with turf, which concealed at the bottom a kind of spikes called calthrops, designed for the destruction of the enemy's cavalry. The position was besides protected by a neighbouring morass. On Sunday, the 23d, an alarm being given of the approach of the enemy, Bruce prepared to receive them. His army heard mass: and in answer to a proclamation that whoever would, might retire, all unanimously declared their resolution to conquer with him or die. His right wing was commanded by his brother Edward, the left by Lord Douglas and the younger Stewart, and the centre by his nephew, Randolph, earl of Murray, while he himself commanded a reserve posted on a rising ground. The English army meanwhile had sent a squadron of 800 horse for the purpose of gaining Stirling castle by a circuitous route, which the king perceiving, reproached the earl of Murray with leaving the place exposed, and the latter hastened with 500 spearmen to turn the enemy, an object which he with difficulty accomplished. The van of the English army soon after appeared in sight. Henry de Bohun, a knight of the Hereford family, advancing a bow-shot before his comrades, now distinguished 'the Bruce' from a crown surmounting his helmet, and the manner in which he disposed his troops, he himself being in advance of his front. The Englishman advanced upon him, but his spear missing the king, the latter, rising in his stirrups, cleft his opponent's helmet with a single blow of his battle-axe, and Bohun fell: this was the only memorable event the first day. At the succeeding dawn Bruce reminded his troops of the past conduct of the enemy before them, their usurpation of the government of the country, and their barbarous treatment of those that had fallen into their hands, that they therefore were now to fight for all they held dear, their own liberty, and the comfort and existence of their families. He showed them his excellent position, urged the necessity for order, and to preserve their line unbroken, while he promised the amplest rewards to all who exerted themselves, and to their heirs if they fell. At day-break Maurice, Abbot of Inchaffray, celebrated mass in front of the army, and exhorted the soldiers, bearing a crucifix in his hand. The troops now breakfasted on the ground, and Bruce created some of the most distinguished of his followers knights. Edward also in person commanded the English army, attended by a body-guard of 500 cavalry: among his troops were 52,000 archers. He likewise was confident of victory, but the same unanimity did not subsist as among his foes; and the Scottish host having knelt to utter a prayer and receive benediction, he exclaimed to those around him, 'Behold, they kneel for mercy!' But they quickly undeceived him;—the armies approached, and a contest ensued, unexampled in the annals of British history. The English van, composed of

cavalry, charged the right wing of the Scots in full gallop. Here Edward Bruce commanded, and received them with intrepidity. While this wing was engaged, Randolph advanced to meet the main body of the enemy; and the left wing also hastened into the conflict. Repeated charges of cavalry in vain attempted to break the Scottish line—it was impenetrable; everywhere they were resisted and driven back. At this time the battle became general. The Scots were annoyed by the English archers; but they fought desperately with their spears, swords, and knives, and also with iron clubs or maces, and found the advantage of acting in a compact body, while the English forces were too unwieldy to be concentrated. The Scots were also protected by their light armour, which at the same time did not restrain their movements. Edward, the king's brother, was hard pressed by the English cavalry, and Murray, making a movement to his support, was almost overwhelmed by the multitude of the enemy, who presented a vast and extensive front. The Scottish king now directed Sir Robert Keith to take the archers in flank with 500 horse, and their impetuosity proved irresistible. The enemy were overthrown, and fled with precipitation. The earl of Gloucester, endeavouring to rally the fugitives, was unhorsed and slain. The numbers of the English finally proved their destruction: for those who recoiled threw the rest into disorder, and those who fell were trampled to death. The battle, notwithstanding, continued to rage, and victory was long and furiously contested. But, at length, the retainers of the Scottish camp, who had previously been sent to a valley in the rear, suddenly appeared on a neighbouring height, and the enemy, believing it a strong reinforcement, took at once to flight. Edward, with 500 horse, sought shelter in Stirling castle, but the governor found means to dissuade him from remaining there. The rout of his army became complete. Some sought refuge among the rocks of the castle, others hurried to the river Forth, and they were drowned; but the most terrific carnage was in the valley of the Bannock, for the ascent towards the east being difficult, and probably impeded by wood, the fugitives were exposed to inevitable destruction. Scarcely any who took that direction escaped; and the course of the river is said to have been completely dammed up by the English who were slain. Edward, hotly pursued, continued his flight, followed by sixty horse, to Winchburgh, twenty miles from the field of battle, where, again mounting, the pursuit was continued to Dunbar castle, whence he was ultimately conveyed by a vessel to England. The loss on both sides in this memorable battle was immense. Barbour asserts that the English had 30,000 men and 200 knights killed: but the truth of this calculation is questionable, as it is said elsewhere that only forty-two knights were slain, and sixty made prisoners. Barbour also affirms that only two Scotsmen of note fell on the occasion, Sir William Vipont and Sir Walter Ross. The earl of Gloucester's fate, who was the near relative to Edward, was much lamented; and historians state that had the Scots known him he would not have fallen. His body

was carried to St. Ninian's church, and sent with that of lord Clifford to England. 'O day of vengeance and fatality,' one of our historians exclaims, 'hateful accursed day, to be blotted from the circle of the year; a day which tarnished the glory of England, despoiled our nation, and enriched its enemies to the amount of £200,000. How many valiant youths and illustrious nobles, how many excellent horses and beautiful arms, how many precious vestments and golden vessels, were lost in that single unfortunate day.' The privy seal of Edward was among the spoils, and afterwards restored by Robert. He is said, indeed to have acted upon this victory with that clemency and moderation which has rarely been equalled.

The consequences of this great battle were the surrender of the fortresses of Scotland to Bruce, the liberation of the inhabitants from a foreign yoke, and the firm establishment of that prince upon the throne. Memorials of it are said still to remain near the spot, where armour and weapons are frequently dug up; and at an interval of 500 years the inhabitants of the vicinity met on the 24th of June 1814, to celebrate the triumph of their ancestors. Sir Walter Scott has commemorated it with enthusiasm in his *Lord of the Isles*.

BANNOV, a town of Ireland, ten miles south-west of Wexford.

BANNUM, in law, the utmost bounds of a manor or town; *bannum capitis* was a mulct paid in cattle.

BANNUS DEI, the bann of God, an expression used by writers of the middle age, for excommunication.

BANNUS REGIS, a proclamation of silence anciently made by the court, before the encounter of the champions in a combat.

BANOLAS, a town of Spain, in Catalonia, district of Gerona, with 3000 inhabitants, and a considerable trade in linen.

BANOS, a town of Leon, Spain, thirty miles from Plasencia, in Estremadura. The number of families is about 300, who are employed principally in the manufacture of linen. It takes its name from the hot sulphureous baths to the north-east of the town. Here are to be seen the remains of a Roman mound or dyke. The territory is covered with olives, chestnuts, and vines; the last produces annually 15,000 arabas of wine.

BANOY, the name given by the people of the Philippine Islands, to a species of hawk, somewhat larger than our sparrow-hawk, of a yellowish color on the back and wings, and white under the belly. It is the most common species of hawk in that part of the world, and is very voracious.

BANQUET, *v. & n.* } Fr. *banquet*, Ital.
BANQUETANT, } *banchetto*, Span. *ban-*
BANQUETE, } *quete, vanqueto*; Germ.
BANQUETING, } and Dut. *bancket*.

Derived from *bank*, a bench or table, around which messmates or companions sit to eat or feast together. It now signifies a luxurious and sumptuous entertainment. Whether the feast, or the dessert which succeeds it, or both.

Shall the companions make a *banquet* of him?—
 Shall they part him among the merchants? *Job.*

In which how many wonders doe they reed,
 To their conceipt that others never see!
 Now of her smiles with which their soules they feede,
 Like gods with nectar in their *bankets* free. *Spenser.*

The mind shall *banquet*, tho' the body pine:
 Fat paunches make lean pates, and dainty bits
 Make rich the ribs, but bankerout the wits. *Shakespeare.*

Welcome his friends,
 Visit his countrymen, and *banquet* them. *Id.*
 In his commendations I am fed;
 It is a *banquet* to me. *Id.*

You cannot have a perfect palace, except y-u have two sides; a side for the *banquet*, and a side for the household; the one for feasts and triumphs, and the other for dwelling. *Bacon.*

They were *banqueted* by the way, and the nearer they approached, the more increased the nobility.

Sir J. Hayward.
 In a *banqueting*-house, among certain pleasant trees, the table was set near to an excellent water-work. *Sidney.*

Home then, my lambs; the falling drops eschew
 To-morrow shall ye feast in pastures new,
 And with the rising sun, *banquet* on pearled dew. *Fletcher's Purple Island.*

When Venus was born all the gods were invited to a *banquet*. *Burton's Anatomy of Melancholy.*

If a fasting-day come, he hath on that day a *banquet* to make. *Hooker.*

At that tasted fruit,
 The sun, as from Thyestian *banquet*, turn'd
 His course intended. *Milton.*
 So long as his innocence is his repast, he feasts
 and *banquets* upon bread and water. *South.*

That dares prefer the toils of Hercules,
 To dalliance, *banquets*, and ignoble ease. *Dryden.*

At the walk's end behold, how rais'd on high,
 A *banquet*-house salutes the southern sky. *Id.*

I purpos'd to unbend the evening hours,
 And *banquet* private in the women's bow'rs. *Prior.*

With royal *banquets* feasts my longing soul,
 And seals his truth with sacramental wine. *Mrs. Rowe.*

BANQUETING-HOUSE, BANQUETING ROOM.
 The ancient Romans supped in the atrium, or vestibule of their houses; but, in after-times, magnificent saloons, or *banqueting* rooms, were built for the more commodious and splendid entertainment of their guests. Lucullus had several of these, each distinguished by the name of some god; and there was a particular rate of expense appropriated to each. Plutarch relates with what magnificence he entertained Cicero and Pompey, who went with design to surprise him, by telling only a slave who waited, that the cloth should be laid in the Apollo. The emperor Claudius, among others, had a splendid *banqueting* room named Mercury. But every thing of this kind was outdone by the lustre of that celebrated *banqueting* house of Nero, called *domus aurea*; which, by the circular motion of its partitions and ceilings, imitated the revolution of the heavens, and represented the different seasons of the year, which changed at every service, and showered down flowers, essences and perfumes, on the guests. See **SALOON**.

BANQUETTE, *n. s.* Fr. in fortification, a small bank at the foot of the parapet, for the soldiers to mount upon when they fire.

BANSTICKLE, in ichthyology. See **GAS-TEROSTEUS**.

BANSTICKLE, *n. s.* A small fish, called stickleback.

BANTAM, a large town of the island of Java, in the East Indies, once the capital of an independent state. But its harbour has been gradually choked up with soil from the surrounding hills: and the air is so unhealthy that its inhabitants have been compelled to desert the place almost entirely. In 1595 the king of Bantam called in the assistance of the Dutch of Java, against the Portuguese, and as a return for their aid allowed them to build a factory here, where also the English, under Captain Lancaster, established one in 1603. At this time the sovereign had a commercial navy of his own, and until the latter end of the seventeenth century, when he sent an embassy to England, to request assistance against the Dutch. In the following year the latter took his capital, and in 1683, they entirely dispossessed him of the government; the English factory withdrawing to Surat.

The Dutch East India Company now keep a garrison here, nominally to defend the king, but in fact to have him always in their own power. The chief authority on the part of the Dutch East India Company was vested in a senior merchant, with the title of Commandant, who had the management of the trade, which consisted chiefly in pepper and some cotton yarn. To the commandery at Bantam belonged the residencies of Lampong, Toulang, Baunang, and Lampong Samanca, situated on the southern part of Sumatra. The sovereigns possess the power of life and death over their subjects, but pay an annual tribute of six million pounds of pepper to the Dutch.

The climate of Bantam, says Mr. Hamilton, is still more pestilential than that of Batavia, of which a remarkable instance is mentioned. On the night of the 18th March 1804, the king of Bantam was murdered by one of his grand nephews, who had concealed himself under his bed, and who was afterwards discovered and put to death. An embassy was sent from Batavia, to elect and instal the new king in the name of the Dutch Company, part of which ceremony consists in having him weighed in a pair of scales at the palace gate, after having feasted for fifteen days. This deputation was composed of a counsellor of India, four senior merchants, a major, lieutenant, serjeant, two corporals, eighteen French and eighteen Dutch grenadiers. The external forms occupied fifteen days; at the end of which time, or soon after their return, the whole of the European grenadiers and subalterns died, except two or three of the French who escaped. The counsellor, his wife who had accompanied him, the major and four merchants, all returned with putrid fevers, which brought them to the brink of the grave, and the secretary died. In 1811, after the conquest of Batavia, the town and district of Bantam surrendered to the British arms without resistance. Bantam was restored to the Dutch by the peace of 1814. Long. 106° 31' E., lat. 6° 14' S.

BANTAM, or dwarf cock, in zoology, a well known variety of the species *phasianus gallus*. See **PHASIANUS**.

BANTAM WORK, a kind of painted or carved work, resembling that of Japan, only more gaudy. Some are flat, lying even with the black, and others highly embossed, as we find in many large screens. The Japan artists work chiefly in gold and other metals; and those of Bantam generally in colors, with a small sprinkling of gold here and there: for the flat Bantam work is done in colors mixed with gum-water, proper for the thing designed to be imitated.

BANTER, *v. & n.* The derivation unknown.

BANTERER,

BANTERING.

Perhaps from *badiner*, Fr. It signifies to mock with ridicule. A lighter kind of raillery. Playing upon the fretfulness of the testy, the simplicity of the ignorant, the self-importance of the proud, and the conceitedness of the vain. It is sometimes employed against the infirmities of the good and the virtuous. A species of humor that is more allied to malignity than kindness, and which sometimes meets with its reward.

'Tis thus, malicious deity,

That thou hast *banter'd* wretched me;

Thus made me vainly lose my time,

Thus fool away my youthful prime.

Walsh. On loving one I never saw.

The magistrate took it that he *bantered* him, and bade an officer take him into custody. *L'Estrange*.

It is no new thing for innocent simplicity to be the subject of *bantering* drolls. *Id.*

This humour, let it look never so silly, as it passes many times for frolic and *banter*, is one of the most pernicious snares in human life. *Id.*

What opinion have these religious *banterers* of the divine power? Or what have they to say for their mockery and contempt? *Id.*

And the grave affairs of state have been treated with an air of irony and *banter*. *Shaftesbury.*

Could Alcineus' guests withhold

From scorn or rage? Shall we, cries one, permit

His lewd romances, and his *bantering* wit? *Tate.*

Metaphysics are so necessary to a distinct conception, solid judgment, and just reasoning on many subjects, that those who ridicule it, will be supposed to make their wit and *banter* a refuge and excuse for their own laziness. *Watts.*

BANTIUS (L), a spirited youth of Nola, whom Hannibal found almost dead among those who had fallen in the battle of Cannæ. Having been kindly treated, and sent home with great generosity, he took it into his head to betray his country to such a humane enemy; but Marcellus, the Roman general, being informed of it, reprimanded Bantius, and he afterwards continued steady in the Roman interest.

BANTLING, *n. s.* If it has any etymology, it is perhaps corrupted from the old word *bairn*, *bairning*, a little child. A low word; so says Johnson. But it is usually applied to a child born, or at least begotten, before marriage.

If the object of their love

Chance by Lucina's aid to prove,

They seldom let the *bantring* roar

In basket at a neighbour's door. *Prior.*

BANTRY BAY, called also **BEERHAVEN**, a capacious bay of Ireland, on the coast of Cork, capable of containing all the shipping of Europe. It is twenty-six miles long, three broad, and forty fathoms deep in the middle, here are two small islands, Bear and Whiddy. Coral is

dredged from the bottom of the bay, and used as manure in the neighbourhood. Fish were formerly very plentiful here; but of late the business has declined. In May, 1689, a French fleet, which had brought succours of arms, ammunition, and money, to the adherents of king James, was attacked in this bay by Admiral Herbert; and in December, 1796, another French fleet, consisting of seven sail of the line, two frigates armed en flute, and seventeen transports, anchored here for a few days, and landed an officer and eight men in a boat, who were taken prisoners.

BANTRY, a large barren barony of Ireland, in the county of Cork.

BANTRY, a sea-port town of Ireland, in the county of Cork, and province of Munster, seated on the bay, about thirty miles west of Cork, and 164 south-west of Dublin.

BANYAN TREE, in botany, a name sometimes given to the ficus Indica.

BANYOUWANGY, a Dutch settlement of Java, containing the residence of a native chief. The Dutch garrison the fort to protect themselves and commerce from the numerous pirates of the straits of Bali.

BANZA, a town of Congo Proper, on the river Zaire.

BAOBAB, the name given by Prosper Albinus to the African calabash. See **ADANSONIA**. This is the largest vegetable production known: although the trunk is not above twelve or fifteen feet high, it is from sixty to eighty-five feet round, and the lower branches extend almost horizontally about sixty feet. Their own weight bending these extremities to the ground, they form an hemispherical mass of verdure about 120, and sometimes 150, feet in diameter. The flowers of this plant are in proportion to the size of the tree, and are followed by a fruit pointed at both ends, about ten inches long and five or six broad, covered with a kind of green down, under which is a hard, black, radiated, rind. The fruit hangs to the tree by a pedicle two feet long. It contains a whitish, spongy, juicy, substance of an acid taste, and seeds of a brown color, of the shape of a kidney bean, which are called goui. When dry, the pulp by which the seeds are surrounded, is powdered, and brought into Europe under the name of terra sigillata lemnia. The kernel contains a large proportion of alkali, when burnt, and the negroes mix it with palm oil to make soap. The bark is called lalo; the negroes dry and powder it; after which it is preserved in little cotton bags, and two or three pinches are put into their food: it is mucilaginous and supposed to check perspiration. This

tree is a native of the west coast of Africa, from the Niger to the kingdom of Benin.

BAOL, a small kingdom of western Africa, between the Senegal and Gambia. It lies south of Cayor, by which it has recently been conquered. It has a capital of the same name.

BAPAUME, a strong town of France, in the ci-devant French Netherlands, now included in the department of the Straits of Calais. Fine thread and lawn are made here. De Ville and Vauban fortified it in 1641, and France obtained the cession of it in 1659. Situate eighteen miles south-east of Arras.

BAPHE, in the writings of the ancients, a word used to express that fine red color with which they illuminated the capital letters in manuscripts, at the beginning of chapters. It is also called by some encaustum sacra, and by others coccus and cinnabaris. It was a very elegant color, and said to have been prepared of the purple taken from the murex, and some other ingredients. It was called encaustum, from its resembling the fine bright red used in enamels.

BAPTÆ, in antiquity, an effeminate voluptuous kind of priests of the goddess Cotyto, at Athens; so called from their staid dippings and washings, by way of purification; their rites were performed in the night, and consisted chiefly of lascivious dances. Eupolis having composed a comedy to expose them, entitled βαπτος, they threw him into the sea, to be revenged; and the same fate is also said to have befallen Cratinus, another Athenian poet, who had written a comedy against the Baptæ, under the same title. Others deduce the denomination Baptæ from the practice of dyeing and painting their bodies, especially their eyebrows, and officiating at the service of their deity, with the parade and demureness of women. Juvenal describes them in this light. Stat. ii. ver. 91.

BAPTES, in natural history, a name given by the ancients to a fossile substance used in medicine; they have left us but very short descriptions of it. Pliny only tells us, that it was soft and of an agreeable smell. Hence Agricola judges, that it was probably one of the bitumens.

BAPTISECULA, in botany, a name given by some authors to the blue corn-flower, called the cyanus or blue-bottle.

BAPTISIA, in botany, a genus of plants, class, decandria; order, monogynia. The generic character is: CAL. semi four-fivefid, bilabiate: COR. papilionaceous, petals nearly equal in length: VEXILLUM reflected laterally: STAM. deciduous; legume ventricose, pedicellate, many-seeded.—Hort. Kew. It is a genus closely allied to podalyria, and containing four species.

BAPTISM.

BAPTISM.
BAPTIZE, *v.*
BAPTIZER, *n.*
BAPTISMAL,
BAPTIST,
BAPTISTERY,
BAPTISTICAL,
BAPTIZATION.

Derived from the Gr. βαπτω and βαπτίζω. The primary meaning is to dip, to plunge, to immerge. Protestant Christians use it strictly in its primary sense, or with greater latitude of meaning, according to their respective tenets,

on the subject of the rite of baptism, as an ordinance of Christianity. It is sometimes employed figuratively, to express overwhelming sorrows; the covering of the earth by the dews of heaven; and the sacred influences of the spirit of God in cleansing the heart.

I have a baptism to be baptized with, and how am I straitened till it be accomplished. *Luke.*

Certes, if he be baptized without penitence of his old guilt, he receiveth the mark of baptism, but not the grace, ne the remission of his sinnes, til he have veray repentance. *Chaucer. The Persones Tale.*

Speak, my Lord;

And we will hear, note, and believe in heart,
That what you speak is in your conscience wash'd
As pure as sin with baptism. *Shakspeare.*

His baptism gives virtue to ours. His last action (or rather passion) was his baptizing with blood; his first was his baptism with water: both of them wash the world from their sins.

Hall's Contemplations.

Baptism is given by water, and that prescript form of words which the church of Christ doth use.

Hooker.

He to them shall leave in charge,
To teach all nations what of him they learn'd,
And his salvation; them who shall believe,
Baptizing in the profluent stream, the sign
Of washing them from guilt of sin to life,
Pure, and in mind prepar'd, if so befall,
For death, like that which the Redeemer died.

Milton.

Let us reflect that we are Christians: that we are called by the name of the Son of God, and baptized into an irreconcilable enmity with sin, the world, and the devil.

Rogers.

The sacrament of baptism was supposed to contain a full and absolute expiation of sin; and the soul was instantly restored to its original purity, and entitled to the promise of eternal salvation.

Gibbon.

Philosophy, baptiz'd

In the pure fountain of eternal love,
Has eyes, indeed; and, viewing all she sees
As meant to indicate a God to man,
Gives him his praise, and forfeits not her own.

Cowper's Task.

Pass not unblest the genius of the place!
If through the air, a zephyr more serene,
Winnow the brow, 'tis his; and if ye trace
Along his margin a more eloquent green,
If on the heart the freshness of the scene
Sprinkle its coolness, and from the dry dust
Of weary life a moment lave it clean

With nature's baptism,—'tis to him ye must
Pay orisons for this suspension of disgust.

Byron. Childe Harold.

BAPTISM has been defined, a New Testament ordinance, appointed by our Lord Jesus Christ, as the first or initiatory sacrament of the Gospel dispensation, whereby its subjects are admitted as visible members of that spiritual society of

believers, which is scripturally denominated the 'Church of Christ,' and entitled to all the privileges of church communion. The derivation of the word is from the Greek βαπτίζω, which literally signifies dipping or immersion, but is often used in a lower sense to express the legal ablutions and washings of the ceremonial law. See Heb. ix. 10. and Mark vii. 8. Baptism is denominated or described by various ecclesiastical writers, in other ways; it is sometimes called palingenesia, the laver of regeneration, salus, salvation; σφραγίς, signaculum Domini, or signaculum fidei, the seal of faith; mysterium, mystery; sacramentum fidei, the sacrament of faith, &c. Sometimes it was called viaticum, from its being administered to departing persons; sometimes sacerdotium laici, the lay priesthood, because allowed in cases of necessity to be conferred by laymen; sometimes the great circumcision, because it succeeded in the room of circumcision, and was to be a seal of the Christian covenant, as that was the seal of the covenant made with Abraham. As it had Christ for its author, it was anciently styled Δωρον and χάρισμα Κυρίου, the gift of the Lord; sometimes simply δωρον, by way of eminence. And as it made men members of the church, it had the title of Τελειωσις, and Τελειη, the consecration, and consummation; because it gave men the perfection of Christians, and a right to partake of the Το Τελειον, which was the Lord's Supper. It was also entitled μνησις and μυσαγογια, the initiation, as it admitted men to all the sacred rites of the Christian religion.

Purification by water seems so natural an emblem to express mental purification, that the use of it has prevailed amongst nations who were never enlightened by revelation; water was used in the religious ceremonies both of the Egyptians and Greeks; and Grotius is of opinion that it originated at the time of the deluge. According to Clemens, Alexandrinus, and Tertullian, purification, by water, was the first ceremony performed at initiation into the Eleusinian mysteries, which were derived from Egypt; and Hesychius renders the word υδρανος, or the waterer, by ο αγιστης των Ελευσινων, the priest whose office at the Eleusinian mysteries was that of purifying.

The Jews are said by many writers, to have used Baptism together with circumcision and sacrifice in the admission of male proselytes: all these ceremonies, according to the same authors, having been observed in their own admission into covenant with the Deity at Sinai, when they washed their clothes, and sanctified themselves. See Exod. xix. 10.—14. The female proselyte was admitted by baptism and sacrifice, and in cases where the proselyte had children, they both circumcised and baptised, or baptised them only, according to their sex. The baptism of a proselyte was what they called metonymically his regeneration, or 'new birth.'

The connexion, or rather the similitude between Jewish and Christian baptism has been thus exhibited by Dr. Wall's celebrated treatise upon the latter institution.

1. The Jews required of proselytes a renunciation of idolatry, and to believe in Jehovah.

2. The Jews interrogated the proselyte while standing in the water.

3. The Jews baptised the infant children of proselytes.

4. The Jews required for an infant proselyte that either his father, or the church of the place, or three grave persons should answer for the child.

5. A Jewish proselyte was said to be born again, when baptised.

6. The Jews told the proselyte that he was now clean and holy.

7. The Jews declared the baptised to be under the wings of the Divine Majesty, or Shechinah.

8. At the paschal season, the Jews baptised proselytes, that they might eat the passover.

9. The Jews had their proselytes of the gate.

The above statements are ingeniously drawn from the writings of Maimonides and the Babylonian Talmud, which was completed at the close of the fifth century, and of course affords an historical testimony of facts existing and believed in at that time. Spencer, who is fond of deriving the rites of the Jewish religion from the ceremonies of the Pagans, lays it down as a probable supposition, that the Jews received the baptism of proselytes from the neighbouring nations, who were wont to prepare candidates for the more sacred functions of their religion by a solemn ablution; that, by this affinity of sacred rites, they might draw the Gentiles to embrace their religion, and that the proselytes (in gaining of whom they were extremely diligent) might the more easily comply with the transition from Gentilism to Judaism. In confirmation of this opinion he observes, first, that there is no divine precept for the baptism of proselytes, God having enjoined only the rite of circumcision for the admission of strangers into the Jewish religion. Secondly, that, among foreign nations, the Egyptians, Persians, Greeks, Romans, and others, it was customary that those who were to be initiated into their mysteries, or sacred rites, should be first purified by dipping their whole body in water. That learned writer adds, as a further confirmation of his opinion, that the cup of Hissing likewise, added to the paschal supper, seems plainly to have been derived from a pagan original: for the Greeks, at their feasts, had one cup, called *ποτηριον αγαθου δαιμονος*, the cup of the good demon or god, which they drank at the conclusion of their entertainment, when the table was removed. Since, then, a rite of Gentile origin was added to one of the Jewish sacraments, viz. the passover, there can be no absurdity in supposing, that baptism, which was added to the other sacrament, namely, circumcision, might be derived from the same source. In the last place, he observes, that Christ, in the institution

1. The Christians required to renounce the devil, and all his works, and to believe in the Trinity.

2. The Christians put interrogatories as the catechumen was about to enter the water, when he had before answered in the congregation.

3. The Christians baptised infants.

4. The Christians observed a similar custom.

5. Our Saviour and the Apostles call baptism regeneration, or being born again.

6. The same term is used in the New Testament: the baptised Christians are called the saints, the holy, the sanctified—sanctified with the washing of water.

7. Among Christians this was shown by the gifts of the Holy Ghost: to this end the laying on of hands was used, a custom, probably taken from the Jewish church.

8. The Christians at Easter administered baptism in a solemn manner.

9. The Christians had their catechumens, or competentes.

of his sacraments, paid a peculiar regard to those rites which were borrowed from the Gentiles; for, rejecting circumcision and the paschal supper, he adopted into his religion baptism and the sacred cup; thus preparing the way for the conversion and reception of the Gentiles into his church.

Some able critics, however, who oppose the general conclusions of the Baptists upon this subject, agree with them in discarding these alleged proofs of the connexion between the Christian institute and Jewish proselyte baptism. The learned Owen says:—‘The opinion of some learned men, about the transferring of a Jewish baptismal rite (which, in reality, did not then exist), by the Lord Jesus for the use of his disciples, is destitute of all probability.’ And in his excursions on the epistle to the Hebrews, Exercitat. xiv. ‘From this latter temporary institution (the washing of their clothes commanded upon the Israelites at Sinai) such as they had many granted to them in the wilderness, before the giving of the law, the Rabbins have formed a baptism for those that enter into their synagogue; a fancy too greedily embraced by some Christian writers, who would have the holy ordinance of the Church’s baptism to be derived from thence. But this washing of their clothes, not of their bodies, was temporary, never repeated; neither is there any thing of any such baptism or washing required in any proselyte, either man or woman, where the laws of their admission are strictly laid down. Nor are there the least footsteps of any such usage among the Jews until after the days of John the Baptist, of whom it was first taken up by some antemishical Rabbins.’ Jennings, in his *Jewish Antiquities*, (vol. I. p. 134, 8.) a work recommended by the bishop of Lincoln, and placed in the first class of those which every clergyman ought to possess; says it is more likely the Jews took the hint of proselyte-baptism from the

Christians after our Saviour's time, than that he borrowed his baptism from their's; which, whenever it came into practice, was one of those additions to the law of God, which he severely censures. There wants more evidence of its being as ancient as our Saviour's time, than I apprehend can be produced, to ground any argument upon it in relation to Christian baptism. We therefore dismiss this form of the admission of proselytes, as uncertain.' And Dr. Lardner, works, vol. V. p. 501, 2. : 'I pay no regard to what the later Jewish Rabbins say of the method of initiating proselytes, by circumcision, baptism, and sacrifice; who have made void not only the moral (with which our Lord often charged them, as Matth. xv. 1—9, Mark vii. 1—13, and other places), but also the ritual part of the law of God. Indeed, they had corrupted the Mosaic ritual by numberless additions, before the coming of our Saviour. As appears from the text of St. Mark just referred to. Nor have they ceased to do the like since.

'I think, as before said, that women were first baptised under the evangelical dispensation. I am also of opinion, that our blessed Lord's forerunner first made use of baptism as an initiating ordinance; and therefore he was called the Baptist, Ο ΒΑΠΤΙΣΤΗΣ. Matth. iii. 1, and in many other places. Nor am I singular in this opinion.'

From this alleged Jewish ordinance, as Jennings has observed, some sects infer, that under the Christian dispensation baptism is only to be administered to converts from Judaism, Mahomedanism, paganism, or some other religion, and to their descendants born before their conversion and baptism, but to none born after. Mr. Emlyn, in particular, (Previous Question to several Questions, or Valid and Invalid Baptism), insists upon this argument against the constant and universal obligation of infant baptism. And the Society of Friends ground on this their principal argument for rejecting baptism with water as a 'carnal washing.' See Mr. Gurney's late defence of the 'Peculiarities of Friends,' p. 67, &c.

The baptism of John naturally presses upon our consideration at the commencement of every enquiry upon this subject. Its divine original is expressly taught, John 1 and 33, and its object was to prepare the way for the Messiah by calling a general attention to him and preaching the necessity of repentance. The Jews seem to have expected a general baptism at the coming of the Messiah, and accordingly express little surprise at the fact of the baptism itself, but rather question the authority of John to administer it. 'Why baptisest thou then if thou be not Christ, neither Elias, nor the prophet?' John uniformly bore testimony to the more glorious person and office of the Messiah; 'I indeed,' said he, 'baptise you with water; but there standeth one among you whom ye know not, he shall baptise you with the Holy Ghost and with fire:' and, agreeably to the nature of his mission, he taught them that his baptism was of no more force after the entrance of the latter upon his public ministry; 'He must increase, but I must decrease; 'I know him not but that he should be made manifest to Israel; therefore am I come

baptising with water;' and the whole of his ministry received a perfect accomplishment, when, amidst the admiring multitudes, assembled on occasion of his baptising his great successor, there came a voice from heaven, saying, 'this is my beloved son, in whom I am well pleased, hear ye him.' The cause of Christian baptism has frequently been advocated, and, as some have thought, illustrated, from the baptism of John; but John, according to the scriptures, is to be considered as a member of the Old Testament church, agreeably to our Lord's language 'the least in the kingdom of heaven is greater than he.' The nature and obligation of baptism as a Christian ordinance, is to be placed on different and on better grounds.

1. The first thing to be considered is the original institution of this sacrament by our Lord himself, as a means of admission into his church. He gave the universal commission to the disciples after his resurrection from the dead, 'Go ye and teach all nations, baptising them in the name of the Father, and of the Son, and of the Holy Ghost. He that believeth and is baptised shall be saved, he that believeth not shall be damned,' Mark, xvi, 15, 16. As a sacrament of initiation, baptism, according to the majority of writers on this subject, corresponds with circumcision in the Jewish establishment, being the badge of distinction between the church and the world. The analogy between these two ordinances appeared so forcible to the church in the time of St. Cyprian, that his opinion was requested upon the point, whether baptism ought not to be delayed till the eighth day after the birth of a child, in order that the resemblance between the Jewish and Christian sacraments might be more perfectly exhibited. Gregory Nazianzen was an advocate for the eighth day. Circumcision has been considered, from a very remote period, as a type of baptism, and those arguments in behalf of infant baptism have been deemed valid, which are drawn from the practice of circumcision under the ceremonial law. St. Paul himself appears to teach the analogy of the two ordinances in the following language, found in Col. ii. 11. 'In whom ye are circumcised with the circumcision made without hands, in putting off the body of the sins of the flesh by the circumcision of Christ (or Christian baptism), buried with him in baptism.'

That baptism must be received by all believers, is evident from the very language of the original institute, 'he that believeth and is baptised shall be saved,' and so strongly did the early fathers feel the necessity of it, that they frequently expressed their doubts as to the safety of infants who died in an unbaptised state. Whether it be possible for a man to be saved in an unbaptised condition the church of England nowhere decides; but the scriptures have been thought to lean to the side of absolute necessity, in our Lord's words to Nicodemus, John, iii, 5, 'Verily, verily, I say unto thee, except a man be born again of water and of the spirit, he cannot enter into the kingdom of God.' The fathers generally supposed this intended to express the absolute necessity of baptism: the former part of the verse evidently alluding to the outward form

of administration by water; the latter, to the substance of an inward grace by the spirit of God; constituting, in reality, that regeneration of the mind of which the outward regenerative rite is an imperfect representation. Hooker's language upon the necessity of the exterior ordinance is, 'If Christ himself, which giveth salvation, do require baptism it is not for us, that look for salvation, to sound and examine him whether unbaptised men may be saved, but seriously to do what is required, and religiously to fear the danger which may grow by the want thereof.'

2. The second thing worthy of consideration is the proper subjects to whom baptism may be administered.

The church of England admits, equally, to the sacrament persons of both sexes, adults or children. Considerable opposition of opinion, nevertheless, prevails at present, with respect to the validity of infant baptism and its benefits; for an historical sketch of the ceremony, see PÆDO-BAPTIST. It may be sufficient to our present enquiry to observe, that there is no church in the world, the Baptist excepted, that does not admit of infant baptism, and that the question was never agitated upon any considerable scale until the period of the reformation. The service found in the Common Prayer for the baptism of such as are of riper years, was added at the review on the restoration of Charles II, in consequence of the growth of Anabaptists, who had become so numerous in the preceding century, that it was necessary to have a form fitted for their service.

CLINICAL BAPTISM, which was used in the first centuries of the christian era, was baptism administered to a person on his death-bed; of which custom, mention is made by Cyprian and Eusebius, by Epiphanius in Heres. Cérinth, and by other writers of the fourth and fifth centuries. In a case where a heathen in his last sickness, was converted to the Christian religion, such a baptism became necessary. But, in consequence of the superstitious notion that baptism alone washed away all the sins of the past life, many persons delayed the consideration of Christianity till their last moments, intending just at that crisis to make use of baptism, and thus die in the hope of heaven. Gregory Nyssen, Chrysostom, Nazanzon, and other fathers of the church, inveighed against this delusion in the most powerful language. The two most remarkable instances of the superstition alluded to, are found in the emperor Constantine and his son Constantus, who were both baptised on their death-beds. But, since in all cases the sincerity of the heathen religion is, to say the least, doubtful, it was decreed by the council of Neocesarea, A. D. 350, and of Laodicea, 363, that no clinic should ever be admitted to the order of presbyter.

3. The third enquiry on this subject respects the persons in whom is vested the office of administering this sacrament. The right of baptism, generally, been committed to the clergy of all communions. It belongs to bishops and presbyters as a part of their office, although, from the example of Philip, it appears that deacons have a divine authority for performing it, and are equal to either of the two former. In our established church deacons are empowered

to baptise only in the absence of the priest, a limitation which is intended out of respect to the higher orders of the clergy. Different opinions appear to have been held by the fathers upon the subject of lay-baptism. Tertullian admits laymen to administer it in cases of urgent necessity: the same sentiment was expressed by St. Jerome, and by the council of Eliberis, A. D. 305. Calvin also confesses the antiquity of the opinion.—Inst. l. iv. c. xv. sec. 20. Basil however held the contrary notion, and the apostolic, Const. c. x. l. iv., forbids laymen to baptise. It is however one thing to dispute the right of a layman to baptise, and another thing to deny the spiritual validity of a sacrament so administered, especially since several of the ancient fathers allowed the validity of the ordinance even when administered by women. Baptism by laymen is at present unknown in our national church, it may nevertheless be interesting to our readers to notice some of the ancient canons upon the subject, made in England by the Pope's delegates, during the thirteenth century. In the constitution of Edmund, archbishop of Canterbury, A. D. 1236, 26 Hen. III., there is this direction:—'Item interroget sacerdos laicum diligentur, cum in necessitate baptizaverit puerum; quid dixerit, etiam, quid fecerit. Et si diligenter præcedente inquisitione factâ sibi fide plenâ, invenirit laicum distinctè et in formâ ecclesiæ baptizasse, sive in Latino, sive in Gallico, sive in Anglico, approbet factum. Si verò baptizatus fuerit puer a laico, præcedentia et subsequenta mersionem explanatur vel suppleantur à sacerdote.' 'When a layman has, upon urgent necessity, baptised a child, the priest shall enquire diligently with what words and acts it was performed, and if upon diligent enquiry he find, and is well persuaded, that the layman did distinctly, and according to the forms of the church, whether in Latin, French, or English, baptise the child, he shall confirm the proceeding: but in this case the rites preceding and following the immersion shall be supplied by a priest.' By another constitution of the same archbishop, order was given, that in cases of child-birth the attendants should have water ready at hand to baptise the child if necessity required. The legantine constitutions of Otho the year following gave order that laymen should be instructed how to baptize; which was again enforced by the constitution of Otobon, another legate, in 1260. It would perhaps, under all circumstances, be difficult to decide the point, whether this earnest solicitude to prevent any child dying unbaptised was the effect of a deplorable superstition, or a profound policy on the part of the clergy, but evidently the compliance arose from ignorance on the part of the people. It is also certain, that in consequence of these institutions baptism became very prevalent, for we find a constitution of archbishop Peccham, in a provincial synod held at Reading in 1279, enjoining that baptism by laymen should not be repeated; and, in cases where it appeared doubtful, whether the child had been baptised or not that the form should be used, which is still preserved in our liturgy. 'If thou art not already baptised, I baptise thee &c.' In the liturgy of Edward VI. there is internal evidence that the

form of private baptism was intended for the use of the laity, as well as the clergy, at least in cases of extreme danger. In the articles drawn up by the convocation, A. D. 1575, the twelfth takes notice of a doubt which had frequently arisen; namely, whether the form of private baptism might be administered by laymen or no. The convocation decided in the negative; but this article, though existing in the MS., was never printed, and the question still remained till the conference at Hampton Court, which took place in the first year of the reign of James I., when the form itself was so altered as to exclude lay baptism altogether. Upon the whole, then, it appears 'that lay baptism is now excluded from the church of England, there existing no necessity for it, but that the church does not say that lay baptism is no baptism.'

4. The fourth enquiry is, what facts go to constitute baptism. These, with reference to the outward administration of it, are two; namely, the application of water, and the using of the original words of institution—'I baptise thee in the name of the Father, and of the Son, and of the Holy Ghost.'

The Baptists consider that it is an essential part of baptism that the subject should be applied to the water and immersed in it, for which reason many of them abstain from Christian communion with members of other churches, considering them as unbaptised persons. It is certain that the literal meaning of the word baptism is immersion, which is further confirmed by the practice of the ancient church; but whether immersion be essential to the constitution of the ordinance, is in our opinion a separate enquiry. The practice of sprinkling in some cases was adopted, and even justified by all the parties, as in the baptism of sick persons and weak children. It follows that baptism is valid where immersion is not used, and therefore that immersion is no essential part of it; besides which, there is a strong probability that in the baptism of the jailor, Acts xvi. 33, immersion was not resorted to. With respect to the practice of our established church, dipping appears to have been the regular and established mode, and was general at the Reformation; but, in 1644, when the Presbyterians had the ascendancy, the original practice of the church began to decline, and, after several centuries had elapsed, the present mode became universal. It contributed not a little to the cause of sprinkling, that during the bloody reign of queen Mary, many of our Protestant divines, flying into Germany and Switzerland, and returning when queen Elizabeth came to the crown, brought back with them a great zeal for the protestant churches beyond sea, where they had been sheltered and received; and having observed, that at Geneva and some other places, baptism was administered by sprinkling, they introduced the same practice into the churches of England.

The next point essential to a valid baptism, is that it be administered 'in the name of the Father, and of the Son, and of the Holy Ghost.' A baptism not thus administered, or administered without water, the church of England considers no baptism, and would insist on a proper sub-

mission to the sacrament. But sundry passages occur in the new testament which relate to the administering of baptism in the name of Christ alone, as Acts ii. 38; viii. 16; xx. 48; xix. 5; Rom. vi. 3; Gal. iii. 27; accordingly in St. Basil's time, the question was agitated, and some contended that baptism ought to be thus administered. But being baptised in the name of Christ implies being baptised 'in the name of the Father, &c.' because these were points in which all catechumens were instructed, and in which every baptised Christian was supposed to be established.

The following illustration of this subject, taken from Dr. Lightfoot's Harmony of the New Testament, Acts ii., is worthy the attention of the reader. 'Three thousand converted are baptised in the name of the Lord Jesus,' verse 38, which no whit disagreeeth from the command, 'Baptise in the name of the Father, and of the Son, &c. Matt. xxviii. 19. For the form of baptism in these first days of the gospel, of which the New Testament giveth the story, may be considered under a threefold condition. 1. John the Baptist baptised in the name of Messias, or Christ that was then ready to come, but that Jesus of Nazareth was he, he himself knew not till he had run a good part of his course, John, i. 31, 32. The disciples baptising the Jews, baptised them in the name of Jesus, upon this reason, because the great point of controversy then in the nation about Messias was, whether Jesus of Nazareth were he or no. All the nations acknowledged a Messias, but the most of them abominated that Jesus of Nazareth should be thought to be he, therefore those that by the preaching of the gospel came to acknowledge him to be Messias, were now baptised in his name as the critical badge of their embracing the true Messias. But 3d, where the question was not on foot, they baptised in the name of the Father, and of the Son, and of the Holy Ghost. And so that baptising in the name of Jesus was for a season for the settling of the evidence of his being Messias, and when that was thoroughly established, then it was used no more; but baptism was in the name of the Father, and of the Son, &c. Of the same cognizance were those extraordinary gifts of the spirit evidences of Jesus his being the Messias, and means of conveying the gospel through the world, and when both these were well established, then those gifts ceased for ever.' See also his sermon on Matt. xxviii. 19, where it is proved that John baptized in the name of Messias now coming.

According to the general sentiment among Christians this sacrament can be received but once, thus expressed in the Nicene creed, 'I believe in one baptism for the remission of sins.' The cases mentioned in ecclesiastical history to the contrary, are derived from the re-baptising of persons who had been baptised by heretics, the validity of which the orthodox, or party baptising, denied and said that it was no baptism. The subject was therefore in those cases considered as an unbaptised person.

5. Our next object will be to illustrate the time, place, and manner of baptism. In the earliest ages of the church, there was no stated time or place for the reception of baptism. After-

wards Easter, Whitsuntide, and Epiphany, became solemn seasons, out of which baptism was not administered, except in cases of necessity. The catechumens, who were to receive it at these times, were called *competentes*; and to these it is that St. Cyril addresses his catechises. In the apostolical age, and some time after, before churches and baptisteries were generally erected, they baptised in any place where they had convenience; as John baptised in Jordan, and Philip baptised the eunuch in the wilderness, and Paul the jailor, in his own house. But in after ages, baptisteries were built adjoining to the church; and then rules were made, that baptism should ordinarily be administered nowhere but in those buildings. Justinian refers to ancient laws, appointing that none of the sacred mysteries of the church should be celebrated in private houses. Men might have private oratories for prayer in their own houses; but they were not to administer baptism or the eucharist in them, unless by a particular license from the bishop of the place. Such baptisms were frequently condemned in the ancient councils, under the name *παράβαπτισμα*, baptismus in private conventicles. As to the attendant ceremonies and manner of baptism in the ancient church: The person to be baptised, if an adult, was first examined by the bishop or officiating priest, who put some questions to him; as, first, Whether he abjured the devil and all his works? secondly, Whether he gave a firm assent to all the articles of the Christian faith? to both which he answered in the affirmative. If the person to be baptised was an infant, he answered by his sponsors or godfathers. After the questions and answers followed the exorcism: The minister laid his hands on the person's head, and breathed in his face, to expel the devil from him, and prepare him for baptism, by which the holy spirit was to be conferred upon him. After exorcism, the minister, by prayer, consecrated the water. The person was then baptised in the name of the Father, and of the Son, and of the Holy Ghost? In performing the ceremony, the usual custom (except in church cases, or where there was scarcity of water, was to immerse and dip the whole body. Thus St. Basil and Chrysostom, a baptised person says, 'We go down into the water full of sin and guilt, but we rise up bearing fruit in our hearts.' And this practice was so general that we find no exceptions made in respect either to the tenderness of infancy, or the bashfulness of the other sex, unless in case of sickness or other disability. But to prevent any indecency, men and women were baptised apart; and either the baptisteries were divided into two apartments, one for the men, the other for the women, as Bingham has observed; or the men were baptised on one side, and the women on another, as observed by A. C. de Bona, P. O. de Romanus, &c. &c. in the same place. There was also an order of baptism, a part of whose business was to assist in the baptism of women. These persons, however, rather indicate a custom of sprinkling, than imply any immersion it self. For if the women were immersed, there is no room for a second person to be asked: The

present baptists never baptise naked, though they always immerse. After immersion, followed the unction; by which (says St. Cyril) was signified, that they were now cut off from the wild olive, and were ingrafted into Christ, the true vine; or else to show that they were now to be champions for the gospel, and were anointed thereto, as the old *athletæ* were against their solemn games. With the anointing was joined the sign of the cross, made upon the forehead of the person baptised; which being done, he had a white garment given him, to denote his being washed from the defilements of sin. From this custom the feast of Pentecost, which was one of the annual seasons of baptism, came to be called Whit-sunday, i. e. White Sunday. This garment was afterwards laid up in the church, that it might be an evidence against such persons as violated or denied that faith which they had owned in baptism. The person baptised was then, according to Justin Martyr, 'received into the number of the faithful, who sent up their public prayers to God, for all men, for themselves, and for those who had been baptised.'

The FORM OF BAPTISM in the church of Rome is as follows:—When a child is to be baptised, the persons who bring it, wait for the priest at the door of the church, who comes thither in his surplice and purple stole, attended by his clerks. He begins with questioning the godfather, whether they promise, in the child's name, to live and die in the true catholic and apostolic faith, and what name they would give the child. Then follows an exhortation to the sponsors: after which the priest calling the child by its name, asks it, What dost thou demand of the church? The godfather answers, eternal life. The priest goes on: If you are desirous of obtaining eternal life, keep God's commandments, thou shalt love the lord thy God, &c. After which he breathes three times in the child's face, saying, Come out of this child, thou evil spirit, and make room for the Holy Ghost! This said, he makes the sign of the cross on the child's forehead and breast, saying, Receive the sign of the cross on thy forehead, and in thy heart. Then taking off his cap, he repeats a short prayer; and laying his hand softly on the child's head, repeats a second prayer: which ended, he blesses some salt, and putting a little of it into the child's mouth, pronounces these words, Receive the salt of wisdom. All this is performed at the church door. The priest, with the godfathers and godmothers, coming into the church, and advancing towards the font, repeat the apostle's creed and the Lord's prayer. Being come to the font, the priest exorcises the evil spirit again; and taking a little of his own spittle, with the thumb of his right hand, rubs it on the child's ears and nostrils, repeating, as he touches the right ear, the same word (*Ephatha* be thou opened), which our Saviour made use of to the man born deaf and dumb. Lastly, they pull off its swaddling-clothes, or strip it below the shoulders, during which the priest prepares the oils, &c. The sponsors then hold the child directly over the font, observing to turn it due east and west: whereupon the priest asks the child, Whether he renounces the devil and all his works? and the godfather having answered in

the affirmative, the priest anoints the child between the shoulders in the form of a cross. Then taking some of the consecrated water, he pours part of it thrice on the child's head, at each perfusion calling on one of the persons of the Holy Trinity. The priest concludes the ceremony of baptism with an exhortation. The Romish church allows midwives, in cases of danger, to baptise a child before it is come entirely out of its mother's womb: where, it is to be observed, that some part of the body of the child must appear before it can be baptised, and that it is baptised on that part which first appears: if it be the head, it is not necessary to re-baptise the child; but if only a foot or hand appears, it is necessary to repeat baptism. A still-born child, thus baptised, may be buried in consecrated ground! The Greek church differs from the Romish, as to the rite of baptism, chiefly, in performing it by complete immersion.

FORMS OF BAPTISM in the Church of England. The forms of administering baptism among us being too well known to require a particular description, we shall only mention one or two of the more material differences between the form, as it stood in the liturgy of king Edward, and that in the English Common Prayer Book at present. The form of consecrating the water did not make a part of the office in king Edward's liturgy, as it does in the present, because the water in the font was changed, and consecrated but once a month. The form likewise itself was something different from that now used; and was introduced with a short prayer; that Jesus Christ, upon whom (when he was baptised), the Holy Ghost came down in the likeness of a dove, would send down the same Holy Spirit, to sanctify the fountain of baptism; which prayer was afterwards left out at the second review.—By king Edward's first book, the minister is to dip the child in the water thrice; 1st, dipping the right side; 2dly, the left; the 3d time, dipping the face toward the font. This trine immersion was a very ancient practice in the Christian church, and used in honor of the Holy Trinity; though some later writers say, it was done to represent the death, burial, and resurrection of Christ, together with his three days continuance in the grave. Afterwards, the Arians, persuading the people that it was used to denote that the three persons in the Trinity were three different substances, the orthodox left it off, and used only one single immersion. By the first common prayer of king Edward, after the child was baptised, the godfathers and godmothers were to lay their hands upon it, and the minister was to put on him the white vestment commonly called the chrysome, and to say, 'Take this white vesture, as a token of the innocency, which by God's grace, in the holy sacrament of baptism, is given unto thee; and for a sign, whereby thou art admonished, so long as thou livest, to give thyself to innocency of living, that after this transitory life thou mayest be partaker of the life everlasting. Amen.' As soon as he had pronounced these words, he was to anoint the infant on the head, saying, 'Almighty God, the father of our Lord Jesus Christ, who hath regenerated thee by water and the Holy Ghost, and hath given unto thee remis-

sion of all thy sins; may he vouchsafe to anoint thee with the unction of his Holy Spirit, and bring thee to the inheritance of everlasting life. Amen.' This was manifestly done in imitation of the practice of the primitive church.

The only human institutions connected with baptism in our established church, at present, are two, namely, sponsors and signing with the cross. Sponsors, or godfathers, called in ancient ecclesiastical writings, *patrini*, and *ἀνάδοχοι*, or susceptores, are mentioned as early as Tertullian. Cyril of Alexandria, A. D. 412, mentions the susceptor as saying Amen for the child baptised. It is also evident that in the second century there were attendants upon the children to be baptised, whose distinct office was to receive them from the priest, and who, it is highly probable, answered for them at the font; but that the practice was not used in the days of the apostles is evident, since it is not mentioned by Justin Martyr. The sign of the cross is a ceremony against which much censure has been levelled. It was used as early as the third century, and, although many efforts were made at the reformation to abolish it, has been carefully preserved.

Other customs, however, have by different churches, and in different ages, been introduced into the celebration of this sacrament, which are now totally disused, or retained only in the church of Rome. They may be enumerated in the following order: 1. Trine immersion, already alluded to, the practice of which commenced about the opening of the fourth century. Although prescribed in the English church by the prayer-book, 2 of Edward VI., this form was afterwards omitted. 2. *Chrism*, or unction, as mentioned by Tertullian, Cyprian, Cyril, and Chrysostom. It was performed with plain oil before baptism, and with unguent afterwards. 3. Tertullian mentions the practice of giving milk and honey to persons after baptism. This ceremony, which after a few centuries was discontinued, has been derived by some learned men from the Jewish customs at proselyte baptism. 4. Exorcism, or putting the baptised person upon his oath, and declaring to him his obligation to renounce sin, was used in the fourth century. This ceremony abounds with corruption in the church of Rome. 5. Candles lighted after baptism, and placed in the hands of the person baptised, as an emblem of the illumination of the spirit, was a ceremony used as early as the fourth century. 6. The *chrisom*, so called in the English church, was a white garment or surplice, put on immediately after baptism. 7. Easter and Pentecost were considered solemn times for the administration of baptism, as early as the second and third centuries. 8. Salt was not given to the baptised till the eighth century; nor, 9. The ears touched with spittle till the ninth.

6. Our sixth object will be to exhibit some of the most popular heresies which have prevailed at different periods respecting baptism. These arose chiefly in the second and three following centuries. 1. In the second century Marcion permitted women to baptise; affirmed that none but virgins, widows, or celibates, were fit subjects for baptism; and allowed baptism to be

repeated thrice. The Montanists baptised the dead. The Valentiniens, instead of baptising in the name of the Father, &c. used a mystical form in the name of the Unknown Father of all things, in the Truth the Mother of all things, in him that came down on Jesus, in the union and redemption and communion of powers. Instead of using water they poured a mixture of oil and water on the head, after which they anointed the persons so baptised. 2. In the third century arose the heresy of the Manichees, who affirmed that baptism by water was not necessary to salvation, and accordingly neglected it. 3. The fourth century was remarkable for the heresy of Arius, who baptised in the name of the Son only. 4. Pelagius, in the fifth century, affirmed that infants were baptised for other reasons, and not because of original sin.

7. Several laws have passed in different ages for enforcing and restricting baptism. In the ancient church, baptism was frequently conferred on Jews by violence; but the church never seems to have allowed of force on this occasion. By a canon of the fourth council of Toledo, it is expressly forbidden to baptise any against their wills. That which looks most like force in this case, allowed by law, were two orders of Justinian; one of which appoints the heathens, and the other Samaritans, to be baptised, with their wives and children and servants, under pain of confiscation. By the ancient laws, baptism was not to be conferred on image-makers, stage-players, gladiators, aurige or public drivers, magicians, or even strolling beggars, till they quitted such professions. Slaves were not allowed the privilege of baptism without the testimony and consent of their masters; excepting the slaves of Jews, heathens, and heretics, who were not only admitted to baptism, but, in consequence thereof, had their freedom. Vossius has a learned treatise of *honte* work, *De Baptismo*, wherein he very copiously discusses all the questions concerning baptism according to the doctrine of the ancients.

8. *Baptismus*, or *the Bath* was a sort of vicarious expiation, merely of men, where a person dying without baptism, his brother was baptised in his stead. *Theophrastus* tells us, this was practised among the Manichees with a great deal of ceremony. After any catechumen was dead, there was a living man under the bed of the deceased; when coming to the dead man's feet, he asked whether he would receive baptism; if he refused to answer, the other asked him if he would die, he would be baptised, and if he said no, so they baptised the corpse of the dead. *Epiphanius* assures us, the heathens practised this among the Corinthians. *Theophrastus* also appears to be founded on the passage of *Isaiah*, by alleging that text for it, If thou shalt not do all what I shall they do who are baptised, thou art dead? This text, indeed, is not applicable to a variety of different and opposite opinions. *Bosius* enumerates no less than eight different opinions among divines concerning the nature of the phrase. *St. Ambrose* is of opinion, that such a study of opinion, concerning the nature of such a custom; that is, whether the persons are of the

same opinion, as *Baronius*, *Jos. Scaliger*, *Justellus*, and *Grotius*. But *Bellarmin*, *Salmeron*, *Menochius*, and several other Roman catholics, understand it of the baptism of tears, and penance, and prayers, which the living undergo for the dead; and thus allege it as a proof of the belief of purgatory in *St. Paul's* days. Some protestant divines read the passage, baptised into death; and illustrate it by the context; particularly the words 'being buried with Christ by baptism into death.' *Paul*, they say, is proving the resurrection by that of our Saviour, and the strength of his argument is, (1 Cor. xv. 16, 17, 29.) 'If Christ be not raised, and if the dead rise not, what shall they do who are baptised into his death?' This appears the most probable interpretation of the text.

BAPTISM OF THE DEAD was a custom which anciently prevailed among some people in Africa. The third council of Carthage speaks of it as a thing that ignorant Christians were fond of. *Gregory Nazianzen* also takes notice of the same superstitious opinion prevailing among some who delayed to be baptised. In his address to this kind of men, he asks whether they staid to be baptised after death? *Philastrius* also notes it as the general error of the Montanists or Cataphrygians, that they baptised men after death. The practice seems to be grounded on a vain opinion, that, when men had neglected to receive baptism in their life-time, some compensation might be made for this omission by receiving it after death.

BAPTISM OF BELLS, a superstitious custom practised in the church of Rome, whereby the bell was supposed to be rendered capable of driving away tempests and devils. It is first taken notice of in the capitulars of *Charles the Great*. *Baronius* carries its antiquity no higher than the year 968, when the greatest bell of the church of Lateran was christened by pope *John III*. In 1581 it was complained of in the centum gravamina of the German nation, drawn up in the public diet at Nuremberg. In this ceremony the bell was provided with godfathers, who made responses, and gave it a name; after which they clothed it with a new garment, as Christians used to be clothed on coming out of the water.

BAPTISM, FIRE, spoken of by *St. John* the Baptist, has occasioned much conjecture. Some of the fathers held that believers, before they enter paradise, are to pass through a certain fire, which is to purify them from all remaining pollutions. Others, with *St. Basil*, understood it of the fire of hell; others of that of tribulation and temptation. Others, with *St. Chrysostom*, will have it to denote an abundance of graces. Others suppose it to mean the descent of the Holy Ghost on the apostles, in the form of fiery tongues. Lastly, others maintain that the words 'with fire' are an interpolation. Some MS. copies of *St. Matthew*, indeed, want these words; but still they are to be found in *St. Mark* and *St. Luke*. The ancient Seleucians and Herminians, understanding it literally, maintained that material fire was necessary in the administration of baptism. But we do not find how, or to what part of the body, they applied it, or whether they were satisfied with obli- ging the

person baptised to pass through the fire. Valentinus, according to Tertullian, rebaptized all who had received water baptism, and conferred on them the baptism of fire. Heracleon, cited by Clemens Alexandrinus, says that some applied a red hot iron to the ears of the person baptised, as if to impress some mark upon him! If many of the plainest texts of Scripture had not been misconstrued by ignorance, and darkened by knavery, one would be surprised that ever this text should have occasioned the smallest controversy. The context suggests one good interpretation. The Baptist spoke to a mixed multitude, many of whom were or would be believers, and many of whom never did believe the gospel. He therefore tells them that One, mightier than he, should baptise them (the one class) with the Holy Ghost, and (the other) 'with fire;' that he will thoroughly purge his floor and gather his wheat into his garner; but he will burn up the chaff, &c. Other passages of the New Testament speak of a 'fiery trial,' which is to try all faithful believers, as no 'strange thing,' 1 Pet. iv. 12; and Jesus Christ, alluding to his own sufferings, assured his immediate followers 'that they should be baptised with the baptism wherewith he was baptised.' Probably therefore we unite the best interpretations of the passage by considering it to refer to the baptism of the day of Pentecost literally, and symbolically to the Christian's share of afflictions in this suffering and vain world.

BAPTISTS, a general name by which those Christians are distinguished who deny the validity of infant baptism, and restrict the administration of that sacrament to persons capable of believing and understanding the religion into which they are thus initiated. They also maintain generally that immersion is necessary to constitute a scriptural baptism. Like all other denominations of Christians, they call in the evidence of antiquity; and their pretensions, if founded on fact, as will be seen hereafter, are considerable. They affirm that infant baptism was unknown before the third century, was established in the fourth and fifth, and prevailed generally till the Reformation; that even in the dark ages some traces of pure baptism are discernible; that the ancient British church, before the arrival of St. Austin, did not baptise infants; that Bruno and Berengarius in the eleventh century, the Waldenses, the Lollards, and the Wickliffites, opposed infant baptism, together with William Sawtre, the first Lollard martyr in England, who was burnt A.D. 1401, in the reign of Henry IV. This is certain, with respect to their antiquity, that at an early period of the Reformation disputations were held at Zurich, Bale, and Berne, upon infant baptism.

To the class of Baptists belong the ancient Novatians, Cataphrygians, the Donatists, the Anabaptists and Mennonites of Germany, and others, who, though they differed widely in their opinions upon other subjects, held the same general views with respect to the initiatory sacrament.

Although the term Anabaptist has been promiscuously used as a general name by which to distinguish Baptists or re-baptisers, still we must distinguish between the Baptists in general and the Anabaptists of Germany, for which see article

ANABAPTIST. It would be equally uncandid and unjust to confound, with the latter enthusiasts, so respectable and consistent a body of Christians as the Baptists are, merely from a coincidence of opinion on the subject of baptism, especially since the wild doctrines of the latter on the subject of civil government have always been disclaimed by the former, although it must be confessed a difficulty to distinguish them for some years after the Reformation.

The Baptists in England separate from the establishment for the same reasons as their brethren of the other denominations do; and from the additional motives derived from their particular tenets respecting baptism. The constitution of their churches, and their modes of worship, are congregational or independent; in the exercise of which they are protected in common with other dissenters, by the act of toleration. Before this act they were liable to pains and penalties as nonconformists, and often for their peculiar sentiments as Baptists. A proclamation was issued out against them, and some of them were burnt in Smithfield in 1538. Many of them were persecuted as Anabaptists in the reign of Elizabeth, charged with holding opinions which tended to anarchy. Indeed, during the latter part of Elizabeth's reign, the powers of the Star Chamber, and the High Commission, had almost destroyed dissent; the Baptists fled the country, and settled principally in Holland. Mr. Smyth, a benefited clergyman who had seceded from the establishment, founded a Baptist church of English refugees at Amsterdam. He appears to have been an Arminian in point of sentiment; but in his settlement over this people we have the earliest evidence of the existence of regular Baptist churches. Mr. Smyth died in 1610, and was succeeded in his ministry by Thomas Helwisse, who shortly after returned with his congregation to England, and settled in London. The severities exercised by king James I. at this time against the Puritans and Baptists, called forth some able writings in explanation and defence of their principles. A petition was presented to parliament in 1620, after which the Baptists were legally acknowledged as a body distinct from the Anabaptists, although considerable prejudice existed against them, even to the time when bishop Taylor wrote his *Liberty of Prophecy*. It was particularly unhappy for their cause that the fifth monarchy men, of Cromwell's time, were chiefly Baptists. The year 1633 affords us the earliest records remaining of a particular Baptist church in London, formed under a Mr. Spilbury. The persons who formed this congregation had separated from one of the independent persuasion; and, conceiving the right of administering baptism to descend in uninterrupted succession, sent one of their members over to Holland to receive that ordinance, and bring it over to them.

They might, it is true, have received baptism from some member of Mr. Spilbury's congregation; but that body being Particular or Calvinistic Baptists would not have any connexion with the Arminian or General Baptists. Between these two denominations there never was much intercourse, nor is there at the present

day. After the murder of Charles I. both the Baptists and Independents suffered much from the intolerant spirit of the Presbyterians; but in the short parliament of Cromwell, commonly called 'Praise God Barebone's parliament,' from the circumstance of Mr. Barebone, a Baptist minister, having made himself conspicuous in it, the Baptists appear to have had some influence. Great suspicion, nevertheless, rested upon them generally; especially as amongst the Baptists at that period were found some who opposed the Protector's government, and advocated republican principles, and others who believed the near approach of Christ to reign upon the earth, and were ever ready to promote by the sword the establishment of what was called by way of contempt the fifth monarchy. A conspiracy of the fifth monarchy was defeated by Cromwell, in 1650, and Harrison, the regicide, at their head, was imprisoned for life; but upon the restoration the Baptists publicly disclaimed Anabaptist principles, and presented the king with a confession of their faith. A second conspiracy of the same deluded class took place in 1661, after which the Baptists repeated their disavowal of Anabaptist principles, and, with the exception of their sufferings in common with their dissenting brethren during the period between the Restoration and the Revolution in 1688, from the rigorous measures employed to compel them to conform, neither the general nor particular Baptists have since that period suffered any considerable molestation. The particular Baptists, at a general assembly held in London in the year 1699, professed their belief in the distinguishing doctrines of Calvinism, which are still the general fundamentals of all their churches. As a body they are highly respectable, and rising in importance. They have several academies for the education of students for the ministry in their congregations, the oldest of which is at Bristol; and also two institutions for students to be educated at one of the universities in Scotland, given them by Dr. Ward of Gresham college.

Both the particular and the general (or Arminian) Baptists had formerly messengers of their churches, who exercised a species of episcopal authority; but their only church officers, at the present time, are ministers or pastors, and deacons. Their churches are not parochial, or confined to certain districts, but congregational and independent, every congregation being empowered to prescribe its own rulers. The meetings of the messengers and members of the different congregations are not for the general government of the body, but for mutual advice and encouragement.

A considerable controversy has of late agitated the churches, respecting the opinions of Baptists, on the question of open communion, namely, whether persons who have been baptised in infancy may be admitted without any further baptism to the communion of the church, or whether years of dissent are to prevail on other respects they are not fit proper persons. On this particular the members of both communions are much divided of opinion, and frequent pamphlets have been published on both sides.

The churches are in the communion of

Christians in Scotland, who profess to deduce their original from the apostolic age. Their views of the initiatory sacrament, and arguments against the validity of infant baptism, are the same as those held by Baptists generally, but their collateral opinions, especially on the subject of church government, are peculiar. They stand in no particular connexion with any other class of Baptists, either abroad or in England, although they have churches and brethren in their own communion in London and other places. It was not known till lately that a society of Baptists had existed in Scotland before 1765, but now the fact is ascertained that such a society did really exist, and usually met both in Leith and Edinburgh as far back as the middle of the last century. At the period already alluded to, the Baptist profession publicly revived, first in Edinburgh and afterwards in other places, so that now there are disciples and brethren in all parts of the kingdom.

They are generally remarked for their unity and love to each other, to which is superadded a firmness in maintaining their religious opinions. I. They hold, from the New Testament, that each church planted by the apostles was a single congregation, and met together in one place. Acts ii. 1. 46; iv. 31; and v. 12; 1 Cor. xi. 18. 20; so that it was composed of visible believers; 1 Cor. i. 2; Philip i. 1; Col. i. 2; that it had a plurality of elders, or bishops, to rule and labor in the word and doctrine; (Acts xiv. 23; xx. 17; Philip i. 1; Titus i. 5; 1 Tim. v. 17; also a plurality of deacons to minister in the proper application of the church's bounty; Acts vi. 1—17; Philip i. 1; and that both were chosen not by their academical abilities, but by their characters laid down in 1 Tim. iii. 1—16; Tit. i. 5—10; and set apart by the laying on of hands; Acts vi. 6; 1 Tim. iv. 14; v. 22. II. They aim at the faithful and impartial exercise of discipline, according to the several rules laid down in the New Testament; Matt. xvii. 15—17; 1 Cor. v. 5; 2 Thess. iii. 6—15; 2 Tim. iii. 5. Tit. iii. 10, 18. Gal. vi. 1 Jude 22, 23. Such discipline, they say, is essential to the very being of a christian church; but altogether impracticable in any other society. III. They receive none into church-fellowship but such as make a scriptural profession of their faith in Christ, and show their readiness to observe whatsoever he enjoins; and they retain none in their communion who visibly depart, in any instance, from the faith and obedience of the gospel, and are proof against all the instituted means of recovery. IV. They hold that the rule of forbearance is divine revelation, making all due allowance for differences in natural tempers, capacities, growth in grace, &c. and exercising all long-suffering, lowliness, and meekness, in their endeavours to reclaim an erring brother. V. They consider it their duty to be all of one mind, in every thing that regards their faith and practice as a body. Acts iv. 32. 1 Cor. i. 10. 2 Cor. xiii. 11. Philip. i. 27. ii. 2. 1 Pet. iii. 8. Nothing is decided among them by human influence or policy, or by majority of votes, but by the unanimous consent and explicit agreement of every member. VI. They meet every first day of the week for

reasons and ends given in Matt. xxvii. 1—7. Luke xxiv. John xx. 19, 26. Acts ii. 1. xx. 7. 1 Cor. xi. 18. 20. xvi. 2. Rev. i. 10. When they observe the following institutions of divine worship: 1. The public reading of the scriptures of the Old and New Testaments, from what is written, Acts xv. 20, 21. Col. iv. 16. 1 Thess. v. 27. 1 Tim. iv. 13. 2. The mutual exhortation of the brethren, which is attended to on the morning of Lord's day, immediately after the reading of the scriptures. Col. iii. 16. 1 Thess. iv. 13. Heb. iii. 13.; x. 24, 25. 3. Preaching and expounding the word, which is done by the elders and pastors. 1 Pet. v. 2. 1 Tim. v. 17. Acts v. 42. xx. 20. 2 Tim. iv. 2. 4. The public prayers, not only of the elders, but also of the brethren, as was exemplified in the first churches. Rom. xii. 12. 1 Cor. xi. 4. xiv. 14. Eph. vi. 18. 1 Tim. ii. 1, 2. Jas. v. 16. Jude 20. To these prayers and thanksgivings, the whole church say Amen. 1 Cor. xiv. 16. 5. The singing of praise. Matt. xxvi. 30. 1 Cor. xiv. 15. In doing which they use the Psalms of David, and other spiritual songs. Eph. v. 19. Col. iii. 16. 6. The fellowship, contribution, communication, distribution, or well doing, as in Rom. xvi. 26. 2 Cor. ix. 13. Philip. iv. 14, 15. 1 Tim. vi. 18. Heb. xiii. 16. i. e. the collection for the support of the poor saints, and other necessary uses. See Acts ii. 41. and 1 Cor. xvi. 1, 2. 7. The breaking of bread, or the Lord's supper: this they observe every Lord's day without any regard to preparation and thanksgiving days, as the church at Troas came together chiefly for that end on the first day of the week. Acts xx. 7. 8. In the interval of public worship, they have the feast of charity, in an appropriate place, and generally contiguous to the ordinary place of meeting for worship, where every member may attend. Its nature is to promote love, pleasure, harmony, and mutual edification among the brethren, also for disengaging the minds of the members, from the time and care spent in preparing a diet at their own houses on that day; for refreshing those who come from a distance, and for affording a moderate repast to the poorer members. These love feasts they deduce from the apostolic churches. Acts ii. 46. xx. 11. 1 Cor. xi. 20, 21, 22. Jude 12. 2 Pet. ii. 13. VII. They consider it their duty to join fasting with prayer, on particular occasions. Matt. ix. 25. Acts xiii. 2. compare Isaiah lviii. 5. with James iv. 8—10. VIII. They use the kiss of charity on various occasions; such as, the reception of a new member, the forgiveness of offences, the reconciliation of differences, the setting apart of office-bearers, the departure or return of brethren, &c. Rom. xvi. 16. 1 Cor. xvi. 20. 2 Cor. xiii. 12. 1 Thess. v. 26. 1 Pet. v. 14. IX. They wash the saints' feet, even literally, and that not as a ceremony, but whenever it can be of real service to a brother; the men perform that service to those of their own sex, and the women to their's only. John xiii. 14, 15. X. They abstain from eating of blood and strangled, or 'flesh with the blood thereof;' because these were not only forbidden to Noah and his posterity. Gen. ix. 3, 4; but also under the gospel. See Acts xv. 28, 29. xvi. 4. and xxi. 25. Rex. ii. 20. 24. and ver. 52.

XI. They do not find themselves at liberty to eat a common meal with persons excommunicated from their fellowship; but they do not set aside any natural or relative duty. Matt. xviii. 17. Luke xv. 2. Acts x. 28. 1 Cor. v. 9, 10, 11. And XII. They consider themselves subject to the powers that be in all lawful civil matters, Rom. xiii. 1—6. 1 Pet. ii. 13—16. to honor them, ver. 17. pray for them, 1 Tim. ii. 2. pay them tribute, Rom. xiii. 6, 7. and rather to suffer patiently for a good conscience, than in any case to resist them by force. Acts v. 29. 1 Pet. ii. 19—24. Therefore they can have no fellowship with any who are known to be disaffected to government; Prov. xxiv. 21.

BAPTISTERY, in ecclesiastical writers. was one of the exedra, or buildings distinct from the church itself; and consisted of a porch or antiroom, where the persons to be baptised made their confession of faith, and an inner room, where the ceremony of baptism was performed. Thus it continued till the sixth century, when the baptisteries began to be taken into the church porch, and afterwards into the church itself. The ancient baptisteries were commonly called *φωτιστήρια*, photisteria, q. d. places of illumination; either because that name was sometimes given to baptism, or because they were the places of an illumination, or instruction, preceding baptism; where the catechumens were taught the first rudiments of the Christian faith.

Baptisteries in general are either octagonal or circular, surmounted with a dome, and as the font is usually placed at the entrance of the church to represent the initiation of the new christian, so the baptistry is situated at the approach to the western or principal gate. These edifices are of very high antiquity, since one was prepared for the ceremonial of the baptism of Clovis; and, as the times of baptising returned but seldom, they have been usually very capacious. In Italy, although the churches were numerous, in some of the most considerable cities there was only one general baptistry, to which they all resorted. This was dedicated to John the Baptist, and the church to which it was attached, assumed the pre-eminence connected with the church of Santa Sophia. At Constantinople was a spacious baptistry, in which we read of ancient councils assembling. Of the baptisteries of Rome, the Lateran is the most ancient, in which some antiquaries are said to have discovered the remains of the Thermæ, anciently within the precincts of the imperial palace. The baptistry of Pisa, both externally and internally, presents a fine display of the most exquisite workmanship, and accordingly has greatly excited the admiration of modern travellers, among whom we may distinguish the celebrated Joseph Addison. The baptistry of Florence is remarkable for the beauty of its gates. Here also are to be seen the bas reliefs, of which Michael Angelo was so enamoured, that he exclaimed they deserved to be portals of paradise. The Italian baptistry in appearance is not very dissimilar to the octagon in Ely cathedral at the intersection of the transepts and nave; but it does not appear from history that any building especially devoted to the purpose of baptism, was ever

erected in England. Many of the fonts in our churches are nevertheless highly interesting to the antiquarian, that of Bridekirk in Cumberland is of Danish origin, and that which was removed from the church of St. Peter in the east, Oxford, exhibited proofs of an antiquity almost as early. See Foxr.

Upon fonts and baptisteries in general, the following curious inscription is frequently found, especially upon those which are ancient: 'NIPON ANOMHMATA MH MONAN OWIN.' The pious monks often exercised their gifts in forming acrostics and chronograms; but this line exhibits the happiest instance of the amphibæna; the words being exactly the same whether we read the line backwards or forwards.

BAPTIST MISSION.—While the Missionary Societies of various denominations have an ulterior object in view, too high and sacred for much discussion in books of human science, there are collateral benefits to mankind, which gradually accompany their march, that fall strictly within our sphere to record. The bearing of these societies, on our acquaintance with the physical and political geography of the globe, and on the study of its languages, ancient and modern, is obvious; while the very object alluded to, and a missionary ardor for its accomplishment, has armed, and will arm, the traveller and the scholar (when a missionary), with a patient and persevering zeal, to be imbibed, perhaps, in no other school. It will be principally to the literary and scientific aspect of these institutions that we shall, in this work, direct the attention of the reader; but we purpose, in so doing, to insert a slight sketch of the rise and progress of all the reputable societies of this kind.

Among Protestants, it may be said, that in 1732 the *Unites Fratrum*, or Moravian brethren, led the way in these benevolent enterprises. They became deeply impressed with the fact that so many millions of the human race were sitting in darkness, and held in bondage by idolatry and vice; and they formed themselves into a small society for endeavouring to convey the benefits of Christianity to heathen nations. At first their beginnings were very small; but they now possess between forty and fifty settlements, employing from 160 to 180 missionaries. For sixty years this society pursued its way, in the most unostentatious and silent manner, before any others of a like nature were formed.

On the 21st of 1732, a few Baptist ministers meeting at Kettling, Northamptonshire, entered into a series of resolutions for the formation of a society, to be called *The Particular (or Calvinistic) Baptist Society for propagating the Gospel among the Heathen.* 'But so far,' say they, 'were we from having in view the exclusive promotion of our own peculiar principles as Baptists, that we were determined from the beginning, if no opportunity appeared for sending out Missionaries of our own, that we would assist other societies already in being amongst the Presbyterians and the Moravians.' The names of the first committee were John Ryland, Reynold Hogg, William Carey, John Sutchin, and Andrew Fuller. Reynold Hogg was chosen Treasurer, and Andrew Fuller, Secretary.

Nov. 13.—The committee meeting again at Northampton, learned that a Mr. John Thomas, a surgeon, who had been several years in Bengal, and during that period had occasionally preached the gospel to the natives, was then in London. He was said to be endeavouring to establish a fund for a mission to that country, and to be desirous of engaging a companion to return with him. Enquiry was made concerning Mr. Thomas, as to his character, principles, &c.; and the accounts which were received proving satisfactory, the committee resolved to invite him to go out as one of their missionaries, and to endeavour to furnish him with a colleague. Mr. Carey, on being asked if he were willing to accompany Mr. Thomas, answered readily in the affirmative. And thus was furnished to the society one of the most useful laborers in the missionary field, and ultimately one of the most profound of oriental scholars, from the humble station of an uneducated provincial dissenting minister.

The next step was to calculate the expense of sending them out, and to obtain the means or defraying it. The expense was estimated at £500, which sum required to be raised in about three or four months. To accomplish this the committee frankly stated to the religious public their plan, requesting that so far as it appeared to be deserving of encouragement, they would encourage it. Letters also were addressed to the most active ministers of the denomination throughout the kingdom, requesting their concurrence and assistance. The result was, that more than twice the sum which had been asked for was collected; yet, when the work was finished, the actual expense had so far exceeded the estimate, that there were only a few pounds to spare. A principal cause of this was, that the whole of the new missionary's family were induced to accompany him.

The first laborers in this mission sailed on June 13, 1793, on board the *Princessa Maria*, a Danish Indianman; but no tidings of their proceedings arrived in this country until July of the following year. For the first three or four months, it seems, Mr. Carey found himself in considerable pecuniary difficulties. The investment which was taken out for their immediate support, was sunk; and he, with his wife and family in a foreign land, were utterly destitute of the means of subsistence. He now, therefore, enquired for secular occupation; and early in March, 1795, received an invitation from Malda, to take the superintendance of an indigo factory. His colleague also, Mr. Thomas, who had stopped at Calcutta, under an idea of supporting himself by his profession, received, a little before, a similar invitation.

Mr. Carey accepted the superintendance of an indigo factory at Mudnabatty, and Mr. Thomas of another at Moypauldiggy, both in the neighbourhood of Malda. Here they considered themselves capable of watching the best opportunity for proceeding with their noble undertaking in coming out; and letters were sent to England, expressing their great pleasure in being able to decline, at present, any further assistance from the Society's funds.

At home, about this time, two young men, Mr. Jacob Grigg, and Mr. James Rodway, had offered themselves as missionaries, and being considered suitable persons, the committee resolved on another mission, i. e. to Africa, in the neighbourhood of Sierra Leone. In the autumn of 1795, the missionaries left England; but through the indiscretion of one of them, and the ill health of the other, the undertaking failed. In the spring of 1796, a Mr. J. Fountain offering himself as a missionary, was accepted, and sent out to join his brethren in India.

During the first year of his residence, Mr. Carey had repeated attacks of an intermittent fever with a dysentery. Mrs. Carey also, and their eldest son, were much afflicted; and their third son, Peter, died at five years of age. As soon as they were able to apply themselves to the work, they set up schools at their respective factories; preached every Sunday, and frequently on week days; and Mr. Thomas being particularly attentive to the poor, in administering medicines, &c. to them; many people, besides the workmen, attended their preaching. Two Englishmen, a Mr. Long and a Mr. Powell, who had settled in Bengal, joining in the views of this little band, on Nov. 1, 1795, they, with the missionaries, formed a church, and commemorated the sacrament of the Lord's Supper. Mr. Long was afterwards excluded for improper conduct; but Mr. Powell continued a useful character till his death, which was at Dinagepore, on Sept. 25, 1802. An European or two were joined to this body, from 1796 to 1800; a spirit of enquiry was awoke among the natives, and a school erected at Dinagepore; but no native converts manifested, as yet, sufficient boldness to shake off caste for the benefit of the new faith.

The missionaries, however, were not easily discouraged. They requested new helpers from home, and particularly some one who should understand the printing business. Accordingly, in the spring of 1799, Mr. and Mrs. Marshman, Mr. and Mrs. Grant, Mr. and Mrs. Brunson, Mr. William Ward, and Miss Tidd, embarked for India. Mr. Ward being a printer, and Mr. and Mrs. Marshman having kept a school. Their instructions were, to 'beware, both from a principle of conscience, and from a regard to their own interest, and that of the mission, of intermeddling with any political concerns—to be obedient to the laws in all civil affairs—to respect magistrates, both supreme and subordinate, and teach the same things to others—in fine, to apply themselves wholly to the all-important concerns of that evangelical service to which they had so solemnly dedicated themselves.' Moreover, that 'however gross might be the idolatries, and heathenish superstitions that might fall under their notice, they should sedulously avoid all rudeness, insult, or interruption, during the observance of such superstitions, observing no methods but those of Christ and his apostles, namely, the persevering use of scripture, reason, prayer, meekness, and love.'

Mr. Carey was anxious that the new missionaries and their wives might be permitted to proceed and settle in the neighbourhood of Malda. He had taken a small place at Kidderpore, about

twelve miles distant, where he intended to carry on a little business, and to erect some dwellings for them. The relinquishing of this undertaking would be a loss of £500. But the British authorities were inflexible in their opposition to his plan of increasing his establishment. Mr. Carey, therefore, determined to remove to the Danish settlement of Serampore, where his brethren had arrived.

This important step was accomplished January 10, 1800, and the next day he was introduced to the governor, who received him in a very friendly manner. The first object of attention was to settle a plan of internal government. All the missionaries determined to consider themselves as one family; they were to preach and pray in turn; one to superintend the affairs of the family for a month, and then another. Mr. Carey was appointed treasurer and keeper of the medicine chest; Mr. Fountain librarian. Saturday evening was devoted to adjusting any differences which might arise during the week, and pledging themselves to love one another; finally, it was resolved that no one should engage in any private trade; but that whatever was done by any member of the family, should be done for the benefit of the mission.

The first sheet of the Bengalee New Testament was printed May 16. They worked off 2000 copies, besides 500 of the gospel by Matthew, for immediate distribution. Early in June they opened a Bengalee school, in which the children of those natives who chose to send them, were taught gratis; and by the 20th of July they had forty pupils. A native, named Gokool, also appeared exceedingly attentive to their ministry. On the 22d of December, Gokool, and a man named Kristno, came and ate in public with the missionaries, by which act they threw off their caste. All who witnessed it were surprised; it was so universally said, No one would lose caste for the Gospel.

'Thus the door of faith is opened to these Gentiles—who shall shut it?' said Mr. (now Dr.) Marshman. 'The chain of the caste is broken, who shall mend it?' The same evening Gokool, without his family, and Kristno with his, came and offered themselves willingly to the church, each making a solemn profession of faith in Christ, and of obedience to his commands. It was soon noised abroad that these people had lost caste; and now a time of trial drew near. The next day a great company of people assembled, two thousand or thereabouts, pouring out their execrations upon them. Taking them by force, they first dragged them before the Danish magistrate; but he, instead of censuring, commended them for what they had done. Being dismissed, they came a second time with Kristno with a new charge, accusing him of refusing to deliver up his daughter to a man who had contracted for her in marriage. The magistrate, however, defended Kristno, and assured the girl that she should not be compelled to marry the man against her consent. The governor also promised the missionaries that they should not be interrupted in baptising. The hubbub that had thus been raised, did not shake the resolution of Kristno; but his family, and Gokool, were in-

timidated by it. On the 27th they sent to the mission-house, saying, 'they wished to put off their baptism for a few weeks.' The next day (the 28th) was the time appointed for baptising. Kristno came forward, and with Felix Carey, was baptised in the Hoogiy. A considerable number of Europeans and natives attended; many of whom appeared to be struck with the solemnity of the ordinance. Shortly after, a Mr. Fernandez, and Joymoon (Kristno's wife's sister), were baptised, and joined the church. At a meeting on the 22d, she said, 'She had found a treasure in Christ greater than every thing else in this world.' Kristnoo said his chief 'thoughts now were about the salvation of others.'

The effect of these baptisings was, that all the children of the Bengalee school were taken away by their parents, lest they should be made Christians; and the only children left for instruction were those of Kristno, to whom the missionaries now paid the greater attention, and amongst whom there were some hopeful appearances. The baptised Hindoos appeared to improve much in knowledge and affection. Their manner of speaking was singular and impressive. 'Christ (said one) is my joy, my hope, my all. If worldly things draw my mind from him, I say, mind, why dost thou leave Christ? There is no other Saviour. If thou leave him, thou fallest into hell.' 'I was formerly,' said another, 'in prison; the light of the Gospel came to the prison door, and I got out!'

About this time Mr. Carey was appointed by Marquis Wellesley to a professorship in the New College of Fort William. When an application was made to him on the subject, he had some hesitation as to complying with it, lest it should interfere with his proper work as a missionary. Nor did he accede to the appointment till he had consulted with his brethren, who thought that it might promote rather than obstruct the great objects of the mission. Every temporal advantage that might arise from it would, on the ground of their established rules, be only so much added to the missionary stock. And here let us add, that steadily, and when these advantages have risen to several thousands per annum, has this good man added them to that stock.

On the morning of May 8th, during our short war with the Danes, the British flag was hoisted at Serampore. At ten o'clock the missionaries were ordered to appear at the government house. On presenting themselves, they were treated with the utmost civility, both by the late Danish Governor, and the English commander, and told to go on with their school, preaching, &c. in the same peaceable way as before. On the 29th, Gokool, who had fainted at the outset, came forward again, and on June 7th, he was baptised. Kristno was now in the habit of talking to his neighbours who came to him at his work, in some persuasion as this:—'In all your worship there is no fruit. None of the debts died for sinners; but Jesus Christ came into the world for this. This is the greatest love I ever heard of. At the house of the missionaries I have seen such

love as I never saw before. When a man believes in Christ he gets a new mind. This is the fruit of becoming a Christian, &c. &c. The missionaries from such specimens hoped that he would soon be able to preach Christ to his countrymen.

During this month, Mr. Ward and Kristno visited certain parts of the country from whence persons had come for religious instruction, preaching and distributing papers as they proceeded; and some of the women went to visit their female relations up the country, where they also conversed about the gospel. Mr. Ward in his excursion was detained by a police officer, on the ground 'that the company had given no orders for the natives to lose caste.' Mr. W. assured him that the papers were entirely religious; and on his offering to sign them with his own name, the officer released him. The papers thus signed were sent to Calcutta, and examined. Some alleged, that it was improper to attack the religion of the natives; but others answered that there was nothing more in the papers than had been always tolerated in the Roman Catholics in the company's territories. Nothing therefore came of it; and during the administration of Marquis Wellesley, no more was heard of the subject.

In the course of this year, colonel Bie transmitted to his government an account of the settlement of the missionaries at Serampore, in consequence of which his Danish majesty directed the Royal College of Commerce at Copenhagen to signify his pleasure to the governor of Serampore, that the society of missionaries be considered as under his majesty's protection and patronage, which they accordingly signified by a letter, bearing date Sept. 5, 1801. The governor-general also of British India was pleased to assure one of the missionaries, that he 'was perfectly acquainted with all the concerns and operations at Serampore, and felt great satisfaction at their affairs being attended with a degree of success'.

In the beginning of 1802 the mission had baptised seven natives.

On the 4th of April, a native who had previously lost caste, of the name of Syam Dass, was baptised. He proved to be a simple-hearted good man, and was instrumental to the conversion of one of his neighbours, Bharut; but died, or was murdered on a journey in the autumn of the same year, about five months after his baptism. About this time a brahmin came to Serampore, who lived with Dulol, a famous leader of a Hindoo sect. They are a kind of Deists, setting light by the superstitions of the country, and by the caste; but making light also of sin, and a future state. He said that Dulol sent him to get baptised first, and that he himself would follow, and bring with him an hundred thousand disciples! The missionaries had no faith in this tale; but thought it right to pay him a visit. Mr. Carey, Mr. Marshman, and Kristno (who had formerly been one of his disciples) therefore, set off for Ghospura, the place of his residence. They perceived him to be what they expected, a designing man, living in state only upon the credulity of his followers.

On May 10th, Mr. Ward and Mrs. Fountain were married. Heretofore the marriages had been performed by an English clergyman; but the missionaries having been advised to marry their own people, they, with the concurrence of the civil authorities, drew up a simple form for the purpose; and the business was conducted to the satisfaction of all present. In June or July five more natives were baptised at Serampore. Towards the end of this last month, a Mussulman, whose name was Moorad, came from Ponche-taluckphool, or as they usually call it by way of contraction, Luckphool, with an invitation from a considerable number of people in that part of the country to go and preach the gospel to them. Mr. Marshman, accordingly, set out on the 10th of August, taking Petumber Mitre and Bharut with him. At Luckphool, they halted under a large tree, which was the appointed place for hearing; the people came together and received them sitting down on the grass, and after having heard with much earnestness for about half an hour, entreated the preacher to rest, and take refreshment. He did so, and then renewed his subject. They spent the evening, sitting round him, and asking questions on Christ, the resurrection, a future state &c.

These people, amounting to some hundreds, had, for the last fourteen years, begun to dislike the idolatry of the country; and attaching themselves to a grave elderly man, as their goroo or teacher, had from that time been enquiring after the right way. Neelo, for that was the old man's name, had taught them that there was one God, whom he called father, who alone was to be worshipped; that sin was to be forsaken; and that a farther revelation was to be expected. It was in consequence of his having heard of the missionaries that Moorad was sent to Serampore, to request them to come and visit them. After the worship, as above related, the old man took Mr. Marshman aside for private conversation, and appeared to be very averse to Brahminism, and friendly to the gospel as opposed to it; recommending it also to his people, as being the revelation which he had given them to expect. In returning home, Mr. M. called on another goroo, who had nearly 20,000 followers. His name was Seeb Ram Dass, and his residence at Juggerdandakatty. There was much less pomp and artifice in him than in Dulol; and less conviction and affection than in Neelo; and his people at Luckphool. The general impression was, that these people were loosened from the Hindoo and Mahomedan systems, which marked the land of providence, and might be introductory to the gospel.

During this year Mr. and Mrs. Chamberlain were sent out by the committee to assist in the labors of the India mission. About the same time, the missionaries purchased the house and premises adjoining their own. The garden and out-buildings contained more than four acres of land. By this addition they had room not only for the schools, and for the printing and binding business, but also for any new missionaries that might arrive. They made themselves trustees for the society, as they had done in the first purchase. Towards the end of January, 1803, be-

sides the New Testament, the first volume of the Old, the Psalms, and a part of Isaiah, were finished, and began to be a good deal read in different places. A new fount of Naggree types was nearly completed; and a house was taken in Calcutta for preaching to both Europeans and natives.

In February they speak of 'the affairs of the mission growing more and more weighty.' Several new enquirers arrived; amongst whom was Sheetaram, a sooder, from Bishoohurry; in Jessore, and who on the 27th was baptised. The zeal, the simplicity, and the good conduct of this man proved, as will be seen, a great blessing to several of his relations and neighbours.

In April two of the native converts intermarried. The ceremony was conducted much in the same way as Mr. Ward's had been. Mr. Carey, after explaining the nature and ends of marriage, and noticing the impropriety of the Hindoo customs, read certain portions of scripture, and after them the marriage agreement. The parties then joined hands, promised love, faithfulness, obedience, &c.; then signed the agreement, to which others added their names as witnesses. A prayer for a divine blessing followed, and the whole was concluded with a temperate and cheerful repast of raisins, plantains, &c. The day following they had a supper at the house of Kristno, the bride's father, where all sat down together without distinction of color or country. This to the spectators was quite a new thing. During this month several of the native brethren, as Kristno, Pressaud, Ram Roteen, &c. went into the villages to talk with the people about Christ. They were treated with abuse, but bore it with Christian meekness, telling their abusers, that they 'only did what every sect did, who, whether Hindoos or Mussulmans, were allowed to perform their poorjabs in the streets; and that insults, stripes, and even death were good for them, so that God by them did but turn their hearts.'

Frequent additions were now made to the Baptist flock here; nor did the diligence of the missionaries slacken in their noble work of translating the scriptures.

In August, a new and improved edition of the Bengalee New Testament was begun, as only 600 copies remained of the first impression. In September, the convert, Gokool, seemed to be drawing near his end. But his mind was steadily fixed in the faith of Christ, and on the 7th of October he died. 'About two hours before his death,' says Mr. Marshman, 'he called the native brethren round him to sing and pray. He was perfectly sensible, resigned, and tranquil. Some of the neighbours had been trying to persuade him to employ a native doctor; but as all their medicines are accompanied with heathen incantations, he refused them, saying, he would have no physician but Jesus Christ. 'How is it,' said they, 'that you, who have turned to Christ, should be thus afflicted?' My affliction, replied he, is on account of my sins: my Lord does all things well. Observing Komal to weep (who was a most affectionate wife) he said, Why do you weep for me? His tranquil and happy end made a deep impression on all around. They said one to another, May my

mind be as Gokool's was.' His funeral, in the European manner, made also a considerable impression on the natives. On the 23d, a brahmin from Assam was baptised.

During this year, the society presented a copy of the Bengalee New Testament, and of the pentateuch, to his majesty, Geo. III. by the hands of Robert Bowyer, Esq. His majesty was pleased graciously to accept of them, and to direct that his thanks should be given to the society. During this year also a plan was laid for translating the scriptures into various other eastern languages.

In February, 1804, these worthy laborers had the happiness of devolving a portion of their work upon two native teachers, and ordained Kristno and Petumber Shingo to the work of the ministry, with prayer and the imposition of hands. In the course of the year, fourteen more natives were baptised.

About four years previously, Mr. Ward being, on a visit at Calcutta, went with Kristno to a village called Ramkreeshnupore, on the other side of the river, opposite Calcutta. Here they left a number of small tracts, and a New Testament. Till now the effects were unknown. Kristno, on revisiting the village, meets with a byragee, who tells him that the books have been read, and that several persons are convinced by them.

In November and December twenty-one persons were baptised, seven of whom came from Kristnupore, and were the fruits of the New Testament and tracts which were left at that village. One of them, named Kristnoo Dass, referring to Mr. Ward's having declared that 'it was for the use of the whole village, and that he who could read the best should keep it, and read it to all who wished to hear it,' said, 'he had got it, and that the reading of it had changed his ideas, and made him leave off idolatry, and put his trust in Christ.' The Testament was produced, and was nearly worn out by reading. Ten out of the twenty-one were baptised on November 3d. 'A solemn seriousness,' says Mr. Biss, 'pervaded the company. Some who seemed to know nothing of the power of religion, nevertheless shed tears.' At the Lord's supper there was great joy through the whole church, singing, and making melody in our hearts to the Lord.'

In the autumn of this year, captain Wickes being in London, the committee sent by him 1000 guineas, which had been collected in England, Scotland, and Ireland, towards the translation of the Scriptures into the eastern languages. On the captain's arrival in America, he expressed a wish in the public papers, that the friends of religion in his country would add something to it. The result was, that by the generous exertions of the different denominations, the original sum was considerably more than doubled, and sent in dollars to Serampore.

We have been following this band of brethren to the period of their cause-taking that deep and well-grounded root in India, from which it will not quickly be removed. But their steps were not everywhere encouraging. Both at home and in India, British authority and influence were occasionally arrayed against them. When, on the 23d of August, Messrs. Chater and Robinson

arrived, a demur was made as to their being permitted to proceed to Serampore. Next day, Mr. Carey was told by the magistrates that they had a message for him, 'that as government did not interfere with the prejudices of the natives, it was the governor-general's request that Mr. Carey and his colleagues would not.' As explained by the magistrates, this request was said to be a kind of order. 'They were not to preach to the natives, nor suffer the native converts to preach; they were not to distribute religious tracts, nor suffer the people to distribute them; they were not to send forth converted natives nor take any steps, by conversation or otherwise, for persuading the natives to embrace Christianity. Mr. Carey enquired whether they had any written communication with the governor-general; and being answered in the negative, took leave. This, however, it was afterwards said was not meant 'to prohibit Mr. Carey or his brethren from preaching at Serampore, or in their own house at Calcutta; only they must not preach at the loll bazaar. Nor was it intended to prevent their circulating the scriptures, but merely the tracts abusing the Hindoo religion: or to forbid the native Christians conversing with their countrymen on Christianity, only they must not go out under the sanction of the missionaries.'

In a conversation that took place between the magistrates and a friend of the missionaries, they acknowledged themselves 'well satisfied with their character and deportment.' Messrs. Chater and Robinson, however, were commanded to return to Europe.

A tract, about this time, was translated and sent to England, in which the missionaries were represented as calling the natives 'barbarians,' and their shasters 'barbarian shasters,' when in the original they had only intreated them not to reject the bible as being the shaster of the barbarians, or 'M'leeches, a name by which they designate all who are not of the caste. After this a pamphlet appeared by Mr. Twining, and was followed by several more, written by major Scott Waring, and others: some openly espousing the cause of idolatry, and most of them filled with unfounded statements, and ineffectual endeavours to trace the Vellore mutiny to the attempts at christianising the natives. The charges produced in these pamphlets were answered by the friends of the mission. Not long after, a tract which had been printed in Bengalee, and which in that language contained nothing offensive, was put into the hands of a native to be translated into Persic. The translation being finished, it was, through the pressure of business, inadvertently printed off without being first inspected by the missionaries; and the translator having introduced various strong epithets, calling Mahomet a tyrant, &c. which it was alleged would irritate his followers, the British authorities took it up in a serious manner. Mr. Carey being sent for, readily acknowledged the impropriety of the epithets, and promised to enquire into the affair. Had the object of the party been merely to prevent the disturbance of the public tranquillity, things would have issued here. But proceedings were commenced

which threatened ruin to the mission. In consequence, however, of an explanation, and a respectful memorial presented to the governor-general, the most serious part of the proceedings was revoked; and when two of the missionaries waited on his lordship to thank him for his candour in regard to their memorial, he replied, that nothing more was necessary than a mere examination of the subject, on which every thing appeared in a clear and favorable light. The missionaries however, were required, in future, not to print any tracts without first submitting them to the inspection of government.

In 1807 new rules were formed suited to the present state of the mission, every station being independent of the other, but all united as a general body. A considerable advance was made in ten of the translations: two new founts of type completed, viz. the Orissa and the Mahratta, and two others begun, viz. the Burmah and Chinese; a new and improved fount of Nagree also begun. With respect to printing, an impression of 1500 copies of the fourth volume of the Bengalee Old Testament, containing all the prophets, was completed; the third volume, comprising the historical books, being in the press; an edition of 10,000 copies of Luke, the Acts, and the epistle to the Romans was completed; the New Testament in the Sungscrit and Orissa considerably advanced; and the Hindostanee, Mahratta, and Guzuratee, put to press.

January 28, 1808, Serampore was taken by the English, but without making any difference in the situation of the missionaries. Mr. F. Carey, having studied medicine at Calcutta, introduced the vaccine inoculation at Rangoon. After having inoculated about fifty in the city with success, he was sent for by the governor to perform the operation on his children. This circumstance proved favorable to their settling as missionaries.

During this year the Danish clergyman at Serampore being dead, a question was moved among the inhabitants who should succeed him? The majority expressed their wish, that the missionaries might be permitted to do so. A petition was accordingly presented to the governor-general for the purpose, which being granted, the parish church has from that time, about September, been occupied by some of the Baptist brethren. They accept of no pecuniary reward for their services.

Towards the latter end of September there was a second examination of the lads engaged in the study of the Chinese language, held at Serampore; at which were present the vice-president of the Asiatic Society, with several other European gentlemen, who expressed their satisfaction in very strong terms. The missionaries now occupy the ten following stations, viz.

Bootan,	Missionary, Robinson.
Dinagapore, Fernandez.
Saddamah, Win. Carey.
Goanalty, Mardon.
Miniary, Moore.
Cutwa, Chamberlain.
Jessore, Carapeit Chater.
Serampore, Carey, &c.
Calcutta, Carey, &c.
Rangoon. Chater and F. Carey.

In the month of March, 1809, they finished the Orissa New Testament. Towards the close of this year an improved paper manufacture was established in Serampore. The Benevolent Institution had increased to nearly ninety children, and a humane medical gentleman prescribed and furnished medicines for it and the family gratis. Access was allowed, and the gospel freely preached amongst the soldiers and their wives in the fort. In all the stations 106 were baptized during the year.

From the commencement of the following year, the missionaries speak of themselves no longer as a single mission, but as divided into five missions, according to the different languages of the country, and which they designate, the United Missions in India. These are the Bengal, the Burman, the Orissa, the Bootan, and the Hindoost'han. The Bengal contains five stations, the Hindoost'han two, and the rest one each.

In March the New Testament in the Hindoe and Mahratta languages, the Pentateuch in Sungscrit, and the Prophetic books in Orissa, were finished at press; and considerable numbers of them were sent and distributed in the respective countries, from whence they afterwards received intelligence of their being read and understood.

In April the plan suggested by Dr. Bell and improved by Mr. Lancaster was introduced by Mr. Marshman into the school at Calcutta, by which the number of children could be greatly increased, and the expense contracted. Ground was purchased, and a new school-house erected, near the chapel, ninety feet by seventy, which would contain 800 children. Among the children in this school was a Malay boy, bought by Captain W. out of the hands of persons who were fattening him for sale to the Batta cannibals!

On the 11th of March, 1812, occurred a memorable calamity for the mission, the spacious printing-office at Serampore was consumed by fire, with all the types, many valuable MSS. and a large quantity of paper; the whole amounting to a loss of nearly £10,000. The missionaries, though much affected, were not greatly disheartened, nor in any degree induced to relax their efforts. New founts of type, in all the eastern languages, were cast, as soon as possible, from the melted metal recovered from the ruins; and the printing of the Scriptures was resumed, as fast as they could be prepared.

On the 19th of February the following year, the Tamul New Testament was finished at the press, and on the 20th was laid before the Calcutta Auxiliary Bible Society, at their anniversary. This edition, consisting of 5000 copies, was begun in April 1812, and completed in rather more than ten months.

The progress of the translations, during this year, cannot be better described than in an extract from a letter of Dr. Carey, dated December 14.—‘We are, at this time, engaged in translating the Bible into twenty-one languages, including the Bengalee, which is finished. This week, we obtained a person to assist in the translation of the Scriptures into the Kassai language. About a fortnight ago we obtained help for the Sindh and Wuch. I believe we have now all the languages in that part, except that of Kutch,

which, I hope, will soon be brought within our reach. We have not yet been able to secure the languages of Nepala, Bootan, Munipoora, and Siam, and about five or six tribes of mountaineers: besides these, I am not acquainted with any language on the continent of India, into which the word of God is not under translation.

At the public disputation of the students of the college of Fort William, held before Lord Minto as visitor of the college, on September 20th, his lordship, after enumerating their recent labors, concludes thus: 'I profess a very sincere pleasure in bringing the literary merits of Mr. Marshman and the other Reverend Members of the Serampore Mission to the notice of the public, and in bearing my testimony to the great and extraordinary labors which constancy and energy in their numerous and various occupations have enabled this modest and respectable community to accomplish. I am not less gratified by the opportunity which their literary achievements afford, of expressing my regard for the exemplary worth of their lives, and the beneficent principle which distinguishes and presides in the various useful establishments which they have formed, and which are conducted by themselves.' The stations occupied by the mission in 1814 had increased to twenty-four.

In 1815 the society had to sustain one of its greatest losses at home in the death of their secretary, the Rev. Andrew Fuller, who expired at Kettering, after a short illness, on May 7th. He had sustained this arduous and important office ever since the commencement of the society in 1792; and at length fell a sacrifice to its accumulated cares and labors. At the next meeting of the committee, Dr. Ryland, of Bristol, was requested to undertake the office, *pro tempore*; and, at the annual meeting, held at Northampton, in October, this appointment was confirmed, and Mr. Hinton, of Oxford, associated with the Doctor, as joint-secretary. November 27th the mission premises were visited by the Right Hon. Earl Moira, the bishop of Calcutta, and other distinguished personages, who expressed their high gratification with what they saw. On December 15th the settlement was restored to the Dutch government.

January, 1818, say the missionaries, 'In the Bengalee we have commenced a new edition, of 5000 copies, of the whole Scriptures, in a new and much-reduced type, reduced by brother Lawson, when he resided at Serampore. By means of this alteration we shall be able to compress the whole Bible in one large octavo volume of 350 pages; which has hitherto occupied five volumes, of 200 pages each. The brethren intend to print 5000 additional Testaments, forming a thin volume, of about 180 pages. In the Samscrit, the Latin of the east, and intelligible to almost all the learned men throughout Hindoostan, the Historical Books have been completed, and the printing advanced to the middle of Jeremiah. We therefore expect to complete this volume within the next three months, and shall then have printed the whole of the Scriptures in that language. The Hindoe Bible is still further advanced; and we fully expect that

within a month the last part will be ready for distribution. We shall then have printed the first edition of the whole Scriptures, with a second edition of the New Testament. In the Mahratta the historical books have been printed off, since the last Memoir, and the Hagiographa advanced to the middle of Proverbs. In the Sikh, the Pentateuch is just completed, and the historical books begun. In the Chinese we have just completed the Pentateuch, and are now proceeding with a second edition of the New Testament. In the Telinga the New Testament is printed as far as the Thessalonians; and we hope to have finished the volume ere this reaches you. In the Pushtoo Testament the printing is advanced as far as the first of Peter; and in the Assam and Wuch, to the Romans: while, in the Bruj Bhassa, although a delay has arisen in consequence of the distance of brother Chamberlain's station, who was superintending the version, we are preparing to proceed with the version as before. In the Kurnata we have finished Mark, and are proceeding with Luke: while in the Kunkuna, the Mooltanee, the Sindhee, the Kashmere, the Bikaneer, the Nepal, the Oodypore, the Marwar, the Juypore, and the Khassee, not much progress in printing has been made since the last Report. As soon, however, as the Hindee and Sungscrit versions are completed, it is intended to proceed with them. These translations were never advancing more rapidly than at present. The office now furnishes our venerable editor, Dr. Carey (independently of the Chinese proofs it forwards to Dr. Marshman) with twelve proofs per week, on an average. To which may be added, that opportunities of distributing the Scriptures, when printed, are becoming more extensive.'

Copies of the New Testament, in various languages, as printed and published at Serampore, were presented by Mr. Ward at the Annual Meeting of the British and Foreign Bible Society, in 1820; and two years after, the Chinese Bible complete, the result of sixteen years labor on the part of Dr. Marshman, was presented on a similar occasion, by his eldest son, then in England. At that time, 1822, the New Testament had been printed and published in twenty-one different languages, and the work was proceeding in ten others. Four versions, after having been carried to a certain point, had been resigned to other individuals, whose local residence afforded greater facilities for completing them; and ten besides were suspended, principally because the requisite pecuniary means were wanting.

In 1819 a new station was formed in the island of Ceylon, at a place called Hangwell, about fourteen miles from Colombo. Mr. Siers removed hither, and a small church was subsequently formed under his direction. The translation of the whole Bible into Cingalese, by the united efforts of Messrs. Chater, Armour, and Clough, was completed about the end of 1822.

No part of the missionary undertakings of this society has succeeded more satisfactorily than the Jamaica mission. In 1819 two gentlemen left England for Kingston and Spanish town; a spacious chapel has been built at the former place.

In the year 1822 the number of members in the church exceeded 2,000: Mr. Knibb arrived this year to take charge of a free school, established and maintained by the congregation; and Mr. Tinson to commence a new station in a distant part of the island. A station has been also formed in the north-west part of the island, on an estate in the parish of St. James's; the owners of which had long been favorable to the instruction of their negroes.

In consequence of facilities afforded by some pious gentlemen, in the habit of trading to that quarter, the committee were induced, in 1822, to turn their attention further westward still, and to send out Mr. James Bourne as a missionary to the bay of Honduras, South America.

At home, the business of the society having become far more extensive than formerly, some alterations were made in the manner of conducting it. At the General Meeting held at Cambridge, October, 1819, it was resolved that a central committee should be formed out of the general committee, who should meet monthly, in London, for the transaction of business; and from that time the Annual Meeting of the society has been held also in the Metropolis, in the month of June. Mr. Hinton, of Oxford, in consequence of his other numerous and important engagements, had resigned the office of joint secretary, in October, 1817, on which Mr. Dyer, then of Reading, now of Battersea, was chosen assistant secretary to Dr. Ryland, and, in the following year, requested to devote himself exclusively to the service of the mission, as joint secretary. In 1820 premises were engaged for the society in London, and at length a suitable house purchased, at No. 6, Fen Court, Fenchurch Street, where its still increasing business is now carried on.

Exclusive of the Chinese, the New Testament is published and sent into circulation in twenty of the languages of India. They are:

The Nepalee . . .	1812	1821
The Harotee . . .	1815	1822
20. The Kanoja . . .	1815	1822
The Chinese, 2d edition of the gospels printed	1806	1817

From this view of the translations, and of the time when they were respectively begun and finished at press, it will be evident that none of them have been brought hastily through the press. Seven years have formed the shortest period which has been occupied, even by those in which the terminations were the nearest akin to those in the neighbouring dialects: we have before us the most honorable and competent eastern testimony to the correctness of these versions.

The following list exhibits ten other versions now or recently in the Serampore press, with the period of their commencement, and the state of their progress.

	Begun.	Printed to.
The Jumboo	1814	Phil. iii. 9
The Manipoor	1814	2 Cor. xiii. 4
The Mugudh	1814	Rom. xiii. 4
The Khasee	1814	Acts xix. 25
The Oojjuynee.	1815	Phil. i. 10
The Bruj	1815	2 Cor. ii. 9
The Kumaoun	1815	Luke x. 23
The Bhutneer	1816	Rom. xiv. 13
The Sree-nugar, or Gurwal	1816	Luke xi. 21
The Palpa	1817	Matt. xxvii. 8

To these we may add the Kyttee edition, which is the Hindee in the current Naguree character, chiefly used by the mercantile and trading classes, and in which at the earnest request of the late Mr. Chamberlain, they prepared a fount of types for the sake of printing the New Testament. We are able further to submit to the reader a brief view of what have been done by this society relative to the Old Testament, as well as the New.

State of the Versions of the Old Testament.

	Commenced.	Finished at press.
1. The Bengalee, 6th edition in the press }	1794	1801
The Hindee, 2d edition in the press }	1802	1811
The Sungscrit, 2d edition in the press }	1803	1810
The Orissa, 2d edition in the press }	1803	1811
5. The Mahratta, 2d edition in the press }	1804	1811
The Telinga	1805	1818
The Sikh	1807	1815
The Gujuratee	1807	1820
The Kunkuna	1808	1819
10. The Kurnata	1808	1822
The Pushtoo or Affghan }	1811	1819
The Assamee	1811	1819
The Wutch or Mal-tanee }	1812	1819
The Bikaneer	1813	1820
15. The Kashmeer	1810	1820
The Bhugulkhund	1814	1821
The Maruwar	1814	1821

- The Bengalee, second edition advanced to 1 Sam. xx.
- The Sungscrit, second edition advanced to Exod. xxxi.
- The Orissa, first edition finished at press in 1819.
- The Mahratta, first edition printed off in 1820.
- The Chinese, finished at press April 1822.
- The Sikh, Pentateuch, and Historical Books, printed; Prophetic printed to Jer. xiii.
- The Assamee, Pentateuch finished, Historical Books begun.
- The Pushtoo or Affghan, Pentateuch advanced to Deut. xxx.
- The Kashmeer, Pentateuch advanced to Gen. xxxvi.
- The Telinga, Pentateuch printed; and the version resigned to the Madras Bible Society.

The Old Testament now printed off in Chinese, forms the sixth version completed here of the whole Scriptures in the different Indian languages. This was finished at press in April this year; after sixteen years of unremitting labor.

Hath he set bounds between their love and me ?
I am their mother, who shall *bar* them from me ?

Shakespeare.

My duty cannot suffer
T' obey in all your daughter's hard commands ;
Though their injunction be to *bar* my doors,
And let this tyrannous night take hold upon you.

Id.

When law can do no right,
Let it be lawful, that law *bar* no wrong.

Id.

VIOLA. I'll do my best
To woo your lady ; yet, a *barrefull* strife,
Whoe'er I woo, myself would be his wife.

Id. Twelfth Night.

Ye sit like pris'ners, *barr'd* with doors and chaines,
And yet no care perpetual care restraines.

Beaumont. Of True Liberty.

Hard, thou know'st it, to exclude
Spiritual substance with corporeal *bar*.

Milton.

These *bars* enclose that wider den,
Of those wild creatures called men.

Marvell.

Our hope of Italy, not only lost,
But shut from ev'ry shore, and *barr'd* from ev'ry coast.

Dryden.

When you *bar* the window shutters of your lady's
bed-chamber at nights, leave open the sashes, to let in
air.

Swift.

What is a greater pedant than a mere man of the
town? *Bar* him the playhouses, and you strike him
dumb.

Addison.

With emulation fr'd,

They strain to lead the field, top the *barr'd* gate,
O'er the deep ditch exulting bound, and brush
The thorny-twining hedge. *Somerville. The Chace.*

The folded gates would *bar* my progress now,
But that the lord of this enclos'd demesne,
Communicative of the good he owns,
Admits me to a share ; the guiltless eye
Commits no wrong, nor wastes what it enjoys.

Couper's Task.

BAR, in law, is a peremptory exception against a demand or plea brought by the defendant in an action, that destroys the action of the plaintiff for ever. It is divided into a bar to common intent, and a bar special ; a bar to common intent is an ordinary or general bar, that disables the declaration or plea of the plaintiff ; a bar special, is that which is more than ordinary, and falls out in the case in hand, upon some special circumstance of the fact.

BAR, in heraldry, one of the honorable ordinaries, consisting of two horizontal lines drawn across the escutcheon, as in fig. 1. The *bar* differs from the *fesse* in three particulars, namely, that it occupies a fifth part of the field instead of a third ; it is not limited to any part of the escutcheon, and is never borne single. It has two diminutives, namely, the *closet* (fig. 2), which is half the bar, and the *barrule* (fig. 3), which is half the closet. Of the closet there may be five in one field ; but the barrule can be borne only in couples. *Bars-gemelles* are so called when they stand in couples, as in fig. 4. 'The field is *argent*, a fesse between two bars, *gemelles gules*, by the name of Badlemere.'

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 4.

BAR, in African traffic, is used for a denomination of price : payment being formerly made by the negroes almost wholly in iron bars.

BAR, in courts of justice, is an enclosure made with a strong partition of timber, where the council are placed to plead causes. It is also applied to the benches where the lawyers or advocates are seated, because anciently, there was a bar to separate the pleaders from the attorneys and others. Hence our lawyers, who are called to the bar, or licensed to plead, are termed barristers, an appellation equivalent to licentiate in other countries.

BAR of gold or silver, is a lump or wedge from mines, melted down into a sort of mould, and never wrought.

BARS of a horse, are the upper part of the gums between the tusks and grinders, which bear no teeth, and to which the bit is applied, and by its friction the horse is governed.

BARS, in music, are strokes drawn perpendicularly across the lines of a piece of music ; used to regulate the beating or measure of musical time. The use of bars in music is a modern invention. They cannot be traced higher than the year 1574, and seem not to be in general use till about the middle of the seventeenth century. It is not easy to imagine how music in many parts could be composed without bars, or how the

maxima, or large, equal to eight semibreves, could be divided into bars of one or two semibreves in each. See **BATTUTA**, and **TIME-TABLE**. A double bar implies the end of a strain. When double bars are dotted on both sides, thus, the dots imply a repetition of each strain ; but if dotted only on one side, that strain only which precedes or follows the dots, is to be repeated.

BAR, in geography, (Gael. a hill or brae), the name of several places in different parts of Europe : such as,

BAR, a ci-devant duchy of France, bounded on the east by Lorraine, on the north by Luxembourg, on the west by Champagne, on the south by part of the same country and by Franche Comté ; it is crossed by the Meuse from south to north, and watered by several other rivers, which render it very fertile. It was divided into four bailiages, viz. Bassigni, Bar, St. Michael, and Clermont. The chief towns are Bar-le-Duc, Clermont, St. Michael, Longwy, Pont-a-Mousson, and Stenay. In 1736 it was given to Stanislaus, then king of Poland.

BAR, a city of Poland, in Podolia, seated on the river Kiov, and strongly fortified ; forty-eight miles north-west of Braclaw, and sixty-five north-east of Kamienieck.

BAR, a town in the province of Bahar, in the district of the same name, thirty-five miles E. S. E. of Patna. Long. $86^{\circ} 46'$ E., lat. $25^{\circ} 28'$ N.

BAR, a hill of Scotland, in Renfrewshire, in the parish of Kilbarchan, on the top of which are the remains of an old encampment, consisting of a semicircular parapet of loose stones towards the south, and defended on the north by perpendicular basaltic rocks. Tradition says it was an encampment of the celebrated Sir William Wallace; and the people show a pinnacle of rock where they say he sat, while he enticed the English forces into a bog at the bottom of it, where they perished. But Mr. Maxwell, the minister of the parish, concludes it to be Danish from its form, and from the silence of historians respecting this anecdote of the Scots patriot. Mr. Maxwell also mentions it as a singular fact in natural history, by no means consonant to the prevailing theories, that these perpendicular basaltes are incumbent upon coal, formerly wrought to a great extent.

BAR, or **BARR**, a small but thriving town of France, in the department of the Lower Rhine, sixteen miles south-west from Strasburg. It has a population of 4100 souls.

BAR-LE-MONT, a town of France, in the ci-devant French Netherlands, now in the department of the North; fifteen miles south of Mons, situated on the Sambre.

BAR-SUR-AUBE, an ancient town of France, in the department of Aube, and ci-devant province of Champagne, twenty-six miles east of Troyes, famous for its excellent wines. The manufactures are soap, linen, serge, and leather. Here are also some good iron-works. It is the capital of an arrondissement, containing 44,000 inhabitants.

BAR-SUR-ORNAIS, or **BAR-LE-DUC**, a town of France, in the department of Meuse, and the ci-devant capital of the duchy of Bar. It is seated on the declivity of a hill, and divided into the higher and lower town; the lower town is watered by the rivulet Ornain, which abounds with excellent trout. The population nearly 10,000. Here are manufactures of calicoes, woollen stuffs, stockings, hats, and leather; also a good trade in grain, wood, brandy, wine, and hemp. Forty-two miles west of Nancy, and 133 east of Paris. Long. $52^{\circ} 15'$ E., lat. $48^{\circ} 47'$ N.

BAR-SUR-SEINE, a town of France, in Burgundy, on the Seine; formerly the capital of a county of the same name, now of an arrondissement in the department of the Aube. In it are 460 houses, and 2270 inhabitants, with manufactures of knives, leather, and woollen caps, and a trade in wine, grain, and paper. Eighteen miles south-east of Troyes, and 110 south-east of Paris. Long. $4^{\circ} 27'$ E., lat. $48^{\circ} 7'$ N.

BAR-SOMMET, or **bars-gemelles**, are diminutives of the bar, and are placed in pairs, or two and two on a shield. They derive their name from the Latin gemelli, twins.

BARA, a festival celebrated with much magnificence at Messina, and representing the assumption of the Virgin. The bara, though used as the general denomination of this festival, signifies more particularly a vast and lofty pile of wood, the top of which a young girl of four-

teen, representing the Virgin, stands upon the hand of an image of Jesus Christ. Round him turn vertically, in a circle, twelve little children, which represent the seraphim; below them, in another circle, which turns horizontally, are twelve more representing the cherubim; below these a sun turns vertically, with a child at the extremity of each of the four principal radii or his circle, who ascend and descend with his rotation, yet still stand upright. Below the sun is the lowest circle, about seven feet from the ground, in which twelve boys turn horizontally without interruption: these are intended for the twelve apostles, who are supposed to surround the tomb of the Virgin at the moment when she ascends into heaven. This description of such a complication of superstitious whirligigs may nearly turn the stomachs of our delicate readers; but think of the poor little cherubim, seraphim, and apostles, who are twirled about in this procession! 'For,' says M. Houel, in his Travels through Sicily, 'some of them fall asleep, many of them vomit, and several do still worse;' but these unseemly effusions are no drawback upon the edification of the people; and nothing is more common than to see fathers and mothers soliciting with ardor for their boys and girls the pious distinction of puking at the bara. This machine is not drawn by asses or mules, but by a multitude of robust monks!

BARA, in ancient geography, 1. a small island in the Adriatic, opposite to Brundisium; the Pharos of Mela: 2. A Frith, or arm of the sea of Britannia, supposed to be the Murray frith.

BARA, or **BARRAY**, one of the Western Islands of Scotland, eight computed miles in length, and from two to four in breadth.

BARABAIAN DESERT. See **BARABINZIANS**.

BARABBAS, from בן, a son, and אבא, a father, a notorious robber and murderer, whom Pilate, wishing to save Jesus, offered for execution to the Jews; but they, instigated by their rulers, saved the murderer, and murdered the Saviour of mankind.

BARABINZIANS, a tribe of Tartars, who live on both sides the river Irtisch. They seem to derive their name from the Barabaian desert, whose lakes supply them abundantly with fish, on which, and their cattle, they chiefly subsist.

BARABRAS, a people of Lower Nubia, contiguous to Egypt. They are a distinct race from their neighbours, and of unknown origin.

BARACHAN, a creek on the western coast of Scotland, on the Ross side of the Sound of Eye, where vessels of considerable burden may anchor in safety.

BARACOA, a sea-port on the north-east coast of the island of Cuba, fifty miles north-east of St. Jago.

BARADÆUS, **JACOB**, or **JACOB ZANZALUS**, a monk of the sixth century. He was a Syrian by birth, and a disciple of Eutyches and Dioscorus. He maintained that there is but one nature in Christ; and his doctrines spread so much in Asia and Africa that the Eutychemans were swallowed up by that of the Jacobites, which also comprehended all the Monophysites of the east. His party made him bishop of Edessa. He died in 538.

BARAK, ברק, i. e. lightning; the son of Abinoam, of Kedesh Naphthali, one of the deliverers of Israel from the oppression of the Canaanites. See Judges iv.

BARAKAN, or **PARKAN**, a town of Hungary, formerly fortified, in the farther circle of the Danube, where the Turks were defeated, and the town recovered by the Imperialists, who took it by storm in 1684. It is opposite to Gran, of which it is reckoned a part.

BARALIPTON, among logicians, a term denoting the first indirect mode of the first figure of syllogism. A syllogism in baralip-ton, is when the two first propositions are general, and the third particular, the middle term being the subject in the first proposition, and the predicate in the second. The following is of this kind:

- B.** Every evil ought to be feared;
R. A. Every violent passion is an evil;
LIP. Therefore something that ought to be feared is a violent passion.

BARALLOTS, in church history, a sect of heretics at Bologna, in Italy, who had all things in common, even their wives and children! Their facility in complying with all manner of debauchery made them get the name of obedientes, or compliers.

BARAN, a river rising in the Hindoo Kho mountains, and flowing through the north-east of Calcutta.

BARANCA DE MALAMBO, a town of Terra Firma in America, with a bishop's see and a good haven. It is a place of great trade, seated on the river Magdalena, seventy-five miles north of Carthagena.

BARANGI, officers among the Greeks of the lower empire, who kept the keys of the city gates where the emperor resided. Codinus says, they stood guard at the door of the emperor's bed-chamber and dining-room. Codinus and Cuiopolata observe, that the name is English, formed from bar, to shut; and that the barangi were Englishmen by country; Anglo-Danes, who, being driven out of England, were received into the service of the emperor of Constantinople, and made guards or protectors of his person. Whence they are called in Latin (Cujaccius), protectores; by others, securigeri, as being armed with securis, a battle-axe. Codinus adds, that they still spoke the English tongue. Anna Comnena says, the barangi came from the island Thule; by which is doubtless meant our island. Yet Nicetas makes them Germans; a mistake easy to be made at that distance, considering the relation the Anglo-Saxons bore to Germany. There were barangi as early as the emperor Michael Paphlagonius, in 1035, as appears from Cedrenus; but they were then only common soldiers, not a life-guard. Their commander was called *ακολοθος*, importing a person who always followed the emperor.

BARANTA, a West Indian balsam.

BARANYAT, a county of Lower Hungary, bounded by the Danube, Sclavonia, and the counties of Tolna and Schumeg. It abounds in grain, fruit, wine, cattle, and gama. Its capital is Funfkirchen, and it has a population of 140,000 persons.

BARANZANO (Redemptus), a Barnabite monk, born in Piedmont in 1590. He became professor of philosophy and mathematics at Anagni, and was highly esteemed by lord Bacon, who corresponded with him. He died at Montargis in 1622. He wrote, 1. Uranoscopia, seu Universa Doctrina de Cælo, fol. 1617; 2. Campus Philosophicus, 8vo. 1620; 3. De Novis Opinionibus Physicis, 8vo. 1617.

BARA-PICKLET, bread made of fine flour kneaded with barm, which makes it very light and spongy: bara being the Welch for bread.

BARATHIER (Barthelemy), an Italian lawyer of the fifteenth century. He was born at Placentia, and became professor at Pavia and Ferrara. He published a New Digest of the Feudal Law, at Paris, in 1611.

BARATHRA, a name of the Serbonian bog.

BARATHRO, a glutton. See **BARATHRUM**.

BARATHRON, solemn games held at Thesprotia.

BARATHRUM, *βαραθρον*, in antiquity, a deep dark pit at Athens, into which condemned persons were cast headlong. It had sharp spikes at the top that no man might escape out; and others at the bottom, to pierce and torment such as were cast in. Its depth and capaciousness made it to be applied proverbially to a covetous person, a glutton, called barathro by the Romans, and a common prostitute.

BARATHRUM, in physiology, a baleful cavern, inaccessible on account of its fetid, or poisonous fumes; styled by others fossa charonia.

BARATIER (Philip), a most extraordinary instance of early and rapid exertion of mental faculties. This surprising genius was the son of Francis Baratier, minister of the French church at Schwabach, near Nuremberg, where he was born January 10, 1721. The French was his mother-tongue, and High Dutch the language of the place; but his father talking Latin to him, that language became as familiar to him as the rest: so that without knowing the rules of grammar, he, at four years of age, talked French to his mother, Latin to his father, and High Dutch to the maid, or neighbouring children; and all this without mixing or confounding the respective languages. About the middle of his fifth year he acquired Greek in like manner; so that in fifteen months he perfectly understood all the Greek books in the Old and New Testament, which he readily translated into Latin. When he was five years and eight months old, he entered upon Hebrew; and in three years was so expert in the Hebrew text, that from a bible without points, he could give the sense of the original in Latin or French; or translate extempore the Latin or French versions into Hebrew, almost word for word; and had all the Hebrew psalms by heart. He composed, at this time, a dictionary of rare and difficult Hebrew words, with critical remarks and philosophical observations, in about 400 pages in 4to; and, about his tenth year, amused himself for twelve months with the rabbinical writers. With these he intermixed a knowledge of the Chaldaic, Syriac, and Arabic; and acquired a taste for divinity and ecclesiastical antiquity, by studying the Greek fathers and councils of the first four ages of the church. In the midst of these occupations, a pair of globes

coming into his possession, he could, in ten days time, resolve all the problems on them; and in about three months (in January, 1735), devised his project for the discovery of the longitude, which he communicated to the Royal Society at London and the Royal Academy of Sciences at Berlin. In June, 1731, he was matriculated in the university of Altorf; and at the close of 1732, he was presented by his father at the meeting of the reformed churches of the circle of Franconia; who, astonished at his wonderful talents, admitted him to assist in the deliberations of the synod; and to preserve the memory of so singular an event, it was ordered to be registered in their acts. In 1734 the margrave of Brandenburg Anspach granted this young scholar the use of whatever books he wanted from the Anspach library, together with a pension of fifty florins, which he enjoyed three years; and his father receiving a call to the French church at Stettin, in Pomerania, young Baratier was, on the journey, admitted M. A. with universal applause at the university of Halle; at Berlin he was honored with several conversations with the king of Prussia, and was received into the royal academy. Towards the close of his life he acquired a taste for medals, inscriptions, and antiquities; metaphysical enquiries, and experimental philosophy, intervening occasionally between these studies. He wrote several essays and dissertations; made astronomical remarks and laborious calculations; and took great pains towards a history of the heresies of the anti-trinitarians, and of the thirty years' war in Germany. His last publication, which appeared in 1740, was on the succession of the bishops of Rome. The final work he was engaged in, and for which he had collected many materials, was Enquiries concerning the Egyptian Antiquities. But the substance of this blazing meteor was now nearly exhausted; he was always weak and sickly, and died October 5, 1740, aged nineteen years, eight months, and sixteen days. He published eleven different pieces, and left twenty-six MSS. on various subjects, the contents of which may be seen in his life, written by M. Forney, professor of philosophy at Berlin.

BARATOR, or **BARRETOR**, in law. Lambert derives the word from the Latin *balatro*, a vile knave; but the proper derivation is from the French *barrateur*, i. e. a deceiver; and this agrees with the description of a common barretor in lord Coke's report, viz. that he is a common mover and maintainer of suits in disturbance of the peace, and in taking and detaining the possession of houses and lands, or goods, by false inventions, &c. And, therefore, it was adjudged that the indictment against him ought to be in these words, viz. that he is communis malefactor, calumniator et seminator litium et discordiarum inter vicinos suos, et pacis regis perturbator, &c. It is said that a common barretor is the most dangerous oppressor in the law, for he oppresseth the innocent by color of law, which was made to protect them from oppression.

BARARY, or **BARRETRY**, in a shipmaster, is his cheating the owners. If goods delivered on ship-board are embezzled, all the mariners ought by the maritime law, to contribute to the sa-

tisfaction of the party that lost his goods, and the cause is to be tried in the admiralty. In a case where a ship was insured against the baratry of the master, &c. and the jury found that the ship was lost by the fraud and negligence of the master, the court agreed, that the fraud was baratry, though not named in the covenant; but that negligence was not.

BARATRY, or **BARRETRY**, from *baraterie*, Fr. fraud; in law, is the offence of frequently stirring up suits and quarrels between his majesty's subjects, either at law or otherwise. The punishment for this offence, in a common person, is by fine and imprisonment: but if the offender, as is too frequently the case, belongs to the profession of the law, the barator who is thus able as well as willing to do mischief, ought always to be disabled for practising for the future. And, indeed, it is enacted by statute 12 Geo. I. c. 29, that if any one having been convicted of forgery, perjury, subornation of perjury, or common barretry, shall practice as an attorney, solicitor, or agent in any suit, the court, upon complaint, shall examine it in a summary way; and if proved, shall direct the offender to be transported for seven years. Hereunto also may be referred another offence of equal malignity and audaciousness, that of suing another in the name of a fictitious plaintiff, either one not in being at all, or one who is ignorant of the suit. This offence, if committed in any of the king's superior courts, is left, as a high contempt, to be punished at their discretion: but in courts of a lower degree, where the crime is equally pernicious, but the authority of the judges not equally extensive, it is directed by statute 8 Eliz. c. 2, to be punished by six months imprisonment, and treble damages to the party injured.

BARATRY is also used for bribery or corruption in a judge, giving a false sentence for money.

BARATRY is also used, in middle age writers, for fraud or deceit in making of contracts, sales, or the like.

BARATZ, Turkish, letters-patent granted by the Turkish emperors to the Greek patriarchs, bishops, &c. for the exercise of their ecclesiastical functions. This baratz gives the bishops full power and authority to establish and depose the inferior clergy, and all other religious persons; to grant licenses for marriages, and issue out divorces; to collect the revenues belonging to the churches; to receive the pious legacies bequeathed to them; in short, to enjoy all the privileges and advantages belonging to their high station: and all this (as it is expressed in the baratz itself), 'according to the vain and idle ceremonies of the Christians.'

BARB, *v. & n.* } Fr. *barbier*, Dut *barbeeren*,
BARB'ATED, } Lat. *barba*. The etymology
BARB'EN, } doubtful. It signifies a
BARB'ER, *v. & n.* } *beard*; hence it has grown
BARB'ET. } to mean a covering and
 protection; as armour and trappings for horses, a hood or muffler for the head and lower part of the face and shoulders. It has also been extended in its application to the jags or reversed points of an arrow or hook. To *barb*, is to cut, to shave, or to dress out the beard. *Barb*, contracted from *Barbary*, signifies a Barbary horse

For of a suertio the duke strake the kyng on the brow, right under the defence of the hedpece, on the very coffie scull or bassenet pece, whereunto the *barbed* for power and defence is charnel'd.

Hall. King Henry VIII. fol. 133.

But let be this, and tell me how you fare,
Do way your *barbe*, and shew your face bare,
Do way your boke, rise up and let us dance,
And let vs done to May some observance.

Chaucer. Troilus and Creseide.

Two manner of arrows heades sayth Pollux, was used in olde time. The one he calleth *εγκλιος*, describing it thus, having two points or *barbes*, looking backward to the stele and the feathers, which surely we call in English, a brode arrowe head or a swallow taylor.

Roger Ascham. Toxophilus.

Thanked they were from the senate, and presents were sent unto them, to wit, a chaine of gold weighing two pounds; certain golden cups of foure pounce weight; a brave courser *barbed* and trapp'd, and an horseman's armour.

Holland. Livius.

Shave the head, and tie the beard, and say it was the desire of the penitent to be so *barbed* before his death.

Shakspeare.

Grim-visag'd war hath smooth'd his wrinkled front;
And now—instead of mounting *barbed* steeds,
To fright the soul of fearful adversaries,
He capers nimbly in a lady's chamber,
To the lascivious pleasing of a lute.

Id.

Their horses were naked, without any *barbs*; for albeit many brought *barbs*, few regarded to put them on.

Hayward.

The stooping scythe-man, that doth *barb* the field,
Thou mak'st wink-sure; in night all creatures sleep.

Marston. Malcontent.

No drizzling show'r,
But rattling storm of arrows, *barb'd* with fire.

Milton.

Thy boisterous looks
No worthy match for valour to assail,
But by the *barber's* razor best subdued.

Id.

A warrior train
That like a deluge pour'd upon the plain;
On *barbed* steeds they rode, in proud array,
Thick as the college of the bees in May.

Dryden's Fables.

Nor less the Spartan fear'd before he found
The shining *barb* appear above the wound.

Pope.

Watermen brawl, coblers sing; but why must a *barber* be for ever a politician, a musician, an anatomist, a poet, and a physician?

Talter, No. 34.

I cannot lay so much stress on a plate and description, given by Plot, of a dart uncommonly *barbated*.

Warton.

To make a fine gentleman several trades are required, but chiefly a *barber*. You have undoubtedly heard of the Jewish champion, whose strength lay in his hair; one would think the English were for placing all wisdom there; to appear wise nothing is more requisite here than for a man to borrow hair from the heads of all his neighbours, and clap it like a bush on his own.

Goldsmith. Citizen of the World.

Straight as above the surface of the flood,
They wanton rise, or urg'd by hunger leap,
Then fix, with gentle twitch, the *barbed* hook.

Thomson.

Horses brought from Barbary are commonly of a light slender size, and very dear, usually chosen from stallions. *Barbs*, it is said, may die, but never grow old; the vigour and mettle of *barbs* never cease but with their life.

Farrier's Dictionary.

They are ill-built,
Pin-buttock'd like your dainty *barbaries*,
And weak i' the pasterns.

Beaumont and Fletcher.

But why should you who still succeed,
Whether with graceful act you lead
The fiery *barb*, or with as graceful motion treat
In shining balls, where all agree
To give the highest praise to thee.

Verses to Lanedowns.

BARB is also used for the Barbary pigeon, called by Moore the columba numidica. This bird is but a small pigeon, and has a very short beak like a bullfinch, with a small water, and a naked circle of tuberosed red flesh round the eyes; the iris of the eye is of a pearl color, and the broader and redder this circle round them is, the more the pigeon is valued; but this is always narrow while they are young, and does not arrive at its full breadth till they are four years old. Some of this species have a tuft of feathers behind their head, and others not. The red circle round their eyes grows pale and whitish if they become sick, but always recovers its redness as they grow well. Their proper color is black or dun. There are likewise pied ones; but they are of a mixed breed and not so valuable.

BARBA, in botany, a species of pubes, or down, with which the surface of some plants is covered. The term was invented by Linnæus, and by its application in the Species Plantarum, seems to signify a tuft or bunch of strong hairs terminating the leaves. The mesembryanthemum barbatum, a species of marygold, furnishes an example. The word is also often used in composition to form the trivial names of several plants.

BARBA ARON, in botany, a name given by some authors to the common great house-leek.

BARBA CAPRÆ, in botany. See SPIRÆA. Of this genus Mr. Tournefort allows only one species, the common barba capræ, or, as it is called by some, drymopogon.

BARBA JOVIS, in botany, a species of anthyllis
BARBA (Alvarez Alonzo), curate of St. Bernard de Potosi, in the seventeenth century. He was author of a curious book on metallurgy, published at Madrid in 1620, quarto, and again in 1730, abridged in French, 12mo.

BAR'BACAN, n. s. Fr. *barbacane*, Span. *barbacana*. A fortification placed before the walls of a town. A fortress at the end of a bridge. An opening in the wall through which the guns are levelled.

Within the *barbacan* a porter sate,

Day and night duly keeping watch and ward:

Nor wight nor word mote pass out of the gate,

But in good order, and with due regard.

Faerie Queene.

BARBACAN, or BARBICAN. See CASTLE.

BARBADENSIS, in conchology, a species of voluta, inhabiting the American seas. The shell is an inch and a half long, tapering; color reddish, with very fine transverse striæ.

BARBADENSIS, in ornithology, a species of psittacus, the ash-fronted parrot of Latham. This bird is green; about the size of a pigeon, and inhabits Barbadoes.

BARBADILLO (Alphonsus Jerom de Salas), a Spanish dramatic writer, born at Madrid. He

was author of several comedies, and of the *Adventures of Don Diego de Noche*, 1624, 8vo.

BARBADINO, a learned Portuguese. He wrote and published at Paris, in 1746, a book in his native language, *On the present state of Literature in Portugal*. This work was attacked with great severity by a Portuguese jesuit, and defended by Don Joseph de Maymo.

BARBADO, a district in the island of Arbe, which produces excellent wines. See ARBE.

BARBADOES, the most easterly of all the Carribee Islands, subject to Great Britain, and according to the best geographers, lying between 59° 50' and 62° 2' W. long., and between 12° 56' and 13° 16' N. lat. It is seventy miles from St. Vincent's. Its extent is not certainly known; but, according to Edwards, the length of the island is twenty-one miles, and its breadth fourteen. From the returns to parliament in 1811, it appears that the population of its different parishes was at that time as follows:—viz.

Parishes.	Whites.	Free color.	Slaves.
St. Michael .	5405	1551	12,198
Christ Church	1570	66	9234
St. Philip . .	1510	212	9682
St. John . . .	1143	887	58
St. Joseph . .	1066	77	3104
St. Andrew . .	571	165	3249
St. Lucy . . .	1043	34	5282
St. Peter . . .	1356	223	5725
St. James . . .	708	33	4295
St. Thomas . .	773	31	4003
St. George . .	1139	113	5428
	16,289	3392	62,258
By latest returns the populat on was,	Whites & Free Color		Slaves.
	21,000		79,000

The population of the island, therefore, was 100,000; and from this statement it appears that the number of slaves had increased at a comparatively slow rate during a period of twenty years, i. e. from 1811 to 1831. It was affirmed by Mr. Wilberforce, in the House of Commons, in the course of the debates on the slave trade, that in the former of these years there were 63,248 slaves on the island; in 1786 the number was 62,115; and in 1811 they were, as we see, 62,258. Barbadoes is supposed to have attained the summit of prosperity more than a century ago; and between the great planters and the people of color here there is a numerous and remarkable class of inhabitants, descended from the original settlers, who have no precise knowledge when their ancestors arrived at the island. These, consequently, consider it as their country, and do not look back, therefore, like the planters or the negroes, to early associations or other scenes as their home. At a distance, Barbadoes presents a brown and nearly uniform surface, and the West Indians generally think it a very hot country; but on a nearer approach the prospect improves, and the scenery becomes more diversified. The ground rises in singular and almost regular ridges from the shore. Rugged declivities of about 100 feet each are reported by plans or terraces, nearly half a

mile broad, and these, highly cultivated, form a strong contrast with the black rocky precipices and bold promontories, projecting over deep ravines covered with dark foliage, by which they are surrounded.

When Barbadoes was first settled by the English, in 1605, few or no quadrupeds were found upon it except hogs, which had been left there by the Portuguese. For convenience of carriage to the sea-side, some of the planters at first procured camels, which undoubtedly would, in all respects, have been preferable to horses for their sugar and other works; but the nature of the climate disagreeing with that animal, it was found impossible to preserve the breed. Some gentlemen of small fortune in England resolved at this time to become adventurers thither. The trees were large, and of a wood so hard and stubborn that it was with great difficulty they could clear as much ground as was necessary for their subsistence; but by unremitting perseverance they brought it to yield them a tolerable support. They found that cotton and indigo agreed well with the soil; and that tobacco, which was beginning to come into repute in England, answered tolerably well. These prospects, together with the storm between the king and parliament, which was beginning to break out in England, induced many to transport themselves into this island: and so great was the increase of people in Barbadoes, within twenty-five years after its first settlement, that in 1650 it contained more than 50,000 whites, and a much greater number of negro and Indian slaves. They now applied for horses to Old and New England: from the former they had those that were fit for show and draught; from the latter those that were proper for mounting their militia, and for the saddle. They had likewise some of an inferior breed from Curassao, and other settlements. They are reported to have had their first breed of black cattle from Bonavista and the Isle of May; they now breed upon the island, and often do the work of horses. The sugar, which soon after this was cultivated, rendered them extremely wealthy. The number of slaves, therefore, was still augmented; and in 1676 it is supposed that they amounted to 100,000, which, together with 50,000 whites, made 150,000 on this small spot: a degree of population unknown in Holland, in China, or any other part of the world most renowned for numbers. At this time Barbadoes employed 400 sail of ships, one with another 150 tons, in their trade. Their annual exports in sugar, indigo, ginger, cotton, and citron-water, were above £350,000; and their circulating cash at home was £200,000. Such was the increase of population, trade, and wealth, in the course of fifty years. The asses here are very serviceable in carrying burdens to and from the plantations. The hogs of Barbadoes are finer eating than those of Britain, but the few sheep they have are not near so good. They likewise have goats, which when young are excellent food. Racoons and monkeys are also found here in great abundance. A variety of birds are produced on Barbadoes, of which the humming-bird is the most remarkable. Wild fowl do not often frequent this island; but sometimes

teal are found near their ponds. A bird which they call the man of war, is said to meet ships at twenty leagues from land, and their return is to the inhabitants a sure sign of the arrival of these ships. When the wind blows from the south and south-west they have flocks of curlews, plovers, snipes, wild pigeons, and wild ducks. The wild pigeons are very fat and plentiful at such seasons, and rather larger than those of England. The tame pigeons, pullets, ducks, and poultry of all kinds, that are bred at Barbadoes have also a fine flavor, and are accounted more delicious than those of Europe. Their rabbits are scarce; they have no hares; and the few deer they have are kept as curiosities. The insects of Barbadoes are not venomous, nor do either their snakes or scorpions ever sting. The mosquitoes are troublesome, and bite; but are more tolerable in Barbadoes than on the continent. Various other insects are found on the island, some of which are troublesome, but in no greater degree than those that are produced by every warm summer in England. Oranges and lemons grow in Barbadoes in great plenty, and in their utmost perfection. The lemon juice here has a peculiar fragrantcy. The citrons of Barbadoes afford the best drams and sweetmeats of any in the world, the Barbadoes ladies excelling in the art of preserving the rind of the fruit. The pine-apple is also a native of Barbadoes, and grows there to much greater perfection than it can be made to do in Europe. A vast number of different trees, peculiar to the climate, are also found to flourish in Barbadoes in great perfection, such as the aloe, mangrove, calabash, cedar, cotton, ginger, plantains, guavas, mastic, &c. Here likewise are produced some sensitive plants, with a good deal of garden stuff. Barbadoes is well supplied with fish; and some caught in the sea surrounding it are almost peculiar to itself, such as the parrot-fish, snappers, gray cavallos, terburns, and coney-fish. The mullets, lobsters, and crabs, caught here are excellent; and the green turtle is perhaps the greatest delicacy that ancient or modern luxury can boast of. At Barbadoes this delicious shell-fish seldom sells for less than a shilling a pound, and often for more. There is found in this island a kind of land-crab which eats herbs wherever it can find them, and shelters itself in houses and hollows of trees. According to report they are a shell-fish of passage; for in March they travel to the sea in great numbers. See **CANCER**.

Barbadoes is considered by some writers as having its fertility diminished by long cultivation; and its produce is, therefore, thought to be little in proportion to the quantity of land. The soil chiefly rests upon a basis of calcareous rock, formed of madripores and other marine concretions. In some places it is composed of a deep black mould; red earth, of the same kind as in Jamaica, is also found, and sometimes the surface consists of a species of light white earth, which is chiefly indurated argil, bleached by exposure. Barbadoes on the whole must be considered as an important possession: its situation renders it the key to the West Indies; and its fine bay affords an excellent rendezvous for sniping while the salubrity of its climate exceeds

that of most of the other West India islands. But it has been thought to decline considerably since the year 1787, a circumstance ascribed to the dreadful succession of hurricanes with which it has been visited. The capital of the island was scarcely risen from the ashes to which it had been reduced by fire, when it was torn from its foundations, and the whole country made a scene of desolation by the storm of the 10th of October, 1780. Above 4000 of the inhabitants miserably perished, and the damage of property was computed at above one million sterling. Independent of those sudden calamities, arising from the fury of the elements, its inhabitants are also subject to a distressing malady, in the form of an elephantiasis, so peculiar to this island that it has obtained the appellation of the Barbadoes disease. Dr. Pinckard, however, describes the heat as less inconvenient than he expected. In the harbour, and placed in the shade, the thermometer seldom rose higher than 84°, and never exceeded 86°. The inhabitants may be considered in three classes, viz. the masters, white servants, and blacks. The former are either English, Scots, or Irish; but the great encouragement given by government to the peopling this and other West India islands, induced some Dutch, French, Portuguese, and Jews, to settle among them with their estates; by which, after a certain time, they acquire the rights of naturalization in Great Britain. The white servants, whether by covenant or purchase, are said to live more easy lives than the day-laborers in England; and when they come to be overseers, their wages and other allowances are considerable. The earliest planters of Barbadoes were reproached with cruelly forcing into slavery the Indians of the neighbouring continent; and the history of Inkle and Yarico, which Mr. Addison, in his Spectator, has recorded for the detestation of mankind, took its rise in this island.

We retain from a preceding work of this kind an illustration of this subject; not the most glaring, perhaps, which has happened in the same quarter of the world; as it displays at once the savage cruelty of a man bred among Christians, and the noble disinterested friendship and true greatness of soul, in those too often considered barbarians. A planter in Virginia, who was owner of a considerable number of slaves, instead of regarding them as human creatures, and of the same species with himself, used them with the utmost cruelty, whipping and torturing them for the slightest faults. One of these, thinking any change preferable to slavery under such a barbarian, attempted to make his escape among the mountain Indians; but unfortunately was taken and brought back to his master. Poor Arthur (this was his name) was immediately ordered to receive 300 lashes. These were to be given him by his fellow slaves, among whom there happened to be a negro whom the planter had purchased on the preceding day. This slave, the moment he saw the unhappy wretch destined to the lashes, rushed forward, clasped him in his arms, and embraced him with the greatest tenderness: the other returned his transports, and nothing could be more moving than their mutual bemoaning each other's misfortunes.

Their master was soon given to understand that they were countrymen and intimate friends; and that Arthur had formerly, in a battle with a neighbouring nation, saved the life of his friend at the expense of his own. The newly purchased negro threw himself at the planter's feet, with tears, beseeching him, in the most moving manner, to spare his friend, or at least to permit him to undergo the punishment in his stead, protesting he would rather die ten thousand deaths than lift his hand against him. But the haughty planter, looking on this as an affront to the absolute power he pretended over him, ordered Arthur to be immediately tied to a tree, and his friend to give him the lashes; telling him that for every lash not well laid on, he should himself receive a score. The negro, amazed at a barbarity so unbecoming a human creature, with a generous disdain refused to obey him, at the same time upbraiding him with his cruelty; upon which, the planter turning all his rage on him, ordered him to be immediately stripped, and commanded Arthur, to whom he promised forgiveness, to give his countryman the lashes which he himself had been destined to receive. This proposal was heard with scorn, each protesting he would rather suffer the most dreadful torture than injure his friend. This generous conflict, which must have raised the strongest feelings in a breast susceptible of pity, did but the more inflame the monster, who now determined they should both be made examples of, and, to satiate his revenge, was preparing to begin with Arthur, when the negro drew a knife from his pocket, stabbed the planter to the heart, and, at the same time struck it to his own, rejoicing with his last breath, that he had avenged his friend, and rid the world of such a monster. — *Encyclo. Perthensis.*

In 1831 this island was again visited by a hurricane, by which 3000 souls perished. St. Vincent may be seen from Barbadoes in a clear day. It is twenty-five miles only from St. Lucia; twenty-eight south-east from Martinico; sixty north-east from Trinidad; and 100 south-east from St. Christopher.

BARBADOES, FLOWER-FENCE. See POINCIANA.

BARBADOES TAR, a bituminous substance, differing little from the petroleum floating on several springs in England and Scotland. It is a mineral fluid of the nature of the thicker fluid bitumens, of a nauseous bitterish taste, very strong and disagreeable smell, found in many parts of America, trickling down the sides of the mountains, and sometimes floating on the surface of the waters. It has been greatly recommended in coughs, and other disorders of the breast and lungs.

BARBARA, a district and village of the late maritime Austria, in the province of Istria, seated on the Aeza, with two forts.

BARBARA, in logic, the first mode of the first figure of the syllogisms. A syllogism in barbara is that whereof all the propositions are universal and affirmative; the middle term being the subject in the first proposition, and attribute or predicate in the second. Example:

BAR Whoever suffers a man to starve, whom he is able to sustain, is a murderer:

BA Whoever is rich, and refuseth to give alms, suffers those to starve, whom he is able to sustain:

RA Therefore, whoever is rich, and refuses to give alms, is a murderer.

BARBARA, sister and successor of Zingha, queen of Angola.

BARBARA, St., an island on the coast of Brasil.

BARBARA, St., the capital of New Biscay.

BARBARANO, a district of maritime Austria, in the Vicentino, on the banks of the Bacchiglione, among the Berean hills, containing one town, of the same name, &c., and fifteen populous villages.

BARBARIANI. See BARBELICOTE.

BARBARICARII, in antiquity, 1. artists, who, with threads of divers colors, expressed the figures of men, animals, &c., or whose business was to gild and decorate shields and helmets with gold and silver. They were so called, because they learned these arts from the Phrygians, who were particularly denominated barbarians, in regard of their opposition to the Greeks. The name is sometimes also written *branicarri*. 2. Soldiers, or officers, who wore masks and vizards thus adorned with gold and silver.

BARBARICUM, in ancient writers, 1. A military shout raised by the soldiers on point of engagement; so called from the barbarians, in whose armies this method much prevailed: 2. A war or expedition undertaken against the barbarians; *Quousque ad ipsum tempus quo barbaricum exortem est inter nos et vos*: 3. An army or magazine, wherein the Greek emperors kept the spoils taken from the barbarians.

BARBARICUM, in botany, an appellation given by the modern Greeks to *rhubarb*; so called from the *sinus barbaricus*, by the way of which this root was first brought to them.

BARBARICUS, in entomology, a species of *cimex* (*reduvius*) of a black color; thorax and wing-cases obscure ferruginous, and a little white line on the middle of the scutellum. A native of Barbary. Gmelin.

BARBARICUS, in ornithology, a species of rallus that inhabits Barbary; the Barbary rail of Latham; and, 2. A species of *turdus*, of a green color, with the breast spotted with white; rump and tip of the tail yellow. It is the *grive bassette de Barbarie* of Buffon, and the Barbary thrush of Linnæus.

BARBARIES, that rudeness of mind wherein the understanding is neither furnished with useful principles, nor the will with good inclinations.

BAR'BARIZE,

BAR'BARISM,

BARBA'RITY,

BARBA'RIAN, *n.* & *adj.*

BARBA'RICK, *n.* & *adj.*

BAR'BAROUS,

BAR'BAROUSLY,

BAR'BAROUSNESS.

Gr. *βαρβαρος*, Lat. *barbarus*, of uncertain etymology, applied to any nation, person, or thing, which indicates a want of culture. It is opposed

in all respects to civilisation. It seems to have signified at first only foreign, or a foreigner. The Greeks applied it to all nations but themselves, and conveyed by it an idea of disparagement and contempt. It is now applied to every species of wildness, fierceness, and cruelty; to untaught savages; to mon-

sters without pity; to ignorance of arts and want of learning; to inaccuracies, vulgarisms, impurities of speech and language; and to incivility of manners. Bruce has shown, that *barbarick*, *barbarine*, and *barberin*, are names derived from *Berber* or *Barbar*, the native name of the coast of the troglodytæ, ichthyophagi, and shepherds. It goes down the whole western coast of the Red Sea. The Egyptians hated and feared them. It was therefore in Egypt a term both of dread and contumely; in which sense it passed to the Greeks, and from them to the Romans. To *barbarize*, is to reduce to a state of *barbarism*; to make, or cause to be made, fierce, cruel, and uncivilised.

Nor were the Corinthians proude only by reason of their welthe, but also because they were learned in the Grecians' philosophy, and therefore despised they such as were not learned therein as rude and *barbarous*. *Udall*.

What need I say more to you? What ear is so *barbarous*, but hath heard of Amphialus? *Sidney*.

The doubtful damsel dare not yet commit

Her single person to their *barbarous* truth.

Spenser. Faerie Queene.

I have for *barbarism* spoke more
Than for that angel knowledge you can say.

Shakespeare.

Thou art a Roman; be not *barbarous*. *Id.*

No joyful tongue gave him his welcome home;

But dust was thrown upon his sacred head;

Which with such gentle sorrow he shook off,

His face still combating with tears and smiles,

The badges of his grief and patience,

That had not God for some strong purpose steel'd

The hearts of men, they must perforce have melted,
And *barbarism* itself have pitied him. *Id.*

I would they were *barbarians*, as they are,
Though in Rome littered. *Id. Coriolanus.*

Moderation ought to be had in tempering and managing the Irish, to bring them from their delight of licentious *barbarism* unto the love of goodness and civility. *Spenser's Ireland.*

Divers great monarchies have risen from *barbarism* to civility, and fallen again into ruin.

Davies on Ireland.

A *barbarous* country must be broken by war, before it be capable of government; and when subdued, if it be not well planted, it will etsoons return to *barbarism*. *Id.*

He left governor, Philip, for his country a Phrygian, and for manners more *barbarous* than he that set him there. *Macc.*

Our groaning country bled at every vein,

When murders, rapes, and massacres prevail'd,

When churches, palaces, and cities blaz'd,

When insolence and *barbarism* triumph'd,

And swept away distinction. *Rowe.*

By their *barbarous* usage, he died within a few days, to the grief of all that knew him. *Clarendon.*

And they did treat him with all the rudeness, reproach, and *barbarity*, imaginable: *Id.*

The *barbarousness* of the trial, and the persuasives of the clergy, prevailed to antiquate it.

Hale's Common Law.

The gorgeous East, with richest hand,
Show'rs on her kings *barbarick* pearl and gold.

Paradise Lost.

Next Petrarch follow'd, and in him we see

What rhyme, improv'd in all its height, can be;

At best a pleasing sound, and sweet *barbarity*.

Dryden.

They who restored painting in Germany, not having those reliques of antiquity, retained that *barbarous* manner. *Id.*

Latin expresses that in one word, which either the *barbarity* or narrowness of modern tongues cannot supply in more. *Id.*

The genius of Raphael having succeeded to the times of *barbarism* and ignorance, the knowledge of painting is now arrived at perfection.

Id. Dufresnoy, Preface.

The language is as near approaching to it, as our modern *barbarism* will allow: which is all that can be expected from any now extant.

Id. Juvenal, Dedication.

The eastern front was glorious to behold,
With diamond flaming, and *barbarick* gold.

Pope.

Some felt the silent stroke of mould'ring age,
Barbarian blindness. *Id.*

We *barbarously* call them blest,

While swelling coffers break their owner's rest.

Stepney.

Excellencies of music and poetry are grown to be little more, but the one fiddling, and the other rhyimg; and are indeed very worthy of the ignorance of the friar, and the *barbarousness* of the Goths. *Temple.*

Proud Greece all nations else *barbarians* held,
Boasting her learning all the world excell'd.

Denham.

There were not different gods among the Greeks
and *barbarians*. *Stillingfleet.*

But with descending show'rs of brimstone fir'd,
The wild *barbarian* in the storm expir'd. *Addison.*

She wishes it may prosper; but her mother used
one of her nieces very *barbarously*. *Spectator.*

Thou fell *barbarian*,

What had he done? What could provoke thy
madness,

To assassinate so great, so brave a man?

A. Phillips.

This moon, which rose last night, round as my
shield,

Had not yet fill'd her horns, when by her light,

A band of fierce *barbarians*, from the hills,

Rush'd like a torrent down upon the vale,

Sweeping our flocks and herds. *Home.*

The *barbarians* of Germany, still faithful to the maxims of their ancestors, abhorred the confinement of walls, to which they applied the odious names of prisons and sepulchres; and fixing their independent habitations on the banks of rivers, the Rhine, the Moselle, and the Meuse, they secured themselves against the danger of a surprise, by a rude and hasty fortification of large trees, which were felled and thrown across the roads. *Gibbon.*

We shall be *barbarized* on both sides of the water, if we do not see one another now and then, we shall sink into surly brutish Johns, and you will degenerate into wild Irish.

Burke. Letter to Sir C. Bingham.

That saddening hour when bad men hotlier press,

But these did shelter him beneath their roof,

When less *barbarians* would have cheer'd him less,

And fellow-countrymen have stood aloof—

In aught that tries the heart, how few withstand
the proof! *Byron. Childe Harold.*

BARBARISM, a name applied by St. Epiphanius, to the most ancient of the four primitive religions; that which worshipped hills, trees, and fountains.

BARBAROLOGIA, barbarology, a word used

by Isidore, to express that species of writing, wherein foreign words are adopted, or as he styles it, intruded into the Latin language.

BARBAROSSA (Aruch), and his brother Hayradin, were famous corsairs, the sons of a potter in the isle of Lesbos; who being of a restless and enterprising spirit, left their father's employment, and joined a crew of pirates. They soon distinguished themselves by their zeal and activity, and, becoming masters of a small brigantine, they carried on their depredations with such success and conduct, that they were soon possessed of twelve galleys, besides smaller vessels. Of this fleet Aruch, the elder brother, was admiral, and Hayradin the second in command; they called themselves the friends of the sea, and the enemies of all who sailed upon it; and their names became terrible, from the straits of the Dardanelles to those of Gibraltar. With such a power they wanted an establishment; and the opportunity of settling themselves offered in 1416, by the inconsiderate application of Eutemi, king of Algiers, to them for assistance against the Spaniards. The active corsair gladly accepted the invitation, and, leaving his brother Hayradin with the fleet, marched at the head of 5000 men to Algiers, where he was received as their deliverer. Such a force gave him the command of the town; and observing that the Moors neither suspected him of any bad intentions, nor were capable, with their light-armed troops, of opposing his disciplined veterans, he secretly murdered the monarch he came to assist, and caused himself to be proclaimed king in his stead. The authority thus boldly usurped, he endeavoured to establish by arts suited to the genius of the people he had to govern; by liberality without bounds to those who favored his promotion; and by cruelty no less unbounded, towards all whom he had any reason to distrust. See ALGIERS. The Arabians, alarmed at his success, implored the assistance of Hamidel Abdes, king of Tunis, to drive the Turks out of Algiers. That prince readily undertook to do what was in his power for this purpose, and, upon their agreeing to settle the kingdom on himself and his descendants, set out at the head of 10,000 Moors. Upon his entering the Algerine dominions, he was joined by all the Arabians in the country. But, on his engaging him, with only 1000 Turkish muskets and 500 Granada Moors; totally defeated his numerous army; pursued him to the very gates of his capital, which he easily made himself master of; and, having given it up to be plundered by his Turks, obliged the inhabitants to acknowledge him sovereign. This victory, (which was chiefly owing to his fire-arms), was followed by an embassy from the inhabitants of Tremecen, inviting him to come to their assistance against their prince, with whom they were dissatisfied on account of his having dethroned his nephew, and offering him even the sovereignty, in case he accepted of their proposal. The king of Tremecen, not suspecting the treachery of his subjects, met the tyrant with an army of 6000 horse and 3000 foot; but Barbarossa's artillery gave him such an advantage, that the king was at length forced to retire into the capital; which he had no sooner entered, than his head was cut

off, and sent to Barbarossa, with a fresh invitation to take possession of the kingdom. On his approach he was met by the inhabitants, whom he received with great complaisance, and many fair promises; but beginning to tyrannise as usual, his new subjects soon convinced him that they were not so passive as the inhabitants of Algiers. He therefore entered into an alliance with the king of Fez; after which he secured the rest of the cities in his new kingdom, by garrisoning them with his own troops. Some of these, however, revolted soon after; upon which he sent one of his corsairs, named Escander, a man no less cruel than himself, to reduce them. The Tremecenians now began to repent of their having invited such a tyrant to their assistance; and consulted how to bring back their lawful prince Abuchen-Men: but their cabals being discovered, a great number of the conspirators were massacred in the most cruel manner. The prince escaped to Oran, and was taken under the protection of the marquis of Gomarez, who sent immediate advice of it to Charles V. then lately arrived in Spain, with a powerful fleet and army. That monarch immediately ordered the young king a succour of 10,000 men, under the command of the governor of Oran; who, under the guidance of Abuchen-Men, began his march towards Tremecen; and in their way were joined by prince Selim, with a great number of Arabs and Moors. The first thing they resolved upon was to attack the important fortress of Calau, situated between Tremecen and Algiers, and commanded by Escander at the head of about 300 Turks. They invested it closely, in hopes that Barbarossa would come out of Tremecen to its relief, which would give the Tremecenians an opportunity of keeping him out. That tyrant, however, kept close in his capital, being embarrassed by his fears of a revolt, and the delays of the king of Fez, who had not sent the auxiliaries he promised. The garrison of Calau, in the mean time, made a brave defence; and, in a sally, cut off near 300 Spaniards. This encouraged them to venture a second time; but they were now repulsed with a great loss, and Escander himself wounded: soon after which, they surrendered, but were all massacred by the Arabians, except sixteen, who clung close to the stirrups of the king, and of the Spanish general. Barbarossa being now informed that Abuchen-Men, with his Arabs, accompanied by the Spaniards, were in full march to lay siege to Tremecen, came out at the head of 1500 Turks, and 5000 Moorish horse, in order to break his way through the enemy; but he had not proceeded far, before his council advised him to return and fortify himself. This advice was now too late; the inhabitants being resolved to keep him out, and open their gates to their own lawful prince as soon as he appeared. In this distress Barbarossa saw no way left but to retire to the citadel, and there defend himself till he could find an opportunity of stealing out with his men and all his treasure; but, his provisions failing, he took advantage of a subterraneous back way, and, taking his immense treasure with him, stole away as secretly as he could. His flight, however, was soon discovered; and he was so closely pursued, that to amuse, as he

hoped, the enemy, he caused a great deal of his money, plate, jewels, &c. to be scattered all the way, thinking they would not fail to stop their pursuit to gather it up. This stratagem, however, failed, through the vigilance of the Spanish commander, who being at the head of the pursuers, obliged them to march on, till he was come up close to him on the banks of the Huexda, about eight leagues from Tremecen. Barbarossa had just crossed the river with his vanguard, when the Spaniards came up with his rear on the other side, and cut them all off; and then crossing the water, overtook him at a small distance from it. Here a bloody engagement ensued, in which the Turks fought like lions; but being at length overpowered by numbers, they were all cut to pieces, and Barbarossa among the rest, in the forty-fourth year of his age, and four years after he had raised himself to the royal title of Jigel of the adjacent country; two years after he had accomplished the reduction of Tremecen. His head was carried to Tremecen, on the point of a spear; and Abuchen-Men proclaimed king, to the joy of all the inhabitants. A few days after, the king of Fez appeared at the head of 20,000 horse, near the field of battle; but hearing of Barbarossa's defeat and death, marched off with all possible speed.

BARBAROSSA (Hayradin), upon his brother's death, assumed the sceptre at Algiers with equal abilities, but with better fortune; for the Spaniards, sufficiently employed in Europe, giving him no disturbance, he regulated the interior police of his kingdom with great prudence, carried on his naval operations with vigor, and extended his conquests on the continent of Africa. But perceiving that the Moors and Arabs submitted to his government with the utmost impatience, and being afraid that his continual depredations would one day draw upon him the arms of the Christians, he put his dominions under the protection of the Grand Seigneur, and received from him a body of Turkish soldiers, sufficient for his security against his domestic, as well as his foreign enemies. At last the fame of his exploits daily increasing, Solyman, the Turkish emperor, offered him the command of his fleet, as the only person whose valor and skill entitled him to command against the famous Andrew Doria. Proud of this distinction, Barbarossa repaired to Constantinople; and with a wonderful versatility of mind, mingling the arts of a courtier with the boldness of a corsair, gained the entire confidence both of the sultan and his vizier. To them he communicated a scheme he had formed of making himself master of Tunis, the most flourishing kingdom at that time on the coast of Africa; which being approved of, they gave him whatever he demanded for carrying it into execution. He obtained it in a manner similar to that by which his brother gained Algiers; but was driven from it by Charles V. in 1536. After this he ravaged several parts of Italy, and reduced Yemen, in Arabia Felix, to the Turkish government. He died in 1547, aged 80. See ALGIERS.

BARBAROSSA was also a title or surname of Frederick I. emperor of Germany, one of the first sovereigns in Europe who ventured to speak freely of the papal hierarchy, and the pride of

the popes. Of the cardinals he said, *Cardinalis non esse prædicatores sed prædatores*;—the cardinals were not preachers, but plunderers. This was so early as A.D. 1155. See GERMAN.

BARBAROSSA, in entomology, a species of scarabeus, a native of New Holland. The anterior part of the thorax is scabrous; horns of the head recurved and short.

BARBAROUX (Charles), a French republican, and a sufferer by the guillotine. He was a native of Marseilles, and became a member of the national assembly. He was a great adversary to Robespierre and Tallien, against whom he brought many charges. He likewise proposed the trial of the king and the royal family. On the overthrow of the Girondist party, he was arrested, but found means to escape. Some time after, however, he was seized, and brought to the guillotine at Bourdeaux, on the 25th of June, 1794.

BARBARUS (Daniel), a noble Venetian, patriarch of Aquileia, and famous for his learning, was ambassador from Venice to England; and one of the fathers of the council of Trent, where he acted with great zeal for the interest of the pope. He wrote, 1. A Commentary upon Vitruvius. 2. *Catena Græcorum Patrum in quinquaginta Psalmis Latine versa*. 3. *La Pratica della Perspectiva*. He died in 1569, aged 41.

BARBARUS (Francis), a noble Venetian, of the same family with Daniel. He was born in 1398, and gained great fame in the fifteenth century, not only for his learning, but for a skilful address in the management of public affairs. He wrote a book *De Re Uxoriam*, on the Choice of a Wife and the Duties of Women; and translated some of Plutarch's Lives. He died in 1454. His book, *De Re Uxoriam* was printed at Paris in 1515, and his Letters in 1743.

BARBARUS, (Hermolaus), grandson of Francis, one of the most learned men of the fifteenth century. The public employments he was entrusted with early, did not prevent him from cultivating letters. He understood the most difficult authors; wrote a celebrated paraphrase upon Aristotle; and corrected and translated Dioscorides, and added a commentary. But of all his works none gained him so much reputation as his commentary upon Pliny; wherein he corrected above 5000 passages, and occasionally restored 300 in Pomponius Melæ. Pope Innocent VIII. to whom he was ambassador, conferred upon him the patriarchate of Aquileia. He imprudently accepted it without waiting for the consent of his superiors; though the republic of Venice had made laws forbidding the ministers they sent to the court of Rome to accept any benefice. The haughty aristocrats were inflexible; and not being able to gain anything upon them either by flattery or his father's interest, the father died of grief, and the son soon followed him.

BARBARUS (Hermolaus), was a nephew of Francis, and distinguished himself by his knowledge of the Greek language. At the age of twelve years he translated some of Æsop's Fables into Latin. He was successively bishop of Trevisa and of Verona, and died at the latter in 1470.

BARBARUS, in entomology, 1. A species of papilio; the wings without tails, and blueish. 2. A species of tenebrio, of a black color, and very glossy. 3. A species of cryptocephalus that inhabits Barbary.

BARBARUS, in ichthyology, a species of syngnathus, found in European seas.

BARBARUS, in ornithology, a species of brown vulture that inhabits Barbary, and some other parts of Africa. The vultur barbatus, Briss. Orn. and bearded vulture of Edwards and Latham. Also a species of Falco, called by the English writers Barbary falcon.

BARBARY, a part of Africa, including the states of Fez, Algiers, Morocco, Tripoli, and Tunis. This country contains almost the whole of what the Romans possessed of the continent of Africa, excepting Egypt. It stretches in length, from east to west, from Egypt to the straits of Gibraltar, full 35° of longitude; and from thence to Santa Cruz, the utmost western edge of it, about six more, in all 41°. On the south, indeed, it is confined within much narrower bounds, extending no further than from 27° to 35½° N. lat. In this view of it Barbary begins on the west of the famed mount Atlas, called by the Arabs Al Duacal, enclosing the ancient kingdoms of Suez and Dela, now provinces of Morocco; thence stretching along the Atlantic to the pillars of Hercules at cape Finisterre, then along the coast of the Mediterranean, it is at last bounded by the city of Alexandria in Egypt. In the ancient world this comparative desert was rendered interesting by being the seat of the Carthaginian empire; and portions of it were then so fruitful, that Northern Africa was sometimes denominated the granary of Italy.

Concerning the origin of the name there are many conjectures. According to some, the Romans, after they had conquered this large tract of country, gave it the name of Barbary, out of dislike to the manners of the natives, according to their custom of calling all other people but themselves and the Greeks, Barbarians. Marmol, on the contrary, derives the word Barbary from Berber, a name which the Arabs gave to its ancient inhabitants, on account of the barrenness of the country, and which they retain to this day in many parts of it, especially along the great ridge of the mountains of Atlas. According to Leo Africanus, the name of Barbary was given by the Arabs on account of the strange language of the natives, which appeared to them more like the grumbling of brutes than articulate sounds. Others derive it from the Arabic word bar, signifying a desert, which was given by one Africus, a king of Arabia, from whom the whole continent of Africa is said to have taken its name; and who being driven out of his own dominions, and closely pursued by his enemies, some of his retinue called out to him Bar-bar; that is, To the desert, to the desert; from which the country was afterwards called Barbary.

Gibbon (Decline and Fall Rom. Emp. v. ix.) says that the history of the word Bar-bar is divisible into four periods. 1. In the time of Homer, when the Greeks and Asiatics might probably use a common idiom, the imitative sound of Bar-bar, was applied to the ruder tribes, whose pro-

nunciation was most harsh, whose grammar was most defective. Καρις Βαρβαροφωνος (Iliad. ii. 867. with the Oxford Scholiast, Clarke's Annotations and Henry Stephens's Greek Thesaurus, tom. i. p. 720.) 2. From the time, at least, of Herodotus, it was extended to all nations who were strangers to the language and manners of the Greeks. 3. In the age of Plautus, the Romans submitted to the insult (Pompeius Festus, l. ii. p. 48. ed. Dacier), and freely gave themselves the name of Barbarians. They insensibly claimed an exemption for Italy, and her subject provinces, and at length removed the disgraceful appellation to the savage or hostile nations beyond the pale of the empire. 4. In every sense it was due to the Moors; the familiar word was borrowed from the Latin provincials by the Arabian conquerors, and has justly settled as a local denomination, (Barbary) along the northern coast of Africa.

By the Romans, this country was divided into the provinces of Mauritania, Africa Propria, &c. and they continued absolute masters of it from the time of Julius Cæsar till A. D. 428. At that time Bonifacius, the Roman governor of these provinces, having through the treachery of Ætius been forced to revolt, called to his assistance Genseric king of the Vandals, who had been some time settled in Spain. The terms offered, according to Procopius were, that Genseric should have two thirds, and Bonifacius one third, of Africa, provided they could maintain themselves against the Roman power; and to accomplish this they were to assist each other to the utmost. This proposal was instantly complied with; and Genseric set out from Spain in May 428, with an army of 80,000 men, according to some, or only 24,000 according to others, together with their wives, children, and all their effects. In the mean time the Empress Placidia, having discovered the true cause of Bonifacius's revolt, wrote a most obliging letter to him, in which she assured him of her favor and protection for the future, exhorting him to return to his duty, and exert his usual zeal for the welfare of the empire; by driving out the Barbarians, whom the malice of his enemies had obliged him to call in for his own safety and preservation. Bonifacius readily complied, and offered the Vandals considerable sums if they would return to Spain. But Genseric, already master of the greatest part of the country, returning a scornful answer, and falling unexpectedly on him, cut most of his men in pieces, and obliged Bonifacius himself to fly to Hippo, which he invested in May 430. The siege lasted till July 431, when the Vandals were forced, by a famine that began to rage in their camp, to drop the enterprise, and to retire. Soon after, Bonifacius having received two reinforcements, one from Rome, and the other, under the celebrated Aspar, from Constantinople, a resolution was taken by the Roman generals to offer the enemy battle. A bloody engagement ensued, in which the Romans were utterly defeated, a prodigious number of them taken, and the rest obliged to shelter themselves among the rocks and mountains. Aspar, who commanded the eastern troops, escaped with difficulty to Constantinople, and Bonifacius was recalled to Italy. Upon their departure, the Vandals overran all Africa, committing

everywhere the most terrible ravages, which struck the inhabitants of Hippo with such terror, that they abandoned the city, which was first plundered, and then set on fire by the victorious enemy ; so that Cirtha and Carthage were now the only strong places possessed by the Romans. In 435, Genseric, afraid of an attack by the united forces of the eastern and western empires, concluded a peace with the Romans, who yielded to him part of Numidia, the province of Proconsularis, and Byzacene, for which, according to Prosper, he was to pay a yearly tribute to the emperor of the east. Genseric delivered up his son Hunneric by way of hostage ; but so great was the confidence which the Romans placed in that barbarian, that some time after they sent him back his son. Of this they soon had reason to repent ; for in 439, the Romans being engaged in a war with the Goths in Gaul, Genseric laid hold of that opportunity to seize upon the city of Carthage ; by which he considerably enlarged his African dominions. Valentinian, however, retained as long as he lived, the two Mauritanias with Tripolitana, Tingitana, and that part of Numidia where Cirtha stood. On taking Carthage, Genseric made it the seat of his empire ; and in 440 ravaged the island of Sicily, and laid siege to Palermo. Not being able, however, to reduce that place, he soon returned to Africa with an immense booty, and a vast number of captives, Being now become formidable to both empires, Theodosius, emperor of the east, resolved to assist Valentinian against so powerful an enemy. Accordingly, he fitted out a fleet consisting of 1100 large ships ; and putting on board of it the flower of his army, under the conduct of Arcovindas, Ansilus, and Germanus, he ordered them to land in Africa, and joining the western forces there, to drive Genseric out of the countries he had seized. But the latter, pretending a desire to be reconciled with both empires, amused the Roman general with proposals of peace, till the season for action was over ; and, next year, Theodosius being obliged to recal his forces to oppose the Huns, Valentinian found it necessary to conclude a peace with the Vandals ; and this he could obtain on no other terms than yielding to them the quiet possession of the countries they had over-run. So powerful was Genseric now become, or rather so low was the Roman empire by this time reduced, that in 455 he took and plundered the city of Rome itself (See *ROME*), and, after his return to Africa, made himself master of the remaining countries held by the Romans in that part of the world. Hereupon Avitus, who had succeeded Valentinian in the empire, despatched ambassadors to Genseric, putting him in mind of the treaty he had concluded with the empire in 442 ; and threatening if he did not observe the articles at that time agreed upon, to make war upon him, not only with his own forces, but with those of his allies the Visigoths, who were ready to pass over into Africa. To this Genseric was so far from paying any regard that he immediately put to sea with a fleet of sixty ships ; but being attacked by the Roman fleet under Ricimer, he was utterly defeated, and forced to fly back into Africa. He returned, however, soon after, with a more powerful armament, committing great ravages on the

coast of Italy : but in a second expedition he was not attended with so good success ; the Romans falling unexpectedly upon his men, while busied in plundering the country, put great numbers of them to the sword, and among the rest the brother-in-law of Genseric himself. Encouraged by this advantage, Majorian, then emperor, resolved to pass over into Africa, and attempt the recovery of that country. For this purpose he made great preparations ; but his fleet being surprised and defeated by the Vandals, through the treachery of some of his commanders, the enterprise miscarried. Notwithstanding this misfortune, Majorian persisted in his resolution, and would in all likelihood have accomplished his purpose, had not he himself been murdered soon after by Ricimer. After his death Genseric committed what ravages he pleased in the poor remains of the western empire, and even made descents on Peloponnesus and the islands belonging to the emperor of Constantinople. In revenge, Leo made vast preparations for the invasion of Africa, insomuch that, according to Procopius, he laid out 130,000 pounds weight of gold in the equipment of his army and navy. The forces employed on this occasion were sufficient for expelling the Vandals, had they been much more powerful than they were ; but the command being given to Basiliscus, a covetous and ambitious man, the fleet was utterly defeated through his treachery, and all the vast preparations came to nothing. By this last defeat the power of the Vandals in Africa was fully established, and Genseric made himself master of Sicily, as well as all the other islands between Italy and Africa, without opposition from the western emperors, whose power was entirely annihilated, A. D. 476. Thus was the Vandalic monarchy in Barbary founded by Genseric, between the years 428 and 468. That prince's government, in his new dominions, presents no very agreeable prospect. Being himself a barbarian in the worst sense of the word, and an utter stranger to every useful art, he displayed his prowess by the destruction of all the monuments of Roman greatness, which were so numerous in the country he had conquered. Instead of improving the country he laid it waste, by demolishing all the stately structures both public and private with which those proud conquerors had adorned this part of their dominions. Monuments which the Romans had been at an immense expense to erect, the barbarous Vandals reduced to heaps of ruins. Besides this kind of devastation, Genseric made his dominions a scene of blood, by persecuting the orthodox Christians ; being himself, as well most of his countrymen, zealously devoted to the Arian party. He died in 477, after a reign of sixty years ; and was succeeded by his son Hunneric, who also proved a still greater tyrant than his father, persecuting the orthodox with the utmost fury ; and, during his short reign of seven years and a half, destroying more of them than Genseric had done in all his life. He died miserably ; his flesh rotting upon his bones, and crawling with worms, so that he looked more like a dead carcase than a living man. Concerning his successors Gundamund, Thrasimund, and Hilderic, we find nothing remarkable, except that they sometimes

persecuted, and sometimes were favorable to, the orthodox. Hilderic by favoring them was ruined; for, having published, in the beginning of his reign, a manifesto, wherein he repealed all the acts of his predecessors against them, a rebellion was the immediate consequence. He was deposed in the seventh year of his reign by Gilimer, a prince of the blood-royal, who caused the king with all his family to be closely confined, and himself to be crowned at Carthage. Gilimer proved a greater tyrant than any that had gone before him. He not only continued the persecutions of the orthodox, but horribly oppressed the rest of his subjects, so that he was held in universal detestation, when the Greek emperor Justinian projected an invasion of Africa. This expedition is fabled to have been occasioned by an apparition of Lætus, an African bishop, who had been murdered some time before, and now commanded the emperor to attempt the recovery of Africa, assuring him of success. Justinian, notwithstanding his being at that time engaged in a war with Persia, now, therefore, sent a powerful fleet and army to Africa, under the command of the celebrated Belisarius. At this time Gilimer was so much taken up with his pleasure that he knew little or nothing of the formidable preparations against him. On the arrival of Belisarius, however, he put himself in a posture of defence. The management of his army he committed to his two brothers, Gundimer and Gelamund, who accordingly attacked the Romans at the head of a numerous force. The engagement was long and bloody; but at last the Vandals were defeated, and the two princes slain. Gilimer, in desperation, sallied out at the head of his corps of reserve, to renew the attack with the utmost vigor; but by his own indiscretion lost a fair opportunity of defeating the Romans. For as soon as they perceived Gilimer hastening after them at the head of a fresh army, they fled and the greatest part were dispersed in such a manner, that, had the king followed them close, they must have been totally cut off. Instead of this, however, stumbling on the body of one of his slain brothers, the sight of it made him lose all thoughts of the enemy; and instead of pursuing them, he spent his time in idle lamentations, and in burying the corpse with suitable pomp. Belisarius had thus an opportunity of rallying, which he did so effectually, that, coming unexpectedly upon Gilimer, he easily gained a new and complete victory over him. This defeat was followed by the loss of Carthage, which the barbarians had been at no pains to put into a posture of defence. Gilimer, having in vain solicited assistance from the Moors and Goths, recalled his brother Zano from Sardinia, resolving to make one desperate attempt to regain the kingdom, or at least recover the captives. The consequence was another engagement, in which Zano was killed with 800 of his choicest men, while the Romans lost only fifty; after which Belisarius, moving suddenly forward at the head of his army, fell upon the camp of the Vandals. This Gilimer was no sooner apprised of than he fled towards Numidia in the utmost consternation. As soon as the flight was known among his troops, they abandoned their camp to the Romans, who plundered

it, and massacred all the men that were left, carrying the women captives. Thus a total end was put to the power of the Vandals, and the Romans once more became the masters of Barbary. The Vandal inhabitants were permitted to remain, on condition of exchanging the heresy of Arius for the orthodox faith. Gilimer fled to Medamus, a town situated on the top of the Papuan mountains, and almost inaccessible by its height and ruggedness. The siege of this place was committed to Pharas, an officer of great experience, who having shut up all avenues to the town, the fugitive was reduced to the greatest straits for want of provisions. Pharas being apprised of the distress he was in, wrote him a friendly and pathetic letter, exhorting him to put an end to the distress of himself and his friends by a surrender. This Gilimer declined; but at the same time concluded his answer with a most submissive request, that Pharas would so far pity his great distress as to send him a loaf of bread, a sponge, and a lute. This strange request surprised Pharas, but was explained by the messenger, who told him that the king had not tasted any baked bread since his arrival on that mountain, and earnestly longed to eat a morsel of it before he died; the sponge he wanted to allay a humor that had arisen in one of his eyes; and the lute, on which he had learned to play, was to assist him in setting some elegiac verses, he had composed on the subject of his misfortunes, to a suitable tune. At this mournful report, Pharas could not refrain from tears, and immediately despatched the messenger with the things he wanted. Gilimer had spent nearly three winter months on the summit of this inhospitable mountain, his misery hardening him against the thoughts of surrendering, when a melancholy scene in his own family at once reconciled him to it. This was a bloody struggle between two boys, one of them his sister's son, about a flat bit of dough, laid on the coals; which the one seized upon, burning hot as it was, and clapped into his mouth, but the other by dint of blows forced it out, and eat it from him. The quarrel, which might have ended fatally, had not Gilimer interposed, made so deep an impression upon him, that he immediately despatched a messenger to Pharas, acquainting him that he was willing to surrender himself and all his effects upon the conditions he had offered, as soon as he was assured that they were embraced by Belisarius. Pharas lost no time in getting them ratified and sent back to him. Gilimer was afterwards brought in golden chains before Justinian, whom he besought in the most submissive manner to save his life. That emperor treated him with a degree of humanity he little merited; allowing him a handsome yearly pension to live upon as a private gentleman. But his mind was too much unsettled to enjoy the sweets of a private life; so that, oppressed with grief, he died in the first year of his captivity, five years after he had been raised to the throne, A. D. 554. Barbary being thus again reduced under the power of the Romans, its history falls to be noticed under that of Rome. In the khalifat of Omar this country was reduced by the Saracens, as the reader will find under the article KHALIFES. It continued subject to the khalifs of Arabia and Bagdad till the reign of

Haroun Al Raschid, who having appointed Ibrahim Ebn Aglab, governor of the western parts of his empire, that prefect took the opportunity, first of assuming greater powers than had been granted by the khalif, and then erecting an independent principality. The race of Aglab continued to enjoy their new principality peaceably till the year of the Hegira 297 or 298, during which time they made several descents on the island of Sicily, and conquered part of it. About this time, however, one Obeidallah rebelled against the house of Aglab, and assumed the title of khalif of Kairwan, the ancient Cyrene, and residence of the Aglabite princes. To give the greater weight to his pretensions he also took the surname of Al Mohdi, or Al Mohedi, the director. He pretended to be descended in a right line from Ali Ebn Abu Taleb, and Fatema the daughter of Mahomet; for which reason the Arabs called him and his descendants Fatemites. He likewise encouraged himself and his followers by a traditional prophecy of Mahomet, that at the end of 300 years the sun should rise out of the west. Having at length driven the Aglabites into Egypt, where they became known by the name of Magrebians, he extended his dominions in Africa and Sicily, making Kairwan the place of his residence. In the 300th year of the Hegira, Habbasah, one of Al Mohdi's generals, overthrew the khalif Al Mokhtader's forces in the neighbourhood of Barca, and made himself master of that city. After which he reduced Alexandria; and was making great progress in the conquest of the whole country, while Al Mokhtader sent against him his generals Takin and Al Kasem, with an army of 100,000 men. Habbasah, being informed that the khalif's troops were in motion, advanced at the head of his army to give them battle, and at last came up with them in an island called by the Arabs Ard Al Khamsin. Here he attacked them with incredible bravery, notwithstanding their force was much superior to his; but the approach of night obliged both generals to sound a retreat. The action therefore was by no means decisive, though extremely bloody, the khalif's generals having lost 20,000 men and Habbasah 10,000. The latter, however, durst not renew the fight next morning; but stole off in the night, and returned home, so that Al Mokhtader in effect gained a victory. In the 302d year of the Hegira, however, Habbasah returned, possessed himself of Alexandria a second time, defeated a body of the khalif's forces, and killed 7000 upon the spot. In the 307th year, Abul Kasem, son to Al Mohdi, entered Egypt with an army of 100,000 men. At first he met with extraordinary success, and overran a considerable part of that fine country. He made himself master of Alexandria, Al Tayum, Al Baknasa, and the isle of Ashmaryin, penetrating even to Al Jizah, where the khalif's army under the command of Munes was posted to oppose him. In this country he maintained himself till the 308th year of the Hegira, when he was entirely defeated by Munes, who made himself master of all his baggage, as well as of the plunder he had acquired. This obliged Abul Kasem to fly to Kairwan with the shattered remains of his army, where he remained without making any

further attempt on Egypt. Al Mohdi reigned twenty-four years, and was succeeded by Abul Kasem, who then took the name of Al Kayem Mohdi. During his reign we read of nothing very remarkable, except the revolt of Yezid Ebn Condat, a man of mean extraction, but who, having been raised to the dignity of chancellor, found means to create such a strong party, that the khalif was obliged to shut himself up in the castle of Mohedia. Yezid, being then at the head of a powerful army, soon reduced the capital of Kairwan, the cities of Al Rakkada and Tunis, and several other fortresses. He was no less successful in defeating a considerable number of troops which Al Kayem had sent against him; after which he closely besieged the khalif himself in the castle seven months, when the khalif died, in the twelfth year of his reign, and 334th of the Hegira. Al Kayem was succeeded by his son Ishmael, who immediately took the title of Al Mansur, but concealed the death of his father till he had made preparations for reducing the rebels. In this he was so successful, that he obliged Yezid to raise the siege of Mohetdi, and in the following year obliged him to shut himself up in the fortress of Kothama, where he besieged him in his turn. Yezid defended the place a long time with desperate bravery, but, finding the garrison at last obliged to capitulate, he made shift to escape privately. Al Mansur despatched a body of forces in pursuit of him, who overtook, and brought him back in fetters, after a vigorous defence, in which Yezid got several dangerous wounds, of which he died in prison. After his death Al Mansur caused his body to be flayed, and his skin stuffed and exposed to public view. For Al Mansur's exploits in Sicily, see that article. Nothing farther remarkable happened in his African dominions. He died after reigning seven years and sixteen days, in the 341st of the Hegira, and was succeeded by his son Abu Zammin Moab, who assumed the surname of Al Moez Ledinilloh; and maintained a bloody contest with Abdalsahman, khalif of Andalusia: for a particular account of which, see SPAIN. In the 347th year of the Hegira, beginning March 25th A. D. 958, Al Moez sent a powerful army to the western extremity of Africa, under the command of Abul Hasan Jawhar, one of his slaves, whom he had advanced to the dignity of vizier. Jawhar first advanced to a city called Tahart, which he besieged for some time ineffectually. From thence he marched to Fez, which he took at last by storm in the following year. But the greatest achievement performed by this khalif was his conquest of Egypt, and the removal of the khalifat to that country. This conquest, though long projected, he did not attempt till the year of the Hegira 358. Having then made all necessary preparations for it, he committed the care of that expedition to an experienced general called Giafar, but in the mean time, this enterprize did not divert Al Moez from the care of his other conquests, particularly those of Sicily and Sardinia; to the last of which he sailed in the year of the Hegira 361, continuing a whole year in it, and leaving the care of his African dominions to an experienced officer named Yusef Ben Zeiri. He sailed thence the following year for Tripoli in Barbary, where he

had not staid long, before he received the agreeable news that his general had made himself master of Alexandria. He lost no time, but immediately embarked for it, leaving the government of his old African dominions in the hands of his trusty servant Yusef, and arriving safely at that port was received with all the demonstrations of joy. Here he began to lay the foundations of his new Egyptian dynasty, which put a final end to the old one of Kairwan, after it had continued about sixty-five years. Al Moez, however, preserved all his old dominions of Barbary and Africa Proper. But the avarice of the governors, whom he appointed, occasioned them to run quickly to decay; particularly the new and opulent metropolis of Mohedia, on which immense sums had been lavished, so as to render it not only one of the richest and stateliest, but one of the strongest cities in the world. But the wealth and splendor of this once famed, short-lived state, took their leave of it with the departure of the khalif Al Moez. The whole maritime tract from the Egyptian confines to the Straits of Gibraltar has since become the nest of the most odious piratical crew that ever existed. Under the article ALGIERS we have given a short account of the erection of a new kingdom in Barbary by Texefien; which, however, is there no farther continued than is necessary for connecting the history of that country. A general history might here be given of the whole country of Barbary; but as that would occasion repetitions under the articles MOROCCO, TRIPOLI, TUNIS, &c. we must refer to these articles for the rest of its history, as well as for other particulars not here mentioned.

The great natural feature of this region, and that which appears to exempt it from the sterility by which it is surrounded, is the mountain chain of Atlas. This celebrated range, which ancient fable imaged as the prop of heaven, has its loftiest pinnacles in the west, immediately behind Morocco; but it extends in various branches, which have been little explored, and at different heights, along the whole southern frontier of Algiers and Tunis, leaving a fertile tract of from 50 to 200 miles on the shores of the Mediterranean. Limestone is the predominant rock of this range, which in the western and loftier ranges appears in the form of marble, and afterwards in the looser forms of secondary limestone. The marbles of Numidia are well known in history. The metallic products are not well ascertained, from the unskilful manner in which they have been worked. Silver, copper, and lead, are found to a considerable extent in Algiers and Tunis. Iron, lead, copper, silver, antimony, and a mixture of antimony, lead and gold, are found in the mountainous districts; but none of them are worked to any great extent. Salt, in many places, especially in the southern countries bordering upon the Great Desert, completely impregnates the earth; and the water of the springs and pools, when evaporated, leaves a thick crust of saline matter; in others it appears in large solid masses. Springs, some of them hot, containing other mineral substances, particularly sulphur, are frequent; indicating the presence of great internal heat. At Hamman Mescouteen, near Constantia, the waters of a spring absolutely calcine the rock over which they pass.

Much of the general character and productions of this entire region appears in our article ALGIERS, now a French province: the whole is ill-cultivated. Of the improvements in agriculture they have no notion; and their industry is constantly checked by the pressure of a short-sighted and iniquitous government. Burned stubble and the litter of the cattle turned out upon the fallows, is the only manure they use. Their ploughing is done by a wooden plough, drawn by a single yoke of oxen, going over not more than one acre in a whole day. Two bushels and a half per acre is their ordinary allowance of seed-corn, and 1200 per cent. the return expected. Dr. Shaw found the Asiatic customs introduced by the Arabs everywhere prevailing; the ox is driven round the circular threshing-floor, to tread out the corn, which is afterwards winnowed by being thrown up against the wind, just as it was in Judea three thousand years ago. (Deut. xxv. 4. Is. xxx. 24.) The grain is deposited in large subterraneous magazines called *matmors*, each containing at least 500 bushels. Wheat, maize, and different species of millet (sorghum), pulse, vetches, lentils, and caravances (garbanzos), chick-peas, (cicer arietinum), are their agricultural objects. Neither oats nor hay are used; but, as in western Asia, barley and chopped straw are substituted for them. Hemp, flax, cotton, and tobacco, make up the remainder of their field produce. Their gardens abound with figs, melons, oranges, lemons, and limes; vineyards and olive-yards are seen on the plains and declivities, and our common forest-trees, corks and evergreen oaks, in the woods. There are also some inferior kinds of fruit, such as the jujube, lote-tree (*zizyphus lotus*), *elæagnus*, argan (*elæodendrum arg.*), *diospyros lotus*, *celtis australis*, and *cornelian cherry* (*cornus mascula*), not common among us: some gum resins, such as galbanum, *opopanax*, *ammoniacum*, and *sandarac*, the produce of the *Arâr*, or *Juniperus communis*, and medicinal herbs, such as wormwood, *orrisroot* (*iris Germanica*, *Florentina*), *colocinth*, or *coloquintida*, &c.

The climate is upon the whole temperate and salubrious, with considerable variations in the different regions. The formidable scorpion, the boa constrictor, and above all the dreaded locust, appear here; the latter in those prodigious swarms that convert a 'garden of Eden into the wilderness.' Here also range the lordly lion, (who is nowhere seen more strong or ferocious), the panther, and the hyena. The last is said, however, not to manifest in its wild state that fierceness which it displays in our menageries, and which is generated by confinement. It seldom attacks man, unless molested by him; and boys are sometimes seen leading it about with ropes. It remains all day in its cave, staring with its eyes fixed, and comes out in the night, chiefly after dead bodies. The same is observable of the jackal, here called the *deeb*, about half the size of the hyena. The animal most valued is the antelope or gazel, whose beauty is the object of universal admiration here; the term gazel being employed as the highest praise to a beautiful woman. The mutton is very fat here, but it is eaten as a great delicacy. The sheep of eastern Barbary, according to Shaw,

have fleeces coarse and hairy, like those of the goat; but Morocco contains some breeds with very fine wool. That territory produces likewise the breed of goats whose skins yield the leather so much esteemed in Europe. The finest species is produced in Tafilet, on the southern side of the Atlas. They are tanned with the leaves of a shrub called tizre, which are thought by some to give them their peculiar softness and pliability. The tanners, however, conceal as much as possible the processes employed.

The government of each of the three states, Morocco, Tunis, and Tripoli, is deemed essentially despotic. For any varieties in their particular forms, we must refer the reader to the separate articles. The general population of Barbary consists of, 1. Moors, who are the ruling race; 2. Jews; 3. Arabs; and 4. Brebers, or ancient natives. The Moors are the chief inhabitants of the towns and cities. The term may be considered as including that portion of the Mahomedan conquerors of northern Africa who have habituated themselves to a settled mode of life, along with all the inhabitants who have been incorporated with them, and trained to the same religious habits, which here regulate all the social relations, and extend their influence to the minutest practices of life. The daily ceremonies of worship are very numerous. Prayer is repeated five times a day, once before, once after sun-set, and three times in the course of the day; the crier each time from the top of a minaret loudly announcing the hour. Necessity allows the Moor to worship in any spot where he may be placed, at these hours; but such devotions are not considered equally beneficial with the public ones. At the door of the mosque is a bath for ablution; and no worshipper must enter unless barefooted. Mr. Addison relates the contempt with which a Moor once spoke to him, of the indecencies of our admitting into Christian places of worship 'women, clogs, and dirty shoes,' all of which are here excluded.

The Jews, who are numerous, are the objects of constant insult and oppression. They are envied for their wealth, despised for their avarice, and abhorred as enemies to the faith; and, as in most of the states there exists no law for their protection, the hardships of their situation are no where greater. As they form, however, the only class capable of managing trade or money concerns, they make immense profits, the opportunity of reaping which no oppression can induce them to relinquish. The Arabs occupy, with their flocks and herds, all the interior and pastoral districts. They live in movable villages or douars composed of tents, which are generally arranged in concentric circles, around the habitation of the sheik. They are made of camels' hair and the fibres of the palm tree. In removing, they place on the backs of camels the women, children, and young animals, the latter enclosed in baskets. The interior government of these villages is entirely conducted by their own chief or sheik, who, when the supreme government is weak, often sets it at defiance. The Brebers inhabiting the mountain districts have a language of their own, which seems to be indigenous. They live in small fixed villages, and cultivate the ground.

They also elect their own sheik, and have some forms of popular government; are very strong, athletic, and formidable. Their chief amusement consists in the use of the musket.

With respect to the habits and manners of Barbary, nowhere is grovelling ignorance subject to a worse tyranny on the part of knavish priests, called here marabits, or as the word is commonly written in Europe, marabouts. These men, affecting a scrupulous observance of the Koran, and continually repeating favorite texts, gain the reputation of extraordinary sanctity, and soon persuade the people to believe them the favorites of heaven. Some pretend to miraculous powers; others practise the arts of divination, and all deal in charms, from the sale of which they make great profits. The greater part wander about through the country, professing to live on charity, (they call themselves dervises or fakirs, i. e. poor men,) and doing far more mischief than the mendicants in Popish countries. Amongst all classes in Barbary their influence is uncontrolled. At the great festivals they give an entire loose to religious phrenzy, heightened probably by large doses of opium, and the excesses in which they then indulge are truly horrible. Mr. Lyon (*Travels*. ii.) saw a man thrust his hand into the side of a living ass, tear out his bowels, and devour them! Idiots and madmen are, on the same stupid principle, considered as half-inspired, and are therefore looked upon with veneration, and allowed to do all the mischief which their bewildered imagination suggests. The most simple arts are little known here. Though the hardest stone and better materials abound, timber, we are told by travellers, is almost the only thing used for building. They have, however, in some parts, a sort of artificial stone, called tabiah, a mixture of lime, sand, and pebbles, put into a wooden frame of the proper size and shape, and beaten down with square rammers; and a hard and durable cement, a compound of sand, wood ashes, and lime beaten together for three days and nights without intermission, and frequently sprinkled with oil and water. Another cement used by them is made of tow, lime, and oil. The houses are built round (sometimes paved) square courts, into which the windows open; the lower part is used as stables or out-houses, the upper part for the apartments of the family. In each story is an open corridor, with which stair-cases from below and all the chambers communicate. Sometimes a fountain appears in the centre of the court, and an awning is stretched across from side to side. The ordinary houses seldom have more than one story, about sixteen feet high, with an apartment on each side of the court; and the windows being small, the want of light and air are insufferable to Europeans. No fire-places appear: a charcoal fire, in an earthen chafing dish, placed in one corner of the court, serves to cook the dinner; and mattresses on the floors, with large cushions against the walls, are the seats by day and beds by night: at one end of the room, a raised platform sometimes receives the beds. Their household utensils consist of a few pewter plates, spoons and basins, wooden bowls, earthen pots, and iron ladles, some China plates for show, and

perhaps a tea equipage. The roofs of their houses are flat, and in the cool of the day are much used by the females. The rich have often a small additional building, called *öliyyah*, for the accommodation of strangers. It is like another house on a small scale, and is placed over the gateway at the entrance, exactly answering to the upper chamber of the Jews. Boarded ceilings, diversified by painted lattice work, walls covered half-way down with gilt and painted wainscoting, hangings of different colored cloths, or tyger-skins, filling the interval between the wainscot and the floor, looking-glasses, clocks, or arms arranged in fanciful patterns, are the decorations of their rooms; and the courts of better houses, paved with marble and elegantly covered above, form an agreeable saloon for their company.

Eastern Barbary is distinguished by several noble monuments of antiquity. The traces of Punic architecture indeed have in a great measure disappeared; and the labors of that celebrated people are only attested by subterraneous ruins, particularly those of the celebrated aqueduct, by which water was conveyed to it from the distance of upwards of sixty miles. The whole course of it may still be traced; and several arches are entire, seventy feet high, and supported by columns sixteen feet wide. The architectural ruins being of Roman erection, are chiefly of the composite order, the favorite one of that people. The temple at Spaitla appeared to Bruce to present a specimen superior to what is to be found on any other spot. In consequence of recent excavations, some very valuable remains of statuary have been dug up; and it is probable that, by the continuance of similar researches, further valuable discoveries might be made.

The dress of the inhabitants of Barbary is cumbersome, and unlike those of eastern climates generally. The men wear a red woollen skull-cap, called *Fez*, (where it is manufactured,) and a white shawl twisted round the head; linen and woollen trowsers, a cotton or silk shirt, a tunic called *kaftan*, with or without sleeves, having rows of buttons down the front, kept close to the body by a sash folded round the waist; and a pair of yellow slippers. The better sort have a strip of velvet passed over the right shoulder, by which they suspend the sabre; and the dagger is stuck into the folds of the sash.

The arrangements in Barbary regarding the female part of society are the same as in all Mahomedan countries. The harem is supplied chiefly from Constantinople, by Georgian or Circassian slaves, trained for this purpose by persons who carry on this employment as a trade. The interior arrangements appear to differ considerably in the different states, and, so far as known, will be described respectively under each. The women are fattened to make them plump, the grand criterion of beauty; and their under dress resembles that of the men. Two broad straps pass over the shoulders from their girdle, and are crossed upon the breast. Their hair, as in the east, is tress'd and braided, and a handkerchief is tied close round the head. They wear earrings from the upper and lower parts of the

ears, and upon their ancles gold and silver rings. Their slippers are always red, and usually embroidered. Veils and hayics, and sometimes straw hats, form a part of their dress out doors. A black stripe down the forehead, along the nose, chin, and throat, is considered as a great improvement of their beauty. This is very conspicuous in a plate of the Tripolitan costume, given by Captain Lyon, p. 7. They use a profusion of *hinna*, for giving a red tint to their hair and fingers, and *stibium* (*al-cohl*), to blacken the inside of their eye-lids. Some days before a marriage the bride is visited by her female friends, and the bridegroom parades the streets on horseback, attended by his associates, a band of music, musketry, shouting, racing, &c. announce his expected joys. On the wedding day the bride is carried through the town in a sort of sedan-chair, fixed on the back of a mule or camel, (see plate at p. 299, Captain Lyon's Travels,) covered with silk or linen. In this attire, surrounded by torches, drums, and musketry, large bodies of her relations attend her home. Nor are the attendants of the bridegroom less dazzling and noisy. Arrived, the company retire, and he is left alone with his wife, whose veil he then removes for the first time.

The amusements in Barbary are the indolent Asiatic ones of smoking, tea, and pompous talk, or the most violent exercises, such as playing with the *jerid*, (see *JERID*), leap-frog, football, and a few more such games, probably borrowed from Spain; but one is quite peculiar to themselves: it consists of a sort of mock-fight; parties of horsemen riding full speed at each other, discharge their pieces, then wheel round and retreat. This is much like the game with the *jerid*; but to improve it they ride full gallop towards a wall, approach it as near as possible, then stop short and fire. Sometimes, instead of chasing a wall for this purpose, they chase a friend, when they think they cannot do him a greater honor, than by galloping up and discharging their muskets full in his face. Their lively musical airs are said to be simple and beautiful; but their serious ones dull and tedious. In riding they have a thong attached to the rein, which serves as a whip. Their spur is a long spike loosely attached to the foot, and carefully kept from the horse's side, except in case of need.

The principal and best manufacture here is morocco leather. Good carpeting is also made: mats of the palmetto; and cotton, silk and woollen cloths. Their swords and gun-barrels are also of home make. An inland traffic is maintained by periodical fairs; but the caravans, protected by their numbers, are the only safe medium of general commerce.

BARBASTELLUS, *VESPERTILIO*, in zoology, the tailed bat, with elevated hairy cheeks, and large ears, angulated on the lower part, the *barbastelle* of Buffon and Pennant.

BARBATA, in entomology, a species of brown cantharis that inhabits Germany. 2. A species of cicada (*deflexa*), of a brown color, with greenish abdomen. 3. A species of *phalæna* that inhabits Barbary. 4. A species of *pimelia*, (*Helops* Fabr.) inhabiting Saxony. Fabricius.

BARBATA, in natural history, a species of corallina, about three inches in length, that grows on the shores of Jamaica. Ellis, in his work on coralline, calls it the rosary or bead-coralline of Jamaica; it is the bead-band string of Plunket, and corallina major, *nervo cassiori fuciformi intermedia breviora necente* of Sloane. (Hist. Jam.) Also, a species of Nais.

BARBATA, in ornithology, is a species of fringilla of Chili; and a species of muscipa, inhabiting Cayenne: called by Linnaeus, the whistler fly-catcher.

BARBATED LEAF, in botany, a leaf terminated by a bunch of strong hairs.

BARBATELLI (Bernardino), otherwise called Pochetti, an eminent painter of history, fruit, animals, and flowers, was born at Florence in 1542. He was the disciple of Ridolfo Ghirlandajo at Florence, from whose school he went to Rome, and studied there with such uncommon assiduity, that he was frequently so absolutely engrossed by the objects of his contemplations, as to forget the necessary refreshments of sleep and food. His touch was free, light, and delicate, and the coloring of his objects inexpressibly true. The historical pieces which he designed were much admired. He died in 1612.

BARBATINA, a seed which is thought efficacious in extirpating worms from the human body, to which children are chiefly liable. It comes from Persia, and the borders of Russia. It ought to be chosen plump, of an agreeable scent, and very green: special care must be taken that the color be not dyed, and that the seed of southernwood be not sold instead of it.

BARBATULA, in ichthyology, a species of cobitis, with six cirri; head unarmed and compressed; the bearded loche of English writers; enchelyopus, &c. Klein; cobitis fluviatilis, Ray; fundulus, Marsden. It is a native of Europe and Asia; and is most frequent in fresh-water streams, and lakes in mountainous countries. From its habit of lurking at the bottom of the water, on the gravel, it has been called the groundling; but the latter name is now more generally given to the spiny loche, a fish distinguished from the present, by having a forked spine under each eye, and is that species of cobitis, which Gmelin calls tænia. This is a fertile creature. We are told by Mr. Pennant, that it is frequent in a stream near Amesbury in Wiltshire, where the sportsmen, through frolic, swallow it down alive in a glass of wine. It is also found in great abundance in France.

BARBATUS, in entomology, a species of cerambyx (prionus), of a large size that inhabits South America. Also a species of scarabeus, unarmed, smooth, and black; vent bearded. (Fabricius.) A native of India.

BARBATUS, in ichthyology, a species of gobius. 2. A species of lophius, of a depressed form, with the lower jaw bearded. (Montin. act. suec, 1779.) Inhabiting the seas in the northern parts of Europe.

BARBATUS, in ornithology, a species of falco, of a whitish red color, with brown back: the *vultus barbatus*, Linn., and vulturine eagle of Albinus.

BARBATUS PISCIS, in ichthyology, a name given by Salvian and others, to the Silurus, or sheat-fish; the *Glanus* of Pliny, and the ancients.

This Artedi describes under the name of *silurus* with four cirri at the mouth. By this it is distinguished from the fish called the *alkussa*, or lake, which, though a genuine species of the *silurus*, has one beard.

BARBAULD (Anna Letitia), was the daughter of the Rev. John Aikin, of Kibworth, in Leicestershire, and born June 20, 1743. She received from her father, who in the early part of her life presided over a dissenting academy at Warrington, an excellent classical education, to which she was indebted for the full development of her great natural talents. Her first production was a small volume of miscellaneous poetry, printed in 1772, which in the year following was succeeded by a collection of pieces in prose, published in conjunction with her brother, Dr. John Aikin, of Stoke Newington. She accepted, in 1774, the hand of the Rev. R. Barbauld, with whom she took up her residence at Palgrave in Suffolk, and there composed the work on which her reputation is chiefly founded, viz. *Early Lessons and Hymns for Children*, pieces of standard merit, in conveying the first rudiments of instruction. In 1785 she accompanied her husband on a tour to the continent, and on their return they resided for several years at Hampstead; in 1802 they again removed to Stoke Newington, in order the more constantly to enjoy her brother's society. In 1812 appeared the last of her publications, entitled *Eighteen Hundred and Eleven*, a poem; previous to which she had amused herself by selecting and editing a collection of English novels, with critical and biographical notices. A similar selection followed, from the best British Essayists, since the reign of Anne, and another from Richardson's manuscript correspondence, with a memoir and critical essay on his life and writings. Mrs. Barbauld died at Stoke Newington, March 9, 1825, in her eighty-second year.

BARBAZAN, (Stephen) a French author, born at Saint Fargeau, in the diocese of Auxerre, in 1696, and died in 1770. He wrote *Instructions from a Father to a Son*, 8vo. 1760; but he is chiefly famed as the editor of old French books, particularly *Tales and Fables of the twelfth and thirteenth Centuries*, 3 vols. 12mo. Few persons were so well acquainted as he was with the antique French language, and he had almost an equal knowledge of the provincial dialects.

BARBE, or **BARBETTE**, in the military art. To fire in barbe means to fire the cannon over the parapet, instead of firing through the embrasures; in which case the parapet must not be above three feet and a half high.

BARBE, or **BARB**. See **BARB**.

BARBE, or **BARDE**, is an old word, denoting the armour of the horses of the ancient knights and soldiers, who were accoutred at all points. It is said to have been an armour of iron and leather, wherewith the neck, breast, and shoulders of the horse were covered.

BARBE, St. a town of Biscay in Mexico, near which are rich silver mines, 500 miles north-west of the city of Mexico. Long. 110° 5' W., lat. 26° 10' N.

The BARBE, or **BARB**, of zoology and commerce, brought from Barbary, is a horse much esteemed for its beauty, vigor, and swiftness. It has a long fine neck, not overcharged with

hair, well divided from the withers: the head small and beautiful; the ears handsome; the shoulders light and flat; the withers thin and well raised; the back straight and short; the flank and sides round, and the belly not too large. The haunch bones are properly concealed; the crupper is somewhat long, and the tail placed high; the thigh is well formed, and rarely flat; the limbs are fine, handsome, and not hairy; the tendon prominent, and the foot well made; but the pastern is often long. They are of all colors, but generally gray. In their movements they are apt to be careless, and require to be checked. They are swift, nervous, light, and make very fine hunters. These horses are much sought after for improving a breed. They are seldom, however, above four feet eight inches, and never exceed four feet nine inches, or $14\frac{1}{2}$ hands; but they produce foals which grow larger. Those of the kingdom of Morocco are said to be the best, and next to these the barbs from the mountains. The horses from Mauritania are of an inferior quality, as well as those of Turkey, Persia, and Armenia. (Buffon's Nat. Hist. vol. iii. p. 357.) It is a maxim, that barbs grow ripe, but never grow old, because they retain their vigor to the last, which makes them prized for stallions. In Numidia, the race of horses is much degenerated. The Tingitarians and Egyptians have had the reputation of preserving the best breed. Some of these are sixteen hands high, and all of them shaped, according to their phrase, like the antelope. The good qualities of a Barbary horse, besides the supposed one of never lying down, and of standing still when the rider drops his bridle, are to have a long walk, and to stop short, if required, in full career. The barb is very lazy and negligent in his general motions; he will stumble in walking upon the smoothest ground; his trot is like that of a cow, and his gallop very low, very easy to himself. This sort of horse, however, is for the most part sinewy, nervous, and excellently winded: it is therefore good for a course, if not overweighted. The mountain barbs, which are the largest and strongest, are much esteemed: common barbs have been usually bought in Provence and Languedoc in France, at a moderate price; and many of our persons of fashion in England have them from thence. Barbs, amongst us, fall short of the witiness attributed to them in their native country: this is, by consequence, partly from the softness and heaviness of their riders, and partly from the nature of the horse, loaded with heavy saddles and being dressed in a manner, not even with shoes. An Arabian horse is usually clothed in iron with a pair of half stirrups, and a sort of pannel to sustain the rider.

The Barbary horse, after ascending from England, was discovered by Arab stallions, and was chiefly exported into the Barbary states, where it was used for the saddle, then their mode of riding, and for the war.

BARBER, a name given by the Abbé Lewis, a learned French scholar, to a town at Paris in the neighbourhood of the Louvre, on a map of the city, drawn by the Abbé, Brocard, and his company, as contained in a new view, or an edition, of a great part of which he compiled, of the Abbé

Lenglet's Chronological Tables; also, La Croix's Modern Geography, and the two last volumes of Bibliotheque de France. Besides which, he translated into French, Strahlenberg's Description of Russia, &c. He died in 1781.

BARBEAU, a river of Canada, which runs into the Utawas. Long. $76^{\circ} 55'$ W., lat. $45^{\circ} 5'$ N.

BARBED, in heraldry, the five petals or leaves which appear on the outside of a full blown rose are called barbs; and are thus emblazoned: a rose gules barbed and seeded proper, the rose is red, the barbs green, and the seeds yellow or gray. A barbed arrow, signifies an arrow whose head is pointed of an angular form, and jagged. A barbed horse is a horse barbed at all points, that is, a war-horse completely armed, furnished, and accoutred.

BARBED CROSS, in heraldry, a cross, the extremities whereof are like the barbed irons used for striking fish.

BARBEL. A fish so called by reason of the barb, or wattels, at his mouth, which are under his nose or chops, so says old Izaak Walton. It is the vulgar name of the cyprinus barbus, which cost the fisherman so dear, when he presented it to the gloomy and savage Tiberius, at Capræa.

The lavish slave

Six thousand pieces for a barbel gave;

A sesterce for each pound it weigh'd, as they

Gave out, that hear great things, but greater say.

Duke.

BARBEL, in heraldry, is understood of a cock, when his comb and wattles are of a different color from the rest of the body; in which case he is said to be barbed and crested.

BARBEL, in ichthyology. See CYPRINUS.

BARBELA, or VERBELA, the branch of the Zaire or Congo which comes from the south, and is considered by the Portuguese geographers as the principal one. It is said to take its rise in the kingdom of Matamba.

BARBELICOTÆ, an ancient sect of Gnostics, spoken of by Theodoret. Their doctrine was, that one of the Æons, possessed of immortality, had commerce with a virgin spirit named Barbeloth, who demanded of him, first prescience, then incorruptibility, and lastly eternal life; all which were granted to her: that being one day in a gayer humor than ordinary, she conceived and afterwards brought forth light, which being perfected by the unction of the spirit, was called Christ: the child Christ desired to have understanding, *νοη*, and obtained it; after which, understanding, reason, incorruptibility, and Christ united together; and from their union arose autogenes *αυτογενης*. To these fables, they add divers others. They were also denominated Barbariani.

BARBELOTIL. See the last article.

BARBER-CHIRURGEONS anciently had a lute, viol, or some other musical instrument, as part of the furniture of their shops, which were frequented by persons above the ordinary level, who resorted to the barber either for the cure of wounds, or to undergo some chyrurgical operations, or, as it was then called, to be trimmed

a word that signified either shaving or cutting and curling the hair; these, together with letting blood, were the ancient occupations of the barber-surgeons. As to the other important branch of surgery, the setting of fractured limbs, that was practised by another class, called bone-setters, of whom there are hardly any now remaining. The musical instruments in their shops were for the entertainment of waiting customers; and answered the end of a newspaper, with which those who now wait for their turn at the barber's amuse themselves.

BARBER, CHIRURGEONS, in heraldry, were incorporated by king Edward IV., but the barbers were separated from the surgeons by 18 Geo. 2, c. 15. Their arms are, 'A St. George's cross *gules*; thereon a lion passant gardant, *or* quarterly; the first and fourth a chevron between three fleams; the second and third *per pale argent and vert*, a rose, *gules*, crowned, and seeded *or*.'

BARBERS OF EDINBURGH were formerly united in one incorporation with the surgeons; but about the year 1720, some disputes arising about precedency, a process commenced before the Court of Session, which ended in a total separation of these two bodies; and the surgeons were found entitled to retain the charter and privileges of the incorporation. The barbers have ever since met as a regular, but unincorporated society; and though they retain some of their former privileges, such as their preses being one of the governors of the Trades Maiden Hospital, &c. they have no representative in the town council, nor even the shadow of a vote in the election of a member of parliament. Mr. Creech, in his Statistical Account of Edinburgh, records a revolution of a different nature in that society, which affords an instance of the rapid progress of refinement, or, as a philosopher would express it, the rapid increase of luxury, in the metropolis of Scotland. 'In 1763,' he says, 'there was no such profession known as a perfumer; barbers and wigmakers were numerous, and were in the order of descent burghesses: hairdressers were few, and hardly permitted to dress hair on Sundays; and many of them voluntarily declined it. In 1783 perfumers had splendid shops in every principal street: Some of them advertised the keeping of bears, to kill occasionally, for greasing ladies' and gentlemen's hair, as superior to any other animal fat. Hairdressers were more than tripled in number; and their busiest day was on Sunday. There was a professor who advertised a hair-dressing academy, and gave lectures on that noble and useful art.'

BARBER'S POLE. See APPELLATION.

BARBERINO (Francis), one of the most excellent poets of his age, was born at Barberino, in Tuscany, A. D. 1264. As his mother was of Florence, he settled in that city; where his profession of the law, but especially the beauty of his poetry, raised him a very considerable character. The greatest part of his works are lost; but his 'Precepts of Love, a moral poem, calculated to instruct all who have a regard for glory, virtue and eternity,' has had a better fate. It was published

at Rome, adorned with beautiful figures, in 1640, by Frederick Ubaldini; who prefixed the author's life; and, as there are in the poem many words which are grown obsolete, he added a glossary to explain them, which illustrates the sense by the authority of contemporary poets.

BARBERINO, a town of Italy, in Tuscany, situated at the foot of the Appenine mountains, twelve miles south of Florence.

BARBERRY, in botany. See **BERBERIS**.

BARBERSTOWN, a town of Ireland, in the county of Kildare, Leinster, twenty-three miles from Dublin.

BARBESULA, in ancient geography, 1. a town, and 2. a river, of Bœtica; 3. a colony in the resort of the Conventus Gaditanus in Spain: now Marbella, in Grenada.

BARBET, in natural history, a name given by M. Reaumur, and other of the French writers, to a peculiar species of the worms which feed on the pucerons or aphides. See **APNIS**.

BARBET, in zoology. Buffon calls the water-dog of Pennant, *canis aquaticus* of Gmelin, &c. *le grand barbet*; and *canis minor* Gmel. *le petit barbet*. Hist. Nat.

BARBET, in ornithology, the English name of a genus of birds in Latham's Synopsis, corresponding with that of *bucco*, Linn. See **BUCCO**.

BARBERS, the name of the inhabitants of several valleys in Piedmont, particularly those of Lucern, Angrona, Perusa, and St. Martin.

BARBEYRAC (Charles), an eminent physician, born at Cereste, in Provence, in 1629. He studied at Montpellier, and afterwards settled there. The celebrated Locke, with whom he was in friendship, compared him to Sydenham. He died in 1699. He was author of *Traité nouveau de Médecine*, &c. 12mo. 1654; and *Questions Médicæ Duodecim*, 4to. 1658.

BARBEYRAC (John), was born at Besiers, in Lower Languedoc, in 1674. He was made professor of law and history at Lausanne in 1710, which he enjoyed for seven years. In 1717 he was professor of public and private law at Groningen. He translated into French, Puffendorf's *Law of Nature and Nations*, and his *Duties of a Man and a Citizen*; to both which he wrote excellent notes, and to the former an introductory preface. He translated also Grotius's treatise *De Jure Belli ac Pacis*, with large and excellent notes; and several of Tillotson's sermons. He wrote a work entitled *Traité de Jeu*, 2 vols. 8vo.

BARBEZIEUX, a town of France, in the province of Saintonge, with 2452 inhabitants, and the title of marquise. It is the capital of an *arrondissement* of six cantons, in the department of the Charente. Here are thriving linen manufactures; and in the neighbourhood there is a mineral spring. Twenty-eight miles south-east of Saintes, and forty-four north-east of Bourdeaux. Long. 0° 4' W., lat. 45° 28' N.

BARBI, in natural history, a species of *echinorhynchus*, of an ovate shape, yellow color, fasciated; neck long, white, cylindrical; and cyathiform (glass or pot-shaped) at the end, found in the intestine of the barbel.

BARBICAN. See **BARBACAN**.

BARBICAN, in ornithology, the name of the Gmelinian *bucco dubius*, or doubtful barbet, in

Buffon's Hist. Birds Barbu is also a name given by that writer to all the birds of the bucco genus, which he describes.

BARBICANAGE, or **BARBICANAGIUM**, in our old writers, money given for the maintenance of a barbican, or watch tower; or a tribute towards repairing or building a bulwark.

BARBICON (**BARBICON DE CAYENNE**), in ornithology, the name of the *Muscipapa barbata* of Gmelin, in Buffon's History of Birds.

BARBICORNIS, in entomology, a species of brenthid that inhabits New Zealand, the *curculio barbicornis* of Fabricius. 2. A species of cerambyx. 3. A species of cimex (*reduvius*), of Sierra Leone. 4. A species of tipula.

BARBIER (M.), an English singer, who appeared on the revival of the opera of *Almahide*, in 1711. Her timidity on this occasion gave birth to an admirable Spectator (No. 131), in which Addison apologises for and commends her diffidence and modesty. This lady was a native of England, who continued to sing at the opera several years, and afterwards was a favorite concert and playhouse singer till the year 1729. In 1717 it seems she had somewhat vanquished her bashfulness in private. Her elopement from her father's house gave occasion to the following elegant lines by Hughes:—

All, who in town or country dwell,
Say, can you tale or tidings tell
Of Tortorella's hasty flight?
Why in new groves she takes delight;
And if in concert, or alone,
The cooing murmur makes her moan?
Now learn the marks, by which you may
Trace out and stop the lovely stray.
Some wit, more folly, and no care,
Thoughtless her conduct, free her air;
Gay, scornful, sober, indiscreet,
In whom all contradictions meet,
Civil, affronting, peevish, easy,
Form'd both to charm you and displease you;
Much want of judgment, none of pride,
Modish her dress, her hoop full wide;
Brown skin, her eyes of sable hue,
Angel when pleased, when vexed a shrew.
Gentle her motion when she walks,
Sweetly she sings, and loudly talks;
Knows all the world, and its affairs,
Who goes to court, to plays, to prayers,
Who keeps, who marries, fails or thrives,
Lead honest or dishonest lives;
What money match'd each youth or maid,
And who was at each masquerade;
Of all fine things in this fine town,
She's only to herself unknown.
By this description, if you meet her,
With lowly bows, and homage greet her!
And if you bring the vagrant beauty
Back to her mother and her duty,
Ask for reward a lover's bliss,
And, if she'll let you, take a kiss;
Or more, if more you wish, and may,
Try if at church the words she'll say,
Then make her, if you can—obey.

BARBIERI (Giovanni Francesco), otherwise called Guercino da Cento, an eminent historical painter, was born at Cento, near Bologna, in 1590. He was the disciple of Benedetto Genari, but afterwards studied in the school of the

Caracci, though he did not adopt the manner of that famous academy. He preferred the style of Caravaggio to that of Guido or Albano, imagining it impossible to imitate nature truly, without the assistance of strong lights and strong shadows. In effect, by this opposition, he gave such force to his pictures, that few, except those of Caravaggio, can stand near them, and not seem feeble in their effect; however, his manner is censured as not being like nature, because it makes objects appear as if they were seen by a candle-light, or a sun-beam, which alone can justify the deepness of his shadowing. His principal attention seems to have been fixed on perfection in coloring; he saw the astonishing effects produced by the coloring of the celebrated Venetian masters; and observed that notwithstanding any imperfection in regard to correctness or elegance, their works were the objects of universal admiration. On this account he devoted his whole study to excel in coloring; being convinced that few are qualified to discern the elevation of thought which constitutes the excellence of a composition; that few are touched with the grandeur or beauty of the design, or have a capacity to examine the correctness of a painting; but that every imperfect judge may be sensibly affected by the beauty of the coloring. His taste of design was natural, easy, and often grand, but without any extraordinary share of correctness or elegance. The airs of his heads are often deficient in dignity, and his local colors want truth. However, there is great harmony in his colors, although his carnations are not very fresh; and in all his works there is an expressive imitation of life, which will always render them estimable. Towards the decline of his life, he observed that the clearer and brighter style of Guido and Albano had attracted the admiration of all Europe; and therefore he altered his manner, even against his own judgment. But he apologised for that conduct, by declaring that in his former time he painted for fame, and to please the judicious; and he now painted to please the ignorant, and enrich himself. He died in 1666. The most capital performance of Barbieri is the history of St. Petronilla which is considered as one of the ornaments of St. Peter's, at Rome.

BARBIERI (Paolo Antonio, da Cento), painter of still life and animals, was the brother of Giovanni, and born at Cento in 1596. He chose for his subjects, fruit, flowers, insects, and animals; which he painted after nature, with a lively tint of color, great tenderness of pencil, and a strong character of truth and life. He died in 1640.

BARBIGEROUS, bearded.

BARBILLONS, in entomology, are certain bodies, usually two in number, placed under the head of an insect, and movable at pleasure, somewhat resembling hands or fingers placed on a short or broken arm. The word is a diminutive of the French *barbe*, the beard.

BARBING, is sometimes used in ancient statutes for shearing. Cloths is not to be exported till it be barbed, rowed, and shorn. 3 Hen. VII. c. 11.

BARBISTON, an ancient castle in the parish of Dalrymple, in Ayrshire, near which a battle was fought. The dates of 1340 and 1345, are on some stones in the old vaults.

BARBITOS, or **BARBITON**, an ancient instrument of music, mounted with three strings; others say seven, much used by Sappho and Alcæus; whence it is also denominated *lesboum*. It is said to have differed from the lyre and cithara. Strabo makes it the same with the *sambuca*. It is represented as yielding a grave, deep, sound, and on that account peculiarly fitted for Doric compositions. Anacreon is said to have been the inventor.

BARBLE, or **BABEL**, in ichthyology. See **CYPRINUS**.

BARBLES, **BARBES**, or **BARBS**, in farriery, the knots or superfluous flesh that grow up in the channels of a horse's mouth; that is, in the intervals that separate the bars, and lie under the tongue. These obtain in black cattle as well as horses, and obstruct their eating. For the cure, they cast the beast, draw out his tongue, and clip off the barbles with a pair of scissors, or cut them with a sharp knife; others burn them off with a hot iron.

BARBO, a river of Mexico, which rises in the province of Honduras, and runs into the Spanish Main, forty miles south-east of Cape Camaron.

BARBONI, in ichthyology, a name given to the *mullus barbatus*, a fish greatly esteemed at table, and caught in the Mediterranean and some other seas.

BARBONNE, a town of France, in the department of the Marne, five miles from Sezanne.

BARBORA, a maritime town of Africa, in the kingdom of Adel.

BARBOUR (John), archdeacon of Aberdeen, was esteemed an elegant poet in the reign of David I. He wrote the history of Robert the Bruce, in an heroic poem, which is still extant, and contains many facts and anecdotes omitted by other historians. An edition of this book was printed at Glasgow, 8vo, in 1762: entitled *The Acts and Life of the most victorious conqueror Robert Bruce, king of Scotland*, wherein also are contained the martial deeds of the valiant princes Edward Bruce, Sir James Douglass, Earl Thomas Randall, Walter Steward, and sundry others. In one passage he calls it a romance; but that word was then of good reputation. The *Romaunt of romaunts* has been applied to true history; as well as the *Ballad of ballads* to a sacred song. Mr. Pinkerton published an edition in 1790, from an ancient MS.

BARBUD, a Persian musician in the service of Kosru Parviz, whose name was afterwards adopted to signify the master of music. *Barbud* is also the name of a sort of lyre in use among the Persians.

BARBUDA, or **BERBUDA**, one of the British Carribee islands, about twenty miles long, and twelve broad. It is low land, but fruitful and pretty populous, abounding in cattle and fruits, especially in cocoa trees, which are here extremely fine. It also yields cotton, pepper, tobacco, indigo, ginger, and sugar-cane, besides fine woods, herbs, and roots, with which it is plentifully stocked. Several species of snakes are found in this island, some of which are harmless, while others are exceedingly venomous. Amongst the latter is one having a flat head, whose bite occasions instant death. The island has no harbour, but a well sheltered road on the

west side. The inhabitants are about 1500, and follow husbandry, finding always a ready market for their corn and cattle in the sugar islands. Barbuda is the property of the Codrington family, who have great numbers of negroes here, as well as in Barbadoes. That family have one merit which few slave-holders can lay claim to: they have given large benefactions to instruct their slaves in Christianity. Barbuda lies about twenty miles north-east of St. Christopher's, and forty-five north of Antigua. Long. 61° 50' W., lat. 18° 30' N.

BARBUE, a river of North America, in the north-western territory, which runs west by north, and falls into the Lake of Michigan. It is about 150 yards broad at the mouth.

BARBULE in botany, a name given by Pliny to the *semi-flosculi*.

BARBURY CASTLE, and **BARBURY HILL**, places in Wiltshire, west of Ogborn St. George, and near Marlborough Downs. There formerly stood here a castle of considerable magnitude, surrounded by a double moat; and on the adjacent plain are many barrows, which seem to indicate that a great battle was fought on this spot, at some remote period.

BARBY, a county in the Prussian states on the Elbe, between Magdeburg and Anhalt, consisting of the bailiwicks of Barby, Rosenberg, Walther-Nienburg, and Muhligen. On the death of the last of the counts in 1659, Barby Proper came to the elector of Saxony, and after forming part of Jerome Buonaparte's kingdom of Westphalia, was annexed to Prussia in 1815.

BARBY, the chief town is situated on the Elbe, near where it receives the Saale, and has 2900 inhabitants. It is well built, has an old castle, and is the seat of the superintendent of eight churches in the county. The Moravian brethren obtained permission in 1749 to remove hither their academy and theological seminary, and they founded an academical college in 1754. They had here also a school and chapel, an observatory, and a cabinet of natural history; but the greater number of these establishments have been transferred to Niesky, in Upper Lusatia. Fourteen miles north-west of Dessau, and fourteen S. S. E. of Magdeburg. Long. 11° 58' 47" E., lat. 51° 59' N.

BARBYLA, in botany, a name by which Theophrastus and other of the early writers, have called the common damask prune.

BARCA, a large county of Africa, lying on the coast of the Mediterranean sea, between the kingdoms of Egypt and Tripoli, extending in length from east to west from 39° to 46° E. long., and in breadth from north to south about thirty leagues, as is generally supposed. It is for the most part, especially in the middle, a dry sandy desert; on which account the Arabs call it *Sahart*, or *Ceyart Barka*, that is, the desert or road of whirlwinds or hurricanes. It labors almost everywhere under a great scarcity of water; and except in the neighbourhood of towns and villages, where the ground produces some small quantities of grain, such as millet, and some maize, the rest is in a manner quite barren and uncultivated, or rather uncultivable: and even of that small quantity which those few spots produce, the poor inhabitants are obliged to exchange some part with their

indigent neighbours, for dates, sheep, and camels, which they stand in greater need of than they, by reason of their great scarcity of grass and other proper food; for want of which, those that are brought to them, seldom thrive or live long. In this territory stood the famed temple of Jupiter Ammon: and notwithstanding the pleasantness of the spot where it stood, this part of the country is said to have been the most dangerous of any, being surrounded with such quick and burning sands as are very detrimental to travellers; not only as their feet sink into them, but being light and heated by the rays of the sun, they are easily raised by every breath of wind; which, if it chance to be in their faces, almost burns their eyes out, and stifles them for want of breath; or, if vehement, often overwhelms whole caravans. Against this temple Cambyses, king of Persia, despatched an army of 50,000 men. They set out from Thebes, in Upper Egypt, and under the conduct of proper guides, reached the city of Oasis, seven days journey from that place: but what was their fate afterwards is uncertain; for they never returned either to Egypt or to their own country. The Ammonians informed Herodotus, that, after the army had entered the sandy desert which lies beyond Oasis, a violent wind began to blow from the south at the time of their dinner, and raised the sand to such a degree, that the whole army was overwhelmed and buried alive. Concerning the government or commerce of this country we know nothing certain. The maritime towns are under the nominal protection of the Porte, and the whole country is subject to Tripoli, the bashaw of which appoints a sangiaek, who resides at Derne, the capital of Barca.

BARCA, a sea-port town in the territory of the same name. Long. 20° 25' E., lat. 32° 26' N.

BARCALAO, a Spanish word, which the French pronounce baccala, or baccaliau. By this last name the Basques most commonly call the fish which we style cod; and those people call also the island which we call Newfoundland, the isle of Barcaliau, cod island, because of the great plenty of cod caught there.

BARCALON, an appellation given to the prime minister of the king of Siam, who superintends every thing relating to commerce, both foreign and domestic, as well as the king's magazines.

BARCA-LONGA, a large Spanish fishing-out, navigated with lug-sails, and having two or three masts, very common in the Mediterranean.

BARCALORE, a town of Cochin, twenty-two miles east of Cranganore.

BARCANS, the natives of Barca, which see.

BARCABIA, old law Lat, a barkery or tannery.

BARCARY, bergerie, Fr. a sheep-cote.

BARCAS, a town of New Mexico, in the infancy of Guadalaxara, which has a numerous population of Spaniards, Mestizoes, and Mulattoes.

BARCATTY, a town of Cochin, on the confines of Dindigul, sixty miles east of Cochin.

BARCE, the chief city in the province of Barca, about nine miles from the sea. It was founded by the brothers of Aresilaus, king of Cyrene, 545 years before the Christian era.

BARCELONA, a handsome, rich, and strong city of Spain, in the province of Catalonia, of which it is the capital. It is situated by the sea side, of a form between a square and an oval; surrounded with a good brick wall, round which is another, with fourteen bastions, horn-works, ramparts, and ditches; the ramparts are high, broad and spacious. This city, which is reckoned the second in Spain in population, is divided into two parts, the Old and the New, separated from each other by a wall and a large ditch; the streets are handsome, well paved with large stones, wide, and very clean. It is a bishop's see, the seat of a captain-general, a governor, and a royal audiencia; and here the archives of the kingdom of Arragon are preserved.

The Barcelonians have also a fine university, and various institutions for the promotion of literature, arts and sciences; the academies for jurisprudence, natural philosophy, medicine, history, and the fine arts, are celebrated throughout Spain. The most remarkable buildings are the cathedral, which is adorned with two high towers; the church of the Virgin Mary, the palace of the bishop, that of the inquisition, and several religious houses; add to these the palace of the viceroy, the arsenal, which contains arms for 1000 men, and a cannon-foundry, the exchange, where the merchants meet, the tersana, where they build the galleys, and the palace where the nobility of the country meet, called La Casa de la Deputation. This last is built with fine large free stone, and adorned with columns of marble: there is in it a large hall, with a handsome portico. There are several fine squares, particularly that of St. Michael, into which all the great streets run.

This city was originally founded by Hamilcar Barca, and from him called Barcino. It was reduced by the Romans, and continued subject to them till Spain was over-run by the Goths and Vandals. In the beginning of the ninth century Barcelona was in the hands of the Saracens, under the government of one Zade. The government having more than once abused the clemency of Charlemagne, at last irritated Louis king of Aquitain, his son, to such a degree, that he gave orders to his generals to invest the city, and not to rise from before it till they had put Zade into his hands. Zade made a most obstinate resistance, so that the siege lasted many months; at last, finding it impossible to preserve the city much longer, and being destitute of all hopes of relief, he determined, or rather was compelled by the inhabitants, to go to the Christian camp and implore the emperor's mercy; and being sent prisoner to Charlemagne, he was condemned to perpetual banishment. The people gaining nothing by this expedient, continued to hold out for six weeks longer, when Louis himself took the command of the siege. To him they made a proposal, that if he would allow them to go where they pleased, they would surrender. Louis, having agreed to this, made his public entry into Barcelona, where he formed a design of extending his father's dominions as far as the Ebro; but being recalled before he could put his design in execution, he appointed one Bera, count of Barcelona. The city continued

subject to him and his successors, who enjoyed the title of counts of Barcelona, from A. D. 802 to 1131; during which time nothing remarkable occurred, except that the city was once taken by the Moors, but soon after retaken by the assistance of Louis IV. king of France. In 1131 it was united to the crown of Arragon by the marriage of Raymond V. count of Barcelona with the daughter of Ramiro the monk, king of Arragon. In 1465 the Catalonians revolted against John II. king of Arragon, out of hatred to the queen Donna Joanna; the consequence of which was, that Barcelona was besieged by that monarch in 1471. Various efforts were made by Louis XI. of France and the duke of Lorraine to raise the siege, but without effect. Things at length were brought to the utmost extremity, when the king offered to pardon them all, without the smallest punishment either in person or property, provided they would submit; but these terms they rejected, chiefly through the influence of the count de Pailhars, who had been pardoned the year before. The army on the other hand, was very earnest in being led on to the assault, in hopes of plunder. The king, however, wrote a letter to the citizens, dated the 6th of October, in terms as affectionate as if he had been writing to his children, bewailing the miseries they had brought on themselves, and concluding with a protestation that they, and not he, must be answerable for the consequences. Upon this, they sent deputies to the king, and made a capitulation on the 17th of that month. In this the king acknowledged they had taken up arms on just motives; and forgave everybody except Pailhars, who was, however, suffered to escape. On the 22nd of October the king made his entry into the city, and confirmed all their ancient privileges. In 1697 Barcelona was taken by the French, after a bloody siege of fifty-two days; and the loss of this city had a considerable effect in disposing the Spaniards to agree to the treaty of Ryswick. In queen Anne's time it was taken by the allies, under the earl of Peterborough, Oct. 4, 1705; but, being afterwards shamefully denied assistance by the English ministry, was obliged to submit to Philip V. by whom the whole province was deprived of its ancient privileges, in 1714; for a particular account of which, see SPAIN.

The port of Barcelona is wide, spacious, deep, and safe; defended on the one side by a great mole, and on the other sheltered from the west wind by two mountains that advance into the sea, and form a kind of promontory; the mole is 750 paces long, with a quay, at the end of which is a light house and a small fort. One of the mountains, called Montjoui or Mount Joy, is very high, and rises in the middle of the plain near the city: it is covered with gardens, vineyards, groves of trees, and has a strong fort for the defence of the city; this mountain being a rock, yields an inexhaustible quarry of fine hard freestone. Barcelona is a place of great trade. The number of ships which arrived here in 1803, before its commerce was impeded by the peninsular war, has been stated at 1333, 927 of which were Spanish, and the remainder belonged to other nations. The manufacturing establishments are calico presses, looms for silk, wool,

and cotton, hats, laces, ribbons, stockings, and soap. Here, also, are fabricated excellent muskets, pistols, swords, and other small arms, not only for the army at home, but for Naples and America. There are, besides, several steel and brass works. It has, also, a good trade in linen, copper, and brass, from Germany. Another extensive article of its trade is salt fish, from Newfoundland, the chief trade for which is with England.

When the trade with Mexico was first opened, in 1778, the Barcelonese merchants soon distinguished themselves by successful enterprises in it. Twenty-three ships, whose cargoes of Spanish produce was valued at £85,000 English, and the foreign freight at £25,000, cleared out here the first year. In ten years after, the goods thus exported amounted to £400,000, and the return cargoes to £450,000. The present export and import trade are taken together at £1,750,000, and the population at about 112,000.

At Barcelona Charles III., of the house of Bourbon, landed from Naples in 1759, to take possession of the throne of Spain. On the 16th February, 1808, it was surprised by a body of French troops under general Duhesme. They arrived in the neighbourhood on the 13th of February to the number of 10,000; and, having requested permission to halt and refresh themselves on their way to Valencia, the gates were opened to receive them, and they were hailed as friends and allies. On the 16th, having assembled on the parade, as if for the purpose of continuing their march, they filed off in two divisions, one to the citadel, the other to Montjui, a fort upon a hill which commands the town, and having summoned those posts, they were immediately surrendered. Barcelona continued in possession of the French until the year 1814.

BARCELONA, one of the principal provinces of the government of Cumana, South America: bounded on the west by Cumana, east by the Caraccas, and south by the river Orinoco, which also divides it from Guiana. Here commence those immense plains, covered with excellent pasturage, which, uniting with those of the Caraccas, extend as far south as the Orinoco. They were formerly well stocked with cattle, 8000 or 9000 head being killed annually, in salting of which the inhabitants exhibited great skill. In the province are four remarkable salt-pits; but of late the supply is much diminished. This province declared its independence in 1811, and is now a part of the republic of Columbia.

BARCELONA NEW, the capital of the foregoing province, is situate in a plain on the left bank of the river Neveri, half a league distant from the sea, in 10° 10' N. lat. and 64° 47' W. long. It is twelve leagues from Cumana in a direct line; but the windings which it is necessary to make to avoid bad roads, make it a journey of twenty hours. It is reckoned ten marine leagues by sea from the port of Barcelona to that of Cumana.

On ascending on the east side of the river, about four miles from its mouth, we observe, on an eminence which bears the name of the city, a fort erected for the protection of vessels which anchor not far from it, in a bay so shallow as not

to be capable of admitting vessels of considerable size. This port, if it may be so called, affords no shelter but against the breeze: but at the distance of one league to the north, the island of Borracha, inhabited by fishermen, presents, on its south side, a safe harbour for ships of the largest size. From the hill of Barcelona, the coast runs to the north-east, as far as Cumana, which is at the distance of two leagues. That space is filled with a chain of islands, not far removed from the coast. Some of these are provided with bays and ports; but they are of no great consequence.

Barcelona has a population of fourteen thousand souls, a single parish church, and an hospital for the Franciscans who support the missions of this part. It is neither handsomely nor agreeably constructed. Its unpaved streets are extremely muddy in rainy weather; and in dry seasons they are covered with a dust so light that the least breath raises it in the air. The immense quantity of hogs fed there, induce in the city a number of stinking and infectious sties, which corrupt the air and frequently create diseases. In 1803, however, the commandant of the place took measures for removing from the town an infection which could not but poison its residence. This town had, in 1807, a population of 15,000 persons; half whites and half mulattoes and negroes.

Hides, tallow, oxen, mules, jirked and salted beef, are the great articles of trade here; in 1800 eight thousand mules left this port for the West India islands. The annual value of the trade is computed at 400,000 dollars.

BARCELONETTA, a small and new town of Spain, in Catalonia, a suburb of Barcelona. It stands on the south-east of that city, between the harbour and the light-house, and was built by the marquis de la Mina, then captain-general of Catalonia, about the middle of the last century. It consists of a square, laid out in twenty-four streets, composed of brick houses, all built upon the same plan, which gives it a neat appearance. The number of houses is stated at 600, and that of the inhabitants at 10,000, the major part of whom are soldiers, sailors, and persons otherwise connected with the navy. The church is a handsome structure, in the form of a Greek cross.

BARCELONNE, a town of France, in the department of the Gers, arrondissement of Mirande, on the river Adour. Population 840. Nine miles south-west of Nogaro, twenty-seven W. N. W. of Mirande.

BARCELONNE, a small town of France, in the department of the Drome, arrondissement of Valence, five miles east of Valence.

BARCELONNETTE, a town of France, in the department of the Lower Alps, and capital of the province and valley of this name.

The arrondissement contains above 18,000 inhabitants, in four cantons. Population of the town 1900. The only objects of trade are corn and cattle, particularly sheep. Near this place is a passage across the Alps to Coni; and the district was the scene of various military operations in the campaign of 1799. Twenty-eight miles north-east of Digne, twelve miles south-

east of Embrun, and fifty-six north-west of Nice. Long. 6° 44' E., lat. 44° 23' N.

BARCELORE, a town of Hindostan, in Canara, on the banks of a broad river, about four miles from the sea. It once belonged to the Portuguese, from whom it was captured by the Dutch, who immediately began to establish a settlement here. It was formerly the capital of an independent state, which in 1575 was ruled by a female sovereign, and the daughters of the family have since succeeded. Barcelore carries on considerable trade with the Arabs of Maskat, exporting rice, the chief product of the country, and pepper, and receiving horses and dates in return. This port is supposed to have been the Barace of the ancients. Long. 74° 46' E., lat. 13° 45' N.

BARCELOS, a town of Portugal, in Entre Duero-e-Minho, ten miles west of Braga, and twenty north of Porto, seated on the river Sourilla.

BARCELOS, a town of Portugal, with the title of a duchy, seated on the river Cavado, over which there is a handsome bridge.

BARCES, or BERCHES, were formerly a kind of ship guns, not unlike sakers, only shorter, thicker in metal, and wider bored.

BARCINO, in ancient geography, a town of the Tarraconensis in Spain, and capital of the Laletani; now called Barcelona.

BARCLAY (Alexander), a learned monk in the reign of Henry VIII. Where he was born, has been subject of contention among his biographers. Bale, his contemporary, says he was born in Somersetshire. There is indeed a village of his name, and a numerous family, in that county. Pits thinks he was born in Devonshire. Mackenzie is positive he was a Scotchman; but without proof, unless we admit as such his name Alexander. He was, however, educated at Oriel College, Oxford. Afterwards he went abroad, and continued some time in France, Italy, and Germany, where he acquired a competent knowledge of the languages of those countries. On his return to England he was made chaplain to his patron the bishop of Tyne, who appointed him a priest of St. Mary, at Ottery College in Devonshire. After the bishop's death he became a Benedictine monk of Ely. On the dissolution of that monastery he obtained a vicarage in Somersetshire; and, in 1549, being D. D., was presented to that of Great Baddow in Essex. In 1552 he was appointed rector of Allhallows, which he enjoyed but a short time; for he died at Croydon in June following. He improved the English language, and was one of the politest writers of his time. He composed several original works; but was chiefly remarkable for his translations from the Latin, Italian, French, and German languages. His version of Sallust's Jugurthine war is accurate, and even elegant. His lives of several saints, in heroic verse, are still in MS. His *Stultifera Navis*, or *The ship of fools*, is the most singular of his performances. It was printed by Richard Pynson at London, 1509, in folio; and contains a variety of wooden plates, which are worthy the inspection of the curious.

BARCLAY (John), son of William, was born

in France, at Pont-a-Mousson, and was so great favorite of the Jesuits, that they used all their efforts to engage him in their society. But his father prevented this, and carried him with him to England. Previously to this young John had already commenced author, for he had published *A Commentary upon the Thebais of Statius*, a Latin poem on the coronation of King James, and the first part of *Euphormio*, in 1603. He returned to France with his father in 1604; and after his death went to Paris, but returned soon after to London, where he was in 1606. He published *The History of the Gunpowder Plot*, a pamphlet of six leaves, printed at Amsterdam. He published at London in 1610, *An Apology for the Euphormio*, and his father's treatise *De Potestate Papæ*. And at Paris, in 1612, he published a book entitled *Pietas*, in answer to Cardinal Bellarmin, who had written against his father's book, on the power of the Pope. Two years after he published *Icon Animorum*. He was invited to Rome by Pope Paul V. and received a great deal of civility from Cardinal Bellarmin, though he had written against him. He died at Rome in 1621, while his *Argenis* was printing at Paris. This celebrated work has since gone through a great number of editions, and has been translated into most languages. M. de Peiresc, who had the care of the first edition, caused the effigies of the author to be placed before the book; and the following distich, written by Grotius, was put under it:

Gente Caledonius, Gallus natalibus, hic est,
Romam Romano qui docet ore loqui.

BARCLAY (Robert), one of the most eminent among the Quakers, the son of Colonel David Barclay, descended of an ancient family, was born at Edinburgh in 1648. He was educated under an uncle, who was principal of the Scots' college at Paris, where the Papists used all their efforts to draw him over to their religion. He joined the Quakers in 1669, and distinguished himself by his zeal and abilities in defence of their doctrines. His first treatise in their defence was published at Aberdeen in 1670. His father the colonel had joined them in 1666. In 1676 he published in Latin at Amsterdam his *Apology for the Quakers*; which is the most celebrated of his works, and esteemed the standard of the doctrine of the Quakers. His *Theses Theologicæ*, which were the foundation of this work, and addressed to the clergy of what sort soever, were published before the writing of the *Apology*, and printed in Latin, French, High Dutch, Low Dutch, and English. He translated his *apology* into English, and published it in 1678, with a dedication to king Charles II. which is remarkable for the uncommon frankness and simplicity with which it is written. Amongst many other extraordinary passages, we meet with the following: 'There is no king in the world, who can so experimentally testify of God's providence and goodness; neither is there any who rules so many free people, so many true christians; which thing renders thy government more honorable, thyself more considerable, than the accession of many nations filled with slavish and superstitious souls. Thou hast tasted of pros-

perity and adversity; thou knowest what it is to be banished thy native country, to be overruled as well as to rule and sit upon the throne; and being oppressed, thou hast reason to know how hateful the oppressor is both to God and man: if, after all those warnings and advertisements, thou dost not turn unto the Lord with all thy heart, but forget him who remembered thee in thy distress, and give up thyself to follow lust and vanity, surely great will be thy condemnation.' He travelled with the famous William Penn through the greatest part of England, Holland, and Germany, and was everywhere received with the highest respect; for though both his conversation and behaviour were suitable to his principles, yet there was such liveliness and spirit in his discourse, and such serenity and cheerfulness in his deportment, as rendered him extremely agreeable to all sorts of people. He returned to his native country, spent the remainder of his life in a quiet and retired manner; and died at his house at Urie, on the 3rd of October 1690, aged forty-two. He wrote other works; particularly, 1. *A Treatise on Universal Love*. 2. *The Anarchy of the Ranters*; a turbulent sect with whom the enemies of the Quakers endeavoured to confound them. 3. *A Letter to the Ministers of Nimeguen*. 4. *The Possibility and Necessity of the Inward Revelation of the Spirit of God*, &c. &c.

BARCLAY (William), a learned civilian, was born in Aberdeenshire, in 1541. He spent the early part of his life, and much of his fortune, at the court of Mary Queen of Scots, from whose favor he had reason to expect preferment. In 1573 he went to France, and at Bourges commenced student of civil law under the famous Cujacius. He continued some years in that seminary, where he took a doctor's degree; and was soon after appointed professor of civil law in the university of Pont-a-Mousson, then founded by the duke of Lorraine. That prince afterwards made him counsellor of state and master of requests. Barclay, in 1481, married Ann de Malleville, a French lady, by whom he had his celebrated son, John. This youth the Jesuits would gladly have received into their society. His father refused his consent, for which reason they contrived to ruin him with the duke. Barclay embarked for Britain, where James I. offered him preferment, if he would join the church of England: but not choosing to comply, he returned to France in 1604; and, soon after, was appointed professor of civil law in the university of Angers, where he died in 1605, and was buried in the Franciscan church. He wrote elaborately in defence of the Divine Rights of Kings, in answer to Buchanan and others. His works are. 1. *De Regno et Regali Potestate*, &c. 2. *Commentarius in tit. Pandectarum de Rebus Creditis, et de Jure-jurando*. 3. *De Potestate Papæ*, &c. 5. *Præmetia in vitam Agricola*.

BARCLAY, CASTLE HILL OF, and BARCLAY MOAT, OR MERKLAND OF, two relics of Danish forts, on the banks of the Urr, in the parish of Colvend, in Kirkcudbrightshire.

BARCLOSH, an ancient edifice in the parish of Kirkcudbright, which seems to have been built

as a place of refuge, being remote, inaccessible, and more defended by nature than art. It belongs to the family of Herries.

BARCOCHAB, or **BARCOHEBAS**, a Jewish impostor, whose real name was Akiba; but he took that of Barcochab, which signifies the Son of a Star; in allusion to the prophecy of Balaam, 'There shall a star arise out of Jacob.' He proclaimed himself the Messiah; and talking of nothing but wars, victories, and triumphs, made his countrymen rise against the Romans, by which means he was the author of innumerable disorders; he ravaged many places, took a great number of fortresses, and massacred an infinite multitude of people, particularly the Christians. The emperor sent troops to Rufus, governor of Judea, to suppress the sedition. Rufus, in obedience, exercised a thousand cruelties, but could not finish his attempt. The emperor was therefore obliged to send Julius Severus, the greatest general of that time; who attained his end without a direct battle: he fell on them separately; cut off their provisions; and at last the whole contest was reduced to the siege of Bitter, in the eighteenth year of Adrian. The impostor perished there. This war cost the Romans a great deal of blood.

BARCO-LONGA. See **BARCA-LONGA**.

BARCONE, a short broad vessel, of a middle size, used in the Mediterranean sea for the carriage of corn, wood, salt and other provisions, from one place to another.

BARD, } Fr. *barde*, Dut. *barderen*, *phar-*

BARD'S, } *barce*, plaleris ornare. This word, of so frequent occurrence in the ancient chronicles, is probably no more than a corruption of *barb*. They are apparently of similar origin, and it is certain that they are used synonymously. See **BARB**.

I saw the muster of the new band-men of arms, &c. some with feathers, staves, and pencils of their colours; some with sleeves and half coats; some with *bards* and staves, &c.

Burnet's History of the Reformation.

BARD'S, } The bard, was the poet, the
BARD'ICK, } musician, and the historian, of
BARD'ISH, } ancient times. The kind of song
BARD'ING, } which the bards sung, is called
barditus, by Tacitus; and *barditus* is derived by Wachter from the Germ. *barten*, *pugnare*. The bards were, therefore, originally the composers of the war-song, the song of battle, and their task was to inspire the love of martial fame, by impassioned tales of heroic deeds. The title is now given to poets without discrimination.

There is among the Irish a kind of people called *bards*, which are to them instead of poets; whose profession is to set forth the praises or dispraises of men in their poems or rhyme; which are had in high regard and estimation among them.

Spenser on Ireland.

And many *bards* that to the trembling chord,
Can tune their timely voices cunningly.

Faerie Queene.

Then you that valiant soules and slaine in warre,
Do celebrate with praise that neuer dyes,
You *bards* securely sing your elogyes. *May. Lucan.*

And indeed my jealousy hath oft vexed me with particular inquisition of whatsoever recurs, bearing not a mark of most apparent truth, ever since I found so intolerable antichronisms, incredible reports, and *bardish* impostures; as well from ignorance as assumed liberty of invention in some of our ancients. *Selden.*

The *bard* who first adorn'd our native tongue
Tun'd to his British lyre this ancient song,
Which Homer might without a blush rehearse.

Dryden.

Rapt into future times, the *bard* begun;
A virgin shall conceive, a virgin bear a son;
From Jesse's root, behold a branch arise,
Whose sacred flow'r with fragrance fills the skies;
Th' ethereal spirit o'er its leaves shall move,
And on its top descends the mystic dove.

Pope's Messiah.

By Pella's *bard*, a magic name,
By all the griefs his thoughts could frame,
Receive my humblest rite:
Long, Pity, let the nations view
Thy sky-worn robes of tenderest blue,
And eyes of dewy light!

Collin's Ode to Pity.

Faith let him 'scape, let love and fame survive,
With your kind sanction keep his scenes alive;
Try to approve (applaud we will exempt)
Nor crush the *bardling* in this hard attempt.

Cunningham. A Prologue to Love and Fame.

The Welsh, kept in awe as they were by the Romans, harassed by the Saxons, and eternally jealous of the attacks, the encroachments, and the neighbourhood of aliens, were on this account attached to their Celtic manners; this situation, and these circumstances, inspired them with a pride and an obstinacy for maintaining a national distinction, and for preserving their ancient usages, among which the *bardic* profession is so eminent.

Warton's History of English Poetry.

Their ashes few;
No marble tells us whither. With their names
No *bard* embalms and sanctifies his song;
And history, so warm on meaner themes,
Is cold on this.

Cowper's Task.

BARD, in antiquity, denotes one who was a poet by genius and profession; and 'who sung of the battles of heroes, or the heaving breasts of love.' Ossian's poems, i. 37. Lord Kaimes justly observes, Sketches i. sec. 2. that the curiosity of man is great with respect to the transactions of his own species; and when such transactions are described in verse, accompanied with music, the performance is enchanting. An ear, a voice, skill in instrumental music, and above all the poetical genius, are requisite to excel in that complicated art. As such talents are rare, the few that possessed them were highly esteemed; and hence the profession of a *bard*, which, besides natural talents, required more culture and exercise than any other known art.

BARDS anciently were capital persons at every festival and at every solemnity. Their songs, which, by recording the achievements of kings and heroes, animated every hearer, must have been the entertainment of every warlike nation. Demodocus is mentioned by Homer as a celebrated *bard*; and Pheuius, another *bard*, is introduced by him deprecating the wrath of Ulysses, Odyss. vii. and urging him to

— spare the poet's ever gentle kind.
 A deed like this thy future fame would wrong,
 For dear to gods and men is sacred song.
 Save then the poet, and thyself reward
 'Tis thine to merit, mine is to record.'

Cicero reports, that at Roman festivals, anciently, the virtues and exploits of their great men were sung. The same custom prevailed in Peru and Mexico, as we learn from Garcilasso and other authors. We have for our authority Father Gobien, that even the inhabitants of the Marian islands have bards, who are greatly admired, because in their songs are celebrated the feats of their ancestors.

BARDS, CELTIC, BRITISH, &c. In no part of the world did the profession of bard appear with such lustre as in Gaul, in Britain, and in Ireland. Wherever the Celtae or Gauls are mentioned by ancient writers, we seldom fail to hear of their druids and their bards; the institution of which two orders, was the capital distinction of manners and policy. The druids were philosophers and priests; the bards their poets, and recorders of heroic actions: and both these orders seem to have subsisted among them, as members of the state from time immemorial. The Celtae possessed, from many remote ages, a system of discipline and manners, which appear to have had a deep and lasting influence. Ammianus Marcellinus, lib. xv. c. 9. gives them this testimony, that they cultivated the study of the most laudable arts; introduced by the bards, who sung in heroic verse the gallant actions of illustrious men; and by the druids, who lived together in colleges or societies, after the Pythagorean manner, and philosophising upon the highest subjects, asserted the immortality of the soul. Though Cæsar, in his account of Gaul, does not expressly mention the bards, yet it is plain, that under the title of Druids, he comprehends that whole college or order; of which the bards, who probably were the disciples of the druids, undoubtedly made a part. According to his account, the druidical institution first took rise in Britain, and passed from thence into Gaul; so that they who aspired to be thorough masters of that learning were wont to resort to Britain. He adds too, that such as were to be initiated among the Druids, were obliged to commit to their memory a great number of verses, inasmuch that some employed twenty years in this course of education; and that they did not think it lawful to record these poems in writing, but sacredly handed them down by tradition from race to race. So strong was the attachment of the Celtic nations to their poetry and their bards, that amidst all the changes of their government and manners, even long after the order of the Druids was extinct, and the national religion altered, the bards continued to flourish; not as a set of strolling songsters, like the Greek *ῥαψοδοὶ* or rhapsodists, in Homer's time, but as an order of men highly respected in the state, and supported by a public establishment. We find them, according to Strabo, and Diodorus, before the age of Augustus; and we find them remaining under the same name, and exercising the same functions as of old, in Ireland, and in the north of Scotland, almost

down to our own times. It is well known, that in both these countries, every regulas or chief, had his own bard, who was considered as an officer of rank in his court.

Of the honor in which the bards were held, many instances occur in Ossian. They were the ambassadors between contending chiefs; and their persons were held sacred. 'Cairbor feared to stretch his sword to the bards, though his soul was dark. Loose the bards (said his brother Cathmor), they are sons of other times. Their voice shall be heard in other ages, when the kings of Temora have failed.' Ossian ii. 22. They and the Druids were exempted from taxes and military services, even in times of the greatest danger: and when they attended their patrons in the field, to record and celebrate their great actions, they had a guard assigned them. At all public assemblies they were seated near the person of the king or chieftain, and sometimes even above the greatest of the nobility and chief officers of the court. Nor was their profession less lucrative than it was honorable. Besides the valuable presents which they occasionally received from patrons, they had estates in land allotted for their support. So great was the veneration which the princes of those times entertained for their poets, and so highly were they delighted with their strains that they sometimes pardoned even their capital crimes for a song. We may reasonably suppose that a profession so honorable and advantageous would not be deserted. It was indeed much cultivated, and the accounts which we have of the number of bards in some countries, particularly in Ireland, are hardly credible. We often read, in the poems of Ossian, of 100 bards belonging to one prince, singing and playing in concert for his entertainment. Every chief bard, who was called *allah redan*, or doctor in poetry, was allowed to have thirty bards of inferior note constantly about his person; and every bard of the second rank was allowed a retinue of fifteen poetical disciples.

Though the ancient South Britons had originally the same taste and genius for poetry with those of the north, yet none of their poetical compositions have been preserved. Nor can we be surprised at this. After the provincial Britons had submitted to the Roman government, yielded up their arms, and lost their martial spirit, they could take little pleasure in hearing or repeating the songs of their bards, in honor of the glorious achievements of their brave ancestors. The Romans also, though they did not exercise the same barbarous policy, which was long after practised by Edward I. of putting the bards to death, would at least discourage them, and discountenance the repetition of their poems. These sons of the song being thus persecuted by their conquerors, and neglected by their countrymen, either abandoned their country or their profession; and their songs, being no longer heard, were soon forgotten. It is probable that the ancient Britons, as well as many other nations of antiquity, had no idea of poems that were made only to be repeated, and not to be sung to the sound of musical instruments. In the first stages of society in all countries, the two sister arts of poetry and music seem to have been always united; every poet

was a musician, and sung his own verses to the sound of some musical instrument. This, we are directly told by two writers of undoubted credit, was the case in Gaul, and consequently in Britain, at this period. 'The bards,' says Diodorus Siculus, lib. v. sect. 31, 'sung their poems to the sound of an instrument not unlike a lyre.' 'The bards,' according to Ammianus Marcellinus, lib. xv. c. 9, 'celebrated the brave actions of illustrious men in heroic poems, which they sung to the sweet sound of the lyre.' This account is confirmed by the general strain, and by many particular passages, of the poems of Ossian. 'Beneath his own tree, at intervals, each bard sat with his harp. They raised the song and touched the string, each to the chief he loved. Vol. ii. p. 112. The invention of writing made a considerable change in the profession of the bards. It is now agreed, that no poetry is fit to be accompanied with music, but what is simple: a complicated thought, or description, requires the utmost attention, and leaves none for the music; or, if it divides the attention, it makes but a faint impression. The simple operas of Quinault bear away the palm from every thing of the kind composed by Boileau or Racine, who were poets of a higher order. But when a language is enriched with variety of phrases, fit to express the most elevated thoughts, men of genius aspired to the higher strains of poetry, leaving music and song to the bards; which distinguished the profession of a poet from that of a bard. Homer, in one sense, may be termed a bard; for in that character he strolled from feast to feast. But he was not a bard in the original sense; he, indeed, recited his poems to crowded audiences; but his poems are too complex for music, and he probably did not sing them, nor accompany them with the lyre. The troubadours of Provence were bards in the original sense, and made a capital figure in the days of ignorance, when few could read, and fewer write. In later times the songs of the bards were taken down in writing, which gave every one access to them without a bard; and the profession sunk by degrees into oblivion. Among the Highlanders of Scotland reading and writing, in their own tongue, is not common even at present; and that circumstance supported long the bard profession among them, after it was dropt among the neighbouring nations.

Among the ancient British bards the most celebrated is the great Merlyn, whose true name, according to Lhuyd, is Merdhyrn. The genealogical sonnets of the Irish bards are still the chief foundations of the ancient history of Ireland. In the Highlands of Scotland there are considerable remains of many of the compositions of their old bards still preserved. But the most genuine entire and valuable remains of the works of the ancient bards, and perhaps the noblest specimen of uncultivated genius, are the poems of Ossian the son of Finlay, a king of the Highlands of Scotland, who flourished in the second or third century; collected by Mr. MacPherson, and by him translated from the Erse, or Gaelic, language into English.

BARDE, in antiquity, housings for horses.

BARBANA, or BIRLOCK. See ARCTUM.

BARDARIOTÆ, in antiquity, a kind of ancient guards attending the Greek emperor, armed with rods, with which they kept off the people from crowding too near the prince when on horseback. Their captain or commander, was denominated primivergius. The word was probably formed from the BARDE, which see.

BARDAS, the brother of the empress Theodora, and uncle of the famous Photius, is said to have had no other good quality besides that of loving the sciences, which he established in the Eastern empire; for he was treacherous, cruel and ambitious. In A. D. 856 he assassinated Theoctistes, general of the emperor Michael's forces, and obtained his post. He caused the disgrace of the Empress Theodora; and St. Ignatius, patriarch of Constantinople, reproaching him for his vices, he had him deposed in 848, to make room for Photius. He was assassinated in 866 by Basilus, afterwards emperor.

BARDED, in heraldry, is used in speaking of a horse that is caparisoned. He bears sable cavalier d'or, the horse barded, argent.

BARDELLE, in the menage, a saddle made in form of a great saddle, but of cloth stuffed with straw, and tied tight down with packthread, without either leather, wood, or iron. In Italy they trot their colts with such saddles; and those who ride them are called Cavalcadours, or Scozone.

BARDESANES, a Syrian of Edessa in Mesopotamia, born in the middle of the second century, who became eminent, after his conversion to Christianity, for his zeal against heretics; against whom, we are informed by St. Jerome and Eusebius, he wrote a multitude of books; yet he himself fell into the errors of Valentinus, to which he added some others of his own. He taught that the actions of men depend altogether on fate, and that God himself is subject to necessity.

BARDESANISTS, a sect of ancient heretics, thus denominated from their leader Bardesanes. They went further than their teacher, and denied the resurrection of the body, and the incarnation and death of our Saviour; holding that these were only apparent or fantastical. They maintained that the supreme God, being free from all imperfection, created the world and its inhabitants pure and incorrupt: that the prince of darkness, who is the fountain of all evil and misery, enticed men to sin; in consequence of which, God permitted them to be divested of those ethereal bodies, with which he had endued them, and to fall into sluggish and gross bodies formed by the evil principle: and that Jesus descended from heaven, clothed not with a real but aerial body, to recover mankind from that body of corruption which they now carry about them; and that he will raise the obedient to mansions of felicity, clothed with aerial vehicles, or celestial bodies.

BARDEWICK, a town of Germany, in the circle of Lower Saxony, and duchy of Lunenburg; formerly a very large place, but being ruined in 1189, by the Duke of Saxony, has never yet recovered itself. It is seated on the Ilmenau, seven miles north-east of Lunenburg, and seventeen south-east of Hamburg. It belongs to the kingdom of Hanover.

BARD, a small fort and town in the valley of Aosta, in Piedmont. The fort commanded the pass from the Valais into Piedmont. It was taken by Buonaparte in 1800, after his passage of the Great St. Bernard, and is now dismantled.

BARDI, a town of Italy, in the duchy of Placentia, on the Genoese frontier. It is near the river Cevo, has a magnificent castle, and is thirty miles south-west of Parma.

BARDOWIE, Loch, a lake of Stirlingshire, in the parish of Baldernock, extending about seventy acres, and containing plenty of pike and perch. The mansion-house of Bardowie lies within a few paces of it.

BARDSEY, an island in the Irish sea, on the coast of Wales, about two miles long, and one broad, with a small harbour on the south-east side. There is good anchorage within the bay, but the entrance is difficult for large ships. It forms the north point of Cardigan bay, and formerly contained a well-endowed monastery. Long. 5° 4' W., lat. 52° 48' N.

BARDT, a river of Germany, in Pomerania.

BARDT, a strong and rich town of Germany, in the duchy of Pomerania, with a castle and spacious harbour. It was subject to the Swedes till 1815, but now belongs to Prussia; and is situated near the Baltic sea, twelve miles west by north of Stralsund.

BARDUS, a druid, the son of Dryis, and the fifth king of the Celts.

BARE, *v. & adj.*

BAREBONES,
BAREFACED,
BAREFACEDLY,
BAREFACEDNESS,
BAREFOOT,
BAREGAWN,
BAREHEAD,
BARELEGGED,
BARELY,
BARENECKED,
BARENESS,
BAREWORN.

Heb. *parah*, to lay bare, and *bar*, pure, Goth. *barhtjan*, Germ. *baren*, Dut. *baeren*, old Sax. *abarian*. It signifies the absence of ornament, of concealment. It is the condition of nudity, of destitution, of want and poverty, of rigid completeness, without any the least appendage. The verb represents the act of

stripping off, of uncovering, of bringing to light and exposing what was hidden, of rendering defenceless. *Barefaced* denotes the absence of all disguise, or all shame; when applied to express impudence, it characterises the individual as more than ordinarily lost to all sense of decorum.

Him thought he rode al of the newe got;
Dischevele; sauf his cappe, he rode all *bare*;
Swiche glaren eyen hadde he as an hare. *Chaucer.*

Thereto he hath a groom of evil guise,
Whose scalp is *bare*, that bondage doth bewray,
Which pils and pils the poor in piteous wize,
But he himself upon the riche doth tyrannize.

Spenser.

For other meed may hope for none of mee,
To whom nought else but *bare* life doth remaine,
And that so wretched one as ye do see,
Is liker to lingering death than loathed life to bee.

Id.

How many flies in hottest summer's day,
Do seize upon some beast, whose flesh is *bare*,
That all the place with swarms do overlay,
And with their little stings do felly fare
VOL. III.

So many theeves about him swarming are,
All which do him assaile on every side,
And sore oppress, ne any him do spare. *Id.*
You have an exchequer of words, and no other
treasure for your followers; for it appears by their
bare liveries, that they live by your *bare* words.

Shakspeare.

So you serve us
Till we serve you; but when you have our roses,
You *barely* leave our thorns to prick ourselves,
And mock us with our *barreness*. *Id.*
To feed were best at home,
From thence, the sauce to meat is ceremony,
Meeting were *bare* without it. *Id.*
For their poverty, I know not where they had that;
and for their *barreness*, they never learned that of me.

Id.

She must have a husband;
I must dance *barefoot* on her wedding-day. *Id.*
Ambitious love hath so in me offended,
That *barefoot* plod I the cold ground upon
With sainted vow. *Id.*

The duke of Lancaster is dead;
And living too, for now his son is duke—
—*Barely* in title, not in revenue.

Id. Richard II.

He *bareheaded*, lower than his proud steed's neck,
Bespoke them thus. *Id.*
Here comes lean Jack, here comes *barebone*; how
long is it ago, Jack, since thou savest thy own knee?

Id. Henry IV.

Your French crowns have no hair at all, and then
you will play *barefaced*.

Id. Midsummer Night's Dream

Going to find a *barefoot* brother out,
One of our order. *Id. Romeo and Juliet.*
Know, my name is lost,
By treason's tooth *baregnawn* and cankerbit.

Id. King Lear.

The external administration of his word, is as well
by reading *barely* the Scripture, as by explaining the
same. *Hooker.*

A desire to draw all things to the determination of
bare and naked Scripture, hath caused much pains to
be taken in abating the credit of man. *Id.*

That which offendeth us, is the great disgrace which
they offer unto our custom of *bare* reading the word of
God. *Id.*

Were it for the glory of God, that the clergy should
be left as *bare* as the apostles, when they had neither
staff nor scrip; God would, I hope, endure them with
the self-same affection. *Id. Preface.*

He *barely* nam'd the street, promis'd the wine,
But his kind wife gave me the very sign. *Donne.*

He himself, with a rope about his neck, *barefooted*,
came to offer himself to the discretion of Leonatus.

Sidney.

Next, before the chariot, went two men *bareheaded*.

Bacon.

There is a fabulous narration, that an herb groweth
in the likeness of a lamb, and feedeth upon the grass,
in such sort as it will *bare* the grass round about.

Id. Natural History.

Though the lords used to be covered whilst the com-
mons were *bare*, yet the commons would not be *bare*
before the Scottish commissioners; and so none were
covered. *Clarendon.*

The animosities increased, and the parties appear-
ed *barefaced* against each other. *Id.*

According to their growth and years, they did
change the exercises of their bodies; they did shave
their heads, they went *bare-legged*, they were constrain-
ed to play naked together the most part of their time.

North. Phytach

Bring summer he would go out *baro-necked* to the waste to work in his ground among his servants and other workmen. *Id.*

How they stood
Their glory wither'd : as when heaven's fire
Hath scath'd the forest oaks, or mountain pines,
With singed top their stately growth, though *bare*,
Stands on the blasted heath. *Milton.*

God said,
Be gathered now, ye waters under heav'n,
Into one place, and let dry land appear.
Immediately the mountains huge appear
Emergent, and their broad *bare* backs upheave
Into the clouds, their tops ascend the sky. *Id.*
He scarce had said, when the *bare* earth, till then
Desert and *bare*, unsightly, unadorn'd.
Brought forth the tender grass, whose verdure clad
Her universal face with pleasant green. *Id.*

Nor are men prevailed upon by *bare* words only,
through a defect of knowledge ; but carried, with
these puffs of wind contrary to knowledge. *South.*
Were it stripped of its privileges, and made as like
the primitive church for its *bareness* as its purity, it
could legally want all such privileges. *Id.*

He held a stirrup, while the knight,
From leathern *barebones* did alight. *Hudibras.*
He *bar'd* an ancient oak of all her boughs ;
Then on a rising ground the trunk he plac'd.

Dryden.
Then stretch'd her arms t' embrace the body *bare* ;
Her clasping hands inclose but empty air. *Id.*
It is most certain, that *barefaced* bawdry is the
poorest pretence to wit imaginable. *Id.*

In the old Roman statues, these two parts were
always *bare*, and exposed to view as much as our
hands and face. *Addison.*

Envoys describe this holy man, with his Alcaides
about him, standing *barefoot*, howing to the earth. *Id.*

For virtue, when I point the pen,

Bare the mean heart that points beneath a star ;
Can there be wanting to defend her cause,
Lights of the church, orguardians of the laws? *Pope.*
Making a law to reduce interest, will not raise the
price of land ; it will only leave the country *barer* of
money. *Locke.*

Though only some profligate wretches own it too
barefacedly, yet, perhaps, we should hear more, did
not fear the people's tongues. *Id.*

If to some common's fenceless limits stray'd,
He drives his flocks to pick the scanty blade,
Those fenceless fields the sons of wealth divide,
And even the *bare-worn* common is dony'd.

Goldsmith. The Deserted Village.

Nor stoop'd at barren *bare* necessity ;
But still advancing bolder, led him on,
To pomp, to pleasure, elegance, and grace,
And breathing high ambition through his soul,
Set science, wisdom, glory in his view,
And bade him be the Lord of all below. *Thomson.*

O may no winter season, *bare* and hoary,
See it half finished : but let autumn bold,
With universal tinge of sober gold,
Be all about me when I make an end.

Keat's Endymion.

How well such dead becomes the turban'd brave—
To *bare* the subject's side before a slave!

Byron's Corsair.

BAREFOOT AUGUSTINES. **BAREFOOT CARMELITES,** are religious of the order of St. Austin and St. Camel, who live under a strict observance, and go without shoes, like the Capuchins. There are barefoot fathers of many. Formerly there were barefoot Dominicans, and even barefoot nuns of the order of St. Augustin.

BAREFOOT FESTIVALS. The Greeks, Romans, and Barbarians, have a feast called nudipedalia, or the barefoot festival. The Abyssinians never enter their churches, nor the palaces of kings and great men, but barefooted.

BAREFOOTED, in antiquity. Sagittarius has a dissertation on those who went barefooted among the ancients, De Nudipedalibus Veterum ; where- in he treats 1. of such as went barefooted in journeys, either out of choice or necessity: 2. of barefooted religious penitents ; and, 3. of the Leviri.

BAREGES, or **BARREGES,** a rugged valley of Gascony, now included in the department of the Upper Pyrenees, arrondissement of Argeliez. The village of Bareges, or Barreges les Bains, lies at the foot of the Pyrenees, contains about 60 houses, and 670 inhabitants, and is famed for its mineral waters, the principal ingredient in which is sulphurate of potash. The springs are of different degrees of heat, from 73° to 120° of Fahrenheit. Their water is limpid, unctuous, and chiefly recommended in consumptions, and in rheumatic and cutaneous diseases ; they are used both for bathing and drinking. The village is ten miles south of Bagneres. Long. 0° 8' E., lat. 42° 53' N.

BAREHEADED WOMEN, in antiquity. The Roman women, in times of public distress and mourning, went bareheaded, with their hair loose.

BAREILY, a district of Hindostan, to the east of the Ganges, between the 27th and 29th degrees of northern latitude. Under the Mogul government it was included in the province of Delhi, but was in fact a part of Kuttaher ; in modern times known by the appellation of Rohilcund. It is very fertile, and well watered. The principal towns are Bareily, Anopsheher, Buda-yoon, Pillybeet, Moradabad, Rampoor, Sumbul, and Amroah. Towards the end of the seventeenth century this country was taken possession of by the Afghan chiefs of the tribe of Roh, and remained in their possession till 1774, when it was conquered by Shuja Addowleh, under whose, and his successor's jurisdiction, it was cruelly harassed and depopulated ; but, having been ceded to the British in 1802, it is daily recovering.

BAREILY, a city of Hindostan, and capital of the above district, is situated on the banks of the Sunkra river, about forty miles east of the Ganges. It was the capital of Hafiz Rahmut, the Rohilla chief, slain at the battle of Cutterah in 1774 ; it is a large and populous town, and the seat of the British judicial establishment of the province. Long. 79° 21' E., lat. 28°.

BAREITHI, a ci-devant margravate of Germany, in the east division of Franconia, subject to the Brandenburg family, and thence styled Brandenburg-Bareith.

BAREITH, a town of Germany in Franconia, in the margravate, with a famous college belonging to the margrave of Brandenburg-Bareith. It is fifteen miles south by east of Culmbach.

BARENTS (Dieterich), an excellent painter, born at Amsterdam, and the son of an industrious but middling artist. He studied in Italy, and became the favorite disciple of Titian, with whom he lived a long time ; but at length returned to Amsterdam,

where he performed many extraordinary pieces. He died in 1582, aged forty-eight.

BARENTON, a town of France, in the department of the Channel, twenty miles E. S. E. of Avranches.

BARETTI (Joseph), an ingenious writer of the eighteenth century, was the son of an architect at Turin. We have no account of the early part of his life; but his writings show that he had travelled through various countries. He came to England in 1750; and, in a short time, he acquired such a knowledge of the English language as to write it with facility and correctness. Becoming acquainted with Dr. Johnson about 1753, he was by him introduced, as a teacher of the Italian language, to the family of Mr. Thrale. In 1760 he went back to Italy, and commenced a periodical work, entitled *Frusta Letteraria*, which was published at Venice; but the freedom of sentiment which appeared in it, giving offence, obliged him to leave that country, and he returned again to England. He was tried at the Old Bailey, in 1769, for killing a man who had assaulted him in the Haymarket, and was acquitted. In 1770 he published his *Travels through France, Spain, Portugal, and Italy*, in four vols. 8vo. When the Royal Academy was established, he was chosen secretary; and during Lord North's administration he obtained a pension. He died in 1789, aged about seventy-three. His temper was pleasant, and his disposition liberal. His works are: 1. A Dissertation on the Italian Poetry; 2. An Introduction to the Italian Language; 3. The Italian Library, 8vo.; 4. A Dictionary, English and Italian, 2 vols. 4to.; 5. A Grammar of the Italian Language, 8vo.; 6. An Account of the Manners and Customs of Italy, 2 vols. 8vo.; 7. An Introduction to the most useful European Languages, 8vo.; 8. A Dictionary English and Spanish, 4to.; 9. *Tolondron, Speeches to John Bowle*, about his edition of *Don Quixote*, 8vo.; and other tracts.

BAR-FEE, a fee of twenty pence, which every person acquitted of felony pays the gaoler.

BARFLEUR, a Cape of France, in the department of the Channel, twelve miles east of Cherbourg. Near this cape part of the French navy was destroyed in 1692, the day after the victory of La Hogue, obtained by the confederate fleet under Admiral Russel.

BARFLEUR, a town of France in the department of the Channel, arrondissement of Valognes. It contains about 140 houses, and 900 inhabitants. Its harbour, which is now choked up with sand, was in former times the best on the coast. Here William the Conqueror equipped the expedition which effected the conquest of England. In the year 1346 it was taken and destroyed by the English army, in the same campaign in which they fought the battle of Cressy. Since that time the port has been neglected, and is now frequented only by small vessels. The trade is confined to fish, fresh and salted. Twelve miles east of Cherbourg. Long. 1° 10' W., lat. 49° 40' N.

BARGA, a town of Italy, in the grand duchy of Tuscany, on the Serchio. It is the capital of a vicariate, bordering on the principality of Lucca, and contains 9000 inhabitants. In the neigh-

bouring Apennines is found beautiful jasper Six miles from Lucca.

BAR'GAIN, *v. & n.* } See to **BAR**. Goth. *bair-*
BAR'GAINING, } *gan*, Ang.-Sax. *beorgan*
BAR'GAINED, } *birgan* byrgan, Welsh
BAR'GAINER. } *bergen*, Fr. *bargaigue*.

To make a confirmed agreement. A contract either with or without purchase, usually held binding.

I do thee no wrong. Did I not *bargayne* with thee, so that thou shouldst have a denary for thy dayes labour? Thou haste done thy labour, thou haste thy couenaunte: I have nothing more to doe with thee.

Udall. Matthew, chap. xx.

Henry is able to enrich his queen,
And not to seek a queen to make him rich.
So worthless peasants *bargain* for their wives.
As market-men for oxen, sheep or horse.

Shakspeare.

No longer than we well could wash our hands,
To clap this royal *bargain* up of peace—
Heaven knows they were besmeared and overstained
With slaughter's pencil. *Id.*

No *bargains* break that are not this day made. *Id.*
Hold, sir, for God's sake: now your jest is earnest:
Upon what *bargain* do you give it me. *Id.*

What is marriage but a very *bargain*? wherein is sought alliance, or portion, or reputation, with some desire of issue; not the faithful nuptial union of man and wife. *Bacon.*

For those that are like to be in plenty, they may be *bargained* for upon the ground. *Id.*

There was a difference between courtesies received from their master and the duke; for that the duke's might have ends of utility and *bargain*, whereas their master's could not. *Id.*

No more can be due to me,
Than at the *bargain* made was meant. *Donne.*
Where sold he *bargains*, whipstitch? *Dryden.*

As to *bargains*, few of them seem to be excellent, because they all terminate in one single point. *Swift.*

No maid at court is less ashamed,
Howe'er for selling *bargains* famed. *Id.*

Give me but my price for the other two, and you shall even have that into the *bargain*. *L'Estrange.*

He who is at the charge of a tutor at home, may give his son a more genteel carriage, with greater learning into the *bargain*, than any at school can do. *Locke.*

It is possible the great duke may *bargain* for the republic of Lucca, by the help of his great treasures.

Addison on Italy.

All offer incense at my shrine,
And I alone the *bargain* sign. *Gay.*

What is all righteousness that men devise,
What! but a sordid *bargain* for the skies;
But God as soon would abdicate his own,
As stoop from heav'n to sell the proud a throne.

Cowper.

It is adjusted, however, not by any accurate measure, but by the higgling and *bargaining* of the market, according to that sort of rough equality which though not exact, is sufficient for carrying on the business.

Smith. Wealth of Nations.

BARGAIN, in the old Scottish writers, is applied to an armed fight or battle. A battle where both parties have settled the preliminaries of weapons and manner of fighting, and are so far on equal terms of security and defence. In this sense it is used by Chaucer in the *Romaunt of the Rose*.

This is the strife, and eke the affraie,
And the batell that lasteth aie,
This *bargaine* end may neuer take
But if that she thy peace wil make.

BARGAIN AND SALE, in the English law, requires to be farther explained. It is a contract whereby the bargainer, for some pecuniary consideration, bargains and sells, that is, contracts to convey the land of the bargainee; and becomes by such bargain a trustee for, or seized to the use of, the bargainee; and then the statute of uses completes the purchase: or, as it hath been expressed, the bargain first vests the use, and then the statute vests the possession. But as it was foreseen that conveyances thus made would want all those benefits of notoriety which the old common law assurances were calculated to give; to prevent clandestine conveyances of freeholds, it was enacted by statute 27 Hen. VIII. c. 16. that such bargains and sales should not enure (be available) to pass a freehold, unless made by indenture, and enrolled within six months in one of the courts of Westminster-hall, or with the custos rotulorum of the county. Clandestine bargains and sales of chattel interests, or leases for years, were thought not worth regarding, as such interests were very precarious till about six years before; which also occasioned them to be overlooked in framing the statute of uses: and therefore such bargains and sales are not directed to be enrolled. This omission has given rise to the species of conveyance by lease and release.

BARGAINS, in commerce, are distinguished, at Amsterdam, into three kinds, viz.

BARGAINS, CONDITIONAL, for goods which the seller has not yet in his possession; but which he knows have been bought for him by his correspondents abroad, and which he obliges himself to deliver to the buyer, on their arrival, at the price and conditions agreed on.

BARGAINS, FIRM, those wherein the seller obliges himself to deliver to the buyer a certain quantity of goods, at the price and in the time agreed on.

BARGAINS, OPTIONAL, those wherein a dealer obliges himself, in consideration of a premium received in hand, either to deliver or take a certain quantity of goods at a fixed price, and within a time limited; but with a liberty of not delivering or not receiving them, if he thinks proper, upon forfeiture of their premium.

BARGAINS, FORWARD, are those wherein goods are bought or sold, to be delivered at a certain time afterwards, some part of the price being advanced.

BARGE, } See to BAR. Dut. *bargie*, low
BARGE, } Lat. *barca*, Goth. *baigan*, to
BARGE-MAN, } strengthen. A barge, says
Tooke, is a strong boat, and this is still its widest meaning, as in coal-barge, &c. &c.; but it has also grown to mean, not merely a boat massy and sea-worthy, but one of pleasure; light, airy, and elegant in construction, but of less strength.

Съмыкъ иль въ пѣту бѣтъ, не можетъ lightly sail,
And the boy or the girl, and the wind may fail.

R. Brunne.

И въ пѣту бѣтъ, не можетъ, as they were,
For the boy or the girl, and the wind may fail.

And every creke in Bretagne and in Spaine;
His *barge* cycledep was the Magdelaine.

Chaucer. Prologue.

Many wafarers make themselves glee, by putting the inhabitants in mind of this privilege; who again, like the Campellians in the north, and the London *bargers*, forslow not to baigne them.

Carew's Survey of Cornwall.

ENO. I will tell you,
The *barge* she sat in, like a burnish'd throne,
Burnt on the water; the poop was beaten gold,
Purple the sails; and so perfumed, that
The winds were lovesick with them; the oars were silver;

Which to the tune of flutes kept stroke, and made
The water, which they beat, to follow faster.
As amorous of their strokes.

Shakespeare. Antony and Cleopatra.

Plae'd in the gilded *barge*,
Proud with the burden of so sweet a charge;
With painted oars the youths begin to sweep
Neptune's smooth face.

Waller.

BARGES are vessels of state, furnished with elegant apartments, canopies, and cushions; equipped with a band of rowers, and decorated with flags and streamers: they are generally used for processions on the water by noblemen, officers of state, or magistrates of great cities. Those annually exhibited on the Thames, at the election of the lord mayor of London, are uncommonly elegant.

BARGES for the use of admirals and captains of ships of war, are smaller and of a lighter frame, and may be easily hoisted into or out of the ships to which they belong.

BARGES OF BURDEN, are for lading and discharging ships, and removing their cargoes from place to place in a harbour.

BARGE, in ornithology, a name used by some authors for the godwit or stone-plover; the ægoccephalus.

BARGE, or **BARGE**, a town of Piedmont in the district of the Four Valleys; seven miles south of Pinarolo, or Pignerol.

BARGE-COUPLES, in architecture, a beam mortised into another, to strengthen the building.

BARGE-COURSE, with bricklayers, a term used for that part of the tiling which projects over, without the principal rafters, in all sorts of buildings where there is either a gable or a kirkin head.

BARGH-MASTER, BARMER, or BAR-MASTER, from beirg-meister, Ger. i. e. master of mines; in the royal mines, the steward or judge of the barmote. The bar-master keeps two great courts of barmote yearly; and every week a small one, as occasion requires.

BARMOTE, or BARMOTE, a court which takes cognizance of causes and disputes between miners. By the custom of the mines, no person is to sue any miner for ore debt, or for ore, or for any ground of variance, but only in the court of barmote, on penalty of forfeiting the debt, and paying the charges at law.

BARGRAVE (Isaac), an English divine, born in 1586, and educated at Clarehall, Cambridge. He was appointed chaplain to James I.; and in 1625 was made dean of Canterbury. When the civil war commenced he was imprisoned in the Fleet, by colonel Sandys, a man whom he had saved from the gallows! He died in 1642.

·BARI, a province in the kingdom of Naples, which has the Gulf of Venice to the north, the Terra d' Otranto to the east, Basilicata to the south, and Capitanata to the west. It contains 1760 square miles, and 290,000 inhabitants, and is rich in grain, wine, oil, cotton, fruit, and saffron. The chief town, called Bari, lies on the Gulf of Venice, and is well fortified; it is a trading place of some consequence, with 18,000 inhabitants. The principal objects of its trade are wine, oil, and fruit; and a great deal of linen is woven here for inland consumption. It has the title of a duchy, and is an archbishop's see. Eighteen miles east of Trani, 120 E. N. E. of Naples. Long. 16° 52' E., lat. 41° 15' N.

·BARI, a town of Hindostan, in the province of Bejapoor, thirty miles south-west of Raibaug.

·BARJAPPOOR, BEJAPPOOR, or BIJA-PUR, (a corruption of Vijaya-puri, the impregnable, the ancient name of the capital;) is a large province in the Deccan, extending from the fifteenth to the nineteenth degrees of north latitude. It is bounded on the north by the province of Aurungabad, south by the Toombuddra River and North Canara district, east by Aurungabad and Beeder, and on the west by the Indian Ocean; including a superficial area of 350 miles in length, by 200 the average breadth. The chain of the western Ghauts traverses the province at a moderate distance from the coast, with which it is in perfect parallel; the surrounding region is mountainous, but the eastern part is more level, watered by several fine rivers, particularly the Krishna, the Beemah, the Toombuddra, and the Gutpurba; the latter of which, before the year 1790, formed the separating boundary between the dominions of Tippoo and the Mahrattas. The productions of this province are the same as of the Deccan generally; the internal traffic is considerable, and the banks of the Beemah, celebrated all over the continent for their superior breed of horses, supply the best cavalry in the Mahratta armies.

The most remarkable natural features of the province are rivers, of which the Krishna, deriving its name from the dark color of its waters, or from its mythological connexion with the Indian Apollo, the Crishna of the Hindoos, is the most important. Emerging from the western Ghauts, forty-two miles from the coast, this river takes a south-west direction, falls in with the Warnah about Merich, and then rolling its vast stream to the east receives the principal rivers which diversify this part of India in its course, and at last empties itself by three channels into the Bay of Bengal. Although from its lofty banks, which do not admit of extensive irrigation, this river contributes less to the fertilisation of the country than others of inferior importance, it is perhaps more abundant in gems than any other river of India; gold, chalcidies, cats-eyes, onyxes, and even diamonds, being found in its bed.

Of the province generally, four-fifths have long appertained to the Mahrattas, and the remainder to the government of Nizam. The Peshwa, though nominal lord of the whole, has little effective jurisdiction. The population is estimated at seven millions, of whom one-twentieth part are Mahomedans, and the rest Hindoos of

the Brahminical order. Two languages generally prevail; the Canara on the north, the Mahratta on the south of the river Krishna; which also forms an interesting line of separation between the two different styles of building, the houses to the south being covered with clay or mud, and flat roofed, those to the north having the roofs pitched and thatched.

At the conclusion of the war between the British and Sindia in 1804, the Mahratta territories of this province exhibited a scene of the greatest anarchy. The authority of the Peshwa was resisted by the chief of every petty village. The chiefs of the various banditti were almost innumerable; amongst whom Goklah, Appah Saheb, and Bala Saheb (the sons of Purseram Bhow, and heads of the Putwurden family), Appah Dessaye, Furkiah, Bapoojee Sindiah, Madarow Rastiah, the Rajah of Colapoor, Futteh Sing Bhoonslah, Chintamun Row (the nephew of Purseram Bhow), Tantia, Punt Pritty Niddy, and others, presented formidable obstacles to the return of peace and tranquillity. The country had likewise been otherwise ravaged and depopulated, from the laxity of its internal government, and the rapid succession of governors appointed by the Peshwa, the preceding one uniformly opposing his successor. The chiefs above-named, although commonly distinguished by the name of 'Southern Jaghiredars,' were properly the Serinjamy Sirdars of the Poonah state; the possession of whose lands being granted for the payment of troops employed in state service, might be changed annually; although in this instance the lands themselves, with several other species of property, had been retained for many years.

Amidst the confusions consequent on so embarrassed a state of government, the British empire interposed her arbitration, ascertained on the part of the Peshwa to what extent of service he was entitled from the Jaghiredars, and, on the part of the latter, engaged to guarantee their possessions, and protect them from the oppressions of the Peshwa's government. General Wellesley (now duke of Wellington) expressed his disapprobation of the projects of vengeance which the above sovereign had formed against the Putwurden family, and others of the Mahratta state in immediate subjection to Poonah; and in his march southwards in 1804, entered into negotiations with the chiefs, adjusted the dissensions of the sovereign, and by the able co-operation of Col. Close and Mr. Strachey succeeded in what the home government contemplated, the final settlement of these complicated claims. That it was effected without bloodshed, is to the honor of British prudence and benevolence. MSS. Ferishta, Moor, Wilks, Scott, &c.

The territorial divisions of the province are as follows:—1. The Cóncan; 2. Cólá-púr; 3. Murtezá-ábád; 4. Ased-nagar; 5. District of Bija-púr; 6. Sácar; 7. Rái-chúr; 8. Mudgal; 9. Gajindra-gar'h; 10. Anágúndi; 11. Baucá-púr; 12. Gandac; 13. Núrgul; 14. Azim-nagar; 15. Rái-bágh.

1. The first of these divisions, Cóncan, Cancana, or Cóncan, includes a portion of territory 220 miles in length, and thirty-five in breadth, occupying the whole sea coast of the province. It is

bounded on the north by the river Sávatrî, which separates it from Cálvâni, on the west by the Indian Ocean, on the south by Canara, and on the east by the G'hâts or Ghauts. Formed by the gradual declivity of the mountains towards the sea, it presents a very unequal surface, intersected by numerous streams and torrents, together with a coast diversified with bays and inlets, although without deep and spacious harbours. The soil below the Ghauts is fertile, producing grain, hemp, cocoa-nuts, &c. The trees planted near the coast are, however, more vigorous and fertile than those cultivated higher up the country, which is commonly attributed to the sea air.

The language of the province is peculiar, possessing a great resemblance to the Sanscrit, from which some imagine it is derived. It is chiefly cultivated by the Brahmans, a peculiar race, not acknowledged by their brethren in the rest of India.

The principal divisions of the province are Concan, B'honsala, and Goa. The former includes Fort Victoria, a fortress at the entrance of the Bancût river. This division, comprehending nine villages, was taken by the British forces in 1756. So great is the advantage of living under the British government, that in 1812 the population had nearly doubled within the last ten years. B'honsala, the second division of the Concan, is a beautiful district formed by a gentle slope of hills descending from the western Ghauts to the sea, and watered by numerous rivers and mountain torrents. Like the former, it has several strong posts or rocky heights, difficult of access.

Though thinly peopled, the soil is extremely fertile, producing cocoa, betel nuts, ginger, sugar, cardamoms, pepper, and other tropical vegetables in great abundance. Iron is also found in the mountains, though wrought in a very clumsy manner by the natives. Goa, now in possession of the Portuguese, forms the southern division of the Concan. Its capital, bearing the same name, although dignified by many noble churches and public buildings, is nearly deserted from the unhealthiness of its climate and the terrors of the Inquisition. So great is the fecundity of the Roman church in this settlement, that in the year 1803 were found no fewer than 2000 ecclesiastics, although the whole extent of the territory does not exceed 400 square miles. The trade has very much declined, and the wretchedness of the country presents a very striking contrast with the English settlements in its vicinity, where every luxury is to be found. It had formerly a considerable manufacture of arack, a spirituous liquor made from toddy, or târi, extracted from the trunks of palm trees; but this is now superseded by a similar spirit at Batavia, of which rice and sugar are the principal ingredients. The dialect that is used here is a barbarous mixture of the Portuguese, Canara, and Malabrita languages. This place has been rendered interesting to the English reader by the visit which Dr. Buchanan paid to it, a full account of which is inserted in his *Christian Researches*.

2. Cólâ-pûr, or Cólâ-poor, according to the former division of the province, was in the Ser-

car of Râibâgh, and subsequently formed a small independent state, composed of several districts above and below the mountains, but so intermingled with the neighbouring states as not to be easily discriminated.

3. Mortezaabad, a contraction of Morteza-abad, is a small hilly division of the province, at a much greater elevation above the sea than the Cóncan, and is traversed by the Krishna, which rises at Mahâbaliser, within the same division of Bijâpûr. Among the most remarkable places of this province is the hill-fort of Satarah, a strong-hold of no small celebrity in the Mahratta annals, standing in lat. 17° 42' N., and long. 74° 12' E., on the pinnacle of a lofty hill, and accessible only by a narrow winding path, which admits no more than one person at a time. Its name, which signifies 'seventeen,' answers to the reputed number of its towers. A wall of solid rock encloses it on all sides to the height of thirty or forty feet. Similar sites are found in the surrounding country, and are occupied by fortresses, which, to a native army, must be nearly impregnable. Kelingah is considered as almost capable of baffling European skill if resolutely defended.

4. Ased-nagar (the city of Lions) is another division of this province. Its chief town is Pundar-pûr, a large well-built handsome town, and what is more extraordinary in an Indian city, has several broad well-paved streets. The markets are supplied with native productions and English manufactures. The banks of the river are lined with stone walls, and handsome flights of steps lead down to the water. The soil around is fertile, but little cultivated; the Brahmans considering it too sacred to be used for the unholy purposes of producing fruit for mortals.

5. Bejapoor, or Vijayapura, the Impregnable, The chief city, of the same name as, and formerly the capital of, the province, has, by European travellers of the last three centuries been denominated Viziapoor. The wall of the city was twenty feet thick, surrounded by a ditch of vast dimensions, excavated out of the solid rock, from the berme of which the curtain rises nearly forty feet, composed of huge stones strongly cemented, and frequently adorned with sculptural representations of lions, tigers, &c. The towers which flank the wall are numerous and of vast size, occurring at intervals of 100 yards. The fort is one of the largest in the world, and, measured by the counterscarp of the surrounding ditch, is no less than eight miles in circumference, and adorned with a spacious courtway from 150 to 200 yards broad. Within the citadel were the king's palace, the houses of the nobility, together with several large magazines; and without the walls were large suburbs, adorned with noble palaces.

The rock on which the city stood furnished abundance of stone for public and private buildings, and the style of their architecture unites elegance with solidity. The city is well watered and the soil rich: large sums of money, with other valuable articles, are also found among its ruins. It is said, in its most flourishing state, to have contained 984,000 inhabited houses and 1600 mosques.

Several enormous pieces of cannon, to the number of twelve, are to be seen here, corresponding with the magnitude of the fort, of which the three largest are of the following dimensions :

1. A Malabar gun.

	Feet. Inches.	
Diameter at the breech	4	5
Length from breech to muzzle . .	21	5
Circumference of the trunnions . .	4	7
Diameter at the muzzle	4	3
Ditto of the bore	1	9

2. A brass gun cast by Aurengzebe to commemorate the conquest of Bejapoor.

	Feet. Inches.	
Diameter at the breech	4	10½
Ditto at the muzzle	4	8
Ditto of the bore	2	4
Length	14	1
Circumference in the middle . . .	13	7

3. The gun called High-flyer.

	Feet. Inches.	
Length	30	3½
Circumference at the breech . . .	9	2
Circumference over the smallest part of the moulding	6	0
Diameter of the bore	1	1

The brass gun is fixed on its centre on an immense iron, fastened in the ground, and grasping its trunnions in the manner of a swivel, its breech resting on a block of wood supported by a thick wall, so that it cannot recoil. For the calibre of this gun an iron ball weighing 2646 pounds would be required. The two other guns are constructed of bars of iron hooped round, not upon carriages, but lying on blocks of wood.

The other provinces above enumerated, as belonging to the territory of Barjapoor are of minor importance, and capable of affording but little interest.

BAR-JESUS, or ELYMAS, a Jew, who pretended to be a magician; and endeavouring to obstruct Paul and Barnabas, was miraculously struck blind, Acts xiii. 8.—12.

BARILLA, or BARILLA, in botany, a plant cultivated in Spain for its ashes, from which the purest kinds of mineral alkali are obtained. There are four plants, which in the early part of their growth, bear so strong a resemblance to each other, that they would deceive any but the farmer or critical botanist. These four are, barilla gazul, or as some call it, algazul, soza, and salicornia, or salicor. They are all burnt to ashes, but applied to different uses, being possessed of different qualities. Some of the farmers mix more or less of the three last with the first; and it requires a complete knowledge of the color, taste, and smell of the ashes to be able to detect their knavery. Barilla is sown afresh every year. Its greatest height above ground is four inches: each root pushes out a vast number of little stalks, which again are subdivided into smaller sprigs resembling samphire; and altogether form a large spreading bush. The color is bright green; as the plant advances towards maturity, this color gradually changes to a dull green tinged with brown. Gazul bears the greatest affinity to barilla, both in quality and appearance. the principal difference consists in

its growing on a still drier salter earth, consequently it is impregnated with a stronger salt. It does not rise above two inches out of the ground, spreading out into little tufts. Its sprigs are much flatter and more pulpy than those of barilla, and are still more like samphire. It is sown but once in three, four, or five years, according to the nature of the soil. Soza, when of the same size, has the same appearance as gazul, but in time grows much larger, as its natural soil is a strong salt marsh, where it is to be found in large tufts of sprigs, treble the size of barilla, and of a bright green color, which it retains to the last. Salicor has a stalk of a deep green color, inclining to red, which last becomes by degrees the color of the whole plant. From the beginning it grows upright, and much resembles a bush of young rosemary. Its natural soil is on the declivities of hills near the salt marshes, or on the edges of the small drains or channels cut by the husbandmen for the purpose of watering the fields; before it has acquired its full growth, it is very like the barilla of those seasons in which the ground has been dunged before sowing. In those years of manuring, barilla, contrary to its usual nature, comes up with a tinge of red, and when burnt falls far short of its wonted goodness, being bitter, more impregnated with salt than it should be, and raising a blister if applied for a few minutes to the tongue. Barilla contains less salt than the others; when burnt, it runs into a mass resembling a spongy stone, with a faint cast of blue. Gazul, after burning, comes as near barilla in its outward appearance as it does while growing in its vegetable form; but, if broken, the inside is of a deeper and more glossy blue. Soza and salicor are darker, and almost black within, of a heavier consistence, with very little or no sign of sponginess. All these ashes contain a strong alkali; but barilla the best and purest, though not in the greatest quantity. Upon this principle, it is fittest for making glass and bleaching linen; the others are used in making soap. Each of them would whiten linen; but all except barilla would burn it. A good crop of barilla impoverishes the land to such a degree, that it cannot bear good barilla a second time, being quite exhausted. For this reason the richer farmers lay manure on the ground, and let it lie fallow for a season, at the end of which it is sown afresh without any danger, as the weeds that have sprung up in the year of rest have carried off all the pernicious effects of the dung. A proper succession of crops is thus secured by manuring and fallowing the different parts of the farm, each in their turn. The poorer cultivators cannot pursue the same method for want of capital; and are therefore under the necessity of sowing their lands immediately after manuring, which yields them a profit just sufficient to afford a present scanty subsistence, though the quality and price of their barilla be but trifling.

BARILLA, BARILLIA, or BARIGLIA, in the glass trade, is a sort of pot ashes imported from Spain, inferior in goodness to those of the Levant, called polverine when loose, small, and in powder, and rochetta when in hard rocky lumps. The frit made of these becomes fine and clear crystal glass, especially that from the rochetta, or.

the polverine in lumps; but the barilla of Spain, though it be usually fatter, yet makes not a glass so white, but usually inclining to a bluish color. The method used in making barilla is the same as that followed in Britain in burning kelp. The plant as soon as ripe is plucked up and laid in heaps, and then set on fire. The salt juices run out below into a hole made in the ground, where they run into a vitrified lump, which is left about a fortnight to cool. An acre may give about a ton.

BARILLARIUS, an ancient officer in monasteries and great households, who had the care of the casks and vessels of wine, &c.

BARJOLS, a small populous town of France, in the department of the Var, (a part of the cidevant province of Provence,) nineteen miles from Riez.

BAR-JONAS, a Syriac designation of St. Peter, importing that he was the son of Jonas.

BARITONO, in music, denotes a voice of low pitch, between a tenor and a base.

BARJUM, in ancient geography, a town of Apulia, on the Adriatic; so called from the founders, who, being expelled from the island Bari, built this town.

It is one of the metallic basis of the earth barytes, which is called by its discoverer, Sir H. Davy. To prepare barytes, make it into a paste with water, and put this on a plate of platinum. Make a cavity in the middle of the barytes, into which a little of mercury is to be placed. Touch the middle with the negative wire, and the platinum with the positive wire of a voltaic battery of about 100 pairs of plates in good action. In a short time an amalgam will be formed, consisting of mercury and barium. This amalgam must be put into a little bent tube, made of glass or silver, luted, sealed at one end, which being filled with the vapor of naphtha, is then to be carefully sealed at the other end. Heat must be applied to the reserved end of the tube, where the mercury will distil over, and the amalgam will remain.

Mr. Berzelius says Dr. Ure, 'is of a dark gray color, and has a lustre inferior to that of cast-iron. It is soluble at a red heat. Its density is superior to that of sulphuric acid; for, though surrounded with globules of gas, it sinks immediately in sulphuric acid. When exposed to air it instantly becomes covered with a crust of barytes; and when strongly heated in air, burns with a deep red flame. It decomposes violently in water, converting this liquid into a solution of barytes.' Sir H. Davy thinks it probable that barium may be prepared by chemical as well as electrical decomposition. When chloride of barium, or even sulphate, is reduced to whiteness, is exposed to the action of potassium, a dark gray substance is produced, which is the barytes or the chloride, and which decomposes copiously in water, and gives a metallic appearance, which disappears on cooling. The potassium, by being thus decomposed, is converted into potash. From numerous experiments, Sir H. Davy was inclined to conclude that the gas composed of 89.7 barium + 10.3 oxygen = 100. Thus would make the weight of the chloride of barium 97, and that of barytes 107, and that of the chloride of oxygen 1.0; a

determination nearly exact. Dr. Clarke of Cambridge, by exposing dry nitrate of barytes on charcoal, to the intense heat of the condensed hydrogen flame, observed 'metallic-looking globules in the midst of the boiling fluid, and the charcoal was found to be studded over with innumerable globules of the most brilliant lustre and whiteness. On letting these globules fall from the charcoal into water, hydrogen was evolved in a continued stream. When the globules are plunged in naphtha, they retain their brilliancy but a few days. Barium combines with oxygen in two proportions, forming, 1st. barytes, and 2d. the deutoxide of barium. See BARYTES.

BAR'K, *v. & n.* } These have the same ori-
BAR'KBARED, } gin with the words barge,
BAR'KY, } &c. The root from
BAR'KER. } which they are derived
 conveys the idea of security and defence. See **BAR**. The defence of a tree is its *bark*. It is that which protects it from the weather. Hence the application of the term to the rind or outside covering of the trees. To *bark*, is used in opposite senses. It signifies either to strip off, or to cover, as with bark.

And as in winter leaves ben biraft,
 Eeh after other til trees be bare,
 So that there nis but *barke* and braunch ylaft.
Chaucer. Troilus and Creseide.

In a walnote, without ys a byter *barke*,
 And often pat biter *barke*, be þe shall aweye,
 Ys a curnal of comfort. *Piers Ploughman.*

Thy palate then didt deign
 The roughest berry on the rudest hedge;
 Yea, like the stag, when snod the pasture sheets,
 The *barks* of trees, thou brow'sd.

Shakespeare. Antony and Cleopatra.
 So doth the woodbine the sweet honeysuckle,
 Gently entwist; the female ivy so
 Enrings the *barky* fingers of the elm.

Id. Midsummer's Night Dream.
 What craftsman art thou, said the king,
 I pray thee tell me trow,
 I am a *barker*, sir, by my trade;
 Now tell me what art thou?

Edward IV. and Tanner of Tamworth, in Percy.

The cause is, for that trees last according to the strength of their sap and juice; being well munit by their *bark* against the injuries of the air.

Bacon's Natural History.
 Perhaps some cold bank is her holster now,
 Or 'gainst the *bark* of some broad elm,
 Leans her unpillow'd head fraught with sad fears.

Milton.
 The slant lightning, whose thwart flame driv'n down,
 Kindles the gummy *bark* of fir or pine,
 And sends a comfortable heat from far,
 Which might supply the sun. *Id.*

I'll carve thy name on *barks* of trees,
 With true love knots and flourishes,
 That shall infuse eternal spring
 And everlasting flourishing. *Hudibras.*

For oft engendered by the hazy north,
 Myriads on myriads, insect armies warp
 Keen in the poison'd breeze, and wasteful eat
 Through buds and *bark* into the blackened core,
 Their eager way. *Thomson.*

Wand'ring in the dark,
 Physicians for the tree have found the *bark*.

Dryden.
 The severest penalties ought to be put upon *barking*
 any tree that is not felled. *Temple.*

These trees, after they are *barked* and cut into shape, are tumbled down from the mountains into the stream. *Addison.*

Excorticated and *bark-bared* trees may be preserved by nourishing up a shoot from the foot, or below the stripped place, cutting the body of the tree sloping off a little above the shoot, and it will heal, and be covered with *bark*. *Mortimer.*

In the kingdom of Monomotapa, they have a method of deciding lawsuits equally whimsical and uncertain. The witness for the plaintiff chews the *bark* of a tree, endued with an emetic quality; which, being sufficiently masticated, is then infused in water, which is given the defendant to drink.

Blackstone's Commentaries.

BAR'K, *v. & n.* } Derived from the same
BAR'KER, } word as the preceding. Its primary sense is to guard and defend. Thus the *bark* of a dog is his own defence and ours. It appraises of danger, expresses anger, and excites fear. To *bark*, therefore, is to make a noise, either to annoy others, or to protect ourselves.

Vile is the vengeance on the ashes cold,
And navy base, to *bark* at sleeping fame.

Spenser's Faerie Queene.

You dare patronage

The envious *barking* of your saucy tongue

Against my lord.

Shakspeare.

Sent before my time

Into this breathing world, scarce half made up,
And that so lamely and unfashionably,
That dogs *bark* at me. *Id. Richard III.*
Why do your dogs *bark* so? be there bears i' th' town?
Id. Merry Wives of Windsor.

What hath he done more than a base cur? *barked* and made a noise? had a fool or two to spit in his mouth? But they are rather enemies of my fame than me, these *barkers*. *Ben Jonson.*

Her clacking mill, driv'n by her flowing gall,
Could never stand, but chide, rail, *bark*, and bawl,
Her shield no word could find, her tongue engross'd them all. *Fletcher's Purple Island.*

And when more age and strength more fierceness lent,

She taught him in a dark and desert wood,
With force and guile poor passengers to slay,
And on their flesh his *barking* stomach stay,
And with their wretched blood his fiery thirst allay. *Id.*

I have oft heard

My mother, Circe, with the graces three,
Amidst the flow'ry kirtled Naiades,
Culling their potent herbs and baleful drugs,
Who as they sung would take the prison'd soul,
And lap it in Elysium; Scylla wept,
And chid her *barking* waves into attention,
And fell Charybdis murmur'd soft applause. *Milton.*

BAR'K, } The *barks* are all of a family;
BAR'KMEN, } for their great progenitor, see to BAR. A *bark*, says Tooke, is a stout vessel, in the same sense that *barge* is a strong boat, implying safety and defence. The word, however, does not always convey this its primary meaning. It is frequently applied indiscriminately to small ships employed either for commerce or pleasure.

Like as a ship with dreadful storme long tost,

Having spent all her mastes and her ground-hold,
Now far from harbour, likely to be lost,

At last some fisher *barke* doth neare behold,
That giveth comfort to her courage cold. *Spenser.*

And I, in such a desperate bay of death,
Like a poor *bark*, of sails and tackling reft,
Rush all to pieces on thy rocky bosom.

Shakspeare.

The duke of Parma must have flown, if he would have come into England: for he could neither get *bark* nor mariner to put to sea.

Bacon, on the War with Spain.

O my soul's joy:

If after every tempest come such calms,
May the winds blow till they have waken'd death!
And let the labouring *bark* climb hills of seas,
Olympus-high; and duck again as low
As hell's from heaven! If it were now to die,
'Twere now to be most happy; for, I fear,
My soul hath her content so absolute,
That not comper comfort like to this
Succeeds in unknown fate. *Id.*

Whilst I, in vale of tears, at anchor ride
Where winds of earthly thoughts my sails misguide,
Harbour my fleshly *bark* safe in thy wounded side.

Fletcher's Purple Island.

Some have the boots of their own life to guide,
Some of whole families doe row the *barge*,
Some govern petty townships too, beside
(To those compar'd which of small *barkes* have charge)

Some others rul'd great provinces, and they

Resemble captains of huge Argosies;

But when of kingdoms any gayne the sway,

To generals of fleets we liken these. *George Wither.*

When they come near the shore the *barkemen* leap
out of the *bark* into the sea to keep the *bark* right,
that she cast not thwart the shore.

Hackluyt. Voyages, &c.

It was that fatal and perfidious *bark*

Built in th' eclipse, and rigg'd with curses dark,

That sunk so low that sacred head of thine. *Milton.*

Who to a woman trusts his peace of mind,

Trusts a frail *bark* with a tempestuous wind.

Granville.

Like a flag floating when the *bark's* ingulph'd,

It floats a moment, and is seen no more;

One Cæsar lives, a thousand are forgot. *Young.*

Ill fares the *bark* with trembling wretches charg'd

That toss'd amid the floating fragments, moors

Beneath the shelter of an icy isle

While night o'erwhelms the sea, and horror looks

More horrible.

Thomson.

My sole resources in the path I trod

Were these—my *bark*—my sword—my love—my God!

The last I left in youth—he leaves me now—

And man but works his will to lay me low.

Byron's Corsair.

BAR'K, in the anatomy of plants, is that exterior coat of trees, corresponding to the skin of an animal. For its organisation, &c. see BOTANY. As animals are furnished with a panniculus adiposus, usually replete with fat, which invests and covers all the fleshy parts, and screens them from external cold; plants are encompassed with a bark replete with fatty juices, by means whereof the cold is kept out, and in winter the spiculæ of ice prevented from fixing and freezing the juices in the vessels: whence it is that some sort of trees remain ever-green all the year round, their barks containing more oil than can be spent and exhaled by the sun, &c. The bark has its peculiar diseases, and is infested with insects peculiar to it. It appears from the experiments of Buffon, that trees stripped of their bark the whole

length of their stems die in about three or four years. But it is very remarkable, that trees thus stripped in the time of the sap, and suffered to die, afford timber heavier, more uniformly dense, stronger, and fitter for service, than if the trees had been cut down in their healthy state. Something of this nature was observed by Vitruvius and Evelyn. The ancients wrote their books on bark, especially of the ash and lime tree, not on the exterior, but on the inner and finer bark called phylra; and this custom is yet frequent in the east. Many kinds of bark are used in the arts. Some in agriculture and in tanning leather, as the oak bark; some in physic, as the Jesuit's &c. others in dyeing, as the bark of alder and walnut trees; others in spicery, as cinnamon, mace, cassia lignea, &c.; and others for divers uses, as the bark of the cork tree, &c. In the East Indies they prepare the bark of a certain tree so as to spin like hemp. After it has been beaten and steeped in water, they extract long threads from it, which are something between silk and common thread; being neither so soft nor so glossy as silk, nor so rough and hard as hemp. They mix silk with it in some stuffs, and these are called millaes, and cherquemolles. The Japanese make paper of the bark of a species of mulberry tree. See MORUS. In the island of Otaheite, the natives make their cloth, which is of three kinds, of the bark of different trees; the paper-mulberry above mentioned, the bread-fruit tree, and the cocoa-tree. That made of the mulberry is the finest and whitest, and worn chiefly by the principal people. Of the bark, too, of a tree which they call poerou, the hibiscus tiliaceus of Linnæus, they manufacture excellent matting; a coarse sort which serves them to sleep upon, and a finer to wear in wet weather. Of the same bark they also make ropes and lines, from the thickness of an inch to the size of a small packthread.

BARK, JESUIT'S, or **BARK** by way of eminence, quinquina, or cinchona. See CINCHONA.

BARK, INDIAN, *Thuris cortex*, a medicinal bark, brought from the East, rolled up like cinnamon; of a rusty color, a warm aromatic bitter taste, and pleasant smell; sometimes used in fumigation against fits of the mother.

BARK, in navigation, is a general name given to small ships; it is however sometimes peculiarly appropriated to those which carry three mariners, who are trained up in the coal trade. Some apply this distinction to a broad sterned ship, which carries no ornamental figure on the stern or prow.

BARK, LONG, is a small vessel without deck, and longer and lower than the common barks, being sharp before, and commonly going both with sails and oars. It is built after the manner of a sloop, and in many places is called a double sloop.

BARK, WATER, a little vessel used in Holland for the carriage of fresh water to places where it is wanting, as well as for the fetching sea-water to make salt of. Water barks have a deck, and are filled with water up to the deck.

BARK BED, in gardening, is that sort of hot-bed which is either wholly or principally constituted of tanner's bark. This bed, from its pre-

paring the most uniform and regular degrees of heat, is found by much the most useful in the propagation and culture of all kinds of tender exotic plants that are brought from warm climates, and which stand in need of the continued assistance of artificial heat in this part of the world. Beds of this nature, with a little trouble in the management of them, are found sometimes to support a pretty uniform and regular temperature for a considerable length of time. They are generally employed in hot-houses, being formed in pits or cavities constructed for the purpose, frequently the whole length of the house, six or seven feet in width, and three in depth, being enclosed by means of brick-work. See **BARK PIT**.

In these beds the pots of tender exotics are plunged and supported; while they at the same time afford the houses or stoves degrees of heat that may be proper for the growth and support of other plants that do not require to be plunged into the beds. Bark hot-beds are likewise occasionally formed in pits, constructed for them in the open ground, separately and detached from the hot-house. These are walled round with bricks, chiefly above the surface of the ground, having a frame or coping of wood upon the top, on which glass lights are fixed so as to slide with facility. See **BARK PIT**.

Beds formed of bark are also employed with success in various sorts of early productions, as early strawberries, melons, peas, French beans, &c., and, by the regular and moderate heat they afford, they mostly bring them forward in the greatest perfection. They are likewise made use of in forcing different sorts of curious flowers, of the bulbous, tuberous, and fibrous-rooted kinds, into early bloom—as hyacinths, dwarf-tulips, narcissus, jonquils, anemonies, ranunculuses, pinks, &c. also many flowering plants of the small shrubby kind, as roses, hypericums, &c. Bark beds are also employed with great advantage in forcing frames for the purpose of producing early fruit of the apricot, peach, and grape kinds. See **FORCING FRAMES** and **HOT-WALLS**.

Hot-beds constituted of bark, from the slow and regular manner in which the heat is in common evolved, are not so liable, as those of dung, to injure the plants by their steam; they are therefore to be preferred for all the more important purposes of forcing, where the material can be obtained. The heat of them may be perpetuated for a great length of time, by having recourse occasionally to the practice of forking or turning them over, adding in such operations about a third part of new tan or bark. The beds are, however, to be wholly, or in great part, renewed every autumn and spring.

BARK MILL, a mill constructed for the purpose of grinding and preparing bark till it is fit for the use of the tanner. Bark mills, like most other mills, are worked sometimes by means of horses, at others by water, at others by wind, or by steam. Several of these mills are described in different volumes of the Repertory of Arts and Manufactures, and an ingenious one in Gregory's *Mechanics*, vol. ii. Mr. Chapman's simple machinery for this purpose (for which he took out a

patent in July 1805) is thus described, as below, in No. 3, of the *Retrospect of Arts and Manufactures*. It may be worked by horses, or in any of the usual ways. A large horizontal face-wheel gives motion to a horizontal tumbling shaft, which unites with the gudgeon of a large rag-barrel: two other cylinders are posited horizontally with respect to this rag-barrel, one on each side; one of these is a smaller rag-barrel, the other is a spike-roller. A moderate-sized wheel at one end of the larger rag-barrel has its teeth to play into the leaves of a pinion on the end of the spike-roller, thus communicating motion to that roller and to a large fly-wheel turning on the same axis: two or three other smaller wheels and pinions communicate motion from the larger to the smaller barrel, and in such manner that the latter has a considerably less velocity than the former, and turns the contrary way. A horizontal hollow frame contains the barrels and spike-roller, and the bottom plate of this is movable by means of screws, so as to be capable of adjustment, and placed at a suitable distance from the rag-barrel, to act as a grinding-plate. Two screws, whose heads are at one end of this frame, serve to place the smaller rag-barrel at a convenient distance from the larger. This large barrel has about twenty rows of plates with their indentations turning downwards, while the indentations of the smaller barrel project upwards; so that this latter barrel gathers the bark and holds it fast, while the larger one tears it to pieces; and the spike-roller on the other side of this larger barrel keeps it clean. A sloping spout conveys the torn bark from the grinding-plate to an inclining cylinder, posited like the cylinders in dressing machines for flour-mills: the wires of this cylinder are of two different kinds with respect to fineness, the coarsest being lowermost; and beneath it two bins are placed, the one to receive the finer dust, the other the coarser or hand-dust from the cylinder; and next to these stands a basket to receive the torn bark as it passes through the cylinder.

BARK PIT, a pit or cavity of a long, square, or other form, a yard or more in depth, appertaining to a hot-house or stove, &c. and being formed internally, or detached externally, in which to make tan or bark hot-beds, commonly called bark beds. The dimensions are four, five, or six feet in width, or more, having length in proportion to that of the hot-house, &c., and when in detached pits, such as may be required. In both methods they are formed by a low surrounding brick-wall, about a yard in height in the internal pits, and in the external ones three or four feet in front, by four or five in the back wall. These different sorts of pits are indispensably necessary, where bark beds are intended, to make the beds in, as the short loose nature of the tan will not admit of being formed into compact regular beds without the aid of such kinds of enclosed pits to confine it close together within the limits that are requisite in the formation of the beds.

Bark pits are necessary for various purposes, in all hot-houses or stoves, and occasionally in forcing-houses, &c. And detached bark pits, distinct from the hot-house, are likewise very

useful in all extensive gardens on many occasions, being of great service in the culture of many sorts of tender exotics, and in raising various kinds under different methods of propagation, as well as for raising and nursing those of similar kinds in their young and tender growth; also occasionally for forcing and raising early productions of several sorts of hardy plants in the greatest perfection.

Hot-houses, or stoves of the common width, have in general only one pit, extending lengthways of them, as described above; but, if they are of considerable extent in length, the pit is sometimes divided in the middle by an intervening passage, to render it more convenient in performing the necessary culture of the plants. Some hot-houses, however, of very great width, have two internal bark pits ranging parallel lengthways, with an alley or passage extending between them, which renders them more commodious in giving the requisite culture to the plants that are plunged in the beds, than if the whole was in one extremely wide pit, in which it would often be very inconvenient to come at the plants placed towards the middle of them; so that two parallel pits, four or five feet wide each, become more eligible than one of eight or ten feet, and, by having an intervening passage, give a larger scope, and afford a better current of air, for the growth of the plants in the beds, as well as admit of viewing them to greater advantage and effect.

Detached bark pits should always be erected in warm dry situations, in a southerly aspect, and be constantly ranged lengthways in the direction of east and west, or nearly so, in order to have the whole front incline fully to the south sun, in a sloping manner, on which to place the glasses in the same position, being generally stationed either contiguous to the hot-house or stove, but at a proper distance in front of it, as the situation and convenience of the place may admit; or they may be erected at one or at both ends, extending in a line with it but separated by a passage between them. But detached bark pits are sometimes formed with ridged tops, like the roofs of houses, the glasses sloping to both sides, being ranged lengthways north and south, in order to have the benefit of the sun equally on both sides, and used for the same purposes as the others; though the common south-fronting pits, extending east and west, are more generally adopted, being less expensive in glass-work, &c. and, in general, more convenient for different purposes of the forcing kind. They should be constructed with walls of brick-work, forming the upright sides and ends nine inches thick; and where fire-flues are intended, the back wall should be of a proper thickness from the bottom to admit of having flues in the upper parts, a fire-place being contrived externally at the bottom at one end; or, in considerably extended pits a double fire-place may be formed in the middle, behind, or one at each end, either endways or in the back part, as may be thought the most convenient. Some detached pits are formed of wood-work only, by means of post and planking, serving for particular occasions, where no fire heat is required, as flues for that

purpose cannot be admitted in such kinds of pits; where additional heat is occasionally necessary in such pits, it is effected by applying a strong lining of hot dung to the outsides; by which a good constant heat may be supported. In these bark pits sometimes the younger pineapple plants are deposited and nursed for the first year; they are likewise occasionally used for the purposes of propagating, raising, and nursing tender plants in spring and summer, &c. also for forcing early esulent crops, flowers, &c.

The principal detached bark pits should, however, be formed with brick-work walls; as being the most effectual for general use, and of the greatest duration.

BARKARY, a tan-house, or place to keep bark in, for tanners.

BARK-BINDING, a distemper incident to trees; cured by slitting the bark, or cutting along the grain.

BARK-GALLING, is when the trees are galled with thorns, &c. It is cured by binding clay on the galled places.

BARKHAM (Dr. John), a learned divine and antiquary, born at Exeter about 1572, and educated at Oxford. He possessed successively several preferments, and died at Bocking in Essex, of which he was rector and dean, 1642. He was an accomplished scholar, and an exact historian. He had an excellent collection of coins and medals, which he gave to archbishop Laud, and which Laud afterwards left to the university of Oxford. Speed acknowledges the assistance he had from Barkham, whom he styles 'a gentleman, composed of learning, virtue, and courtesy.' The 'Annals' of John and Henry II. are reckoned to be chiefly of his writing. He had also the principal hand in 'Guillim's Display of Heraldry,' 1610, fol.

BARKHAM-STEAD. See **BERKHAMSTEAD**.

BARKING OF TREES, the peeling off the rind or bark. This must be done, in our climate, in the month of May, because at that time the sap separates the bark from the wood. It would be very difficult to perform it at any other time of the year, unless the season was extremely wet and rainy; for heat and dryness are a very great hindrance to it.

BARKING, a town of Essex, on the river Rodling, near the Thames, chiefly inhabited by fishermen. It once had a large monastery. The Danes destroyed the town in 870, but it was rebuilt soon after the coronation of William the Conqueror. The soil of the vicinity is remarkably rich, but the air is unhealthy. Goods are brought up from the Thames in vessels to its quay. It is seven miles from London, has a fair October 22d, and a market on Saturday.

BARKSDALE (Clement), a learned writer, born at Winchcombe, in Gloucestershire, in 1609. He received the first part of his education at Abington-school, and afterwards went to Oxford. He became master of the grammar-school at Hereford; but when the rebels took that city, he removed to Hawling, in Gloucestershire, and opened a school there. At the Restoration he was presented to the living of Naunton, and died there in 1637. His writings are, 1. *Monumenta Litteraria: sive obitus Elogia*

Ductorum virorum, ex Historiis J. A. Thuan, 4to. 2. *Nympha Libethitis*, or the *Cotswold Muse*, 8vo. 1651. 3. *Life of Hugo Grotius*, 12mo. 1652. 4. *Memorials of Worthy Persons*, 12mo. 1661; and other tracts. He also published several sermons.

BARKWAY, a town of Hertfordshire, on the great road from London to York; three miles from Royston, eighteen from Cambridge, and thirty-five from London. It has a fair July 20, and a market on Friday.

BARLAAM, a learned monk of the fourteenth century, was a native of Calabria. Having gone to Constantinople to study the Greek language, he gained the favor of the emperor Andronicus, of whom he received the abbey of St. Saviour, and was employed to negotiate a reunion between the two churches. The emperor also employed him to solicit the assistance of the Christian princes against the infidels; and on his return he occupied his pen in writing against the Latins. He, however, quickly changed his principles on being made bishop of Gerace, in Italy, and commenced an opponent of the Greeks. He died in 1348. His letters were printed in Ingolstadt in 1604. He was a great opponent of Greg. Palama and the Hesychastæ.

BARLAAMITES, in church history, the followers of Barlaam.

BARLÆUS (Gaspar), professor of philosophy at Amsterdam, and one of the best Latin poets of the seventeenth century. He defended Arminius; and showed his abilities as an historian by his relation of what passed in Brasil, during the government of prince Maurice, of Nassau, published in 1647. He died in 1648.

BARLÆUS (Lambert), professor of Greek at Leyden. In conjunction with Rivius, he translated the confession of the reformed churches into Greek, and published the *Timon of Lucian*, with notes; also, *Annotations on Hesiod's Theogony*. He died in 1655.

BARLAND (Adrian), a learned Dutch critic, was professor of eloquence at Louvain. He published *Notes on Terence*, *Virgil*, *Pliny the younger*, and *Menander*; *An Abridgement of Universal History*; *The Chronicles of the Dukes of Brabant*; *De Literatis urbis Romæ Principibus*, &c. He died at Louvain in 1542.

BARLERIA, *SNAP-DRAGON*, in botany, a genus of the angiospermia order, and didynamia class of plants, ranking in the natural method under the fortieth order personatæ: *CAL.* quadripartite, two of the stamina much less than the rest; the capsule quadrangular, bilocular, bivalved, elastic, and without elaws; and the seeds are two. There are ten species; all natives of the warm parts of America, and therefore required to be kept in a stove, and treated like other tender exotics. They possess no great beauty nor any remarkable property.

BARLETTA, a sea-port town of Italy, in Naples, in the Terra di Bari, with a bishop's see. It is situated on the Gulf of Venice, thirty miles south-east of Manfredonia.

BARLETTA (Gabriel), a Dominican of singular fame in the fifteenth century. He was born at Barletta, in the kingdom of Naples, about 1400. 'His sermons,' says Dr. Watkins, 'exhibit such

a mixture of religious and comic expressions, sublime and vulgar ideas, the serious and the ridiculous, and, what is more remarkable, the whole written in such a barbarous language, compounded of Greek, Latin, and Italian, as to have rendered them one of the most extraordinary productions of literature. Such, however, was his fame among his contemporaries, as to have occasioned this proverb: 'nescit predicare qui nescit Barlettare.' From this singular and rare merit, his sermons were eagerly sought after and read, and they quickly passed through more than twenty editions. The best is that of Venice, in 1577, two vols. 8vo.

BARLEY, *n. s.* derived by Junius from $\bar{\gamma}$ hordeum; grain of which malt is made. It hath a thick spike; the calyx, husk, awn, and flower, are like those of wheat or rye, but the awns are rough; the seed is swelling in the middle, and, for the most part, ends in a sharp point, to which the husks are closely united. The species are, 1. Common long-eared barley. 2. Winter or square barley, by some called *big*. 3. Sprat barley, or battledoor barley. All these sorts of barley are sown in the spring of the year, in a dry time. In some very dry light land, the barley is sown early in March; but in strong clayey soils it is not sown till April. The square barley, or *big*, is chiefly cultivated in the north of England and in Scotland; and is hardier than the other sorts.—*Miller*. Barley is emollient, moistening, and expectorating; barley was chosen by Hippocrates as a proper food in inflammatory distempers.—*Arbuthnot on Aliments*.

BARLEYBRAKE, *n. s.* a kind of rural play.

By neighbours prais'd she went abroad thereby,
At barleybrake her sweet swift feet to try. *Sidney*.

BARLEY-BROTII, *n. s.* from barley and broth; a low word sometimes used for strong beer.

Can sodden water

A drench for surreyn'd jades, their *barley broth*,
Decoct their cold blood to such valiant heat?

Shakspeare.

BARLEY-CORN, *n. s.* from barley and corn; a grain of barley; the beginning of our measure of length; the third part of an inch.

A long, long journey, choak'd with brakes and thorns,
Ill measur'd by ten thousand *barley corns*. *Tickell*

BARLEY-MOW, *n. s.* from barley and mow; the place where reaped barley is stowed up.

Whenever by yon *barley mow* I pass,
Before my eyes will trip the tidy lass. *Gay*.

BARLEY BIRD, in zoology, a name given in Sussex to the fringilla spinus, or siskin, on account of its visiting them in barley time.

BARLEY, in botany. See HORDEUM and AGRICULTURE. The principal use of barley in England is for making beer; in order to which it is first malted. See BREWING. The Spaniards, among whom malt liquors are little known, feed their horses with barley as we do with oats. In this country barley is a frequent ingredient in broths.

BARLEY, FRENCH, and **BARLEY, PEARL**, barley freed of the husk by a mill; the distinction between the two being, that the pearl barley is reduced to the size of small shot, all

but the very heart of the grain being ground away.

BARLEY-WATER is a decoction of either of these, reputed soft and lubricating, of frequent use in physic. This well known decoction is a very useful drink in many disorders; and is recommended, with nitre, by some authors of reputation, in slow fevers.

BARLEY-BROTH. See BARLEY.

BARLEY-CORN, is used to denote a long measure, containing in length one-third of an inch, and in breadth one-eighth. The French carpenters also use barley-corn, grain d'orge, as equivalent to a line, or one-twelfth of an inch.

BARLEY-CORN, grain d'orge Fr.; is also used in building for a little cavity between the moulding of joiners' work, serving to separate or keep them asunder; thus called, because made with a kind of plane of the same name.

BARLOW (Francis), an English painter, born in Lincolnshire. On his coming to London, he was placed with a limner; but his genius led him chiefly to drawing of birds, fish, and other animals. There are six books of animals from his drawings, and his etchings are numerous; his illustrations of Æsop is his greatest work. He died in 1702. There is something pleasing in his composition and manner, though neither is excellent. His birds, in general, are better than his beasts.

BARLOW (Thomas), born in 1607, was appointed fellow of Queen's college, Oxford, in 1633, and two years after was chosen reader of metaphysics to the university. He was keeper of the Bodleian, and in 1657 was chosen provost of Queen's college. After the Restoration, he was nominated one of the commissioners for restoring the members expelled in 1648. He wrote at this time *The Case of Toleration in Matters of Religion*. In 1675 he was made bishop of Lincoln. After the popish plot, he published several tracts against the Roman Catholics; in which he shows an uncommon extent of learning and polemical skill. When the duke of York, however, was proclaimed king, he took every opportunity of expressing his affection towards him; but after the Revolution, as readily voted that the king had abdicated his kingdom; and was very zealous in excluding those clergymen who refused the oaths. His moderation, to call it by the softest name, was very great; so great, indeed, as often to bring the firmness of his character into question. But casuistry, which was his most distinguished talent, reconciles seeming contradictions. He died at Buckden, in Huntingdonshire, in 1691, aged eighty-five.

BARLOW (Joel), an American poet, the author of the *Columbiad*, was born at Reading, in the state of Connecticut, in the year 1757. He received his education at Dartmouth College; and in the latter part of the struggle which his country maintained for independence, served in her army. When his services were no longer required in the capacity of a soldier, he commenced the task of benefiting his country, and promoting his own fortune as a public writer; and, having engaged in partnership with a bookseller and printer at Hartford, conducted a newspaper there

for two years. His education had been directed to the profession of law, although the troubles of the American union had, for a time, diverted his mind from legal pursuits; and on the restoration of tranquillity, and the establishment of independence, he resumed his original determination. He was accordingly called to the bar in 1785, and practised for some time with success. Two years afterwards he published his *Vision of Columbus*, a poem in nine books, which embraced almost all the events of the epic, which he subsequently gave the world under the title of the *Columbiad*. In the same year, or nearly about the same time, he accepted of the situation of agent to the Ohio Land Company. In this capacity he came to England to sell their lands, and to engage settlers to occupy them. The same employment led him to France, where he remained during the era of the French revolution; and as he witnessed in his own country a struggle for liberty and independence, ending in the most brilliant success, so he sympathised, without reserve, in the feelings of the French popular party, and anticipated from their efforts the most glorious results. Neither the precipitate violence with which the demagogues prosecuted their objects of reform, nor the atrocities of a licentious mob, who received the watchword of havoc and bloodshed from the fierce spirits now called into action, nor the acts of tyrannical injustice committed under the sacred name of liberty, could deter this intrepid republican from admiring and applauding the work of revolution. Nor was he satisfied with bestowing on it his own individual tribute of encouragement and approbation. He offered himself as one of the deputies from the London Constitutional Society, who should carry to the hall of the French convention the congratulations of England upon the glorious prospect of a regenerated people, and to unite their wishes with that assembly for the general diffusion over the world, of the freedom that assembly had conferred on their country. About the same time he published three political pamphlets, containing his opinions on passing events, and preaching the doctrine of reform. One of these is entitled *Advice to the privileged Orders*, and was, at the time read with great avidity. His political lucubrations, and the part he took in conveying to the national convention of France the address of English subjects, were regarded with a jealous eye by the administration of this country, and rendered it unadvisable in him to return to Britain. He continued therefore at Paris, and was much connected with the leaders of the *Gironde* party. Washington, being then president of the United States, appointed him, in 1795, envoy to the *Barbary* powers, and with them, in the following year, he negotiated treaties of peace. From the year 1796 till 1804, he principally resided at Paris, kept an elegant house, entertained occasionally the Americans, or the few English who could visit that city, and gained the esteem of the natives by the politeness and urbanity of his manners. He thus had the misfortune to see the tree of liberty, whose roots had been watered with the best blood of France, cut down by the axe of a military despot. He had

the misfortune to see those ferocious citizens, who, at first, pretended a desire to recline under its shadow, only maddened with its fruits, and, in the paroxysms of the fury which they inspired, rushing forth to conquer and oppress the nations. In 1804 Mr. Barlow resolved to return to America, and in his way thither visited England. In the metropolis he was well received by many who had experienced his hospitality at Paris, and remained for a few months to enjoy their society. He was cured of his admiration for French liberty, and deplored the establishment of the imperial power; but his preference for a republic seemed to have remained unchanged. After returning to America, he occupied himself with revising, amending, and enlarging his poem on American history, which, upon republication, he entitled the *Columbiad*. It appeared in 1808, in a splendid volume, printed at Philadelphia, adorned with engravings, and was the most magnificent work that had issued from the American press. But its reception in the literary world was not conformable with the splendor of its appearance. It was read and criticised in this country when it first appeared, but it never had much circulation, and we believe is now almost forgotten. Mr. Barlow's principles and conduct could not fail to render him a favorite with the ruling party in the American states, and as he was, from long residence in Paris, well acquainted with the French character, and the principles of the French government, he was employed by president Madison, in 1812, in a mission to France. The relations of America with the French empire were then in a very intricate undecided state, but requiring a speedy understanding and prompt adjustment; and as the emperor, in his Russian expedition, had carried the powers of the government along with him, Mr. Barlow set out from Paris to encounter the severities of a Polish winter in obtaining an interview with the Great Napoleon. He was not favored with a sight of the emperor; and though he lived till he returned from Moscow, the swords of the Cossacks had rendered his lustre less dazzling, and a treaty of alliance with him of less importance. He died near Cracow, in Poland, about the beginning of December, 1812.

BARLOWE (William), bishop of Chichester, descended of an ancient family in Wales, was born in the county of Essex. In his youth he favored the Reformation; and went to Germany to be instructed by Luther and other preachers of the new doctrine. How long he continued a Protestant is uncertain: but he was a regular canon in the Augustine monastery of St. Osyth, in Essex, and studied at Oxford with the brothers of that order, where he took the degree of D. D. He was then made prior of the convent at Bisham, in Berkshire; and afterwards succeeded to the several priories of Blackmore, Typtree, Lega, Bromhole, and Ilaverford West. On the dissolution of abbeys, he resigned not only with a good grace, but persuaded several abbots to follow his example. Henry VII. was so pleased with his ready obedience on this occasion, that he sent him, in 1535, on an embassy to Scotland; in the same year made him bishop of St.

Asaph; in two months after translated him to the see of St. David's, and in 1547 to that of Bath and Wells. During this time our good bishop, as appears from his epistle to the king, was, or pretended to be, a staunch papist. It was written in 1533, and in it he regrets that he had 'made certayn bokes, and soffred them to be imprinted, as the tretise of buryall of the masse, &c. In these tretises I perceive and acknowledge myself grievously to have erred against the blessed sacrament of the altare; disallowing the masse and denying purgatory, with slanderous infamy of the pope and my lord cardinal,' &c. However, when Edward VI. came to the crown, he was again a protestant; and for that reason, on queen Mary's accession, was deprived of his bishopric, and sent prisoner to the Fleet, where he continued some time. At length he found means to escape, and join the other English Protestants in Germany. Upon queen Elizabeth's accession, he was raised to the see of Chichester, and soon after made a prebendary of Westminster. He died in 1568, and was buried at Chichester. He had five daughters, each of whom married a bishop. He wrote, 1. The Buryall of the Masse. 2. The Climbing of Fryers and Religious Persons, ported with Figures. 3. Christian Homelies. 4. A Book upon Cosmography. 5. The Godly and Pious Institution of a Christian Man, commonly called the Bishop's Book; and several other works. He is said to have been the translator of the Apocrypha, as far as the Book of Wisdom. His letters to M. Parker, are in MS. in Corpus Christi College, Cambridge, Misc. i. 445.

BARLOWE (William), a mathematician and divine, the son of the bishop, was born in Pembrokeshire, whilst his father was bishop of St. David's. In 1560 he was entered of Baliol college, Oxford; and in 1564 took a degree in arts, which having completed by determination, he left the university and went to sea; but in what capacity is uncertain: however, he acquired considerable knowledge in the art of navigation. About 1573 he became prebendary of Winchester, and rector of Easton near that city. In 1588 he was made prebendary of Litchfield, which he exchanged for the place of treasurer. Some years after, he was made chaplain to prince Henry, the son of king James I.; and in 1614 archdeacon of Salisbury. He was the first writer on the magnet. He died in 1625, and was buried at Easton. His works are, 1. The Navigator's Supply, containing many things of principal importance belonging to Navigation, and the use of divers instruments framed chiefly for that purpose. Lond. 1597, 4to. Dedicated to Robert, earl of Essex. 2. Magnetical Advertisements, or divers pertinent observations and approved experiments concerning the nature and properties of the Loadstone. Lond. 1616, 4to. 3. A Brief Discovery of the idle animadversions of Mark Ridley, M. D. upon a treatise entitled Magnetical Advertisements. Lon. 1618, 4to.

BARM. Goth. *barin*, Ang. Sax. barn, bearm. To cherish; to foster as in the bosom.

And in hire *barne* this litel child she leid,
With full sad face, and gan the child to blesse,
And lulled it, and after gan it kisse.

Chaucer. The Clerkes Tale.

A scint she wered, barred all of silk,
A *barne* cloth eke as white as morwe milk.

Id. The Millers Tale.

BARM', } Welsh, *burm*, Sax. beoþm. Yeast:
BARM'Y. } the ferment put into drink, to make
it work; and into bread to lighten and swell it.

Are you not he

That sometime makes the drink to bear no *barm*;

Mislead night wand'ers, laughing at their harm?

Shakespeare.

Try the force of imagination upon staying the working of beer, when the *barm* is put into it. *Bacon.*

Their jovial nights in frolics and in play
They pass, to drive the tedious hours away;
And their cold stomachs with crown'd goblets cheer,
Of windy cider, and of *barmy* beer. *Dryden.*

BARM is said to have been first used by the Celtæ in the composition of bread. About the time of Agricola's entrance into Lancashire, a new sort of loaf had been introduced at Rome; which was formed only of water and flour, and much esteemed for its lightness; and it was called the water-cake from its simple composition, and the Parthian roll from its original inventors. But even this was not comparable to the French or Spanish bread for its lightness. The use of curmi, see **ALE**, and the knowledge of brewing; had acquainted the Celtæ with an ingredient for their bread, which was much better calculated to render it light and pleasant, than the leaven, the eggs, the milk, or the wine and honey of other nations. This was the spume which arose on the surface of their curw in fermentation, and which the Welch denominate *burm*, and we *barm*. The Celtæ of Gaul, of Spain, and most probably, therefore, of South Britain, had long used it; and their bread was, in consequence of this, superior in lightness to that of any other nation in the world. See **BAKING**, **BREAD**, and **YEAST**.

BAR-MASTER. See **BARGH-MASTER**.

BARMEKIN, a hill of Scotland, in the parish of Echt, in Aberdeenshire, of a conical shape. On the top of it are the remains of an ancient fortification, respecting which tradition is silent. Two dry stone walls and three ditches, all circular, are visible. The inner wall appears to have been twelve feet thick, and 330 yards in circumference: the outer about six feet thick and the outer ditch 560 yards in circumference.

BARMOUTH, a small market and sea-port town, in Merionethshire, North Wales. It is very pleasantly situated, and is much frequented as a bathing-place: 222 miles from London, and ten from Dalgely.

BARMINE denotes such mine or ore as is adjudged at a court of Barghmote.

BARMOTE. See **BARGHMOTE**.

BARN, *v. & n.* See to *bar*, bargain, Goth. to defend; to protect. A covered enclosure in which grain, &c. is protected and defended.

But of herr songe it was as loud and yerne
As any swallow sitting on a *berne*;
Therto she coud skip and make a game
As any kid or calf following his dame. *Chaucer.*

While the cock with lively din
Scatters the rear of darkness thin,
And to the stack or the barn door
Stoutly struts his dames before.

Milton.

And as an owl that on a barn
Sees a mouse creeping in the corn
Sits still, and shuts his round blue eyes
As if he slept, until he spies
The little beast within his reach,
Then starts and seizes on the wretch.

Hudibras.

In vain the barns expect their promis'd load;
Nor barns at home, nor reeks are heap'd abroad.

Dryden.

I took notice of the make of barns here: having laid a frame of wood, they place, at the four corners, four blocks, in such a shape, as neither mice nor vermin can creep up.

Addison.

An owl of grave deport and mien,
Who (like the Turk) was seldom seen,
Within a barn had chose his station
As fit for prey and contemplation.
As near a barn, by hunger led,
A peacock with the poultry fed;
All view'd him with an envious eye
And mock'd his gaudy pagantry.

Gay.

Id.

BARN. See **BEARN.** The past participle of *bearan*, to bear a child; *bearen* or *born*; still in use.

Goodlucke (and't be thy will), what have we here? mercy on's, a *barne*, a very pretty *barne*.

Shakespeare. Winter Night's Tale.

BARNABAS (St.), was born at Cyprus, and descended of the tribe of Levi, whose Jewish ancestors are thought to have retired thither to secure themselves from violence during the troublesome times in Judea. His proper name was Joses, to which, after his conversion to Christianity, the apostles added that of Barnabas, signifying the son of consolation. The time of his conversion is uncertain; but he is generally esteemed one of the seventy disciples chosen by our Saviour himself. At Antioch, Paul and Barnabas had a contest, which ended in their separation; what followed with respect to St. Barnabas is not related in the Acts of the Apostles. Some writers say, he went into Italy, and founded a church at Milan. He suffered martyrdom at Salamis, where some Jews, being come out of Syria, assailed him as he was disputing in the synagogue, and stoned him to death. He was buried by his kinsman Mark, whom he had taken with him, in a cave near that city. The remains of his body are said to have been discovered in the reign of the emperor Zeno, with a copy of St. Matthew's Gospel, written with his own hand, lying on his breast.

BARNABAS'S DAY (St.), a Christian festival, celebrated on the 11th of June.

BARNABAS'S EPISTLE (St.), an apocryphal work ascribed to St. Barnabas, and frequently cited by St. Clement of Alexandria and Origen. It was first published in Greek, from a copy of father Hugh Menard, a Benedictine monk. An ancient version of it was found in a MS. of the abbey of Corbey, near 1000 years old. Vossius published it in 1656, with the epistles of St. Ignatius.

BARNABAS'S GOSPEL (St.), another apocryphal work ascribed to St. Barnabas, the Apostle, wherein the history of Jesus Christ is related in a manner very different from the account given

us by the four Evangelists. The Mahomedans have this gospel in Arabic, and it corresponds very well with those traditions which Mahomet followed in his Koran. It was, probably, a forgery of some nominal Christians; and afterwards altered and interpolated by the Mahomedans, the better to serve their purpose.

BARNABITES, a religious order, founded in the sixteenth century by three Italian gentlemen, who had been advised by a famous preacher of those days to read carefully the epistles of St. Paul. They are regular priests of the congregation of St. Paul; hence they were called Clerks of St. Paul; and Barnabites, because they performed their first exercise in a church of St. Barnabas, at Milan. Their habit is black; and their office is to instruct, catechise, and serve in mission.

BARNACLE, *n. s.*, probably of *bearn*, Sax. a child, and *aac*, Sax. an oak. A kind of shell-fish that grows upon timber that lies in the sea. A bird, like a goose, fabulously supposed to grow on trees.

It is beyond even an atheist's credulity and impudence to affirm, that the first men might grow upon trees, as the story goes about *barnacles*; or might be the lice of some vast prodigious animals, whose species is now extinct.

Bentley.

And from the most refin'd of saints
As naturally grow miscreants,
As *barnacles* turn Soland geese
In th' islands of the Orcaades.

Hudibras.

BARNACLE, an instrument made commonly of iron for the use of farriers, to hold a horse by the nose, to hinder him from struggling when an incision is made. It is also called horse-twitcher, or brake. The barnacle differs from pinchers, as the latter have handles whereby to hold them; whereas the former is fastened to the nose with a lace or cord.

BARNACLE, in ichthyology, a kind of shell-fish, which cleaves to the bottoms and sides of ships in certain seas; the same with what is called by sailors clam; by naturalists, *concha anatifera*. There are divers species of shell fishes included under the denomination barnacles: some reduce them to two, viz. the *balanus* and *pinna marina*. See an account of several rare species of barnacles, by John Ellis Esq. Philosophical Transactions, vol. i. part ii. No. 113.

BARNACLE OF BERNACLE, a species of *Anas*, common in the western isles of Scotland.—See **ANAS**. Concerning the origin and species of this bird many fables have been advanced. Several authors have represented it as the produce of a shell-fish; but later naturalists, on better grounds, refer it to the natural manner of generation; making it a real goose, produced like others from an egg. Some reckon the barnacle the same with the anser *Scoticus*, or Soland goose; others will have it to be the same with the French macreus. Dr. Robinson makes the barnacle to be of the goose, and the macreus of the duck kind. The same author shows, that the macreus is the scoter, or *anas niger minor*, described by Ray and Willughby, contrary to the opinion of Mr. Cattier, who took it for the greater coot of Bellonius.

BARNADESIA, in botany, a genus of the polygamia æqualis order, belonging to the syn-

genesis class of plants; the characters of which are: the *COR.* is radiated; the *CAL.* is naked, imbricated, and pungent; the pappus of the rays feathery, of the disk bristly and retrofracted. There is but one species, viz. *B. spinosa*, a native of America.

BARNARD, or **BERNARD** (John), the son of John Barnard, gent. was born at Castor in Lincolnshire, and educated at Cambridge. After several preferments, he was made a prebendary of the church of Lincoln. He wrote *Censura Clerica*, against scandalous ministers not being fit to be restored to church livings; the *Life of Dr. Heylin*; and several other works. He died at Newark, Aug. 17th, 1783.

BARNARD (Sir John), M. P. for London, a spirited member of the opposition party, in the reigns of Geo. I. and II. He was born at Reading in Berkshire in 1685. His father was a wine merchant, to whose business he succeeded. He particularly distinguished himself, on being appointed by the body of wine merchants to state before the house of lords their objections to a bill then pending in that house; and, from the abilities he displayed on that occasion, was nominated, in 1721, candidate for the city of London, and elected the following year. In 1725 he received the thanks of the common council, for opposing a bill introducing a change in the city elections. In 1727 he presented a bill for the better regulation of seamen. In 1730 he made a violent opposition to the bill prohibiting British subjects from lending money to foreign princes. In 1732 he received the honor of knighthood from Geo. II. whom he attended with an address; and, in 1733, he acquired much popularity in opposing Sir R. Walpole's excise bill, which was at last obliged to be relinquished. In 1735 he introduced a bill to limit the number of play-houses, which passed two years after, and is still in force. In 1737 he formed a scheme for reducing the interest on the national debt, which was afterwards adopted. In 1736 he and his brother-in-law, Sir R. Godschall, were elected sheriffs, and in 1738 he was chosen lord mayor of London. He died at Clapham in 1766, aged eighty, after repeatedly receiving the thanks of his fellow citizens for his public conduct.

BARNARD, a township of Vermont, in Wind-sor county; sixty-five miles north-east of Bennington.

BARNARD'S CASTLE, a town and barony on the Tees, in the county of Durham, belonging to the earl of Darlington. It is fifteen miles from Richmond, thirty south-west of Durham, and 244 north-west of London; has a market on Wednesday, and fairs on Whit-wednesday, St. James's day, and 25th July.

BARNAUL, a town of Siberia, on the river of the same name, which falls into the Obi. It consists of 1000 houses, built chiefly of wood, with several public edifices of stone. This town is the seat of the supreme chancery of the mines contained in the great Altaian mountain chain, and has under its jurisdiction 40,000 peasants. Many of the foundries, however, are abandoned from the want of fuel, which has been exhausted. There is still one mine in the vicinity of Barnaul,

very productive both in gold and silver. A foundry of bells, and manufactories of tiles and glass, are carried on in the town. Distant 100 miles south-east of Kolyvane.

BARNAVE (Anthony), a victim of French republicanism, was born in 1762. Having become a member of the national assembly, he was there distinguished by the warmth and zeal which he displayed. On the stopping of the king at Varennes, he was appointed to conduct his majesty and family to Paris, in doing which he showed the most respectful attention to the royal captives. He was afterwards accused of being a royalist, and guillotined at Paris in 1794.

BARNAY, an ancient fort of Dunse, in Berwickshire. Dr. Anderson of Chirnside says, these Barnays, or Barnekins, were a kind of forts commonly placed, during the feudal system, at some distance from the baron's castle, to defend the bridge or passage to it.

BARNES (Joshua), a learned divine, born in London in 1654. He was educated at Christ's hospital, from whence he removed to Emanuel college, Cambridge, where he was chosen queen's professor of Greek in 1695; a language he wrote and spoke with the utmost facility. His first publication was a whimsical tract, entitled *Gerania*, or a New Discovery of the little sort of people called Pygmies. After that appeared his *Life of Edward III.* In 1700, when he had published many of his works, Mrs. Mason, of Hemmingford, in Huntingdonshire, a widow lady of between forty and fifty, with a jointure of £200 per annum, came to Cambridge, and desired leave to settle £100 a-year upon him after her death; which he politely refused, unless she would also condescend to make him happy with her person; and they were accordingly married. He wrote several other books, viz. *Sacred Poems*; the *Life of Oliver Cromwell*, the *Tyrant*; several dramatic pieces; a *Poetical Paraphrase on the History of Esther*, in Greek verse, with a Latin translation, &c.; and he published editions of *Euripides*, *Anacreon*, and *Homer's Iliad and Odyssey*, with notes and a Latin translation. This excellent man died in 1712, in the fifty-eighth year of his age.

BARNES (Robert), a martyr for the doctrines of Luther, was brought up to the church, obtained the degree of D. D., and became chaplain to Henry VIII., by whom he was sent to Germany, to consult with the divines of that county respecting the lawfulness of his divorce. While in that country he adopted the doctrines of the Reformation, and on his return to England propagated his new opinions with such zeal that he was taken into custody, brought to the stake, and burnt at Smithfield in 1540. He was author of a treatise on *Justification*, and several other tracts.

BARNET, **CHIPPING BARNET**, or **HIGH BARNET**, a town on the top of a hill, partly in Middlesex, and partly in Hertfordshire, eleven miles north by west of London. It is a great thoroughfare; had a market on Wednesday, and two fairs, on April 8th, 9th, 10th, and September 4th, 5th, 6th. Near it two great battles were fought between the houses of York and Lancaster, in 1468, and 1471; in the last of which the earl of

Warwick and 10,000 men were slain. In 1740 Sir Jeremy Sambrooke, Bart. erected a stone column with an inscription on the spot.

BARNEVELDT (John d'Olden), the celebrated statesman, and one of the founders of the civil liberty of Holland, was born about 1550. He had a noble bold air, an expressive eye, and was an able speaker. He possessed a genius equally suited to commerce, finance, and negotiation; the art of pushing any favorite point without seeming importunate, and of withdrawing without appearing indolent; the singular talent of penetrating the secrets of others, whilst he concealed his own. His merit raised him to the first dignities in the government, where he showed himself an enemy to injustice, bribery, parties, and novelties, even though they might appear useful. He undertook to restore the credit of his country, and had the good fortune to succeed. He was the chief author of the truce in 1599, which was concluded for twelve years, between the Arch Duke and the states. He had, by his assiduity prevented the latter from taking part in the troubles of Bohemia, of which Maurice, prince of Orange, was willing to avail himself, to advance his fortune. Barneveldt, who perceived the designs of this ambitious prince, judged it was his duty to oppose him, and Maurice never pardoned his zeal for the liberty of the republic; but having got his partisans to accuse him of a design to deliver his country into the hands of the Spanish monarch, on this absurd charge, he was tried by twenty-six commissaries repared from the seven provinces, condemned to lose his life and his fortune confiscated. He heard the sentence with great composure. 'I have served the states,' said he, 'thirty years as pensionary of Holland, and the city of Rotterdam as pensionary ten years before. My labors and fidelity deserved another reward. If you will have my blood, it should seem that you might spare my fortune, and not ruin, on my account, my wife and children.' He was beheaded in 1619.

BARNYPERID (Rhenus and William), sons of the above, with a view of revenging their father's death, formed a conspiracy against the stadtholder, which was discovered. William fled; but Rhenus was taken and condemned to die, which fatal circumstance has immortalized the memory of his mother, of whom the following anecdote is recorded. She invited a physician to Rhenus; upon which Maurice expressed his surprise, that she should do that for a person which she had not done for her husband. To this she replied with indignation, 'I would not ask a pardon for my husband, because he was innocent. I solicit it for my son, because he is guilty.'

BARNYPERID, an island, south of Terra del Fuoco. Long. 66° 56' W. lat. 55° 49' S.

BARN (A. D. north-bology, the name of a bird usually seen at sea, and esteemed as a foreteller of bad weather. It is about the size of a sparrow, its neck and back are black, and its breast and belly gray; its feet are red, and its bill black and somewhat broad. It skims very nimbly over the surface of the water.

BARNSTABLE, a county and peninsula of

Massachusetts, bounded on the east and south by the Atlantic Ocean, north by Cape Cod Bay, west by Buzzard's Bay, and north-west by Plymouth county, where it is but four miles broad. This county lies nearly in the form of a man's arm when bent, with his hand turned inwards. The whole extent on the outer shore, from Wood-end to Buzzard's Bay, is about 120 miles; and the inner shore on Cape Cod is nearly seventy; its greatest breadth is not more than two miles. It is in general a barren sandy soil, perhaps more so than any other part of the eastern states. The trees which grow here are mostly pitch-pine. It abounds with ponds of fresh water, generally well stored with fish. The principal produce is Indian corn and rye. It is divided into ten townships, viz. Barnstable, Falmouth, Sandwich, Yarmouth, Harwich, Eastham, Wellfleet, Chatham, Truro, and Province-town. The chief towns are Barnstable and Falmouth.

BARNSTABLE, a port of entry and post town of Massachusetts; situated in the above county, at the head of a bay of its own name. It is seventy-two miles south-east by south of Boston, and 119 of Philadelphia. Long. 4° 5' E. lat., 41° 43' N.

BARNSTABLE, or **BARNSTAPLE**, a sea-port town of Devonshire, seated on the river Taw, over which there is a good bridge. It is a corporation town, and sends two members to parliament. It lies thirty-six miles north of Exeter, and 191 from London, has a market on Friday, and fairs, Friday before April 21, September 19, and second Friday in December, which last four days, toll free.

BARNSTEAD, a township of New Hampshire, in Stafford county, thirty-two miles north-west of Portsmouth.

BARNWELL, i. e. Bairn's Well, a village about half a mile north-east of Cambridge. In 1092, a priory being founded in Cambridge in honor of St. Giles, by Hugolina, a Norman lady, Paganus Peverell, a favorite of Henry I., received a grant of the property; and finding the site upon which it had been commenced too small, he transferred it to the spot now called Barnwell, where many of the ancient walls still remain. A pottery fair is held yearly here, on a common called Midsummer-green, which commences on St. John's day, and lasts a fortnight. It assumed a legal form as early as the reign of Henry III., and is proclaimed by the heads of the university. Another fair, called Sturbridge fair, annually held in a meadow in this parish, has been traced by Dr. Stukely to the times of Carausius. Assured documents trace it up to king John, who granted it for the use and maintenance of a hospital of lepers, which here possessed a chapel dedicated to St. Mary Magdalen, which is still in existence. By a charter of Henry VIII. this fair was transferred to the mayor and corporation of Cambridge on the payment of 1000 marks. On the fourth of September the ground is marked out. On the eighteenth, the university officers first, and then the officers of the corporation, proclaim the fair, which lasts fourteen days. One of these days (September 25) is appropriated to the sale of

horses. It was formerly the largest fair in England; and was attended in the year 1605 by Hackney coaches from London.

BARO, or BARON (Peter), was born at Estampes in France, and educated in the university of Bourges, where he was admitted a licentiate in the law: but, being of the Protestant religion, he was obliged to leave his native country to avoid persecution; and withdrawing into England, was kindly entertained by Lord Burleigh. He afterwards settled at Cambridge; and by Lord Burleigh's recommendation, was, in 1674, chosen professor of divinity there. For some years he quietly enjoyed his professorship; but at last a restless faction was raised against him, by his opposing the doctrine of absolute predestination, which rendered his place so uneasy that he left the university, and settled in London. He wrote, 1. In Jonam Prophetam Prælectiones xxxix; 2. De Præstantia et Dignitate Divinæ Legis; and other pieces. He died in London, about 1600.

BAROCCI, or BAROZZI (Francis), a noble Venetian, who distinguished himself in the latter half of the sixteenth century by his erudition, and his extensive knowledge of mathematics. He had, however, the weakness to believe in magic, and his attempts to practise it brought him into the hands of the Inquisition, from which he escaped with difficulty, by the payment of a heavy fine. His published works are, Translations from Proclus and Hiero; four books of a Treatise on Cosmography; a Treatise on Geometry; and a curious volume, intituled, Il Nobilissimo ed Antichissimo giuoco Pitagorico chiamata Ritmo-machia, cioè battaglia di consonanze di numeri, with figures, imitated from the Latin of Buxerius. Among his MSS. is a description of Crete.

BAROCCIO (Frederic), a celebrated painter, born at Urbino. In his youth he travelled to Rome, where he painted several things in fresco. He then returned to Urbino: and giving himself up to intense study, acquired a great name in painting. His genius particularly led him to religious subjects. At his leisure hours he etched a few prints from his own designs; which are highly finished, and executed with great softness and delicacy. The Salutation is his capital performance in that way: of which we seldom meet with any impressions, but those taken from the retouched plate, which are very harsh. He died at Urbino in 1612, at the age of eighty-four.

BAROCHAN, a barony in the parish of Houstoun, in Renfrewshire, belonging to an ancient family of the name of Fleming, whose ancestors came from Flanders in the reign of David I., and one of whom was killed at the battle of Floddon. It had a very ancient cross on the side of the public road, which was removed by the proprietor, Malcolm Fleming, Esq. to a hill where the old mansion-house stood. In the front of this cross, there are two rows of images, four in each row, with long garments and clubs over their shoulders. Tradition is silent respecting it. The barony abounds in free-stone, coals, and lime-stone, and the mansion-house is ornamented with plantations of ash, plane, oak, larch, and fir.

BAROCHE, or BROACH, capital of a district

of the same name, in the province of Gujrat, on the north bank of the Nerbuddah. It is walled round, and was formerly a place of great trade. It is now inhabited by weavers and manufacturers of cotton cloth. Here they have the best cotton in the world, and of consequence the best baftas are manufactured in this place. The waters of the Nerbuddah are also said to have the peculiar property of bleaching cloths to a pure white. Baroche was ceded to Madhajee Sindia in 1782, but was retaken from his successor, Dowlet Row. in 1803, by Sir Arthur Wellesley, and has ever since remained in possession of the British. Long. 72° 5' E., lat. 22° 15' N.

BAROCO, in logic, a term given to the fourth mode of the second figure of syllogisms. A syllogism in baroco has the first proposition universal and affirmative, but the second and the third particular and negative, and the middle term is the predicate in the two first propositions. Example:

BA Every man is a two-legged animal:
RO But every animal is not two-legged;
CO Therefore every animal is not a man.

BAROMETER, } From βαρος, weight, and
BAROMETRICAL. } μέτρον, measure. A machine for measuring the weight and variations of the atmosphere, in order to determine the changes of the weather, the elevation of particular parts of the earth's surface, &c.

The measuring the heights of mountains, and finding the elevation of places above the level of the sea, hath been much promoted by *barometrical* experiments, founded upon that essential property of the air, its gravity or pressure. As the column of mercury in the *barometer* is counterpoised by a column of air of equal weight, so whatever causes make the air heavier or lighter, the pressure of it will be thereby increased or lessened, and of consequence the mercury will rise or fall.

Harris.

He is very accurate in making *barometrical* and *thermometical* instruments. Derh. *Physical-Theol.*

BAROMETER. The name baroscope, signifying an indication of weight, was originally given to the mercurial tube by Sinclair, professor of philosophy in the university of Glasgow, in Charles II. reign: but the more definite one of *barometer*, obtained universally a short time afterwards. The *barometer* is founded upon the Torricellian experiment, so called from Torricelli the inventor of it, at Florence, in 1623; it is a glass tube, filled with mercury, horizontally sealed at one end; the other open and immersed in a basin of stagnant mercury; so that, as the weight of the atmosphere diminishes, the mercury in the tube will descend, and, as it increases, the mercury will ascend; the column of mercury suspended in the tube being always equal to the weight of the incumbent atmosphere. It was long the common opinion among philosophers, that the ascent of water in pumps was owing to what they called nature's abhorrence of a vacuum; and that thus fluids might be raised by suction to any height whatever. But an accident having, early in the seventeenth century, discovered that water could not be raised in a pump, unless the sucker reached to within thirty-three feet of the water in the well, it was conjectured by Galileo, who flourished about that

time, that there might be some other cause of the ascent of water in pumps, or at least that this abhorrence was limited to the finite height of thirty-three feet. Being unable to satisfy himself on this head, he recommended the consideration of the difficulty to Torricelli, who had been his disciple. After some time Torricelli suspected that the pressure of the atmosphere was the cause of the ascent of water in pumps; that a column of water thirty-three feet high was just a counterpoise to a column of air of the same base, and which extended up to the top of the atmosphere; and that this was the true reason why the water did not follow the sucker any further. And this suspicion was soon after confirmed by various experiments. Torricelli considered, that if a column of water thirty-three feet high were a counterpoise to a whole column of the atmosphere, then a column of mercury of about two feet and a half high would also be a counterpoise to it, since quicksilver is nearly fourteen times heavier than water, and so the fourteenth part of the height, or nearly two feet and a half, would be as heavy as the column of water. This reasoning he soon verified; for having filled a glass tube with quicksilver, and inverted it into a basin of the same, the mercury presently descended till its height, above that in the basin, was about two feet and a half, just as he expected. And this is what has, from him, been called the Torricellian experiment. The new opinion, with this confirmation of it, was readily acquiesced in by most philosophers, who repeated the experiment in various ways. Some, however, still adhered to the old doctrine of Linus, and raised several objections against the new one; such as that there was a film or imperceptible rope of mercury, extended through the upper part of the tube, which suspended the column of mercury, and kept it from falling into that in the basin. But this and other objections were soon overcome by additional confirmations of the true doctrine; particularly by varying the elevation of the place. It was hinted by Descartes and Pascal, that if the mercury be sustained in the tube by the pressure of the atmosphere, by carrying it to a higher situation it would descend lower in the tube, having a shorter column of the atmosphere to sustain it, and vice versa. And Pascal engaged his brother-in-law, M. Perier, to try that experiment for him, being more conveniently situated for that purpose than he was at Paris. This he accordingly executed, by observing the height of the quicksilver, in the tube, first at the bottom of a mountain in Auvergne, and then at several different altitudes; wherein it was found that the mercury fell lower and lower all the way to the top of the mountain; and so confirming the truth of the doctrine relating to the universal pressure of the atmosphere, and the consequent suspension of the mercury in the tube of the barometer. Thus, by the united endeavours of Torricelli, Descartes, Pascal, Merseme, Huygens, and others, the cause of the suspension of the quicksilver in the tube of the barometer became pretty generally established. It was some time, however, after this general consent before it was known, that the pressure of the air was various at different times at the same place. This could

not, however, remain long unknown. The frequent measuring of the column of mercury soon showed its variations in altitude; and experience and observation taught that those variations in the mercurial column were always succeeded by certain changes in the weather, as to rain, wind, frosts, &c. Hence this instrument soon came into use, as the means of foretelling the changes of the weather; and on this account it obtained the name of the weather-glass, as it did that of barometer from its measuring the weight or pressure of the air.

It should not be forgotten that Pascal and his brother-in-law seem clearly to have seen the possibility of those numerous experiments of modern times, for ascertaining the altitude of mountains by the barometer. Early in the morning of the 19th of Sept. 1648, the latter assembled with a few friends in the garden of a monastery, situate near the lowest part of the city of Clermont, where he had brought a quantity of mercury, and two glass tubes hermetically sealed at the top. Having filled and inverted them as usual, he found the mercury to stand in both at the same height, namely, 26 inches and $3\frac{1}{2}$ lines, or 28 English inches; when leaving one behind, in the custody of the subprior, he proceeded with the other to the summit of the mountain, and repeated the experiment. Here the party were surprised and delighted to see the mercury sink more than three inches under the former mark, and remain suspended at the height of 23 inches and 2 lines, or 24.7 English inches. In his descent from the mountain, he observed, at two several stations, that the mercury successively rose; and, on his return to the monastery, found it stood exactly at the same point as at first. Encouraged by the success of this memorable experiment, Perier repeated it on the highest tower of Clermont, and noted a difference of two lines at an elevation of twenty toises. Pascal, as soon as the intelligence reached him at Paris, made similar observations on the top of a high house, and in the belfry of the church of St. Jacques des Boucheries, near the border of the Seine; and so much was he satisfied with the results, that he immediately proposed the application of the barometer for measuring the relative height of distant places on the earth's surface. The substance, therefore, of all that has since been more accurately ascertained, was thus at once discovered. Pascal, it is well known, was attacked and persecuted as a heretic by the Jesuits, for these and similar pursuits; and when no other weapon would avail, they contested the originality of his experiments. Their base conduct on this occasion, however, only stimulated his ardor, and gave a keener edge to that wit, which he afterwards directed with such overwhelming energy against this insidious order of the priesthood. In 1653, he composed, though they were not published till after his death, two short but perspicuous treatises, *On the Equilibrium of Liquors*, and *On the Weight of the Mass of Air*. The laws of the equilibrium of fluids are here beautifully deduced from a single principle. In those tracts, he likewise gives a description of the hydraulic press. It has, however, been truly remarked, that the intention of these philosophers, was merely to ascertain whe-

ther the height of the mercury was affected by being carried to different altitudes, and it was some time afterwards that theorems and formulæ were invented for the purpose of barometrical measurement; the balance between the mercury and the atmosphere was indeed known, but the value of the weights remained to be determined. The first thing necessary to be ascertained was the law of the condensation of air under different pressures. Mariotte in France, and Boyle and Townley in England, found from experiment that the density of this fluid was proportional to the compressing weight; but this law is only true when the temperature of the air remains constant; and attention was not at first paid to this important restriction, which in fact could not be indicated by experiments where the compressed volumes of air differed but little from each other in respect to temperature.

The law of compression being otherwise known, Halley made use of it for calculating the decrease of density in the beds of the atmosphere at various altitudes; and thus led to the mathematical formulæ, by means of which the difference of altitude of two places may be calculated from the heights of the mercury in the barometer observed at each of them. Newton, in his *Principia*, perfected Halley's theory, by showing that regard was to be paid to the diminution of gravity, according as the distance from the surface of the earth increased; but, what is very remarkable, he, as well as Halley, omitted to consider the effect of the variations of heat, and of the progressive decrease of the temperature and density of the different strata of the atmosphere. The barometrical formulæ thus obtained, without the correction which renders them applicable to all temperatures, could only furnish a very imperfect approximation, and therefore philosophers and mathematicians, who endeavoured to apply them, found that they succeeded only in a few instances, and that generally the results seemed to be subject to various errors, which appeared to follow no law. Hypotheses were therefore formed for explaining these irregularities; but some maintained that no dependence whatever was to be placed upon such theorems; and others, that they ought to be wholly excluded from works of science. No person seems to have conjectured the true cause; and the omission is the more remarkable, when we reflect that Bouguer and Lambert, men of such peculiar and opposite talents; the one a most accurate observer and philosopher, and the other a very inventive and acute mathematician, were both much occupied with this instrument, and its application.

Deluc at last discovered the true source of these errors and anomalies, by searching in the observations themselves for the correspondence between the temperature of the air and the correction which the general formula required. Numerous experiments on the comparative expansions of air and mercury enabled him to perceive the law that those corrections ought to follow, and the quantity in all cases which should be assigned to them.

This remarkable discovery, by giving to the barometrical formula an unexpected accuracy, animated the zeal of philosophers, and observa-

tions were multiplied to a great extent. Dr. Maskelyne undertook to reduce the new formula into English measures, while Playfair added a correction for the variation of gravity in different latitudes. Sir George Shuckburgh, by very exact measures, verified the results of M. Deluc, and gave them a greater degree of precision: General Roy also made an application of it at a great number of places in the progress of his survey: the Alps were levelled by MM. Saussure and Pictet; the Pyrenees by M. Ramond, and the Andes by Humboldt; and the barometer rendered portable, became an indispensable instrument to all well-informed travellers.

Still the theory of barometrical levelling was far from being brought to its most simple terms. M. Deluc had adapted the constant co-efficient of his formula to a certain degree of the thermometer, which he called the normal temperature, and which he had fixed from the condition, that, for this temperature, the difference of level became a decimal multiple of the difference of the tabular logarithms of the observed barometrical heights. All the corrections relative to temperature which the formula required, commenced, therefore, according to M. Deluc, at the normal temperature; in consequence of which this point of commencement changed whenever the formula was applied to any other measures than French toises. These variations were very inconvenient: and it appeared much more natural to make all the corrections commence at some fixed term, as, for example, the freezing point, which is given by experiment, and common to observers of all countries. This is what Laplace has done, in a chapter of his *Mécanique Celeste*, in which he has established the requisite formula upon the most simple and accurate data. He determines the correction for temperature relative to the expansion of air, according to the experiments of M. Gay Lussac; but he has modified his results in such a manner as to take into the account the humidity of the atmosphere; and, what is very fortunate, the sum of this correction and the co-efficient of the expansion of air is just equal to $\frac{1}{1000}$. With respect to the expansion of mercury, Laplace employed the values obtained, in conjunction with Lavoisier, in experiments on the expansion of bodies, of which there unhappily remains only a small number of results. Finally, he determined the general co-efficient of the formula from barometrical observations themselves, by combining for this purpose, a great number of experiments made in the Pyrenees by M. Ramond, with a degree of care and an accuracy before unknown in this science. The value of this co-efficient has since been confirmed in a direct manner by the experiments made by M. Arago and M. Biot, on the comparative weight of air and mercury; so that all the elements of the barometrical formula, the research of which, has cost travellers so much labor, has been obtained directly, and with great accuracy, without quitting the chemical laboratory. Laplace's formula, founded upon data so exact and so ably combined, coincides with observations better than any other in which these advantages are not united, and the rigorous proofs to which MM. Ramond and Daubusson have submitted it ex-

perimentally, have demonstrated its utility. It still remained, however, to render the observations comparable with each other, though made with different barometers; which has also been done by Laplace, who has shown that the different indications of these instruments, in circumstances otherwise equal, are the effect of capillary attraction, and has given tables for correcting this effect.

The barometrical formula being thus improved, observations with that instrument have been considerably multiplied, and carried to a degree of precision almost incredible; a precision which has already led to the idea of distinguishing every place on the globe (in addition to its latitude and longitude) by its height above the level of the sea, or rather by its distance from the centre of the earth; which corresponds in principle with the determination of the position of a point in absolute space, by means of three rectangular co-ordinates; with this view various tables have been computed, and principles of approximation and compensation invented, highly creditable to their respective authors.

It remains only for us to describe the progressive improvement of this instrument. 1. The common, or Torricellian barometer, is represented in our plate *BAROMETERS*, fig. 1. *AB* is a glass tube, of $\frac{1}{2}$, or $\frac{3}{4}$, or $\frac{1}{2}$ inch wide (the wider the better), and about thirty-four inches long, being close at the top *A*, and the open end *B* immersed in a basin of quicksilver *CD*, which is the better the wider it is. To fill this, or any other barometer, take a clean new glass tube, of the dimensions as above, and pour into it well purified quicksilver, with a small funnel either of glass or paper, in a fine continued stream, till it wants about half an inch or an inch of being full; then stopping it close with the finger, invert it slowly, and the air in the empty part will ascend gradually to the other end, collecting into itself such other small air bubbles as unavoidably get into the tube among the mercury, in filling it with the funnel; and thus continue to invert it several times, turning the two ends alternately upwards, till all the air bubbles are collected and brought up to the open end of the tube, and till the part filled shall appear without speck, like a fine polished steel rod. This done, pour in a little more quicksilver to fill the empty part quite full, and so exclude all air from the tube; then stopping the orifice again with the finger, invert the tube, and immerse the finger and end, thus stopped, into a basin of purified quicksilver. In this position withdraw the finger, so shall the mercury descend in the tube to some place, as *G*, between twenty-eight and thirty-one inches above that in the basin at *F*, as these are the limits between which it always stands in this country, on the common surface of the earth. Then measure, from the surface of the quicksilver in the basin at *F*, twenty-eight inches to *K*, and thirty one inches to *L*, dividing the space between them into inches and tenths, which are marked on a scale placed against the side of the tube; and the tenths are subdivided into hundredth parts of an inch by a sliding index carrying a vernier or nonies. These three inches, between twenty-eight and thirty one, so divided, will

answer for all the ordinary purposes of a stationary or chamber barometer; but for experiments on altitudes and depths, it is proper to have the divisions carried on a little higher up, and a great deal lower. In the proper filling and otherwise fitting up of the barometer, several circumstances are to be carefully noted; as, that the bore of the tube be pretty wide, to allow the freer motion of the quicksilver, without being impeded by an adhesion to the sides; that the basin below it be also pretty large, in order that the surface of the mercury at *F* may not sensibly rise or fall with that in the tube; that the bottom of the tube be cut off rather obliquely, that when it rests on the bottom of the basin there may be a free passage for the quicksilver; and that, to have the quicksilver very pure, it is best to boil it in the tube, which will expel all the air from it. This barometer is commonly fitted up in a neat mahogany case, together with a thermometer and hygrometer, as represented in fig. 2. As the scale of variation is small, being included within three inches in the common barometer, several contrivances have been devised to enlarge the scale, or to render the motion of the quicksilver more sensible.

Descartes suggested a method of increasing the sensibility of this instrument, which was executed by Huygens. This was effected by making the barometrical tube end in a pretty large cylindrical vessel at top, into which was inserted also the lower or open end of a much finer tube than the former, which was partly filled with water, to give little obstruction by its weight to the motion of the mercury, while it moved through a pretty long space of the very fine tube by a small variation of the mercury below it, and so rendered the small changes in the state of the air very sensible. But the inconvenience was, that the air contained in the water gradually disengaged itself, and escaped into the vacuum in the top of the small tube, till it was collected in a body there, and by its elasticity preventing the free rise of the fluids in the tubes, spoiled the instrument as a barometer. And this is the reason why a water barometer cannot succeed. This instrument, however, is represented in fig. 3. *CD* is the vessel, in which is united the upper or small water tube *AC*, with the lower or mercurial one *CB*. To remedy this inconvenience, Huygens thought of placing the mercury at top, and the water at bottom, which he thus contrived. *ADG*, fig. 5, is a bent tube hermetically sealed at *A*, but open at *G*, of about one line in diameter, and passing through the two equal cylindrical vessels, *BC*, *EF*, which are about twenty inches apart, and of fifteen lines diameter, their length being ten. The mercury being put into the tube, will stand between the middle of the vessels *EF* and *BC*, the remaining space to *A* being void both of air and mercury. Lastly, common water, tinged with a sixth part of aqua regia, to prevent its freezing, is poured into the tube *FG*, till it rises a foot above the mercury in *DE*. To prevent the water from evaporating, a drop of oil of sweet almonds floats on the top of it. But the column of water will be sensibly affected by heat and cold, which spoils the accuracy of the instrument. Although the invention of this barometer

Fig. 7.

was claimed by Huygens, and also by De la Hire, it appears first to have been contrived by Dr. Hooke in 1668, and described in Phil. Trans., No. 185. It is most delicately movable; and, when properly managed, by far the fittest for a chamber, or for amusement, by observations on the changes of the atmospheric pressure. The slightest breeze causes it to rise and fall, and it is continually in motion. But, for philosophical purposes, this, and all other instruments of the kind, are inferior to the common barometer, both on account of their being less manageable, and also in point of accuracy. For their scale must be determined in all its parts by the common barometer, and therefore, notwithstanding their great range, they are susceptible of no greater accuracy than that with which the scale of a common barometer can be observed and measured.

The horizontal or rectangular barometer of Bernoulli and Cassini is shown in fig. 4. AD is a pretty wide cylindrical part at the top of the tube, which latter is bent at right angles at B; the lower part, BC, being turned into the horizontal direction and closed above at A, but open at the lower end, where however the mercury cannot run out, being opposed by the pressure of the atmosphere. This, and the foregoing contrivance of Huygens, are obviously founded on the known principles of hydrostatics, 'that fluids of the same base press according to their perpendicular altitude, and not according to the quantity of their matter;' so that the same pressure of the atmosphere sustains the quicksilver that fills the tube BDA and the cistern D, as would support the mercury in the tube alone. Hence having fixed upon the size of the scale, as, for example, the extent of twelve inches instead of three, that is four times as long; the area of a section of the cylinder D must be four times that of the tube, and consequently its diameter double; so that for every natural variation of an inch of air in the cylinder AD, there will be a variation of four inches in the tube CB. But on account of the friction against the sides of the glass, the quicksilver is liable to break; and the rise and fall is then no longer equable; besides the mercury is in danger of being thrown out of the orifice at C, by any sudden motion of the machine.

The diagonal barometer, invented by Sir Samuel Moreland, fig. 6, is another method of enlarging the natural scale of three inches perpendicular, CD, by extending it to any length, BC, in an oblique direction. This is liable in some degree to the inconvenience of friction and breaking; and hence it is found that the diagonal part, BC, cannot properly be bent from the perpendicular more than in an angle of 45°, which only increases the scale nearly in the proportion of seven to five.

But the most perfect of all these instruments, on an enlarged scale, unquestionably is Dr. Hooke's wheel barometer, fig. 7. This was invented about 1668, and is meant to render the alterations in the air more sensible. Here the barometer tube has a large ball, AB, at top, and is bent up at the lower or open end, where an iron ball, G, floats on the top of the mercury in

the tube, to which is connected another ball, H, by a cord, hanging freely over a pulley, turning an index, KL, about its centre. When the mercury rises in the part FG, it raises the ball, and the other ball descends and turns the pulley with the index, round a graduated circle from N towards M and P; and the contrary way when the quicksilver and the ball sink in the bent part of the tube. Hence the scale is easily enlarged ten or twelve fold, being increased in proportion of the axis of the pulley to the length of the index KL. But then the friction of the pulley and axis is some obstruction to the free motion of the quicksilver. Contrivances to lessen the friction, &c., may also be seen in the Phil. Trans. vol. 52, art. 29., and vol. 60, art. 10.

In the Philosophical Transactions, vol. 53, No. 29, Fitzgerald's improvement of the wheel barometer is described as furnished with two pulleys, which move on friction wheels; each of which turns an index on the centre of a graduated circle. The smallest circle is four inches in diameter, and divided into three equal parts, each again being subdivided decimally; and the changes, corresponding to the rise or fall of the mercury from twenty-eight to thirty-one inches, are marked on the margin of it, as they are on the scales of the common barometers. The large circle, which is proposed by the inventor to be thirty inches in diameter, is divided into three hundred equal parts, and the index belonging to it will therefore mark distinctly to the six-hundredth part of an inch in the rise and fall of the mercury. On the centre of this circle two registers are fixed, which are placed along the index when the instrument is adjusted; one of them is carried round as the index advances, and left round on its return; so that their distance will determine the limits of the variation from one observation to another.

Mr. Caswell's barometer, described in the Philosophical Transactions, vol. 24, seems to be as sensible and exact as any. Suppose ABCD, fig. 8, is a bucket of water, in which is the baroscope *x r e y z o s m*, which consists of a body *x r s m*, and a tube *e y z o*, which are both concave cylinders, made of tin, or rather glass, and communicating with each other. The bottom of the tube, *z y*, has a leaden weight to sink it, so that the top of the body may just swim even with the surface of the water by the addition of some grain weights on the top. When the instrument is forced with its mouth downwards, the water ascends into the tube to the height *z u*. To the top is added a small concave cylinder, or pipe, to keep the instrument from sinking down to the bottom: *m d* is a wire; and *m s, d e*, are two threads oblique to the surface of the water, which perform the office of diagonals: for while the instrument sinks more or less by an alteration in the gravity of the air, where the surface of the water cuts the thread is formed a small bubble, which ascends up the thread while the mercury of the common baroscope ascends, and vice versa. It appears from a calculation which the author makes, that this instrument shows the alterations in the air 1200 times more accurately than the common barometer. He observes, that the bubble is seldom known to stand still even for a

minute; that a small blast of wind, which cannot be heard in a chamber, will sensibly make it sink; and that a cloud passing over it always makes it descend, &c.

ROWNING'S COMPOUND BAROMETER has several contrivances for enlarging the scale, and that in any proportion whatever. One of these is described in the Philosophical Transactions, No. 427, and also in his Natural Philosophy, part 2; and another in the same part, which is represented in fig. 9. ABC is a compound tube, hermetically sealed at A, and open at C; empty from A to D, filled with mercury from thence to B, and from hence to E with water. Hence, by varying the proportions of the two tubes AF and FC, the scale of variation may be changed in any degree.

A STEEL-YARD or LEVER BAROMETER, is represented by fig. 13, which enlarges the scale in proportion of the shorter to the longer arm of a steel-yard. AB is the barometer tube, close at A and open at B, immersed in a cylindrical glass cistern CD, which is but very little wider than the tube AB is. The barometer tube is suspended to the shorter arm of an index like a steel-yard, moving on the fulcrum E, and the extremity of its longer arm pointing to the divisions of a graduated arch, with which index the tube is nearly in equilibrio. When the pressure of the atmosphere is lessened, the mercury descends out of the tube into the cistern, which raises the tube and the shorter arm of the index, and consequently the extremity of the longer moves downwards, and passes over a part of the graduated arch. And on the contrary this moves upwards when the pressure of the atmosphere increases.

Artists, however, have of late directed their efforts rather to adapt barometers for particular purposes, and to improve their accuracy of action, than to enlarge the scale.

AN INSTRUMENT called the CHAMBER BAROMETER, constructed by Messrs. Jones, opticians, is shown in fig. 11. It consists of a barometer *d*, thermometer *a a*, and hygrometer *c*, all in one mahogany frame. The thermometer or hygrometer of this apparatus may be separated from the frame, and occasionally used apart if necessary. The thermometer is separated by means of two screws *a a*; and the hygrometer by unscrewing a brass pin at the back of the frame. The index of the hygrometer is set at any time, merely by moving with the finger the brass wheel seen at *c*; and the two sliding indexes of the barometer and thermometer are moved by rack work, set in action by the key *g*, placed in the holes *h* and *l*. The divisions of the barometer, plate *b*, are in tenths of an inch, from twenty-eight to thirty-one inches, and these are subdivided into hundredths by the nonius or vernier scale, on a sliding slip of brass. The vernier scale is divided into ten equal parts, which are equal to eleven on the scale of inches, or to eleven-tenths of an inch. By this means the height of the mercury at *E* is evident merely by inspection to the one-hundredth part of an inch, according to the principle of the vernier scale.

A more common sort of barometer is frequently made, which differs from the one above principally in this, that in general it is not supposed to

register to the same degree of accuracy, having no vernier, and being meant for the common purposes of a weather-glass, its face is marked with different words indicating the probable shades of weather peculiar to different altitudes of the mercury. As the lowest state of the mercury in this country is not less than twenty-eight inches, nor the highest above thirty-one inches, this lowest point on the scale, on the face of the instrument, is marked stormy, and the latter very dry for summer, and on the other side very hard frost for winter. To the next half-inch below this highest point are written set. fair on the one side, and set. frost on the other. At thirty inches, the word fair is placed on the one side, and frost on the other; and at twenty-nine inches and a half there is marked changeable, both for summer and winter. At twenty-nine inches we have rain on the one side, and snow on the other; and at twenty-eight inches and a half, much rain on the summer side, and much snow on the winter; these terms, for want of room, are omitted in the figure.

In the better sort of these chamber barometers the reservoir of mercury is a leathern bag, which is more or less compressed by the atmosphere, according to its greater or less pressure, and the scale is supposed to commence from the bottom of the tube; there is also a screw at the bottom, fig. 29, by which the mercury may be forced to the top of the tube, and thus prevented from oscillating when the instrument is removed. This construction, however, is not sufficiently accurate for those instruments designed for the mensuration of altitudes; portable barometers, therefore, have several adjustments peculiar to this purpose.

PORTABLE BAROMETER.—One of the best instruments of this kind, by Troughton, is exhibited in figs. 12, 13, 14, and 15, (BAROMETERS, plate II.) Its distinguishing characteristic consists in the excellent manner in which the mercury in the cistern is set to the zero in the scale of inches. For this purpose a glass cylinder, of about two inches and a half diameter, and as much in length, contains the mercury. An external covering of hollow brass, terminating in an interior screw a little above and below the glass, admits external screw pieces, whose ends, well leathered, being pressed hard against the ends of the glass, prevent the escape of the fluid. Near the upper end of the brass cover are two slits, made horizontally, one before, and the other behind, exactly similar, and opposite to each other. At bottom is a screw, seen better in the section, fig. 13, which, acting upon the usual leathern bag, forces the quicksilver upwards at pleasure, and, by filling every part, renders the instrument portable. But the primary design of the screw is, to furnish the means of adjusting the surface of the mercury in the glass cistern, so as just to shut out the light from passing between it and the upper edges of the slits in the brass cover. This is the mode of adjusting to zero; and it follows, that the upper edges of the slits must represent the beginning of the scale of inches. The frame is entirely made of brass tube, and above the cistern is of about 1.1 inch in diameter. The first ten inches of the lower end are occupied by a thermometer, whose bulb, bent inwards, is concealed within the frame. At about three inches

higher, it is attached to the stand by a ring, in which the frames turn round with a smooth and steady motion, for the purpose of placing the instrument in the best light for reading off, &c. The actually divided scale commences at about fifteen inches above the zero, and is continued as high as thirty-three inches; and, by the usual help of a vernier, is subdivided down to .001 of an inch. A longitudinal slit, from end to end of the divided part, exposes to view the glass tube and mercury within it. The whole of this part consists of two tubes of brass: in the inside of the interior one, slides a cylindrical piece, and on this is divided the vernier scale, the index to which is the lower end of the piece. In taking the height of the mercury, this piece is brought down so as just to exclude the light from passing between itself and the spherical surface of the mercury. The screw at top, although but a short one, performs this office in whatever part of the scale the vernier piece may be; for it acts upon the interior long tube, in the inside of which the piece is sustained by friction, and in which it is, on every occasion, to be set by hand nearly. The tripod is altogether similar to what Mr. Ramsden used for the same purpose, as far back as the year 1775. It affords when closed, fig. 15, a safe and convenient packing-case for the instrument: the structure of the staff head is curious: the principal part is a circle fig. 16, about .75 of an inch broad, joined in three pieces; these, although they seem in principle to be incapable of motion, yet, in practice, produce what is fully adequate to the purpose. The three joint-pins extend inwards, so as to pass through a circular rim, which they hold fast; within this rim is hung a similar one, by two pivots; and, inside the latter, at right angles to the pivots, are fastened two y's, or angles, in which the barometer hangs by its gudgeons. Thus are brought about, in a small compass, the means of extending the legs, of turning the instrument about in the tripod, and an universal joint, whereon it readily places itself perpendicular to the horizon.

The importance of these instruments at sea, where every real indication of the approaching weather must be important, early suggested a MARINE BAROMETER, first invented by Dr. Hooke. It is contrived so as not to be affected or injured by the motion of a ship. His contrivance consisted of a double thermometer, or a couple of tubes half filled with spirit of wine; the one sealed at both ends, with a quantity of air included; the other sealed at one end only. The former of these is affected only by the warmth of the air; but the other is affected both by the external warmth and by the variable pressure of the atmosphere. Hence, considering the spirit thermometer as a standard, the excess of the rise or fall of the other above it will show the increase or decrease of the pressure of the atmosphere. This instrument is described by Dr. Halley, in the Phil. Trans. No. 269, where he says, 'I had one of these barometers with me in my late southern voyage, and it never failed to prognosticate and give early notice of all the bad weather we had, so that I depended thereon, and made provision accordingly; and from my own experience I conclude, that a more useful contrivance

hath not for this long time been offered for the benefit of navigation.' Mr. Nairne, an artist of London, invented another kind of Marine Barometer, having the lower part of the tube, for about two feet long, made very small, to check the vibrations of the mercury, which would otherwise arise from the motions of the ship. This was also assisted by being hung in gimbals, by a part which subjects it to be the least affected by such motions. It was constructed for the use of Captain Phipps in his celebrated voyage to the North Pole. A marine barometer has also been invented by M. Passemante, an ingenious artist of Paris. This contrivance consists only in twisting the middle of the tube into a spiral of two revolutions; by which contrivance the impulses which the mercury receives from the motions of the ship are destroyed, by being transmitted in contrary directions.

TROUGHTON'S MARINE BAROMETER may be considered the best, perhaps, at present known. The upper part of the tube here is four-tenths of an inch diameter, and the smaller part only one-fiftieth; and, to counteract more effectually the effects of the ship's motion, the instrument, like the above, is suspended in gimbals, as shown in figs. 17 and 18. The whole is attached to the side of the cabin by two brass tubes, which slide one within the other, and render the instrument capable of being suspended at different distances from the place of support; that the bottom of it may not strike the side of the cabin during any heavy rolling of the vessel, the inner tube carries the gimbal. The external frame of the barometer is a cylindrical tube of wood, on which the brass sockets slide; and in this is inserted the innermost pair of pivots, or universal joint, which furnishes the instrument with a movable point of suspension. The top is terminated with a brass ball, of a weight nearly equal to that of the mercury, &c. at the lower end. With respect to the position of the point of suspension, no general rule can be given applicable to every case, though it is a circumstance on which the oscillations of the mercury greatly depends; it is indeed obvious, that, though this point were accurately determined for one particular height of the mercury, it would not correspond with every other. By this ingenious contrivance of the counterpoise to the weight of the mercury, the centre of gravity of the whole will be about the middle; and if the instrument were of the same specific gravity throughout, the point of suspension that would produce the smallest oscillation, would be about one-third of the length of the instrument from the top, considering the lower part as a fixed point; but as this is not strictly the case, the point of suspension is best ascertained by experiment. The graduation is on two scales of ivory, about four inches long, for the reception of which two opposite quarters of the cylindrical frame are sunk through that length, their planes pointing towards the centre of the tube, and the index is very light, and slides on the glass tube, without touching any other part. At the bottom is the usual screw, which, pressing up the leather bag, prevents the mercury from oscillating when the instrument is removed. For an instrument of this kind, lately invented by Mr. Adie, see SYMILESOMETER.

Among barometers, or baroscopes, might be ranked a weather instrument to ascertain the variation of the atmosphere, by the sound of a wire, mentioned by M. Lazowski in his *Tour through Switzerland*, and discovered by accident. A clergyman, who was near-sighted, often amused himself with firing at a mark, and contrived to stretch a wire so as to draw the mark to him to see how he had aimed. He observed that the wire sometimes sounded as if it vibrated like a musical chord; and that after such soundings a change always ensued in the state of the atmosphere; from whence he came to predict rain or fine weather. On making farther experiments, it was found that the sounds were most distinct when extended in the plane of the meridian. According to the weather which was to follow, the sounds were more or less soft, or more or less continued. Fine weather was announced by the tones of counter-tenor, and rain by those of bass. It has been said that M. Volta mounted fifteen chords in this way at Pavia, to bring this method to some precision, but no accounts have appeared of his success.

Marine barometers are now generally used on board all ships of war and Indiamen. To facilitate the keeping of a register of barometrical observations, Mr. Horsburgh, hydrographer to the East India Company, has lately published a set of engraved ruled sheets, adapted for the convenience of navigators. In these plates the height of the mercury, from twenty-seven to thirty-one inches, is represented in inches and tenth parts, by horizontal lines; while each successive day has a space apportioned to it by vertical bars. The state of the barometer at every observation is marked with a dot; and these dots being afterwards connected together, exhibit an irregular wavy line, stretching across the sheet, and indicating the series of the changes of the weather. At the lowest points, from which the curve again returns, a gale generally follows. From the observations made off the Cape of Good Hope, during the month of May 1815, by Captain Basil Hall, of his Majesty's sloop *Victor*, it appears that whenever the mercury fell to 29.60 inches, a storm always ensued; the column always rose when the gale abated, and when it reached near thirty inches, the weather became fair. Those gales often came on suddenly, without any visible change in the aspect of the sky, but the marine barometer never failed to give warning of their approach.

The following observations, upon the movements and state of the mercury in the marine barometer, were made by Captain Flinders, of his Majesty's ship *Investigator*, during his examination of the coasts of New Holland and New South Wales, the *Terra Australis* of the earlier charts, in the years of 1801, 1802, and 1803. *Phil. Trans.* 1806, Part. 2. The barometer, with which these observations were made, was constructed by Nairne and Blunt, and had been used in Captain Cook's voyages. The height of the mercury was taken regularly at day-break, at noon, and at eight o'clock in the evening. The temperature of the thermometer was also registered at the same periods. The circumstances that led Captain Flinders to think his observations worth attention were, the coin-

cidence that took place between the rising and falling of the mercury, and the setting in of wind that blew from the sea and from off the land, to which there seemed to be at least as much reference as to the strength of the wind, or the state of the atmosphere. Among the examples selected from the captain's journals, are nine that relate to the south coast; from these it appears, generally, that a change of wind from the northern, to any point in the southern half of the compass, caused the mercury to rise, and a contrary change, to fall; and that the mercury stood considerably higher when the wind was from the south side of east and west, than it did in similar weather when the wind came from the north side. The cause of this appears to be, that the first portion of air brought in from the sea, is impelled upwards by the land which it encounters, and along the inclined surface of the land, in a sloping direction: the next portion is, in the same manner, stopped and forced upwards; but it has a shorter space to pass through, because the former portion goes along two of the sides, and the latter along the third side of an obtuse-angled triangle: thus, the succeeding portions of air meet the summit of land before the first portions, and cause the latter to eddy and stagnate; while the stream blowing above this portion, compresses it, and augments its density, whence the increased height of the barometer.

'The barometer,' says Captain Flinders, 'was of great service to me in the investigation of this dangerous part of the east coast, where the ship was commonly surrounded with rocks, shoals, islands, or coral reefs. Near the main land, if the sea-breeze was dying off at night, and the mercury descending, I made no scruple of anchoring near the shore, knowing that it would either be a calm, or a wind would come off from the land; but if the mercury kept up, I stretched off, in the expectation that it would freshen up again in a few hours. Amongst the barrier-reefs, when the wind was dying away, the barometer told me, almost certainly, from what quarter it would next spring up. If the mercury stood at 30° 15' or near it, and was rising, I expected the proper trade wind; and if higher, that it would be well from the southward, or would blow fresh; and, if it was up to 30° 30' both. The falling of the mercury to 30° 10' was an indication of a breeze from the north-eastward; and its descent below thirty inches, that it would spring up, or shift round to the westward.' Hence, it appears, that this skillful commander navigated his vessel throughout those dangerous parts of the eastern coast that are between the latitudes of 23° and 17°, pursuant to a confident deduction from his own theory.

DR. HALLEY'S RULES FOR JUDGING OF THE WEATHER BY BAROMETERS.—I. In calm weather, when the air is inclined to rain, the mercury is commonly low. II. In serene, good, and settled weather, the mercury is generally high. III. Upon very great winds, though they be not accompanied with great rain, the mercury sinks lowest of all, according to the point of the compass the wind blows from. IV. The greatest heights of the mercury are found upon easterly or north-easterly winds, other circumstances alike. V. In calm frosty weather, the mercury commonly

stands high. VI. After very great storms of wind, when the mercury has been very low, it generally rises again very fast. VII. The more northerly places have greater alterations of the barometer than the more southerly, near the equator. VIII. Within the tropics, and near them, there is little or no variation of the barometer, in all weathers. For instance, at St. Helena it is little or nothing, at Jamaica three-tenths of an inch, and at Naples the variation hardly ever exceeds an inch; whereas in England it amounts to two inches and a half, and at Petersburg to $3\frac{1}{2}$ nearly.

Mr. Rowning justly remarks, that it is not so much the absolute height of the mercury in the tube that indicates the weather, as its motion up and down, and therefore, to pass a right judgment of what weather is to be expected, we ought to know whether the mercury is actually rising or falling; to which end the following rules are of use. I. If the surface of the mercury is convex, standing higher in the middle of the tube than at the sides, it is a sign that the mercury is then rising. II. But if the surface is concave, or hollow in the middle, it is then sinking. And, III. If it be plain, or rather a very little convex, the mercury is stationary; for mercury being put into a glass tube, especially a small one, naturally has its surface a little convex, because the particles of mercury attract one another more forcibly than they are attracted by glass. IV. If the glass be small, shake the tube; then if the air be grown heavier, the mercury will rise about half a tenth of an inch higher than it stood before; but if it be grown lighter, it will sink as much. And, it may be added, in the wheel or circular barometer, tap the instrument gently with the finger, and the index will visibly start forwards or backwards according to the tendency to rise or fall at that time. This proceeds from the mercury's sticking to the sides of the tube, which prevents the free motion of it till it be disengaged by the shock; and therefore, when an observation is to be made with such a tube, it ought to be first shaken; for sometimes the mercury will not vary of its own accord, till the weather is present which it ought to have indicated.

VARIATIONS OF THE BAROMETER. Several members of a German meteorological society have registered observations upon the barometer. The most noted of those observers are, Steilehner, Planer, Chiminello, and Hemmer.

The first of these gentlemen says, that he found, by several comparative observations, that the greatest fall of the barometer does not happen in very remote places at the same time; but that it is earlier towards the west, and later towards the east; and that the difference of the time is nearly equal to the difference of the meridians of the places; an assertion which deserves to be accurately examined.

M. Planer observed the barometer for a whole year, six times every day, viz. at two, six, and ten o'clock in the morning, and at the same hours in the afternoon; and found, in general, that the barometer, between ten in the morning and two in the afternoon, and between ten at night and two in the morning, was less in its rising, and greater in its fall; and that the contrary was the

case between the hours of six and ten in the evening and morning.

Chiminello observed the barometer twenty-two times a day, for three years, but he left a chasm in the night, which he supplied by calculation. The principal positions which he then deduced are, that the barometer falls towards noon, as well as towards midnight.

Hemmer deduced the three following general rules from a great number of accurate observations: 1. When the sun passes the meridian, the barometer, if in the act of falling, continues to fall, and the falling is accelerated. 2. When the sun passes the meridian, the barometer, if in the act of rising, falls, or becomes stationary, or rises more slowly. 3. When the sun passes the meridian, the barometer, which is stationary, falls, if it has not risen before or after being stationary; in which case it usually becomes stationary during the sun's passage.

From a register kept by a Mr. Dunbar, near the banks of the Mississippi, in N. lat. $31^{\circ} 28'$, we find that, for the space of about four days before, and six days after, the summer solstice, the barometer regularly rises from nine P. M. to about six A. M. then falls till the return of the former hour in the evening, then rises again as before, &c. in alternate periods. In the first four days the direction is ascending, and the elevation of a line drawn through the mean is about $\frac{1}{100}$ of an inch. In the latter six days the mean line is perfectly horizontal, the elevation each night amounting to $\frac{1}{30}$, and the depression each day to the same, but occupying double time.

The celebrated Humboldt made some interesting observations at Caracas, in South America, near the equator. There are, he says, four atmospheric tides every twenty-four hours, which depend only on the attraction of the sun. The mercury falls from nine in the morning to four in the evening: it rises from four to eleven o'clock: it falls from eleven o'clock till past four in the morning: and it re-ascends from that time till nine o'clock. Neither winds, storms, nor earthquakes, have any influence on this motion.

Horsburgh, in his last voyage to Bombay, employed two marine barometers, one made by Troughton, and the other by Ramsden; with which he made very minute observations; which were published in the second part of the Phil. Trans. for 1805; and in the Hist. Roy. Soc. Edin. of the same year, we have a comparison of the diurnal variations of the barometer, made in Peyrouse's voyage round the world, with those made at Calcutta, by Dr. Balfour.

The agreement between these observations seems very remarkable. Dr. Balfour found that, during the whole lunation, in which he observed the barometer from half hour to half hour, the mercury constantly fell from ten at night to six in the morning; from six to ten in the morning it rose; from ten in the morning to six at night it fell again; and, lastly, rose from six to ten at night. The maximum height is, therefore, at ten at night and ten in the morning; and the minimum at six at night and six in the morning. The only difference is, that in M. Lamanon's observations, the minimum is stated to have happened at about four instead of six. This, how-

ever, will not seem a very material difference, when it is remembered, that the instant when any quantity attains either its greatest or its least state is not easily ascertained with precision. From the observations, as detailed by M. Lamanon, the time of the minimum seems to answer fully as well to five as to four; so that the difference of the results is in every view inconsiderable, and their coincidence on the whole not a little singular. The variation in Dr. Balfour's barometer between the nearest maximum and minimum is sometimes about $\frac{1}{5}$ of an inch, though, in general, considerably less.

Many hypotheses have been advanced to explain the cause of the variations of the barometer. The various and often imaginary effects of vapors of heat and winds have been employed in framing an explication of the changes of the atmosphere. The fact that the mercurial column generally falls before rain, seemed at complete variance with the intimation of the senses; it being a notion universally prevalent, that the air is heavier when the sky appears lowering and overcast; another proof, if it were wanted, how fallacious are all current opinions in matters of science.

Leibnitz endeavoured, by a sort of metaphysical argument, to demonstrate that, though a body adds its own weight to the pressure of a fluid in which it is suspended, yet it will cease to be ponderous in the act of falling. This alleged principle will not, in the actual state of science, be thought to require any serious refutation. Dr. Halley thought the winds and exhalations sufficient to account for these variations; and on this principle gives a theory, the substance of which may be comprised in what follows: 1st That the winds must alter the weight of the air in any particular country; and this, either by bringing together a greater quantity of air, and so loading the atmosphere of any place, which will be the case as often as two winds blow from opposite parts, at the same time, towards the same point; or by sweeping away some part of the air, and giving room for the atmosphere to expand itself, which will happen when two winds blow opposite ways from the same point at the same time: or lastly, by cutting off the perpendicular pressure of the air, which is the case when a single wind blows briskly any way; it being found by experience, that a strong blast of wind, even made by art, will render the atmosphere lighter: and hence the mercury in a tube below it, as well as in others more distant, will considerably subside. See Phil. Trans. No. 292. 2dly, That the cold nitrous particles, or even the air itself condensed in the northern regions, and driven elsewhere, must load the atmosphere, and increase its pressure. 3dly, That heavy dry exhalations from the earth must increase the weight of the atmosphere, as well as its elastic force; as we find the specific gravity of menstrua increased by salts and metals dissolved in them. 4thly, That the air being rendered heavier by these, and the like causes, is the more better able to support the vapors; which being likewise naturally mixed with it, make the weather serene and fair. Again the air being made lighter by the contrary causes, it becomes unable to support the vapors with which it is

replete; these therefore precipitating, are collected into clouds, the particles of which in their progress unite into drops of rain. Hence he infers, that the same causes which increase the weight of the air, and render it more able to support the mercury in the barometer, likewise produce a serene sky, and a dry season; and that the same causes which render the air lighter, and less able to support the mercury, likewise generate clouds and rain.

Dr. James Hutton, in his Theory of Rain, printed in the Transactions of the Royal Society of Edinburgh, vol. 1, gives ingenious and plausible reasons for thinking that the lessening the weight of the atmosphere by the fall of rain, is not the cause of the fall of the barometer, but that the principal, if not the only cause, arises from the commotions in the atmosphere, which are chiefly produced by sudden changes of heat and cold in the air. The barometer, says he, is an instrument necessarily connected with motions in the atmosphere; but it is not equally affected with every motion in that fluid body. The barometer is chiefly affected by those motions by which they are produced, accumulations and abstractions of this fluid, in places or regions of sufficient extent to affect the pressure of the atmosphere upon the surface of the earth. But as every commotion in the atmosphere may, under proper conditions, be a cause for rain, and as the want of commotion in the atmosphere is naturally a cause of fair weather, this instrument may be made of great importance for the purpose of meteorological observations, although not in the certain and more simple manner in which it has been with the increase of science, so successfully applied to the measuring of heights. See RAIN.

Hauksbee's celebrated experiment has been quoted as confirming the theory of Dr. Halley. That ingenious experimentalist, about the year 1704, placed two barometers, about three feet asunder, with their naked cisterns in two close square wooden boxes, connected by a horizontal brass pipe; one of these boxes had, inserted at right angles, an open pipe on the one side, and a second pipe, terminating in a screw, on the other side; to this end he adapted a strong globular receiver of about a foot in diameter, which had been charged, by injection from a syringe, with three or four atmospheres; then suddenly opening the stop-cock, and giving vent for the escape of the air through the box and over the surface of the included cistern the mercury sunk equally in both barometers more than two inches. This experiment might be deemed entirely conclusive, if a minute circumstance, on which its success depends, had not unfortunately been overlooked. It will be perceived from the inspection of the figure which Hauksbee has given, that the exit pipe of the box was considerably wider than the pipe which conveyed into it the stream of air. This fluid, escaping from compression, would, therefore, be carried by its elasticity as much beyond the state of equilibrium; while the width of the orifice, by facilitating its emission, would allow the portion occupying the box and the connected reservoir to discharge its acquired expansion. If the pipe of discharge from the box had been much

narrower than the other, an opposite effect must have taken place; for the air accumulated over the cistern, not finding a ready vent, would remain in a state of condensation. This fact is a remarkable indication of the great delicacy required in performing such experiments.

The same result, however, can be exhibited by a very simple apparatus. Let a small box, or rather a glass ball, have a short narrow tube inserted in the one side, and another wide tube opposite to this, with a cross slider of brass, for contracting the orifice at pleasure; and, to the under part of the ball, join a long perpendicular tube, bent back like a syphon to more than half its height and containing a double column of water. Now, blow through the narrow tube into the cavity of the ball, while the orifice of emission is quite opened, and the liquor will rise several inches in a long stem; but, still continuing the blast, let the orifice be gradually contracted, and the column will first descend to its ordinary level, and then sink considerably below it.

It is clear that the fall and rise of the mercury in the barometer must evidently be occasioned by some corresponding reduction or accumulation of the atmosphere at the place of observation. Whatever augments the elasticity of the air will cause part of the incumbent fluid to evade and leave for the time a diminished vertical pressure. The efflux of wind might also produce a temporary reduction of the atmospheric column. But the real difficulty consists in explaining why the variations of the barometer should be greater in the high latitudes than between the tropics, and why they so much exceed in all cases the quantities which calculation might assign. On the whole, the present state of physical science presents nothing but a series of conjectures on this subject. The augmented elasticity communicated to the air by the action of heat or the presence of humidity, and the reduction of the incumbent mass by the efflux of winds, have doubtless each their distinct influence, in disturbing the equilibrium of the atmospheric ocean. But the effects, particularly in the high latitudes, much surpass the regular operation of those causes. The only mode, perhaps, of removing the difficulty, is to take into consideration the comparative slowness with which any force is propagated through the vast body of atmosphere. An inequality may continue to accumulate in one spot, before the counterbalancing influence of the distant portions of the aerial fluid can arrive to modify the result. In the higher latitudes, the narrow circle of air

may be considered as, in some measure, insulated from the expanded ocean of atmosphere, and hence, perhaps, the variations of the barometer are concentrated there, and swelled beyond the due proportion.

The use and application of barometers in measuring altitudes, has of late attracted more of the attention of philosophers than their faculty of indicating the weather. As before observed, this use of the instrument was first proposed by Pascal and Descartes. Succeeding philosophers have been at great pains to ascertain the proportion between the fall of the barometer and the height to which it is carried; as Halley, Mariotte, Maraldi, Scheuchzer, J. Cassini, D. Bernoulli, Horrebow, Bouguer, Shuckburgh, Roy, and more especially De Luc, who has given a critical and historical detail of most of the attempts, that have at different times been made, for applying the motion of the mercury in the barometer to the measurement of accessible heights. We have noticed the researches of Dr. Halley and De Luc, who introduced the corrections of the columns of mercury and air, on account of heat. The following rules for computing heights (the principles of which the reader will find explained under PNEUMATICS,) are given by Dr. Maskelyne, in his Introduction to Taylor's Tables of Logarithms. The altitudes of the barometer at two stations, with the heights of Fahrenheit's thermometer attached to the barometer, and the heights of two thermometers of the same kind, exposed to the air but sheltered from the sun, at the two stations being given, to find the perpendicular altitude of the one station above the other?—Put *B* for the observed height of the barometer at the lower station, and *b* for that at the upper station, *D* for the difference of heights of Fahrenheit's thermometer attached to the barometer at the two stations, and *F* for the mean of the two heights of Fahrenheit's thermometer, exposed freely for a few minutes to the open air, in the shade at the two stations. The altitudes of the upper station above the lower, in English fathoms, will be expressed as follows, according to the respective observations of M. de Luc, the late General Roy, and Sir George Shuckburgh, in which the upper sign — is to be used when the thermometer attached to the barometer is highest at the lower station, (which is most usual,) and the lower sign + when it is lowest at the lower station.

$$\text{M. De Luc} \quad \dots \quad \text{Log. } B - \text{Log. } b \mp 0.452 D \times \frac{1 + F - 40^\circ}{1} \times 0.00223.$$

$$\text{General Roy} \quad \dots \quad \text{Log. } B - \text{Log. } b \mp 0.468 D \times \frac{1 + F - 32^\circ}{1} \times 0.00245.$$

$$\text{Sir G. Shuckburgh} \quad \dots \quad \text{Log. } B - \text{Log. } b \mp 0.440 D \times \frac{1 + F - 32^\circ}{1} \times 0.00243.$$

$$\text{Mean of the two last} \quad \text{Log. } B - \text{Log. } b \mp 0.454 D \times \frac{1 + F - 32^\circ}{1} \times 0.00244.$$

The observations of General Roy and Sir George Shuckburgh having been made with barometers and thermometers constructed and accurately di-

vided by Mr. Ramsden, and with the detached thermometers never exposed to the sun, appear clearly to deserve the preference above those of

M. de Luc. The last of the above rules, which is a mean between those of General Roy and Sir George Shuckburgh, may be expressed in words at length, as follows: take the difference of the tabular logarithms of the observed heights of the barometer at the two stations, considering the four first figures, exclusive of the index, as whole numbers, and the remaining figures to the right as decimals, and subtract or add $\frac{455}{1000}$ of the difference of altitude of Fahrenheit's thermometer, attached to the barometer at the two stations, according as it was highest at the lower or upper station; thus the height of the upper station above the lower in English fathoms, will be found nearly; to be corrected as follows:—Multiply the height found nearly by the difference between the mean of the two altitudes of Fahrenheit's thermometer exposed to the air of the two stations and 32° , and by the decimal fraction 0.00244; the product will be the correction of the approximate height, which added to, or subtracted from the same, according as the mean of the two altitudes of Fahrenheit's thermometer exposed to the air was higher or lower than 32° , will give the true height of the upper station above the lower in English fathoms; which multiplied by 6, will give the true height in English feet.

EXAMPLE. Let the state of the barometers and thermometers be as follows, to find the altitude.

THERMOMETERS.		BAROMETERS.
Detached.	Attached.	
57	57	29.68 lower.
42	43	25.28 upper
Mean $49\frac{1}{2}$	Diff. 14	
	HEIGHTS.	LOG.
	29.68	4724.639
	25.28	4027.771
	from	696.868
Subtract $\frac{455}{1000} \times 14 =$		6.356
Height nearly =		690.512
Multiply by $49\frac{1}{2} - 32 =$		17 $\frac{1}{2}$
Height nearly =		690.512
Product =		21083.960
Multiply by		.00244
Correction =		29.485
Height nearly =		690.512
Correct height in fathoms =		719.997

Professor Playfair, in a learned paper, printed in the first volume of the Transactions of the Royal Society of Edinburgh, has examined all the circumstances which can affect barometrical measurements, with his usual correctness and perspicuity. La Place resumed the subject in his *Mécanique Céleste*, and brought all the conditions together in a very complicated formula, to which we have before alluded. Such an appearance of extreme accuracy, however, is perhaps to be regarded rather as a theoretical illusion, than a view of results founded on the real state of practice. Biot also, in attempting to arrive at a similar conclusion, confines himself to the same

remark. He sets out à priori from some careful experiments on the relative density of air and mercury, performed by him in conjunction with Arago. He thence infers, that in the latitude of Paris, and at the point of congelation, air, under a mercurial pressure of 76 metres, or 29.922 English inches, is 10,463 times lighter than mercury at the temperature of water at its lowest contraction. This would give 26.090 feet for the height of a column of homogeneous fluid, whose pressure is equivalent to the elasticity of the atmosphere. The coefficient adapted to common logarithms, and adjusted to the force of attraction at the level of the sea, would therefore be 60,148 feet, or 18,334 metres; scarcely differing sensibly from the quantity which Ramond had deduced from a very numerous set of experiments made by him on the Pyrenees. But Biot prefers, as the coefficient, the number 18,993, answering for an elevation of 1200 metres, or about 4000 feet above the sea, which is not far from the general level of such observations. The formula is hence, in English feet,

$$60,346 (1 + .002837 \cos. 2\psi) \left(1 + \frac{2(T+t)}{1000} \right)$$

$\log. \frac{H}{h}$; where ψ denotes the latitude of the place, T and t the temperatures of the air at the two stations, as indicated by the centesimal thermometer, and H and h the heights of mercurial columns corrected for the effects of heat.

This writer has likewise given tables for expediting the calculation of barometrical measurements; in which he was anticipated, however, by Oltmans of Berlin, who published, in 1809, large Hypsometrical Tables, as they are called, accommodated to the complex formula of La Place. Such tables might, no doubt, prove useful where very frequent computations are wanted, as in the case of the reduction of the numerous observations brought home by Baron Humboldt, for which, indeed, they were first designed. But still they contain a needless profusion of figures, and hold forth a show of extreme accuracy which the nature of the observations themselves can never justify. By barometrical admeasurements, principally scientific, travellers have of late years been able to form vertical sections of different countries, which contribute further to our knowledge of their geological character than any previous mode of delineation. Thus Humboldt, in his *Geography of Plants*, gives a section across the American continent, one of the best and most interesting that has yet appeared. It consists, in fact, of four combined sections, traversing through an extent of 425 miles. The line begins at Acapulco on the shore of the Pacific Ocean, and runs 195 miles, about a point of the compass towards the east of north, to the city of Mexico; then eighty miles, a point to the south of east, to La Puebla de los Angeles; again it holds a north-east direction of seventy miles, to the Cruz Blanca; and finally bends eighty miles east by south, to Vera Cruz, on the coast of the Atlantic. A scale of altitudes is annexed, which shows the vast elevation of the table-land at Mexico.

This mode of distant levelling has originated also a very interesting discovery, recently made by Engelhardt and Parrot, two Prussian travel-

lers, in another quarter of our globe; they proceeded, on the 13th of July, 1814, from the mouth of the Kuban, at the island of Taman, on the Black Sea; and, examining carefully every day the state of the barometer, they advanced with fifty-one observations, the distance of 990 versts, or 711 English miles, to the mouth of the Terek, on the margin of the Caspian Sea. Similar observations were repeated and multiplied on their return. From a diligent comparison of the whole, it follows that the Caspian is 334 English feet below the level of the Black Sea. That the Caspian really occupies a lower level than the ocean, had been suspected before, from a comparison of some registers of barometers kept at St. Petersburg, and on the borders of that inland sea; but the last observation places the question beyond all doubt. It farther appears, that within 250 versts, or 189 miles, of the Caspian, the country is already depressed to the level of the ocean, leaving, therefore, an immense basin, from which the waters are supposed to have retired by a subterranean percolation.

We subjoin a table of the altitude of some of the most remarkable mountains, &c. on the earth above the surface of the ocean:—

	Eng. feet.
Mount Puy de Dome in Auvergne, the first mountain measured by the barometer	5088
Mount Blanc	15662
Monte Rosa	15048
Aiguille d'Argentiere	13402
Monastery of St. Bernard	7944
Mount Cenis	9212
Pic de los Reyes	7620
Pic du Midi	9300
Pic d'Ossano	11700
Canegou	8544
Lake of Geneva	1232
Mount Ætna	10954
Mount Vesuvius	3938
Mount Hecla in Iceland	4887
Snowdon	3555
Ben Moir	3723
Ben Lawers	3858
Ben Gløe	3472
Schihallion	3461
Ben Lomond	3180
Tinto	2342
Table Hill, Cape of Good Hope	3454
Gondar, city in Abyssinia	8440
Source of the Nile	8082
Pic of Teneriffe	14026
Chimborazo	19595
Cayambouro	19391
Antisana	19290
Pichincha	15670
City of Quito	9977

The mean height of the barometer in London, upon an average of two observations in every day of the year, kept at the house of the Royal Society, for many years past, is 29.88; the medium temperature, or height of the thermometer, according to the same, being 58°. But the medium height at the surface of the sea, according to Sir George Shuckburgh, (Phil. Trans. 1777. p. 586.) is 30.04 inches, the heat of the thermometer being 55°, and of the air 62°.

BAROMETRICAL PHOSPHORUS. See PHOSPHORUS.

BA'RON, } Fr. *baron*; Ital. *barone*; Sp. }
 BA'RONAGE, } *baron*. See to BA'R. *Barigan*, }
 BA'RONESS, } to arm; to defend; to strengthen. }
 BA'RONET, } The etymology of this word is }
 BA'RONIAL, } very uncertain. *Baro*, among }
 BARONY. } the Romans, signified a brave }
 warrior, or a brutal man; and, from the first of }
 these significations, Menage derives *baron*, as a }
 term of military dignity.—Others suppose it }
 originally to signify only a man, in which sense }
baron or *varon*, is still used by the Spaniards; }
 and, to confirm this conjecture, our law yet uses }
baron and *femme*, husband and wife. Others }
 deduce it from *ber*, an old Gaulish word, signi- }
 fying commander; others from the Hebrew כָּרָר }
 of the same import. Some think it a contraction }
 of *par homme*, or *peer*, which seems least prob- }
 able. Allowing the derivation to be from }
barigan, which is the suggestion of Tooke, then }
 the simple idea of *baron* is a man of power, }
 armed and surrounded with abundant means of }
 defence. This generally implies rank; and *baron* }
 is a title of nobility, it is likewise a name of }
 office.

When loue has told herr his extent
 The *baronage* to counsaile went,
 In many sentences they fill,
 And diuersly they saied her will.

Chaucer. Romant of the Roses

My lord, I'll tell you what,—

If my young lord, your son, have not the day,
 Upon mine honour for a silken point
 I'll give my *barony*.

Shakspeare.

Where throngs of knights and *barons* bold
 In weeds of peace high triumph hold,
 With store of ladies, whose bright eyes
 Rain influence, and judge the prize
 Of wit or arms, while both contend

To win her grace whom all commend. *Milton.*

Sir Edward Walker, garter and secretary of war to King Charles the First, observes, 'That in all Queen Elizabeth's forty-four years reign, she created but six earls and eight or nine *barons*.'

Oldys' Life of Sir Walter Raleigh.

The second was the *baronage*, the nobility and gentry who held their *baronies* of the king, and the third was the boroughs, who held of the king by *barony*, though in a community; so that the parliament was truly the *baronage* of the kingdom. The lesser *barons* grew weary of this attendance.

Burnet. History of his own Times.

Coffee (which makes the politician wise,
 And see thro' all things with his half shut eyes)

Sent up in vapours to the *baron's* brain
 New stratagems the radiant lock to gain. *Pope.*

Here might you see

Barons and peasants on the embattled field,
 Slain or half dead, in one huge ghastly heap

Promiscuously amased. *Philips's Cider, b. ii.*

The title of *baronet*, invented by Salisbury, was sold; and two hundred patents of that species of knighthood were disposed of for so many thousand pounds. *Hume. History of England. King James Ist.*

A *baron* is the most general and universal title of nobility; for originally every one of the peers of superior rank had also a *barony* annexed to his other titles. But it hath sometimes happened, that when an ancient *baron* hath been raised to a new degree of peerage, in the course of a few generations the two titles have descended differently. *Blackstone's Commentaries.*

BARON (Robert), a dramatic author, who lived during the reign of Charles I. and the protectorship of Oliver Cromwell. He was educated at Cambridge, after which he became a member of the society of Gray's Inn. During his residence at the university he wrote a novel, called the Cyprian Academy, in which he introduced the first two of the dramatic pieces mentioned below. The third of them is a much more regular and perfect play, and was probably written when the author had attained a riper age. Their names are, 1. *Deorum Dona*, a masque. 2. *Gripus and Hegio*, a pastoral. 3. *Mirza*, a tragedy. Mr. Baron was intimate with the celebrated Mr. James Howell, the traveller, in whose collection of letters there is one to this gentleman, vol. iii. let. 418, who was then at Paris. To Mr. Howell, and the ladies and gentlewomen of England, he dedicated his romance.

BARON. This title in ancient records was applied to all the nobility of England, because regularly all noblemen were barons, though they had also a higher dignity. But it has sometimes happened, that when an ancient baron has been raised to a new degree of peerage, in the course of a few generations the two titles have descended differently; one perhaps to the male descendants, the other to the heirs general; whereby the earldom or other superior title has subsisted without a barony: and there are also modern instances, where earls and viscounts have been created without annexing a barony to their other honors: so that now the rule does not hold universally that all peers are barons. The origin and antiquity of barons has occasioned great enquiries among antiquaries. The most probable opinion is, that they were the same with our present lords of manors. It is said the original name of this dignity in England was *vivassour*, which by the Saxons was changed into *thane*, and by the Normans into *baron*. It may be collected from king John's magna charta, that originally all lords of manors, or barons, had seats in the great council of parliament; but such is the deficiency of public records, that the first precept to be found is of no higher date than the 49 Henry III. which, although it was issued out in the king's name, was neither by his authority nor by his direction: for the king himself, his son prince Edward, and most of the nobility who stood loyal to him, were then prisoners in the hands of the rebellious barons; having been taken in May preceding, at the battle of Lewes, and so continued until the battle of Evesham, in August the year following; when, by the escape of prince Edward, he rescued the king and his adherents out of the hands of Simon Mountford, Earl of Leicester. It cannot be doubted, but that several parliaments were held by Henry III. and Edward I. yet no record is to be found, giving any account of them, except the fifth of Edward I. until the twenty-second year of that king's reign.

Before the 49 Henry III. the ancient parliaments consisted of the archbishops, bishops, abbots, earls, and barons. Of these barons there were two sorts; the greater barons, or the king's chief tenants, who held of him in capite by barony; and the lesser barons, who

held of the first by military service in capite. The former had summons to parliament by several writs; and the latter (i. e. all those who were possessed of thirteen knight's fees and a quarter) had a general summons from the sheriff in each county. Thus things continued till the 49 Henry III. when, instead of keeping to the old form, the prevailing powers thought fit to summon, not all, but only those of the greater barons who were of their party; and, instead of the lesser barons who came with large retinues, to send their precepts to the sheriff of each county to cause two knights in every shire to be chosen, and one or two burgesses for each borough, to represent the body of the people residing in those counties and boroughs; which gave rise to the separation into two houses of parliament. By degrees the title came to be confined to the greater barons, or lords of parliament only; and there were no other barons among the peerage but such as were summoned by writ, in respect of the tenure of their lands or baronies, till Richard II. first made it a mere title of honor, by conferring it on divers persons by his letters patent.

BARONS BY ANCIENT TENURE, were those who held certain territories of the king, who still reserved the tenure in chief to himself. We also read of barons by temporal tenure; who are such as hold honors, castles, manors, as heads of their barony, that is, by grand serjeantry; by which tenure they were anciently summoned to parliament. But at present a baron by tenure is no lord of parliament, till he be called thither by writ. The barons by tenure, after the conquest, were divided into *majores* and *minores*, and were summoned accordingly to parliament; the *majores*, or greater barons, by immediate writ from the king; the *minores*, or lesser barons, by general writ from the high sheriff, at the king's command. Anciently they distinguished the greater barons from the less, by attributing high, and even sovereign jurisdiction, to the former, and only inferior jurisdiction over smaller matters to the latter.

When a baron is called up to the house of peers by writ of summons, the writ is in the king's name, and he is directed to come to the parliament appointed to be held at a certain time and place, and there to treat and advise with his majesty, the prelates, and nobility, about the weighty affairs of the nation. The ceremony of his admission into the house of peers is this: He is brought into the house between two barons, who conduct him to the Lord Chancellor, his patent or writ of summons being carried by a king-at-arms, who presents it kneeling to the Chancellor, who reads it, and then congratulates him on his becoming a member of the house of peers, and invests him with his parliamentary robe. The patent is then delivered to the clerk of the parliament, and the oaths are administered to the new peer, who is conducted to his seat on the barons' bench. Some barons hold their seats by tenure. The coronation robes of a baron are the same as an earl's, except that he has only two rows of spots on each shoulder. In like manner his parliamentary robes have but two guards of white fur, with rows of gold lace.

In other respects they are the same with those of other peers.

A **BARON'S** coronet, in heraldry, is a gold circle, on which are six pearls, which were assigned to barons by king Charles II. after the Restoration. Previously to this time the barons wore scarlet caps, turned up with ermine, and on the top a tassel of gold. Though called pearls, the globes round the coronet are always made of silver. His cap is the same as a viscount's. His style is Right Honourable; and he is addressed by the king or queen, Right Trusty and Well Beloved. See **BARONY**.

BARON AND FEMME, in English law, husband and wife. They are deemed but one person; so that a wife cannot be witness for or against her husband, nor he for or against his wife, except in cases of high treason.

BARON AND FEMME, in heraldry, is when the coats of arms of a man and his wife are borne par pale in the same escutcheon, the man's being always on the dexter side, and the woman's on the sinister; but here the woman is supposed not an heiress, for then her coat must be borne by the husband on an escutcheon of pretence.

BARON, LORD CHIEF, the president of the court of Exchequer.

BARONS OF THE CINQUE-PORTS, are members of the house of commons, elected by the five ports, two for each port. Those who have been mayors of Corfe-castle, in Devonshire, are likewise styled barons; and formerly the principal citizens of London were honored with the title of baron. See **CINQUE-PORTS**.

BARONS OF THE EXCHEQUER, four judges in England, and five in Scotland, to whom the administration of justice is committed, in causes between the king and his subjects, relating to matters concerning the revenue. They were formerly barons of the realm, but of late are generally persons learned in the laws. Their office is also to look into the accounts of the king, for which reason they have auditors under them. See **EXCHEQUER**.

BARONAGIUM. See **BARONY**.

BARONETS OF ENGLAND. The dignity of baronet is given by patent. The order was founded by King James I. at the suggestion of Sir Robert Cotton, in 1611, when 200 baronets were created at once; to which number it was intended they should always be restrained: but it is now enlarged at the king's pleasure, without limitation. They had several considerable privileges given them, with an habendum to them and their heirs male. They were allowed to charge their coat with the arms of Ulster, which are, in a field argent, a sinister hand, gules; and that upon condition of their defending the province of Ulster in Ireland against the rebels, who then harassed it extremely: to which end they were each to raise and keep up thirty soldiers, at their own expense, for three years together, or to pay into the exchequer a sum sufficient to do it; which, at eight-pence per day per head, was £1095. So that, including fees, the expense of this dignity may be about £1200

sterling. To be qualified for it, one must be a gentleman born, and have a clear estate of £1000 per annum. Baronets take place according to the dates of their patents; by the terms of which no honor is to be erected between barons and baronets. The title, Sir, is granted them by a peculiar clause in their patents, though they be not dubbed knights: but both a baronet and his eldest son, being of full age, may claim knighthood. The first English baronet was Sir Nicholas Bacon, of Redgrave, in Suffolk, whose successor is therefore styled primus baronetorum Angliæ. If a baronet be named at an installation as proxy for a knight of the Bath, it appears essential that he should be knighted for the occasion; thus Sir George Osborne, Bart. was knighted by king George III. A baronet takes precedence of all knights, except bannerets. Baronets' mark; the arms of the province of Ulster, viz. argent, a hand, gules, in a canton, or in escutcheon, are borne by every baronet, as in the annexed example. 'He beareth, or, between two chevrons, three trefoils, slipped, sable,' as in the arms of the Abdy family.

BARONETS OF IRELAND. In Ireland, an hereditary dignity somewhat similar to knighthood, appears to have been occasionally conferred in the earliest times; and the knights of Kerry and of Glyn are yet permitted to bear distinctions bestowed on their ancestors by the ancient sovereigns of the country. The order of baronets, however, was likewise instituted here by James I. in the eighteenth year of his reign, for the same purpose, and with the same privileges within the kingdom of Ireland as he had conferred on the like order in England; for which the Irish baronets paid the same fees into the treasury of Ireland. The first of that kingdom who was advanced to this hereditary dignity was Sir Francis Blundell, then secretary for the affairs of Ireland. Several more have been added, no number being limited; but since the union in 1801, none have been created otherwise than as baronets of the united kingdom.

BARONETS OF NOVA SCOTIA, AND BARONETS OF SCOTLAND. The order of knights baronets was also designed to be established in Scotland in 1621, by James I. for the plantation and cultivation of the province of Nova Scotia, in America; but it was not actually instituted till the year 1625, by his son Charles I. when the first person dignified with this title was Sir Robert Gordon, of Gordonstone, a younger son of the Earl of Sutherland. The king granted a certain portion of land in Acadia or New Scotland, to each of them, which they were to hold of Sir William Alexander, afterwards Earl of Stirling, for their encouragement who should hazard their lives for the good and increase of that plantation, with precedence to them, and their heirs male for ever, before all knights called equites aurati, and all lesser barons called lairds, and all other gentlemen, except Sir William Alexander, his majesty's lieutenant in Nova Scotia, his heirs, their wives and children; that the title of Sir should be prefixed to their

Christian name, and Baronet added to their surname; and their own and their eldest sons' wives should enjoy the title of Lady, Madam, or Dame. His majesty was so desirous of adding every mark of dignity to this, his favorite order, that four years after its institution, he issued a royal warrant, granting them the privilege of wearing an orange ribbon and a medal: which last was presented to each of them by the king himself, according to the words of the warrant. All the privileges of the order, particularly this of wearing the medal, were confirmed at the king's request by the convention of estates in the year 1630; and, in order to establish them on the most solid foundation, they were again confirmed by an act of the parliament of Scotland in 1633. The premier baronet of Scotland, at present, is Sir Richard Strachan; and the number of the order, exclusive of such titles as are merged in peerages, is 135. Since the union the power of the king to create new baronets within Scotland is held to have ceased.

BARONI (Adriana), baroness of Piancarea, in Mantua, an eminent singer, surnamed the fair, on account of her uncommon beauty. See next article.

BARONI (Leonora), and her mother, Adriana, were both distinguished for their extraordinary musical talents. Leonora was born at Naples, but spent the greatest part of her life at Rome. She had less beauty than her mother; but excelled her in profound skill in music, the fineness of her voice, and the delicacy of her manner. Mr. Bayle styles her one of the finest singers in the world; she was equally eminent as a composer, and was accordingly, as well as her mother, celebrated by the wits. In 1639 there was published, at Bracciano, a collection of Latin, Greek, Italian, Spanish, and French poems, in her praise, with this title, *Applausi Poetici alle Glorie della Signora Leonora Baroni*. Among the Latin poems of Milton there are three addressed, *Ad Leonoram Romæ canentem*, wherein this lady is celebrated for her singing, with an allusion to her mother's exquisite performance on the lute. A fine eulogium on her is contained in a discourse on the music of the Italians, printed with the life of Malherbe, and some other treatises at Paris, in 1672, in 12mo. It was composed by M. Maugars, prior of St. Peter de Marc, the King's English interpreter, who says, "her singing threw me into such raptures, that I forgot my mortality, and thought myself among the angels, enjoying the felicity of the blessed!"

BARONIE CAPTI. See CAPTI.

BARONIS, a mountain of Chaus, in Barbary, three miles north of Fez. It produces red grapes, of which they make good wine, and is surrounded by villages.

BARONIUS (Cesar), was born at Sora, in 1534, and studied at Rome, under Philip de Neri. In 1593 he was made general of the congregation of the Oratory, on the resignation of Philippe Neri, the founder. Pope Clement VIII. raised him his confessor, and created him a cardinal in 1196. He was afterwards librarian to the Vatican, and died in 1605, at sixty-eight years of age. He wrote several works, the prin-

cipal of which is his *Annales Ecclesiastici*, from A. D. 1 to 1198, in twelve vols. folio; which has been abridged by several persons, particularly by Henry Spondæus, Bzovius, and Ludovico Aurelio.

BARONSTOWN, a town of Ireland, in the county of Louth, six miles W. N. W. of Dundalk.

BARONY, **BARONIA**, or **BARONAGIUM**, may be considered as a lordship, held by some service in chief of the king, coinciding with what is otherwise called grand serjeanty. Baronies, in their first creation, moved from the king himself, the chief lord of the whole realm, and could be holden of no other lord. For example, the king enfeoffed a man of a great seigneurie in land, to hold to the person enfeoffed and his heirs, of the king and his heirs, by baronial service; to wit, by the service of twenty, forty, sixty, knights, or of such other number of knights, as the king by his feoffment limited or appointed. In the ages next after the conquest, when a great lord was enfeoffed by the king of a large seigneurie, such seigneurie was called barony, but more commonly an honor; as, the honor of Gloucester, the honor of Wallingford, and the like. There were in England certain honors, which were called sometimes by English and sometimes by foreign names. This happened when the same person was lord of an honor in Normandy, or some other foreign country, and also of an honor in England. For example, William de Forz, de Force, or de Fortibus, was lord of the honor of Albemarle in Normandy: he was also lord of two honors in England; to wit, the honor of Holderness, and the honor of Skipton in Craven. These honors in England were sometimes called by the Norman name, the honor of Albemarle, or the honor of the earl of Albemarle. In like manner the earl of Britannie was lord of the honor of Britannie in France, and also of the honor of Richmond in England; the honor of Richmond was sometimes called by the foreign name, the honor of Britannie, or the honor of the Earl of Britannie. This serves to explain the terms honor Albemarlæ, or comitis Albemarlæ in Anglia; honor Britannicæ, or comitis Britannicæ in Anglia; not that Albemarle or Britannie were in England, but that the same person respectively was lord of each of the said honors abroad, and of each of the said honors in England. The baronies belonging to bishops are by some called regalia, as being held solely on the king's liberality. These do not consist in one barony alone, but in many; for *tot erant baroniæ quot majora prædia*. A barony, according to Bracton, is a right indivisible. Wherefore, if an inheritance be to be divided among co-partners, though some capital message may be divided, yet if the capital message be the head of a county or barony, it may not be parcelled: and the reason is, lest by this division many of the rights of counties and baronies by degrees come to nothing, to the prejudice of the realm, which is said to be composed of counties and baronies.

BARONY of Glasgow. See GLASGOW.

BAROPTIS, or **BAROPTINUS LAPIS**, among ancient naturalists, a species of stone, supposed

to have wonderful virtues against venomous bites, externally applied. Pliny has left us but a very short description of it; he says, it was black in color, but variegated with large spots of red and white.

BAROS, or **BARIOS**, a sea-port of the island of Celebes, having a Dutch factory and settlement. There is a good trade here in opium. Long. 119° 15' E., lat. 1° 24' S.

BAROSCOPE, *n. s.* Βαροσ and σκοπεω, an instrument to show the weight of the atmosphere. See **BAROMETER**.

If there was always a calm, the equilibrium could only be changed by the contents; where the winds are not variable, the alterations of the *baroscope* are very small.

BAROTH, a market-town of Transylvania, on the Aluta.

BARQUETTE, or **BARCHETTA**, denotes a lesser sort of barks, used in the Mediterranean, for the service of galleys, as boats and shallops are for other ships.

BARQUISIMETO, a city of South America, in the province of Venezuela, founded by the Spaniards in 1552. It is placed on an elevated plain, and enjoys great comparative coolness. The most constant and equal wind which prevails is the north-east, and, whenever the rays of the sun are not tempered by it, the thermometer of Fahrenheit rises to 82° and 84°. In the surrounding plains and hills excellent pasture encourages the rearing of all sorts of cattle. Many of the citizens prefer this speculation, and find it to their advantage, although at the same time they cultivate the sugar-cane and wheat. From a freshness preserved by irrigation the vales produce cacao abundantly, and of a good quality; and the sides of the hills have lately been employed in the culture of coffee. There are in this place from 11,000 to 12,000 inhabitants, and the aspect of the city announces ease and affluence. The houses are well built; the streets straight, wide, and airy. The parish church is handsome, and served by two priests. The judicial and police duties are discharged by a common council and lieutenant. Barquisimeto is 120 miles W. S. W. of Caraccas, 450 N. N. E. of Santa Fé, and forty-five N. N. E. of Tocuyo.

BAR DICE, a species of false dice, so formed as that they will not easily lie on certain sides, or turn up certain points. Bar dice stand opposed to flat dice, which come up on certain points oftener than they should do.

BARR, or **BARRA**, a small kingdom of Africa. See **BARRA**.

BARR, **ST.** the tutelar saint of the island of Barray, which was named after him. His holiday is the 25th of September. On this day the priest says mass, and all those of the Romish religion used punctually to attend. See **BARRY**.

BARRA, a hill of Scotland in Aberdeenshire, in the parish of Bourtie, on the top of which are still distinctly visible the remains of an ancient camp, of a circular form, surrounded with ditches, and extending to near three acres.

BARRA, in commerce, a long measure used in Portugal and some parts of Spain, to measure woollen cloths, linen cloths, and serges. There are three kinds; the barra of Valencia, thirteen

of which make twelve yards and six sevenths. English measure; the barra of Castile, seven of which make six yards and four sevenths; and the barra of Arragon, three of which make two yards and four sevenths English.

BARRA, in law. See **BAR**.

BARRA, a kingdom of the western coast of Africa, at the mouth of the Gambia, fourteen leagues in breadth, and eighteen long, according to Golberry. It contains a population of 200,000 souls, chiefly of the Mandingo race, zealous Mahomedans, and acute in commercial transactions. The capital is

BARRA **INDING**, where a considerable trade is carried on to Barraconda in maize, elephants' teeth, gold dust and cotton cloth. Every vessel entering the Gambia here pays a tax of about £20 sterling to the king of Barra.

BARRABA, or **BARRADA**, a tract of land in Siberia, lying between the rivers Irtisch and Oby, in the province of Tobolsk. It is uninhabited, but not through any deficiency of the soil; for that is excellent for tillage, and part of it might also be laid out in meadows and pastures. It is interspersed with a great number of lakes, which abound with carp, and the country produces great numbers of elks, deer, foxes, ermine, and squirrels. Between the Irtisch and Oby are some copper-mines.

BARRACAN, *n. s.* Fr. *bouracan*, or *barracan*, a strong thick kind of camelot.

BARRACAN, or **BARRAGAN**, is something like camlet but of a coarser grain. It is used to make cloaks, surtouts, &c. to keep off rain. Barracans are chiefly made in France, as at Valenciennes, Lisle, Abbeville, Amiens, and Rouen. Those of Valenciennes are the most valued.

BARRACIDA, in ichthyology, a species of pike. See **ESOX**.

BARRACK, *n. s.* Span. *barracca*. Little cabins made by the Spanish fishermen on the sea shore; or little lodges for soldiers in a camp. It is generally taken among us for buildings to lodge soldiers. It is not found in our early lexicographers. Perhaps from *barricado*, *barrique*. See **BARRICADO**.

Like ours it should wholly be composed of natural subjects; it ought only to be enlisted for a short and limited time; the soldiers also should live intermixed with the people; no separate camp, no *barracks*, no inland fortresses, should be allowed.

Blackstone. Commentaries.

Modern military men have always thought barracks very convenient, when there is sufficient room to make a large square, surrounded with buildings; because the soldiers are easily confined to their quarters, and the rooms being contiguous, orders are executed with privacy and expedition; and the troops have not the least connexion with the inhabitants of the place. This prevents quarrels and riots. Those for the horse were formerly called barracks, and those for the foot, huts; but now barrack is used indifferently for both.

Much opposition was made in parliament during the late war to the erection of barracks, as inimical to the liberties of Britain, by tending to estrange the soldiers from the citizens; thus rendering the former fit tools to enslave the latter,

should any future king or ministry wish to change the constitution, or compel the people to submit to unpopular and arbitrary measures. Plausible as these arguments may appear, there are others that have also considerable weight, on the side of these establishments : in regard to the morals of the people, we are persuaded the most virtuous country town or village will be proportionally corrupt as soldiers are quartered among them; and the fact is, that the soldiers and the citizens may be too much as well as too little inter-mixed:

Until the year 1793, barracks were neither numerous in Great Britain, nor were they under the control and management of a separate and peculiar board. In January 1793, a superintendent-general of the barracks was appointed; and, on the 1st of May that year, the king's warrant was issued for their regulation. Greater powers were given to him in the year 1794; but as these seemed to interfere with the duties and powers of the Board of Ordnance, a new warrant was issued in the year 1795, defining and limiting the respective duties and powers of the Board of Ordnance, and the superintendent-general, or barrack-master-general, as he was now called. The salaries and extra pay of the barrack-master-general and his officers amounted in 1796 to £9524. 17s. 2d. The establishment was afterwards considerably increased, in proportion as the number of barracks throughout the kingdom increased, and by the creation of some new officers, among whom was a law clerk. In 1806, their salaries amounted to £19,329. 4s. 10d.

During this year the commissioners of military enquiry recommended that the offices of barrack-master-general, and deputy barrack-master-general, should be totally abolished, and that the superintendance of the barrack establishment should be vested in commissioners. This suggestion, and some others relative to the mode of transacting the business of the department, and preventing useless and extravagant expenditure, have been followed; and the barrack establishment is now under the direction of four commissioners, one of whom is generally a military man.

As it frequently happened that it was absolutely necessary to build barracks on an emergency, government was often obliged to pay an extravagant price for the land which they needed for their erection; in order to remedy this evil, it was provided by the act, usually called the defence act, 43d Geo. III. ch. 55, that justices of the peace might put any general officer into the possession of such ground as he might deem fit for the erection of barracks; the value of it to be settled afterwards by a jury; provided, however, the necessity for such ground was certified by the lord lieutenant, or two deputy lieutenants of the county. The following are the barrack districts in Great Britain:

1. Northern, containing Northumberland, Cumberland, Westmoreland, and Durham.
2. York, containing Yorkshire.
3. Eastern, containing Norfolk, Suffolk, Cambridge, Huntingdonshire, and all Essex, except Tilbury-fort.
4. Southern, containing Kent, Tilbury-fort, and Essex

5. South-western, containing Hampshire and Dorsetshire.
6. Isle of Wight.
7. Western, containing Devonshire, Cornwall, and Somerset.
8. Severn, containing Gloucestershire, Worcestershire, Herefordshire, Monmouthshire, and South Wales.
9. North-western, containing Cheshire, Shropshire, Lancashire, North Wales, and the Isle of Man.
10. London.
11. Home, containing Middlesex, Surrey, Hertfordshire, and part of Kent.
12. North-inland, containing Derbyshire, Nottinghamshire, Staffordshire, Warwickshire, Leicestershire, and Rutlandshire.
13. South-inland, containing Bedfordshire, Northamptonshire, Oxfordshire, and Buckinghamshire.
14. Jersey, Guernsey, and Alderney.

SCOTLAND.

Northern, containing Caithness, Sutherland, Ross-shire, Inverness-shire, Nairnshire, Morayshire, and Banffshire.

Western, containing Aberdeenshire, Argyleshire, Ayrshire, Bute, Kincardineshire, Lanarkshire, Renfrewshire, and Wigtonshire.

Centre, containing Angusshire, Clackmannanshire, Dunbartonshire, Fifeshire, Kinrossshire, Perthshire, and Stirlingshire.

Southern, containing the Lothians, Berwickshire, Peeblesshire, Selkirkshire, Roxburghshire, and Dumfriesshire.

On the 14th of July, 1805, there were in Great Britain and Jersey, &c.

Established barracks of brick and stone . . .	84
wood	12
Temporary barracks	75
rented	41
	212

The following statement exhibits the several particulars of the total expense incurred by the nation for barracks, and the barrack-office, in Great Britain, between the 25th of December 1792, and the 10th of November 1804:

	£	s. d.
Buildings and purchases of land	3,930,223	5 8
Forage	846,246	7 10
Beer	643,030	9 6
Coals, candles, furniture, rents, repairs, supplied by barrack-masters, and salaries	1,685,487	8 0
Office-establishment	256,129	10 4
Fees at War-office	80,346	3 6
Insurance	1,519	2 2
Additional rents	36,860	13 5
Lodging money to officers	139,582	16 0
Engines	11,866	0 5
Bedding, furniture, &c. issued by the barrack-office, and in store	1,357,215	7 3
Miscellaneous	35,498	4 8
	£9,024,005	8

Total, £9,024,005 8
The annual expense, during the last war, varied from £350,000 to £500 000; in the year

1814, it was £309,826. The peace estimate for 1816 is £173,500. In Ireland, where barracks are more numerous, the expense, in 1814, was £360,515, and the peace estimate for 1816 was £213,000.

See first, second, third, and fourth Reports of the Commissioners of Military Enquiry, 1806; Finance Reports and Estimates laid before Parliament for 1814 and 1816, &c.

BARRACK ALLOWANCE, a specific allowance of bread, beer, coals, &c. to the regiments stationed in barracks.

BARRACK GUARD, the principal guard of a regiment in barracks; the officer of which is responsible for the regularity of the men, and for all prisoners duly committed to his charge while on that duty.

BARRACK-MASTER-GENERAL, a staff-officer at the head of the barrack-department, who has a number of barrack-masters and deputies under him, that are stationed at the different barracks. He has an office and clerks for the despatch of business; and to this office all reports, &c. respecting the barrack department are made.

BARRACOL, in ichthyology, a name given by Artedi, from the Venetians, to the species of ray fish called by Bellonius and Gesner *miraletus*, and by others *raia oculata levis*. The specific name of Artedi carries in it a much better character of the fish; he calls it the ray, with a smooth back and belly; and with the eyes surrounded with a series of spines, and three other rows of them on the tail.

BARRACONDA, a considerable town in central Africa, about 400 miles up the Gambia, where very formidable cataracts obstruct the navigation of the river, and prevent any but the smallest canoes from passing. The tide flows up to this place. Long. 13° W., lat. 13° 36' N.

BARRACUDA, a species of esox.

BARRADA, or **BARRADYS**, a river of Syria, rising at Barraud, twenty-four miles west of Damascus. Receiving the Fiché, it divides into seven branches, six miles from that city; the fourth alone, which washes the northern walls, preserving the original name. All the different branches afterwards rejoin the main stream, which is discharged into a lake twenty-one miles north-east.

BARRAGAN, a river of the province and government of Buenos Ayres, which runs north, and enters the Plata.

BARRAGAN BAY OF, in the La Plata, about twelve miles below Buenos Ayres, to the south-east. Ships discharge, in lighters, their cargoes in the roadstead of Buenos Ayres, and then go to the bay of Barragan to wait for their cargoes out. The land about it is low, and the bay therefore much exposed, nor can ships of any burden come within two or three miles of the shore. Some banks under water, however, meet the force of breakers, but there is little security, when a storm comes on, against a ship's parting from her ground-tackle, and being driven on them. The river running into the bay can receive vessels drawing twelve feet water, but none larger.

BARRAI SCIAHIAT, the Arabian name given to the desert of Natron in Egypt, situated to the

west of the Delta, and the south of lake Mareotis. It contains the two lakes Nedebe and Lebe, from which the Natron is drawn, and is pervaded by a vast and deep ravine, called the Bahr Belame, or river without water. This desert is celebrated for the great number of monasteries which were founded in it at a former period.

BARRAMAHAL, a district in Southern India, situated between twelve and fourteen degrees of north latitude, consisting of twelve places, which the name is said to signify. These are Krishnagiri, Jacadeo, Varinaghada, Maharay-ghada, Bujungaghada, Tripatura, Vanambady, Ghanaganaghada, Sudarshana-ghada, and Tatuallu. This district was ceded to the British by Tippee, in 1792. The inhabitants are Hindoos.

BARRATI, **BARRED**, in ecclesiastical history, an appellation given to the Carmelites, after they were obliged to lay aside the white cap, and wear cowls striped black and white.

BARRATOR, *s.* } From *barat*, old French;
BARRETRY, *s.* } from which is still retained
barateur, a cheat; from the Dano-Norman *barret*, our lawyers have *barletter*, *baretry*, a wrangler and encourager of law-suits; one who harasses the bar or courts with importunate litigations. Lord Coke defines barrator to be a common mover and maintainer of suits, in disturbance of the peace. This exciting and fomenting of litigious quarrels is an offence by common law, and punishable by fine and imprisonment; and if the barrator be an attorney, a statute of the 12th of George the First provides that he shall be incapacitated from practising for the future, under pain of seven years' transportation.

Will it not reflect as much on thy character, Nic, to turn *barrator* in thy old days, a stirrer-up of quarrels amongst thy neighbours?

Arbutnot's History of John Bull.

'Tis arrant *barratry*, that bears
Point blank an action 'gainst our laws.

Hudibras.

BARRATRY, in commerce. See **BARATRY** and **INSURANCE**.

BARRATRY, in the law of England, has been noticed. See **BARATRY**. The term, however, is of foreign origin; and in Italy, and other countries, seems ordinarily to have been applied to the traffic of ecclesiastical benefices; but was afterwards used in a more general sense, as applicable to all corrupt buying and selling of justice. In Scotland it signified the corrupt purchasing of benefices or offices of collection, from the see of Rome, by persons who left the realm for that purpose; a practice which had become frequent, and was in various respects injurious to the realm; as a means of carrying money out of it, without any return of value, as prejudicial to the right of patronage in the king or others, and to the free elections of the monks in the monasteries, both which the pope by prevention pretended to exclude; and as contributing to raise the rate of taxation upon benefices, by the false accounts which those suitors for the office of collector carried to the pope.

BARRAUX, or **FORT BARREAUX**, a fortress of France, in Dauphiny, on the borders of Savoy, now included in the department of the Isere, arrondissement of Grenoble. It stands on the right bank of the river Isere, near the entrance

of the valley of Gresivaudan, on the road from Grenoble to Chamberry, eighteen miles north-east of the former town. The fort was erected at a great expense by Charles Emanuel, duke of Savoy, in 1597, and is strong both by nature and art. The French, however, got possession of it in a single night, and is retained it at the peace of Vervins, on the plea that it was built on French ground. Population 1320.

BARRE (Louis Francis Joseph de la), an ingenious writer, born at Tournay, in 1688. He received his education at the college of St. Barbe, at Paris, where he assisted Anselm Banduri in his extensive work, *Imper. Orientale, Recueils de Medailles des empereurs*, after which he had a pension given him by the grand duke of Tuscany. He also published *Memoirs for the History of France and Burgundy*, and various other works. He died in 1738.

BARRE' or **BARRY** (Madame Du), the favorite mistress of Louis XV. She is said to have been one of the richest women in France. She was condemned by the revolutionary tribunal of Paris, as a conspirator against the republic. Her behaviour was marked by unusual cowardice. The executioner was obliged to support her all the way to the scaffold, and he required two assistants to lift her upon it: after which she exerted all her strength to prevent being fastened to the plank. She was guillotined on the 9th December 1793.

BARRE', a township of Worcester county, Massachusetts, twenty-four miles north-west of Worcester, and sixty-six west of Boston. Also a township of Pennsylvania, in Huntingdon county.

BARREL, *v. & n.* Fr. *barril*, Ital. *barrile*, Span. *barril*. Junius says, perhaps from *barre*, *repagulum* (see **To BAR**): because liquids are held or contained in a cask, quasi in quondam repagulo; as if under bar, or in a stout strong vessel stopp'd close. It is applied to any thing hollow, as to the ear, the barrel of a gun, a cylinder about which any thing is wound. It also denominates a particular measure.

I would have their beef beforehand *burrelled*, which may be used as is needed. *Spenser on Ireland.*

Barrel up earth and sow some seed in it, and put it in the bottom of a pond. *Bacon.*

It hath been observed by one of the ancients, that an empty *barrel*, knocked upon with the finger, giveth a diapason to the sound of the like *barrel* full. *Id.*

Trembling to approach

The little *barrel* which he fears to breach. *Dryden.*

Several colleges, instead of limiting their rents to a certain sum, prevailed with their tenants to pay the price of so many *barrels* of corn, as the market went. *Swift.*

Take the *barrel* of a long gun perfectly bored, set it upright, with the breech upon the ground, and take a bullet exactly fit for it; then, if you suck at the mouth of the *barrel* ever so gently, the bullet will come up so forcibly, that it will hazard the striking of your teeth. *Digby.*

Your string and bow must be accommodated to your drill; if too weak, it will not carry about the *barrel*. *Moran.*

BARREL, in mechanics, a term given by watch makers to the cylinder about which the spring is wrapped: and by gun-smiths to the

cylindrical tube of a gun, pistol, &c. through which the ball is discharged.

BARREL OF A PUMP, is the wooden tube which makes the body of the engine, and wherein the piston moves.

BARREL OF EELS and **BARREL OF SALMON**, ought to contain forty-two gallons each.

BARREL OF SOAP must weigh 256lb.

BARREL, or **BARILLE** of Florence, is a liquid measure, containing twenty flasks, or one-third of a star or stajo.

BARREL, or **BARIQUE** of Paris, contains 210 pints, or twenty-six septiers and a half; four bariques make three muids, or one tun.

BARRELS, in artillery, are used for holding powder, small-shot, flints, sulphur, salt-petre, resin, pitch, quick-match, &c. Barrels filled with earth serve to make a parapet to cover the men, like gabions and canvas bags.

BARRELS, FIRE, are casks of divers capacities, filled with bombs, grenades, fire pots, &c. and mixed with great quantities of tow soaked in petroleum, turpentine, pitch, &c. used by the besieged to defend breaches. Some are mounted on wheels, filled with composition, and intermixed with loaded grenades, and the outside full of sharp spikes; some are placed under ground, which have the effect of small mines: others are used to roll down a breach, to prevent the enemy's entrance. Composition, corned powder, thirty pounds, Swedish pitch twelve, saltpetre six, and tallow three. Not used now. See **FIRE SHIP**.

BARRELS OF GUNPOWDER are about sixteen inches diameter, and thirty or thirty-two inches long, holding 100 pounds of powder; but the quantity put into a whole barrel is only ninety pounds, into a half barrel forty-five pounds, and a quarter barrel, used for rifle powder, only twenty-two pounds and a half; this proportion leaves a space for the powder to separate when rolled, or otherwise it would always be in lumps, and liable thereby to damage.

BARRELS, BUDGE, hold from forty to sixty pounds of powder; at one end is fixed a leathern bag with brass nails: they are used in actual service on the batteries, for loading the guns and mortars, to keep the powder from firing by accident.

BARRELS'S SOUND, on the north-west coast of America, is situated about six leagues north-west of Washington, or Charlotte Islands. Long. 131° W., lat. 52° N.

BARRELLING OF HERRINGS. See **HERRING FISHERY**.

BA'RREN, *adj.* } Barren, i. e. *barr*-ed,
BA'RRENLY, *adv.* } stopped, shut, strongly
BA'RRENNESS, *s.* } closed up, which cannot be opened, from which can be no spirit or issue.—*Tooke*. See **To BAR**. Thus it is applied to sterile ground, unfruitful trees, unprolific animals; to unimaginative and uninstructed minds; to professedly intellectual works, destitute of thought, and originality; to whatever is useless and unproductive.

But I that am exiled; and *barreine*
 Of alle grace, and in so gret despair,
 That there n'is erthe, water, fire, ne aire,

Ne creature that of him maked is
That may me hele, or don comfort in this.

Chaucer.

Glad was the markis, and his folk therefore,
For though a maiden child come all before
She may unto a knave child attein;e;
By likelyhed, sin she n'is not *barreine*.

Id.

It is a darksome delve, farre under ground,
With thornes and *barren* brakes envionned round,
That none the same may easily out-win;
Yet many waies to enter may be found,
But none to issue forth when one is in:
For discord harder is to end than to begin.

Spenser.

Thou *barraine* ground, whom winter's wrath hath
wasted,

Art made a mirror to behold my plight.
Whilome thy fresh spring flow'r'd, and after hasted
Thy summer proude with daffodilles dight;
And now is come thy winter's stormie state,
Thy mantle mard wherein thou maskest late. *Id.*
Yet, O most blessed Spirit! pure Lampe of Light,
Eternal Spring of Grace and Wisdom trew,
Vouchsafe to shed into my *barren* spright
Some little drop of thy celestial dew,
That may my rimes with sweet infuse embrew,
And give me words equal unto my thought,
To tell the marveiles by Thy mercie wrought. *Id.*

It is one especial praise of many, which are due to this poet, that he hath laboured to restore as to their rightfull heritage such good and naturall English wordes as have beene long time out of use and almost clean disherited, which is the only cause that our mother tongue, which truly of itself is both full enough for prose, and stately enough for verse, hath long time been counted most *barren* and bare of both.

Critique on Spenser, prefixed to his Works.

There shall not be male or female *barren* among
you, or among your cattle. *Deuteronomy.*

Give me no help in lamentations;
I am not *barren* to bring forth laments. *Shakspeare.*
There be of them that will make themselves laugh,
to set on some quantity of *barren* spectators to laugh
too. *Id.*

Forget not in your speed, Antonius,
To touch Calphurnia; for our elders say
The *barren*, touched in this holy chase,
Shake off their steril curse. *Id.*

The situation of this city is pleasant, but the water
is naught, and the ground *barren*. *2 Kings.*

Within the self same-hamlet, lands have divers
degrees of value, through the diversity of their fer-
tility or *barrenness*. *Bacon.*

The importunity of our adversaries hath constrain-
ed us longer to dwell than the *barrenness* of so poor a
cause could have seemed either to require or to admit.
Hooker.

Straight mine eye hath caught new pleasures
Whilst the landscape round it measures;
Russet lawns and fallows gray,
Where the nibbling flocks do stray;
Mountains, on whose *barren* breast
The lab'ring clouds do often rest;
Meadows trim, with daisies pied,
Shallow brooks, and rivers wide.

Milton.

They led the vine
To wed her elm; she spous'd about him twines
Her marriageable arms, and with her brings
Her dow'r, th' adopted clusters, to adorn
His *barren* leaves. *Id.*

I pray'd for children, and thought *barrenness*
In wedlock a reproach. *Id.*

No more be mention'd then of violence
Against ourselves; and wilful *barrenness*
That cuts off us from hope. *Id.*

The adventures of Ulysses are imitated in the
Aeneis; though the accidents are not the same, which
would have argued him of a total *barrenness* of invention.

Dryden.

Telemachus is far from exalting the nature of his
country; he confesses it to be *barren*. *Pope.*

Some schemes will appear *barren* of hints and mat-
ter, but prove to be fruitful. *Swift.*

Without the evening dew and show'rs,

The earth would be a *barren* place,

Of trees, and plants, of herbs and flow'rs,

To crown her now enamell'd face.

Charles Cotton.

This heart, by age and grief congeal'd,
Is no more sensible to love's endearments,
Than are our *barren* rocks to morn's sweet dew,
That calmly trickles down their rugged cheeks.

Miller's Mahomet.

There is a power upon me which withholds
And makes it my fatality to live:
If it be life to wear within myself,
This *barrenness* of spirit, and to be
My own soul's sepulchre, for I have ceas'd
To justify my deeds unto myself,
The last infirmity of evil.

Byron.

BARREN ISLAND, an island in the bay of
Bengal, about eighteen miles in circumfer-
ence; the vegetation consists principally of
withered shrubs and trees. It contains a vol-
cano 1800 feet above the level of the sea. Im-
mense columns of smoke and showers of red-hot
stones, some of them three or four tons weight,
are discharged from it. Distant forty-five miles
east of the Lower Andaman Island. Lat. 12°
15' N. Also a small island in Chesapeake bay,
north-east from the mouth of Patuxent river.
Long. 76° 22' W., lat. 38° 34' N.

BARREN ISLAND, CAPE, an island of the South
Pacific Ocean, in Bass Straits, between Great
Island on the north, and Clarke's Island on the
south. It is about twenty miles in length, and
ten in breadth, chiefly covered with low vegeta-
tion. Here are found the peculiar quadrupeds of
the Australasian regions, the kangaroo, wombat,
and duck-billed ant eater.

BARRENNESS. See **STERILITY**.

BARREN-WORT. See **EPIMEDIUM**.

BARRERIA, in botany, a genus of plants,
class pentandria, order monogynia. Its generic
character is CAL. quinquedentate; COR. rotate,
divisions scrobiculate; filaments dilated; ANTH.
tetragonal, marginate, margins cohering. The
only species of this genus is the *B. theobromae-*
folia, a tree of about fifty feet in height, a native
of Cayenne.

BARRETRY. See **BARRATRY**.

BARRETT (George), an eminent landscape
painter, was born in Dublin about 1732. By
natural genius and application, he acquired, with-
out a teacher, such skill in the art of painting,
as to obtain the premium of £50 offered by
the Dublin society for the best landscape in oil.
He afterwards went to London, and there, in
1763, the premium of £50 for the best land-
scape, was adjudged to him by the society for
the encouragement of arts, &c. He was one
of the original planners of the Royal Academy, of
which he became a member. He died in 1784.

BARRETT (William), an eminent surgeon, born
in Somersetshire. He settled at Bristol, and
gained great reputation in his business. In 1788

he published a history of the city of Bristol, in one vol. 4to. the materials of which he had employed upwards of twenty years in collecting. He died in 1789. Mr. Barrett was the early patron of the celebrated Chatterton.

BARRICA'DE, *v. & n.* } From *barr*, to stop,
BARRICA'DO, *v. & n.* } bar, or obstruct. A
BA'RRICO, } fortification; any thing
BARRIER. } fixed to hinder entrance;
barrier likewise signifies boundary or limit; a bar to mark the limits of any place.

Why it hath bay windows, transparent as *barrica-does*; and the clear stones to the north are as lustrous as ebony; and yet complainest thou of obstructions.

Shakspeare.

The access was by a neck of land, between the sea on one part, and the harbour water, or inner sea on the other; fortified clean over with a strong rampier and *barricado*.

Bacon.

For justs, and tourneys, and *barriers*, the glories of them are chiefly in the chariots, wherein the challengers make their entries.

Id.

Past we found, fast shut

The dismal gates, and *barricado'd* strong!

Milton.

He had not time to *barricado* the doors; so that the enemy entered.

Clarendon.

The truth of causes we find so obliterated, that it seems almost *barricaded* from any intellectual approach.

Harvey.

This he courageously invaded,
And having enter'd, *barricaded*,
Inscum'd himself as formidable
As could be underneath a table.

Hudibras.

Pris'ners to the pillar bound,

At either *barrier* plac'd; nor, captives made,
Be freed, or arm'd anew.

Dryden.

The queen is purtante of the Dutch, having possession of the *barrier*, and the revenues thereof, before a peace.

Swift.

But wave what'er to Cadmus may belong,

And fix, O muse, the *barrier* of thy song

At Oedipus.

Pope's Statius.

How instinct varies in the grovelling swine,
Compa'd half reasoning elephant! with thine:
Twist that and reason what a nice *barrier*!

For ever separate, yet for ever near.

Pope.

Safe in the love of Heaven, an ocean flows

Around our realm, a *barrier* from the foes.

Id.

Now all the pavement sounds with trampling feet,
And the mix'd hurly *larricades* the street;

Human'd here, the wagon's lengthen'd team.

Gay.

If you value yourself as a man of learning, you are building a most impassable *barrier* against improvement.

Watts.

The *barrier* wall, the river deep and wide,

The lofty crags, the mountains dark and tall,

As like the rocks that part Hispania's land from Gaul.

Byron.

Every way, in military affairs, is usually fortified when time permits, of pales or stakes crossed with latons, and shod with iron at the feet, and stup in postures or breaches.

BARRICADA, in naval architecture, a strong wooden rail, supported by stanchions, extending across the foremost part of the quarter deck. In vessels of war, the vacant spaces between the stanchions are commonly filled with rope-mats, mats, or pieces of old cable; and the upper part, which contains a double rope-netting above the rail, is stuffed with full hammocks to intercept the motion, and prevent the execution of any sudden attack in time of battle.

BARRIER, in fortification, a kind of fence made at a passage, retrenchment, &c. to stop up the entry. It is composed of great stakes, about four or five feet high, placed at the distance of eight or ten feet from one another, with transoms, or overthwart rafters, to stop either horse or foot, that would enter or rush in with violence: in the middle is a moveable bar of wood, that opens or shuts at pleasure. A barrier is commonly set up in a void space, between the citadel and the town, in half-moons, &c.

BARRIER ISLANDS, a range of islands near the east coast of New Zealand, thirty miles in length, at the mouth of the river Thames. Long. 184° 27' W., lat. 36° 11' S.

BARRIERS, styled the *jeu de barres*, French, was a martial exercise of men armed and fighting together with swords, within certain bars or rails which separated them from the spectators. It is now disused.

BARRIGA NEGRA, a river in the vice-royalty of Buenos Ayres, South America, which has its rise about 160 miles north-west of Monte Video, and after being augmented by the accession of several streams, falls into lake Meri. The country around is well watered, mountainous, and woody. Here are numbers of great breeding estates for cattle.

BARRING A VEIN. See TO BAR.

BARRINGTON (John Shute, Viscount), a distinguished theologian, was the youngest son of Benjamin Shute, Esq. a merchant and a protestant dissenter. He was born in 1678, and received part of his education abroad. On his return to London, he studied in the Inner Temple, and in 1701 distinguished himself as a writer in favor of the civil rights of the dissenters. Being employed by Lord Somers to engage the Presbyterians of Scotland to favor the union between the two kingdoms, he was in 1708 rewarded by the place of commissioner of the customs, from which the tory ministry of Anne removed him. About this time an ample fortune was left him by Francis Barrington of Tofts, Esq. whose name he assumed. On the accession of George I. he was chosen member of parliament for Berwick-upon-Tweed, and in 1720 was raised to the peerage by the title of viscount Barrington of Ardglass. Unfortunately he became connected with one of the bubbles of that time, called the Harburgh Lottery; and was in consequence expelled the House of Commons; a censure which he scarcely merited, as the misconduct seems to have rested principally with the ministry of Hanover. But his strong opposition to Sir Robert Walpole is thought to have produced this severity. In 1725 Lord Barrington published his 'Miscellanea Sacra,' 2 vols. 8vo., since reprinted by his son, the late Bishop of Durham, 3 vols. 8vo. 1770. In the same year he published 'An Essay on the several Dispensations of God to Mankind,' 8vo. and was also the author of various other tracts relative to toleration in matters of religion. He died in 1734, leaving several children, of whom five sons rose to high stations respectively in the state, the church, the law, the army, and the navy; the youngest of them was the late venerable Bishop of Durham. Lord Barrington was the friend and disciple of Locke;

and although bred a Dissenter, and a leader of that body, was also a frequenter and communicant of the Church of England.

BARRINGTON (Daines), fourth son of viscount Barrington, was distinguished as a lawyer, antiquary, and naturalist. He was born in 1727, and, after preparatory studies at Oxford and the Inner Temple, was called to the bar. He held several offices previous to his being appointed a Welch judge in 1757, and was subsequently second justice of Chester till 1785, when he resigned that post, and thenceforward lived in retirement, in the Temple, where he died, March 1800. His works, which are numerous, consist principally of papers in the Transactions of the Royal and Antiquarian Societies, of both which learned bodies he was a fellow; Observations on the Statutes, chiefly on the more Ancient, &c. 1766, 4to.; an edition of Orosius, with the Anglo-Saxon version of king Alfred, and an English translation and notes, 1773; Tracts on the Probability of reaching the North Pole, 1775, 4to. occasioned by the arctic expedition of Capt. Phipps, afterwards Lord Mulgrave.

BARRINGTON, a township of Nova Scotia, in Queen's county, on the east side of the bay of Fundy. 2. A township of New Hampshire, in Stafford county, about thirty miles north-west of Portsmouth. Alum is found here. 3. A township of Rhode Island, in Bristol county, on the north-west branch of the Warren, seven miles south-east of Fox-Point, in Providence.

BARRINGTON, GREAT, a township in Berkshire, county of Massachusetts. It lies 140 miles west of Boston.

BARRINGTONIA, in botany, a genus of the polyandria order, belonging to the monadelphia class of plants, the characters of which are: one female, the calyx dephillous above; with a drupa, which it crowns; and the seed is a quadrilocular nut. There is but one species known, viz. *B. speciosa*, a native of China and Otaheite.

BARRISTER; from *barr*, and *ester*, to remain or continue: thus the combination of the two forms, *barrester*, one who takes his station at a bar; who continues there—that is who carries on his profession at the bar; a pleader of causes.

Jollier of this state,

Than are new-benefic'd ministers; he throws,
Like nets or lime-twigs, wheresoe'er he goes,
His title of *barrister* on every vench,
And woos in language of the Pleas and Bench.

Donne.

This being reveal'd, they now begun
With law and conscience to fall on,
And laid about as hot and brainsick,
As th' utter *barrister* of Swanswick.

Butler's Hudibras.

BARRISTERS are sometimes termed *jurisconsulti*; and in other countries called *licentiati in jure*. Anciently barristers at law were called apprentices of the law, in Latin, *apprenticii juris nobiliores*. The time before they ought to be called to the bar, by the ancient orders, was eight years, now reduced to five; and the exercises done by them, (if they were not called *ex gratia*) were twelve grand moots performed in the inns of Chancery in the time of the grand readings, and twenty-four petty moots in the term times, before

the readers of the respective inns: and a barrister newly called is to attend the six (or four) next long vacations the exercises of the house, viz. Lent and Summer, and is thereupon for those three (or two) years styled a vacation barrister. The duties of a barrister are to be considered honorary, and he can maintain no action for his fees, which are reckoned a gratuity, not a hire; and which cannot be even demanded by a barrister without doing wrong to his reputation.

BARRITUS is a word of German original, adopted by the Romans to signify the general shout usually given by the soldiers of their armies on their first encounter after the *classicum* or alarm. This custom, however, of setting up a general shout was not peculiar to the Romans, but prevailed amongst the Trojans according to Homer, amongst the Germans, the Gauls, Macedonians, and Persians. See **CLASSICUM**.

BARROS (John de), a celebrated Portuguese historian, born at Visere, in 1496. He was educated at the court of king Emanuel, among the princes of the blood, and made a great progress in Greek and Latin. The infant John, to whom he attached himself, and became preceptor, having succeeded the king his father, in 1521, Barros obtained a place in this prince's household; and in 1522 was made governor of St. George del Mina, on the coast of Guinea. The king, having recalled him to court three years after, made him treasurer of the Indies, and this post inspired him with the thought of writing this history; for which purpose he retired to Pombal, where he died in 1570. His history of Asia and the Indies is divided into decades; the first of which he published in 1552, the second in 1553, and the third in 1563; but the fourth decade was not published till 1615, when it appeared by order of Philip III. who purchased the MS. Several authors have continued it, so that we have at present twelve decades. He left many other works.

BARROW, *n. s. beape*, Sax. supposed by Skinner to come from bear; any kind of carriage moved by the hand; as a *hand-barrow*, a frame of boards, with handles at each end, carried between two men; a *wheel-barrow*, that which one man pushes forward by raising on one wheel.

Have I lived to be carried in a basket, like a *barrow* of butcher's offal, and thrown into the Thames.

Shakspeare.

No *barrow's* wheel

Shall mark thy stocking with a miry trace. *Gay*

BARROW, *n. s. beap.* Sax. a hog; whence *barrow* grease, or hog's lard.

His life was like a *barrow* hogge,
That liveth many a day,
Yet never once doth any good,
Until men will him slay.

The Jew of Venice, in Percy.

And therefore take my words thus, that I mean no other swine but such as feed and root in the field: among which the female, especially a gult that never farrowed, is more effectual than a (tame) bore, *barrow* hog, or a breeding sow. *Holland's Plinie.*

BARROW, whether in the beginning or end of names of places, signifies a grove; from *beappe*, which the Saxons used in the same sense. *Gibson.*

BARROW is likewise used in Cornwall for a

hillock, under which, in old times, bodies have been buried. See BARROWS.

BARROW, a river of Ireland, which rises in Queen's county, and passing by Port-Arlington, Monastereven, Athy, Carlow, &c. is joined by the Nore before it arrives at Ross, after which, continuing south, it joins the Suir in Waterford Haven.

BARROW, a river of Westmoreland, which runs into the Burbeck, near Howse-house.

BARROW (Isaac), an eminent mathematician and divine, of the last century, was the son of Mr. Thomas Barrow, a linen-draper in London, where he was born in 1630. He was at first placed at the charter-house school for two or three years; where his behaviour afforded but little hopes of success in the profession of a scholar, but being removed thence his disposition took a happier turn; and having soon made a sufficient progress in learning, he was admitted a pensioner of Peter House, Cambridge. He now applied himself with great diligence to the study of all branches of literature, especially that of natural philosophy. He afterwards turned his attention to physic, and made a considerable progress in anatomy, botany, and chemistry; after which he studied chronology, astronomy, and geometry. He then travelled into France and Italy, and in a voyage from Leghorn to Smyrna, the ship being attacked by an Algerine pirate, he staid upon deck, and with the greatest intrepidity, worked the guns, till the pirate, perceiving the stout resistance the ship made, sheered off and left her. At Smyrna he met with a most kind reception from Mr. Bretton, the English consul, upon whose death he afterwards wrote a Latin elegy. From thence he proceeded to Constantinople, where he received similar civilities from Sir Thomas Bendish the English ambassador, and Sir Jonathan Dawes, with whom he afterwards preserved an intimate friendship. At Constantinople he read the works of St. Chrysostom, once bishop of that see, whom he preferred to all the other fathers, and about a year after he returned to Venice. From thence he came home in 1659, through Germany and Holland; and was ordained by bishop Brownrig. In 1660 he was chosen to the Greek professorship at Cambridge, and gave lectures upon Aristotle's rhetoric. In 1662 he was appointed professor of geometry in Gresham college, and in 1603 elected a fellow of the Royal Society, in the first choice made by the council after their charter. The same year he was chosen professor of mathematics at Cambridge, and resigned his professorship of Gresham college. In 1669 he resigned his mathematical chair to his learned friend Isaac Newton, being determined to give up the study of mathematics for that of divinity. Upon quitting his professorship, he was only a fellow of Trinity college, till his uncle gave him a small sinecure in Wales, and Dr. Seth Ward, bishop of Salisbury conferred upon him a prebend in his church. In 1670 he was created D. D. by mandate; and, upon the promotion of Dr. Pearson, master of Trinity college, to the see of Chester, he was appointed to succeed him by the king's patent, dated the 13th of February, 1672. When the king advanced him to this dignity, he

said, 'he had given it to the best scholar in England.' In 1675 he was raised to be vice-chancellor of the university. He died on the 4th of May, 1677, in the forty-seventh year of his age, and was interred in Westminster abbey, where a monument adorned with his bust was soon after erected. Among other instances of his wit and vivacity, is related the following rencontre between him and the celebrated Lord Rochester. These two meeting one day at the court, while the doctor was king's chaplain in ordinary, Rochester, thinking to banter him, with a flippancy air, and a low formal bow, accosted him with, 'Doctor, I am yours to my shoe-tie;' Barrow, perceiving his drift, and determined upon defending himself, returned the salute, with, 'My lord, I am yours to the ground.' Rochester, on this, improving his blow, returned it with, 'Doctor, I am yours to the centre;' which was as smartly followed up by Barrow, with, 'My lord, I am yours to the antipodes.' Upon which, Rochester, disdain to be foiled by a musty old piece of divinity, as he used to call him, exclaimed, 'Doctor, I am yours to the lowest pit of hell;' upon which, Barrow turning upon his heel, with a sarcastic smile, archly replied, 'There, my lord, I leave you.'

Of Dr. Barrow's numerous works, the principal are, 1. *Euclidis Elementa*, 8vo. Cantab. 1655. 2. *Euclidis Data*, 8vo. Cantab. 1657. 3. *Lectiones Opticæ XVIII.* 4to. Lond. 1669. 4. *Lectiones Geometricæ XIII.* 4to. Lond. 1670. 5. *Archimedis Opera*, Apollonii Conicorum, Libri IV; Theodosii Sphericorum, Lib. III. &c. 4to. Lond. 1675. 6. *Lectio, in qua Theoremata Archimedis de Sphæra et Cylindro exhibentur*, 12mo. Lond. 1678. 7. *Mathematicæ Lectiones*, &c. Lond. 1683. 8. *Theological Works* in 3 vols. fol. Lond. 1683, published by Tillotson. 9. *Isaaci Barrow Opuscula*, &c. fol. Lond. 1687.

BARROWS, in ancient topography, artificial hillocks or mounds, met with in many parts of the world, intended as repositories for the dead, and formed either of stones heaped up, or of earth. For the former, more generally known by the name of cairns see CAIRNS. Of the latter Dr. Plott takes notice of two kinds in Oxfordshire: one placed on the military ways; the other in the fields, meadows, or woods; the first sort doubtless of Roman erection, the other more probably erected by the Britons or Danes. We have an examination of the barrows in Cornwall by Dr. Williams, in the *Phil. Trans.* No. 458, from which we find that they are generally composed of foreign or adventitious earth; that is, such as does not rise on the place, but is fetched from some distance. Monuments of this kind are also very frequent in Scotland. On digging into the barrows, urns have been found in some of them, made of calcined earth, and containing burnt bones and ashes; in others, stone chests containing bones entire; in others, bones neither lodged in chests nor deposited in urns. These tumuli are round, not greatly elevated, and generally at their basis surrounded with a foss. They are of different sizes; in proportion, it is supposed, to the greatness, rank, and power, of the deceased person. The links of Skail, in Sand-

wick, one of the Orkneys, abound in round barrows. Some are formed of earth alone, others of stone covered with earth. In the former was found a coffin, made of six flat stones. They are too short to receive a body at full length: the skeletons found in them lie with the knees pressed to the breast, and the legs doubled along the thighs. A bag, made of rushes, has been found at the feet of some of these skeletons, containing the bones, most probably, of another of the family. In one were to be seen multitudes of small beetles; and as similar insects have been discovered in the bag which enclosed the sacred ibis, we may suppose that the Egyptians, and the nation to whom these tumuli belonged, might have had the same superstition respecting them. On some of the corpses interred in this island marks of burning were observed. The ashes deposited in an urn, which was covered on the top with a flat stone, have been found in the cell of one of the barrows. This coffin or cell was placed on the ground, then covered with a heap of stones, and that again cased with earth and sods. Both barrow and contents evince them to be of a different age from the former. These tumuli were in the nature of family vaults: in them have been found two tiers of coffins. It is probable, that on the death of any one of the family, the tumulus was opened, and the body interred near its kindred bones. Ancient Greece and Latium concurred in the same practice with the natives of this island. Patroclus among the Greeks, and Hector among the Trojans, received but the same funeral honors with our Caledonian heroes; and the ashes of Dercennus the Laurentine monarch had the same simple protection. The urn and pall of the Trojan warrior might perhaps be more superb than those of a British leader: the rising monument of each had the common materials from our mother earth. See Homer's Iliad. xxiv. 1003. The Grecian barrows, however, do not seem to have been all equally simple. The barrow of Alyattes, father of Cræsus king of Lydia, is described by Herodotus as a most superb monument, inferior only to the works of the Egyptians and Babylonians. It was a vast mound of earth heaped on a basement of large stones by three classes of the people: one of which was composed of girls, who were prostitutes. Alyattes died, after a long reign, A. A. C. 562. Above a century intervened, but the historian relates, that to his time five stones (*σφοι termini or stelæ*) on which letters were engraved, had remained on the top, recording what each class had performed; and from the measurement it appeared, that the greater portion was done by the girls. Strabo likewise has mentioned it as a huge mound, raised on a lofty basement by the multitude of the city. The circumference was six stadia or three quarters of a mile; the height two plethra or 200 feet; and the width thirteen plethra. It was customary among the Greeks to place on barrows, either the image of some animal or *stelæ*, commonly round pillars with inscriptions. The famous barrow of the Athenians in the plain of Marathon, described by Pausanias, is an instance of the latter usage. An ancient monu-

ment in Italy, by the Appian way, called the sepulchre of the Curiatii, has the same number of termini as remained on the barrow of Alyattes, the basement which is square, supporting five round pyramids. Of the barrow of Alyattes, the apparent magnitude is described by travellers as now much diminished, and the bottom rendered wider and less distinct than before, by the gradual increase of the soil below. It stands in the midst of others by the lake Gygæus; where the burying place of the Lydian princes was situated. The barrows are of various sizes, the smaller made perhaps for children of the younger branches of the royal family. Four or five are distinguished by their superior magnitude, and are visible as hills at a great distance. That of Alyattes is greatly supereminent. All of them are covered with green turf, and retain their conical form without any sinking in of the top.

BARROWS, AMERICAN. Barrows are also found in great numbers in America. These are of different sizes, according to Mr. Jefferson; some of them constructed of earth, and some of loose stones. That they were repositories of the dead is obvious; but on what particular occasion constructed, is matter of doubt. Some have thought they covered the bones of those who have fallen in battles, fought on the spot of interment. Some ascribed them to the custom said to prevail among the Indians, of collecting, at certain periods, the bones of all their dead, wheresoever deposited at the time of death. Others again supposed them the general sepulchres for towns, conjectured to have been on or near these grounds; and this opinion was supported by the quality of the lands in which they are found (those constructed of earth being generally in the softest and most fertile meadow grounds on river sides), and by a tradition said to be handed down from the aboriginal Indians, that when they settled in a town, the first person who died was placed erect, and earth put about him, so as to cover and support him; that when another died, a narrow passage was dug to the first, the second reclined against him, and the cover of earth replaced, and so on. 'There being one of these barrows in my neighbourhood (says Mr. Jefferson), I wished to satisfy myself whether any, and which, of these opinions were just. For this purpose I determined to open and examine it thoroughly. It was situated on the low grounds of the Rivanna, about two miles above its principal fork, and opposite to some hills, on which had been an Indian town. It was of a spheroidal form, of about forty feet diameter at the base, and had been of about twelve feet altitude, though now reduced by the plough to $7\frac{1}{2}$, having been under cultivation about a dozen years. Before this it was covered with trees of twelve inches diameter, and round the base was an excavation of five feet depth and width, whence the earth had been taken of which the hillock was formed. I first dug superficially in several parts of it, and came to collections of human bones, at different depths, from six inches to three feet below the surface. These were lying in the utmost confusion, some vertical, some oblique, some horizontal, and directed to every

point of the compass, entangled, and held together in clusters, by the earth. Bones of the most distant parts were found together; as, for instance, the small bones of the foot in the hollow of a skull, many skulls would sometimes be in contact, lying on the face, on the side, on the back, top or bottom, so as on the whole to give the idea of bones emptied promiscuously from a bag or basket, and covered over with earth, without any attention to their order. The bones of which the greatest numbers remained, were skulls, jaw-bones, teeth, the bones of the arms, thighs, legs, feet, and hands. A few ribs remained, some vertebræ of the neck and spine, without their processes, and one instance only of the bone which serves as a base to the vertebral column. The skulls were so tender, that they generally fell to pieces on being touched. The other bones were stronger. There were some teeth which were judged to be smaller than those of an adult; a skull which, on a slight view, appeared to be that of an infant, but it fell to pieces on being taken out, so as to prevent satisfactory examination; a rib, and a fragment of the under jaw of a person about half grown; another rib of an infant; and part of the jaw of a child, which had not yet cut its teeth. This last furnishing the most decisive proof of the burial of children here. I was particular in my attention to it. It was part of the right half of the under jaw. The processes by which it was articulated to the temporal bones were entire; and the bone itself firm to where it had been broken off, which, as nearly as I could judge, was about the place of the eye-tooth. Its upper edge, wherein would have been the sockets of the teeth, was perfectly smooth. Measuring it with that of an adult, by placing their hinder processes together, its broken end extended to the penultimate grinder of the adult. This bone was white, all the others of a sand color. The bones of infants being soft, they probably decay sooner, which might be the cause so few were found here. I proceeded then to make a perpendicular cut through the body of the barrow, that I might examine its external structure. This passed about three feet from its centre, was opened to the former surface of the earth, and was wide enough for a man to walk through and examine its sides. At the bottom, that is, on the level of the circumjacent plain, I found bones; above these a few stones, brought from a cliff a quarter of a mile off, and from the river one eighth of a mile off; then a large interval of earth, then a stratum of bones, and so on. At one end of the section were four strata of bones plainly distinguishable: at the other, three; the strata in one part not ranging with those in another. The bones nearest the surface were least decayed. No holes were discovered in any of them, as if made with bullets, arrows, or other weapons. I conjectured that in this barrow might have been 1000 skeletons. Every one will readily seize the circumstances above related, which militate against the opinion that it covered the bones only of persons fallen in battle; and against the tradition also which would make it the common sepulchre of a town, in which the bodies were placed upright, and touching each

other. Appearances certainly indicate that it derived both origin and growth from the accretory collection of bones, and deposition of them together; that the first collection had been deposited on the common surface of the earth, a few stones put over it, and then a covering of earth; that the second had been laid on this, had covered more or less of it in proportion to the number of bones, and was then also covered with earth, and so on. The following are the particular circumstances which give it this aspect. 1. The number of bones. 2. Their confused position. 3. Their being in different strata. 4. The strata in one part having no correspondence with those in another. 5. The different states of decay in these strata, which seem to indicate a difference in the time of inhumation. 6. The existence of infant bones among them. But on whatever occasion they may have been made, they are of considerable notoriety among the Indians: for a party passing, about thirty years ago, through the part of the country where this barrow is, went through the woods directly to it, without any instructions or enquiry; and having staid about it some time, with expressions which were construed to be those of sorrow, they returned to the high road, which they had left about half a dozen miles to pay this visit, and pursued their journey. There is another barrow, much resembling this in the low grounds of the south branch of the Shenandoah, where it is crossed by the road leading from the Rockfish gap to Staunton. Both of these have, within these dozen years, been cleared of their trees and put under cultivation, are much reduced in their height, and spread in width, by the plough, and will probably disappear in time. There is another on a hill in the Blue ridge of mountains, a few miles north of Wood's gap, which is made up of small stones thrown together. This has been opened and found to contain human bones as the others do. There are also many others in other parts of the country. In South Africa, to the north of the Hottentots, innumerable barrows are described to have been seen by Dr. Sparrow, (*Travels* ii. 264.) In New Caledonia, also, Mr. Foster met with a barrow four feet high, surrounded by an enclosure of stakes. But the most recent discoveries of the kind, in countries removed from all intercourse with Europe, have been made by Mr. Oxley during his expedition into the interior of New South Wales, in 1817-18. On his return, he passed two native burial places. The first presented a raised mound of earth, under which were some ashes; but there was no decisive proof whether they were from wood or bones. A semicircular trench was dug round one side of the barrow, as if designed to afford seats for persons in attendance. The second appeared not to have been constructed more than a year or two; and, from the care displayed in it, evidently belonged to some personage of distinction. The form of the whole was semicircular. Three rows of seats occupied one half; the grave and an outer row of seats the other. The seats formed segments of circles of from forty to fifty feet, and were raised by the soil being trenched up between them. The grave

was shaped into an oblong cone, five feet high and nine long. On opening this barrow, a layer of wood presented itself, about two feet beneath the surface, forming a sort of arch, which supported the upper cone. Beneath this were placed several sheets of dry bark; then dry grass and leaves, to which no damp had ever penetrated. The body, which was fresh enough to be extremely offensive, was deposited, at the depth of four feet, in an oval grave, as many feet long, and about two feet broad. The legs were bent quite up to the head, and the arms were placed between the thighs. The face was downwards. The direction of the corpse was east and west, the head being to the east. The body was carefully wrapped in a great number of opossum skins. The head was bound round by the common net and girdle of the natives. Over the whole was a larger net. Two cypress trees were to the west and north of this barrow, distant about fifty feet. The sides of them towards the sepulchre were barked, and curious characters were deeply engraven in them.

BARROW, LITTLE, a river of Ireland, which falls into the Barrow, about four miles east of Portarlinton.

BARROW, POINT, a cape on the south coast of Ireland, in the county of Cork, five miles east of Kinsale. Long. $8^{\circ} 21' W.$, lat. $51^{\circ} 43' N.$

BARROW'S STRAIT, a considerable strait of the Northern Ocean, so named by Captain Parry, in one of his voyages, in honor of Mr. Barrow of the admiralty.

BARROW UPON SOAR, a village in Leicestershire; the birth place of bishop Beveridge. It is celebrated for producing a hard blue stone, which, when calcined, makes a lime fit for a strong cement, and adapted to all works under water. The Barrow blue stone was conveyed to Ramsgate for the building of the pier and was found to succeed, after the Dutch *tarras* mortar had failed.

BARROWS, in the salt works, are wicker cases, almost in the shape of a sugar loaf, wherein the salt is put to drain.

BARRSTOBRIK, a rocky moorish hill, in the county of Kirkcubright and parish of Tongland, where the unfortunate Mary, Queen of Scots, rested and refreshed herself with a few faithful friends, in 1568, after the fatal battle of Langside; on her way to the Abbey of Dundrennan. From this circumstance the farm on that part of Barrstobrick has ever since been called *Queen's Hill*.

BARRUEL (Augustin), a French ecclesiastic, and a literary man of some eminence during the French revolution, commenced his career in 1774, with an ode on the accession of Louis XVI. Soon after he united with Freron in the composition of the *Année Littéraire*. In 1788 he became editor of *Le Journal Ecclesiastique*, which he carried on till July 1792. In 1794 he had escaped, from the opposition his sentiments encountered in Paris, to England, and published his *History of the French Clergy during the Revolution*. In 1796 appeared the first two volumes of the work by which he is best known, *Memoirs for a History of Jacobinism, Impiety, and Anarchy*, the remaining part of which followed some

years after. Though an exaggerated production, it supplies many facts not otherwise to be found recorded. He returned to France in 1802, and died Oct. 5, 1820, at the age of seventy-nine.

BARRULET, in heraldry, the fourth part of the bar, or the one half of the closet, an usual bearing in coat-armour.

BARRÜLY, in heraldry, is when the field is divided bar-ways, that is, across from side to side, into several parts.

BARRY (James), a celebrated painter, was born at Cork on the 11th of October, 1741. His father's occupation was that of a coasting-trader, and, anxious to engage his son in the same business, he carried him along with him in several voyages. The mind of Barry, however, averse to such an employment of his talents, was engaged at all leisure moments in sketching and drawing; and his father, perceiving the impossibility of fixing his choice in a seafaring profession, allowed him at last to pursue the natural bias of his disposition. His eager thirst of knowledge, and his persevering industry in acquiring it, now excited the admiration of all his acquaintance, and carried him forward to improvement and information far beyond his years. He read all the books that his slender finances could command, or the kindness of his friends supplied; and his unwearied diligence allowed him no time for frivolous amusement, and little for repose. But he devoted a part of every day to the exercise of his pencil, and at a very early age furnished designs for a volume of fables, printed by an Irish bookseller. He was seventeen years old when he attempted oil painting; but his progress in this first art must have been extremely rapid, and his execution of individual pieces uncommonly quick, since we find him in less than five years not only finishing several large paintings, but producing that work which drew him from the obscurity of a provincial town, and gave him a high place among the artists of his country. The subject that he chose for this picture was an old traditionary story concerning the arrival of Saint Patrick in Ireland; and as soon as he had finished it he set out with it for Dublin. Without acquaintance or recommendation of any kind, he obtained leave to expose his piece in an exhibition of paintings, which was just opening upon his arrival, and had the happiness to see it marked out by public approbation and applause. He shortly after was introduced to the acquaintance, and soon obtained the friendship, of Burke. With that great man he repaired to London, as a better field for the display of his talents, and, under his patronage, was introduced to several artists of eminence. The talents of Mr. Barry were here universally acknowledged to be great; but in proportion as nature had been liberal, his friends and himself felt the importance of seconding her views, by embracing every attainable opportunity of improving her gifts. The most important part of a painter's education having for a long time been considered to be a short residence in Rome, Barry, was enabled to visit, by the assistance of the Burkes, that seat of the arts. There he remained nearly five years, engaged in the deepest researches on the principles of his art, and in the most laborious examination of its noblest specimens. For three years,

ne mentions in a letter to Sir Joshua Reynolds, he was so completely occupied in studying the inimitable models of perfection bestowed upon the world by the genius of Michael Angelo, Raphael, Titian, Guido, and other celebrated masters, that he could not spare two hours for any other employment. Nor was any of this portion of his time spent in copying them,—it was entirely devoted to a minute and critical examination of their peculiar manner and characteristic excellencies. In 1771 he returned to his native country, and soon displayed the extent of his powers, and the improvement of his taste, in several masterly appeals to public admiration. His first was a *Venus*, in which he embodied an amazing assemblage of beauty and grace. The subject he chose for the following year was likewise mythological, being a representation of *Jupiter* and *Juno* on Mount *Ida*. But Mr. Barry's chief object of ambition was to be employed in some national work, which should raise the character of his country, while it should confer permanent reputation on his own name. He had beheld at Rome the works of Raphael and Michael Angelo on the walls of the Vatican, and he saw what splendor magnificent edifices, and noble designs in painting, mutually diffused over each other. He therefore concurred with alacrity in a proposal made to decorate the cathedral of *St. Paul's* with paintings, and offered his services as one of the artists. But this design was relinquished, owing to the opposition of the primate and the bishop of London. A proposal that was made soon afterwards to Barry and his brother artists, to decorate the great hall of the Society of Arts with historical and allegorical paintings, failed, to his great mortification, like the former. Bent on his great object, he offered to execute this work by himself, and the only condition that he stipulated for was, that he might be allowed to proceed to the end of his designs without interference or control. The condition was agreed to, and the work will remain a lasting monument of his fame. We have not space in this short sketch to describe his beautiful and ingenious designs; we must therefore refer our readers to his own writings for their details, and to the pictures themselves, for a knowledge of the feeling of that excellence; to which his own description can do justice no more than that of others can convey. Dr. Johnson observed, upon seeing them, that they displayed a grasp of mind which was nowhere else to be found. This great work was unproductive of emolument to the author. But the society voted him their gold medal, 250 guineas at different periods, and allowed him the profits of exhibitions, which amounted to £500. It is not very pleasing to follow the artist through the remaining part of his life. In 1777 he was made a Royal Academician, and in 1780 professor of painting in the academy, which situation he held in 1789, in consequence of his extraordinary labors, he induced the academy to appropriate the receipts of the exhibitions to the formation of a gallery of old masters for the use of the pupils. Soon after the death of Buchan set on foot a subscription to him, which amounted to about £1000. What this was intended to purchase an annuity for him, when he was seized with a pleuritic fever, which carried him off on

the 22d of February, 1806, aged sixty-five. 'Mr. Barry, as an artist,' Mr. Hazlett has well said, 'as a writer, and a man, was distinguished by great inequality of powers and extreme contradictions in character. He was gross and refined at the same time; violent and urbane; sociable and sullen; inflammable and inert; ardent and phlegmatic; relapsing from enthusiasm into indolence; irritable, headstrong, impatient of restraint; captious in his intercourse with his friends, wavering and desultory in his profession. In his personal habits he was careless of appearances or decency, penurious, slovenly, and squalid. He regarded nothing but his impulses, confirmed into incorrigible habits. His pencil was under no control. His eye and his hand seemed to receive a first rude impulse, to which he gave himself up, and paid no regard to any thing else. The strength of the original impetus only drove him farther from his object. His genius constantly flew off in tangents, and came in contact with nature only at salient points. His enthusiasm and vigor were exhausted in the conception; the execution was crude and abortive. His writings are a greater acquisition to the art than his paintings. The powers of conversation were what he most excelled in; and the influence which he exercised in this way over all companies where he came, in spite of the coarseness of his dress, and the frequent rudeness of his manner, was great. Take him for all in all, he was a man of whose memory it is impossible to think without admiration as well as regret.' Towards the close of life he was doubtless occasionally deranged. His works are collected in two quarto volumes, 1809, of which his Lectures are deemed the best part.

BARRY (Girald), commonly called Giraldus Cambrensis, Girald of Wales, an historian and ecclesiastic in the reigns of Henry II. and Richard I., was born at the castle of Manorbier, near Pembroke, A. D. 1146. By his mother he was descended from the princes of South Wales, and his father, William Barry, was one of the chief men of that principality. Being a younger brother, and intended for the church, he was sent to *St. David's*, and educated in the family of his uncle, who was bishop of that see. He acknowledges, in his history of his own life and actions, that in his youth he was too playful; but being reproached for it by his preceptors, he became a very hard student, and excelled all his school-fellows. When he was about twenty years of age he was sent, A. D. 1166, for improvement, to the university of Paris; where he continued five years. On his return to Britain he entered into holy orders, and obtained several benefices in England and Wales. Observing that his countrymen were backward in paying the tithes of wool and cheese, which he was afraid would involve them in eternal ruin, he applied to Richard, archbishop of Canterbury, and was appointed his legate in Wales for rectifying that disorder. He executed his commission with great spirit; excommunicating all who refused to save their souls by surrendering the tithes of cheese and wool. Not satisfied with enriching, he also attempted to reform, the clergy; and reported the archdeacon of Brecon, for the unpardonable

crime of matrimony. The poor old man refusing to put away his wife, was deprived of his arch-deaconry; which was bestowed upon our zealous legate. His great vigor involved him in many quarrels. His uncle, the bishop of St. David's, dying A. D. 1176, he was elected his successor by the chapter: but this election having been made contrary to the inclination of Henry II. he did not insist upon it, but went again to Paris to prosecute his studies, in the civil and canon law, and theology. Having spent about four years at Paris, he returned to St. David's, where he found every thing in confusion; and the bishop being expelled by the people, he was appointed administrator by the archbishop of Canterbury, and governed the diocese in that capacity till A. D. 1184, when he was restored. About the same time he was called to court by Henry the Second, appointed one of his chaplains, and sent into Ireland A. D. 1185, with prince John. By this prince he was offered the united bishoprics of Fernes and Leighlin, but declined them, and employed his time in collecting materials for his *Topography of Ireland*, and his history of the conquest of that island. Having finished the former work, which consisted of three books, he published it at Oxford, A. D. 1287, in the following curious manner, in three days. On the first day he read the first book to a great concourse of people, and afterwards entertained all the poor of the town; on the second day he read the second, and entertained the doctors and chief scholars; and on the third day he read the third book, and entertained the young scholars, soldiers, and burghesses. 'A most glorious spectacle!' says he, 'which revived the ancient times of the poets, and of which no example had been seen in England.' He attended Baldwin, archbishop of Canterbury, in his progress through Wales, A. D. 1186, in preaching a crusade for the recovery of the Holy Land; in which he tells us he was far more successful than the primate; and that the people were prodigiously affected with his Latin sermons, which they did not understand, melting even to tears, and coming in crowds to take the cross. Although Henry II. entertained the highest opinion of his abilities, he never advanced him to any higher dignity in the church on account of his relation to the princes of Wales. But on the accession of Richard I. A. D. 1189, his prospects of preferment became better, for he was sent for by that prince into Wales to preserve the peace of that country, and joined in commission with William Longchamp, bishop of Ely, as one of the regents of the kingdom. He did not however, improve this favorable opportunity, refusing the bishopric of Bangor in A. D. 1190, and that of Landaff the year after, having fixed his heart on the see of St. David's, the bishop of which was very old and infirm. In A. D. 1192 the state of public affairs and the course of interest at court became so unfavorable to our author's views, that he determined to retire. At first he resolved to return to Paris to prosecute his studies; but meeting with difficulties in this, he went to Lincoln, where William de Monte read lectures in theology with great applause. Here he spent about six years studying divinity, and composing vari-

ous works. The see of St. David's, which had long been the object of his ambition, now became vacant, (A. D. 1198) and brought him again upon the stage. He was unanimously elected by the chapter; but met with so powerful an adversary in Hubert, archbishop of Canterbury, that it involved him in a litigation which lasted three years, cost him three journeys to Rome, at a great expense, and in which he was at last defeated, A. D. 1203. Soon after, he retired from the world, and spent the last seventeen years of his life in a studious privacy, composing many books, of which we have a catalogue in the *Biographia Britannica*. That Girald of Wales was a man of uncommon activity, genius, and learning, is undeniable; but these and his other good qualities were much tarnished by his insufferable vanity, which must have been as offensive to his contemporaries, as it is disgusting to his readers.

BARRY (James, baron Santry), was also a descendant of the ancient princes of Wales. Being bred to the law, he was appointed king's serjeant for Ireland in 1629. In this station he was noticed by Lord Wentworth, afterwards earl of Strafford, who promoted him to be second baron of Exchequer in 1634. Barry was not ungrateful. In 1640, when the Irish parliament proposed sending over a committee to impeach Lord Strafford, he did his utmost to oppose the measure, though his efforts proved fruitless. During the commotion and revolution that followed, we hear nothing of Mr. Barry; but in 1660 he was appointed chairman of the Convention, which voted for the restoration of monarchy; and in the end of that year, king Charles II. showed his opinion of his services, by appointing him Lord Chief Justice of the King's Bench, and a privy counsellor, and creating him a peer of Ireland. He did not live to see a third revolution, for he died in 1672.

BARRY, a hill of Scotland, in Angushshire, three miles north of Belmont, and 688 feet in height. Tradition says, that queen Guinever or Vanora, the wife of Arthur king of the Britons, was confined upon it, after having been taken prisoner in a battle between that prince and the Scots and Picts. Dr. Playfair has given the following particular account of this hill. 'Barry-hill, the supposed place of Vanora's confinement, merits some description. It is one of the Grampians, one mile and a half north-east of Alyth. It commands an extensive view of Strathmore, and of several remarkable hills in the Sidlaw range, viz. Dunsinnan, Kinpurnie, Sidlaw, Finhaven, &c. all of which might have been anciently used as watch towers, or places of defence. History informs us that the Picts kept possession of Dunbarry, and the adjacent country, from a remote period to the ninth century, or later; but the precise dates of their settlement in these parts, and of their expulsion, cannot be ascertained. The hill itself is of an oval form. Its summit was levelled into an area 180 feet long, and seventy-two or seventy-four broad. Around the area a mound of earth was raised, from six to eight feet high, and ten to twelve broad at top. On this mound a wall of free stone was built without any cement whatever. The

foundation of the wall was composed of rough granite, and still remains. It is of the same breadth with the summit of the mound; but the height of the wall cannot be known; Gordon's estimate of it is extremely erroneous. Among the ruins there are several pieces of vitrified stone; but these vitrifications must have been accidental, as they are few and inconsiderable. Along the west and north borders of the area, barracks, or huts, were built of dry stone, and sufficiently sheltered by the mound and wall; but no structures of this sort can be traced in the south part of the area. As the north and west sides of the hill are steep, and of difficult access, there was no need of an outer ditch in those quarters: but, towards the south and east, where the hill gently slopes, there is a ditch ten feet broad, and from twelve to sixteen feet below the foundation of the wall. At the south-east extremity of the fort, a narrow bridge was raised over the ditch, eighteen feet long, and two broad, except towards each end, where the breadth was increased. It was composed of stones laid together with much art and vitrified above, below, and on both sides; so that the whole mass was firmly cemented. That an opening was left below after the process was finished is doubtful. On the upper part of the bridge a stratum of gravel was laid, to render the passage smooth and easy. This is the sole part of the fort intentionally vitrified. A few yards distant from the ditch there is an outer wall, the foundation of which is about three feet lower than the summit of the mound. The approach to the fort is from the north-east, along the verge of a precipice; and the entrance was secured by a bulwark of stone, the ruins of which are extant. There is no vestige of a well within the fort; but westward, between the basis of the mound and the precipice, there was a deep pond or lake, recently filled up by the tenants in that neighbourhood. About a quarter of a mile eastward, on the declivity of the hill, there are some remains of another oval fort, of less extent than the preceding, consisting of a strong wall and ditch. Tradition says, that there was a subterranean communication between these forts, which is not improbable. From the account now given, it would appear, 1. That both were constructed before the Romans introduced the art of building with lime and other cement. 2. That the Picts and ancient Scots had stone edifices, which Mr Pherson is not inclined to admit. 3. That they sometimes vitrified particular parts of their forts, to render them the more durable.

BARRY, BARRA, or BARA, one of the western isles of Scotland, lying in the Atlantic Ocean; eight miles south from that of South Uist. Its extent has been strangely misrepresented, some stating it at five miles long and three broad, and others reducing it to a mere rock, half a mile in circumference, and inhabited only by solar geese and wild fowls! It is at least twelve English miles long, and from three to six broad; being intersected in different places by arms of the sea; separated from the island of Watersay, by a channel of one mile. It is a barren appearance, from the great quantity of rocks to be seen every where; but on the north end, in good seasons, it may vie in fertility with any ground

of equal extent in Scotland. In the middle and south end there are very high hills, which are a mixture of green, rock and heath, and seem fitted for sheep-walks, if the island were near a good market. The west coast is low and flat; the soil, fine shell sand, in many parts very fertile; but the ground rises to the east coast, where it is barren, and breaks off abrupt, irregular, and steep. In some parts, where the soil is rocky and uneven, it admits not of being plowed; it is cultivated, therefore, by a kind of crooked spade, called cashroom. The inhabitants are about 1500. Long. $7^{\circ} 30'$ W., lat. $56^{\circ} 55'$ N.

BARRY, a town of Ireland, in the county of Longford, fifty-four miles from Dublin.

BARRY, a small island in the Bristol channel, near the south coast of Wales; distant three miles west of Flat Holm. Its name is said to be derived from a hermit, St. Baruch, who died there in 700. Giraldus Cambrensis states, that in a rock near the entrance of the island there is a small cavity, to which, if the ear be applied, a noise is heard like that of smiths at work, the blowing of bellows, strokes of hammers, grinding of tools, and roaring of furnaces; and Sir Richard Hoare adds, that towards the southern part of the island, on a spot, called Nell's point, is a fine well, to which great numbers of women resort on Holy Thursday: having washed their eyes at the spring, each drops a pin into it. The landlord of the boarding-house (for the island is frequented by bathers) informed Sir Richard Hoare, that in the last cleaning of the well he took out a pint of these votive offerings.

BARRY, in heraldry, is when an escutcheon is divided bar-ways, that is, across from side to side, into an even number of partitions, consisting of two or more tinctures, interchangeably disposed. It is to be expressed in the blazon by the word *barry*, and the number of pieces must be specified; but if the divisions be odd, the field must be first named, and the number of bars expressed.

BARRY-BENDY is when an escutcheon is divided evenly, bar and bendways, by lines drawn transverse and diagonal, interchangeably varying the tinctures of which it consists, thus:

BARRY-PILY, is when a coat is divided by several lines drawn obliquely from side to side, where they form acute angles, thus:

BARSA, in ancient geography, an island on the coast of France, in the English channel; now called Basepool, according to some; according to others, Bardsey.

BAR SABABAS; from בר, a son, and צבא, rest; a name of Joseph, surnamed Justus, who was competitor with Matthias for the apostleship, and is said to have been one of the seventy disciples.

BAR SABABAS (Judas), a member of the synod at

Jerusalem, who was sent with Paul, Barnabas, and Silas, to publish their decree against the Judaizing teachers among the Gentile churches at Antioch. He is also styled a prophet: Acts xv. 32.

BARSAC, a town of France, in Guienne, in the Bourdelois, on the left bank of the Garonne; contains 480 houses, and belongs to the department of the Gironde, arrondissement of Bourdeaux, eighteen miles south-east of Bourdeaux. It is noted for its excellent wine.

BARSALLACH, POINT, a cape of Scotland, on the coast of the county of Wigton, in the bay of Luce, eight miles north-west of Burrowhead. Long. 4° 35' 17" W., lat. 54° 43' N.

BARSALLI, or **BARSALLO**, a kingdom of Africa, bordering on the Gambia, inhabited by a trioe of negroes called Jaloffis. Their government is a despotic monarchy; all people being obliged to prostrate themselves on the earth when any of the royal family makes his appearance. It is divided in to a number of provinces, over which governors are appointed, called bumeyes. The Mahomedan is the professed religion, but little regard is paid to that part of the impostor's laws which forbids the use of wine; for the king cannot live without brandy; nor is he ever more devout than when he is intoxicated. When he wants a fresh supply of this liquor, or of any other commodity, he seizes a certain number of his subjects, and sells them as slaves.

BARSANIANI, in church history, a sect who held the errors of the Severians and Theodosians.

BARSANTI (Francisco), an eminent musical performer and composer, was born at Lucca about 1690. He studied the civil law in the university of Padua; but after a short stay there preferred music, and put himself under the tuition of some of the ablest masters in Italy. Having attained to a considerable degree of proficiency in practical composition, he resolved to settle in England, and came hither with Geminiani, in 1714. He was a good performer on the hautboy and flute. He was many years a performer at the opera-house; and at last went to Scotland, where he improved the music of that country, by making basses to a great number of the most popular Scots tunes. About 1750 he returned to England; but, being advanced in years, he went into the opera band as a performer on the tenor violin; and in the summer season into that of Vauxhall. At this time he published twelve concertos for violins; and shortly after, *Sei Antifone*, in which he endeavoured to imitate the style of Palestrina, and the old composers of motets; but so little profit resulted, that, towards the end of his life, the industry and economy of an excellent wife, whom he had married in Scotland, and the labors of a daughter whom he had qualified for a singer, but who afterwards became an actress at Covent Garden, were his chief supports. Miss Barsanti went on the stage in consequence of her entirely losing her singing voice by catching cold. Colman engaged her as a comic actress for the Haymarket theatre, and she gained great applause. She afterwards went to Ireland, became a favorite there, and married Mr. Daly, the manager of the Dublin theatre.

BARSE, in ichthyology, an English name for the perch, still used for the same fish in the Saxon language, and one of the many Saxon words we have retained.

BARSICK, a head land on the coast of the island of South Ronaldshay, one of the Orkneys, which is 250 feet perpendicular above the level of the sea.

BAR-SUR-AUBE. See **BAR**.

BAR-SUR-SEINE. See **BAR**.

BAR'TER, *v. & n.* } Fr. *barater*; Ital. *bar-*
BAR'TERER, } *ratate*; Span. *barrator*,
BAR'TERY. } from *barat*, craft, fraud. It is now, however, no longer used in this ill sense. It signifies a particular mode of exchange. Exchange is the general term signifying to take one for another. To barter is to exchange one article of trade for another. The words that bear a near affinity to this are truck and commute; but their precise difference is this: truck is a familiar term to express a familiar action for exchanging one article of private property for another; and commute is applied to the exchanging one mode of punishment for another. We may exchange one book for another; traders *barter* trinkets for gold-dust; coachmen truck a whip for a handkerchief; government commutes the punishment of death for that of banishment.

For him was I exchang'd and ransom'd;

But with a baser man of arms, by far

Once, in contempt, they would have *barter'd* me.

Shakspeare.

From England they may be furnished with such things as they may want, and in exchange or *barter* send other things with which they may abound.

Bacon.

As if they scorn'd to trade and *barter*,

By giving or by taking quarter.

Hudibras.

A man has not every thing growing upon his soil, and therefore is willing to *barter* with his neighbour.

Collier.

I see nothing left us, but to truck and *barter* our goods, like the wild Indians, with each other.

Swift.

He who corrupteth English with foreign words, is as wise as ladies that exchange plate for china; for which the laudable traffick of old clothes is much the fairest *barter*.

Felton.

It is a received opinion, that, in most ancient ages, there was only *bartery* or exchange of commodities amongst most nations.

Camden's Rem.

Then as thou wilt dispose the rest,

To those who, at the market rate,

Can *barter* honour for estate.

Prior.

If they will *barter* away their time, methinks they should at least have some ease in exchange.

Decay of Piety.

He also *bartered* away plums, that would have rotted in a week, for nuts that would last good for his eating a whole year.

Locke.

At the same time those very men tear their lungs in vending a drug, and show no act of bounty, except it be that they lower a demand of a crown to six, nay to one penny. We have a contempt for such paltry *barterers*.

Tatler. No. 4.

The most ancient and most obvious sort of commercial contract is *barter*, or the exchange of goods for goods. But, where there is no other sort of commerce, contracts of *barter* must be liable to great inequalities.

Beattie. Moral Science

Some men are willing to *barter* their blood for

Burke.

BARTER. See ARITHMETIC, Index.

BARTH, or BART (John), a French admiral, born at Dunkirk in 1651. He left his father, who was a poor fisherman, and entered into the navy, where he distinguished himself by his valor. Having, in 1692, obtained the command of a squadron of frigates and a fire ship, he destroyed eighty-six English merchant ships, made a descent on the English coast, near Newcastle, where he set fire to several houses, and returned to Dunkirk with prizes valued at 500,000 crowns. In 1696 he was appointed with a squadron of six ships, to convoy a fleet laden with corn, and before he fell in with it, it had been captured by a Dutch squadron of eight men of war. Though his numbers and strength were so much less, he not only retook the prizes, but the war ships. For this action a patent of nobility was granted him. He died at Dunkirk in 1702.

BARTHELEMY (John James), a celebrated French writer, born at Cassis, in Provence, in 1716. He was sent to school at Marseilles, and admitted into the college of the Oratory, where his promising genius was discovered, and encouraged, so that he made a rapid progress in learning. But his design being for the church, it was necessary for him to leave the Oratory, and to ferry philosophy and theology to the Jesuits. Here he acquired, more by his own labor and perseverance than by the instructions of the professors, and the aid of the Greek, Hebrew, Chaldean, Syriac, and Arabic languages. Before Barthélemy left Paris, and when about twenty-one years of age, he saw a number of that city, having a great knowledge of his learning, and was distinguished, chiefly, by introducing the most remarkable, and with some difficulty to be pronounced, words of the East; and Barthélemy, being full of admiration of a prodigy of mental strength, and desirous his education at Cassis might be settled at Aubagne, and spent his childhood with his family, by whom he was highly esteemed. But he visited Marguerite, for the company of learned men; and he was especially taken up with one M. Cary, who had a fine cabinet of medals and an extensive library. He also associated himself with Father Boullier, in making astronomical observations. At last, however, he resolved to devote himself to literature, and accordingly went to Paris in 1744. He was recommended to M. de Boves, keeper of the medals, and secretary of inscriptions and belles lettres, who received him kindly, and paid him every possible attention; and, in a short time, on account of the age and industry of M. de Boves, Barthélemy was chosen his substitute in the care of the cabinet of medals; and afterwards, in the absence of Boves only. Sometimes he acted in the name of his secretary to the academy, and he was, in the month of his collection, appointed his secretary. He succeeded Boves in the office of secretary in 1755 he visited the academy, and he had then pursued his studies in the library of the recent king, and in the library, among which he had attracted the notice of the king, he drew his attention to the ruins of Herculanum, and he was the first who published the account writing of the ruins of the city, and the first who published the description of the city.

of them, from their injunctions, could not gratify him. On this he begged a sight of a page for a few minutes. It contained twenty-eight lines, which he read over attentively, and, retiring to a corner, transcribed the whole, and sent the fac simile to the academy of belles lettres. About the end of 1753, the duke de Choiseul, having been appointed minister for foreign affairs, gave him a pension of £250, and in 1765 conferred on him the treasurership of St. Martin de Tours; to which in 1758, he added the place of secretary-general to the Swiss guards. In 1768 appeared his great work, the fruit of thirty years labor, entitled, *The Voyage of the younger Anacharsis in Greece*; in which the traveller gives an account of the customs, government, and antiquities of the country he visited; remarks on the music of the Greeks, on the library of the Athenians, and on the customs of all the surrounding states. In 1789 Barthélemy became a candidate for a chair in the French academy; and so great was the reputation he had gained by his writings, that this learned body elected him by acclamation. The speech he delivered on the occasion, for modesty and simplicity, is deservedly celebrated. In consequence of the revolution, he was reduced to a pittance merely sufficient to furnish the necessaries of life; yet, in 1790, when M. de St. Priest offered him the place of librarian to the king, he expressed his gratitude, but declined accepting, lest it should interfere with his occupations in the cabinet, which he still continued to enrich. In 1792 his strength began to fail, and, in 1793, now a feeble old man, he was arrested as an aristocrat, and hurried to prison; but was liberated the same night, by order of the committee. He died in 1795, regretted by all his relations as their common father. Besides his *Anacharsis*, he was author of many papers, principally on medals, in the collection of the academy of inscriptions, &c.

BARTHELEMY (St.), a town of France, in the department of the Lot and Garonne, arrondissement of Marmande, with 2300 inhabitants. Nine miles east of Marmande, and twenty-four north-west of Agen.

BARTHIUS (Gaspar), a learned and copious writer, born at Custrin, in Brandenburg, in 1576. Mr. Baillet, in his *Enfans Celebres*, tells us, that at twelve years of age he translated David's Psalms into Latin verse of every measure, and published several Latin poems. Upon the death of his father (who was professor of civil law at Frankfort, councillor to the elector of Brandenburg, and his chancellor at Custrin), he was sent to Gotha, then to Eisenach, and afterwards, according to custom, went through all the different universities in Germany. He afterwards visited Italy, France, Spain, England, and Holland, improving himself by the conversation and works of the learned in every country. He studied also the modern languages, and his translations from the Spanish and French show that he was not content with a superficial knowledge. Upon his return to Germany he led a retired life at Leipsic, his passion for study having made him renounce all sort of employment. He wrote a vast number of books; the principal of which are, 1. *Adversaria*, a large volume in folio; the second and third volumes of which he left in

MS. 2. A Translation of *Æneas Gazæus*. 3. A large volume of Notes upon Claudian, in 4to. 4. Three large volumes upon Statius, &c. He died at Leipsic, in 1658, aged seventy-one.

BARTHOLINA, in botany, a genus of plants, named after the naturalist Bartholinus. Class and order, gynandria monogynia. Natural order, orchideæ. Essential character: CAL. tubular at the base: PET. united to the base of the lip, whose spur is shorter than the germen. Stalks of the pollen elongated; their cells laterally fixed; glands distinct, half covered by the exterior lobe. The principal species is, *B. pectinata*. Fringed *bartholina*.

BARTHOLINUS (Gaspar), a learned physician and anatomist of the seventeenth century, born at Malmoe, in Schonen, which then belonged to Denmark. At three years of age he had such a quick capacity, that in fourteen days he learned to read; and, in his 13th year, he composed Greek and Latin orations, and pronounced them in public. When he was about eighteen he went to the university of Copenhagen, and afterwards studied at Rostock and Wittemberg. He afterwards travelled, and neglected no opportunity of improving himself at the different universities which he visited. He was, in 1613, chosen professor of physic in that university, which he enjoyed eleven years; when, falling into a dangerous illness, he made a vow, that if it should please God to restore him, he would solely apply himself to the study of divinity. He recovered and kept his word; and soon after obtained the professorship of divinity, and the canonry of Roschild. He died in 1629, having written several small works, chiefly on metaphysics, logic, and rhetoric.

BARTHOLINUS (Thomas), a celebrated physician, son of the former, born at Copenhagen, in 1616. After studying some years in his own country, he, in 1637, went to Leyden, where he studied physic three years. He then travelled into France; and resided two years at Paris and Montpellier, for improvement. Afterwards going to Italy, he continued three years at Padua; and at length went to Basil, where he obtained the degree of doctor of philosophy. Soon after, he returned to Copenhagen; where, in 1647, he was appointed professor of mathematics; and, in 1648, of anatomy, a branch better suited to his genius and inclination; which he discharged with great assiduity for thirteen years, and distinguished himself by making several discoveries with respect to the lacteal veins and lymphatic vessels. His close application, however, having rendered his constitution very infirm, he, in 1661, resigned his chair; but the king of Denmark allowed him the title of honorary professor. He now retired to a little estate he had purchased at Hagedest, near Copenhagen, where he hoped to have spent the remainder of his days in peace and tranquillity; but his house being burnt in 1670, his library, with all his books and MSS. was destroyed. In consideration of this loss the king appointed him his physician, with a handsome salary, and exempted his land from all taxes; the university of Copenhagen also appointed him their librarian; and, in 1675, the king did him the honor to give him a seat in the grand council of Denmark. He wrote, 1. *Anato-*

mia Caspari Bartholini Parentis, novis Observationibus primum locupletata. 8vo. 2. *De Monstris in Natura et Medicina*, 4to. 3. *De Armillis Veterum*, 8vo; and several other works. This great man died in 1680.

BARTHOLOMEW (St.); from בר, a son, הלה, elevating, and מי, waters; one of the twelve Apostles, and generally believed to be the same with Nathanael, for the following reasons; 1. John never mentions Bartholomew but Nathanael; 2. the other Evangelists never mention Nathanael but Bartholomew; 3. John classes Philip and Nathanael, as the others do Philip and Bartholomew; 4. Nathanael is mentioned with the other apostles that met our Lord, after his resurrection, at the sea of Tiberias; and 5. Bartholomew is not a proper name, but a patronymic signifying the son of Tolmai or Thilomæus; a mode of denomination common among the Hebrews, and other ancient nations (see **BARJONAS**), and which still prevails in some modern nations; for instance in Russia, where Petrowitz, Alexiowitz, Alexandrowitz, &c. signify, the son of Peter, Alexis, Alexander, &c. It is said that this apostle travelled as far as India, to propagate the gospel: and Eusebius relates, that a famous philosopher and Christian, named Pantænus, desiring to imitate the apostolical zeal in propagating the faith, and travelling for that purpose as far as India, found there, among those who yet retained the knowledge of Christ, the gospel of St. Matthew, written by St. Bartholomew. From thence he returned to the more northern and western parts of Asia, and preached to the people of Hierapolis; then in Lycaonia; and lastly, at Albania, a city upon the Caspian Sea; where his endeavours to reclaim the people from idolatry were crowned with martyrdom, he being flead alive, and crucified with his head downwards.

BARTHOLOMEW, CAPE, the southernmost point of Staten-Land, in Le Maire straits, at the south extremity of South America.

BARTHOLOMEW, ST., one of the Caribbee islands, to which, in 1748, a colony was sent by the French, by whom it was ceded to Sweden in 1785. It is reckoned about fifteen miles in circumference, and is now the only island which Sweden possesses in the Columbian Archipelago. It is very fertile, producing sugar, tobacco, cotton, indigo, and cassava, but having no water, except what is supplied by the rains, is not much resorted to. Many of the trees are valuable; the aloe is held in high estimation, and there are others from which a gum of excellent cathartic qualities is extracted. The branches of the parotane growing downwards, take root and rise in fresh stems; forming an almost impenetrable barrier. The species called sea trees, line many parts of the shore. The island also produces *lignum vitæ* and iron-wood; and a great variety of birds. The inhabitants also export a peculiar kind of lime-stone. The coast is surrounded with rocks, and cannot be safely approached without a pilot; but it has a very capacious and well-sheltered harbour, capable of receiving and sheltering the largest ships. About half the inhabitants are Irish Roman Catholics, whose ancestors settled here in 1666.

BARTHOLOMEW, ST. a river of South America,

in the province of Antioquia, which falls into the Madalena.

BARTHOLOMEW (ST.), one of the islands of the New Hebrides, in the South Pacific, three leagues from the north-west point of Mallicolo, from which it is separated by a channel, called Bougainville's passage. It is from six to seven leagues in circumference. Long. 169° 23' E., lat. 15° 41' S.

BARTHOLOMEW'S DAY (ST.), a festival of the Church, celebrated on the 24th of August. This day has been rendered infamous in the annals of France, for the massacre of the protestants in 1572, by the order of the bloody Catharine de Medicis, and her tyrannical son, Charles IX.

On Bartholomew's day also, in the year 1662, the act of uniformity, which obtained the royal assent on the 19th of May, took place, in consequence of which about 2000 ministers relinquished their preferments in the church of England. The liturgy, with its alterations, came out of the press on Bartholomew eve, and the following day was the ultimate time fixed by the act for the subscription; so that all those throughout the kingdom who conformed, except a few in London, subscribed in ignorance of its contents.

'Bartholomew's day,' says Mr. Locke, 'was fatal to our church and religion, by throwing out a very great number (about two thousand) of worthy, learned, pious, orthodox divines, who could not come up to this oath, and other things in that act. And so great was the zeal in carrying on this church affair, and so blind the obedience required, that if you compute the time of passing this act with that allowed for the clergy to subscribe the book of common prayer thereby established, you will find it could not be printed and distributed so as that one man in forty could have seen and read the book they did so perfectly assent and consent to.'—'The matter was driven on,' says bishop Burnet (Hist. of his Times, vol. i. p. 212, 8vo.) 'with so much precipitation, that it seemed expected the clergy should subscribe implicitly to a book they had never seen. This was done by too many, as the bishops themselves informed me.' Among these were several, who, according to Mr. Locke's description of them, were 'taught rather to obey than to understand.'

BARTHOLOMEW'S GOSPEL (ST.), is mentioned in the preface to Origen's Homilies on St. Luke, and in the preface to St. Jerome's commentary on St. Matthew; but generally regarded as spurious; and placed by pope Gelasius among the apocryphal books.

BARTHOLOMEW'S HOSPITAL (ST.), an institution for the reception of sick and wounded poor persons, situated in the north-west side of Smithfield, and incorporated by charter in the hospital of the Holy Trinity, in the year 1193, by the London government. It is situated in a building formerly belonging to the priory of St. Bartholomew, and is now under the management of the Barchese, who reside in a palace near the same. There are 120 beds, and 120 almshouses; and the hospital is supported by the rents of lands, and the contributions of the citizens. It is one of the most ancient and most celebrated hospitals in the world.

VI. and the munificence of the city and private benefactors. This hospital having escaped the dreadful fire in 1666, was repaired and beautified by the governors in 1691. But the buildings became at length so ruinous, that a subscription was entered into in 1729, for defraying the expense of rebuilding it, on a plan comprehending four detached piles of building, to be joined by stone gate-ways, about a court or area. The four piles were erected and finished; one of these piles contains a large hall for the governors at general courts, a counting-house for the committees, and other necessary offices; the other three piles contain wards for the reception of the patients, &c. It is governed by a president, treasurer, &c. It is attended by three physicians, and three surgeons, besides as many assistant surgeons. It has an apothecary, a chaplain, cook, steward, renter, matron, and porter. Since its enlargement, it is capable of accommodating 820 patients; it extends relief also to a great number of out-patients.

BARTHOLOMITES, a religious order, founded at Genoa in 1307; the monks leading very irregular lives, the order was suppressed by pope Innocent X. in 1650, and their effects confiscated. In the church of the monastery of this order at Genoa, is preserved the image which it is pretended Christ sent to king Abgarus.

BARTLEMAN (J.), a very celebrated bass-singer, was educated under Dr. Cooke, and brought up in the choirs of the Chapel Royal and Westminster abbey. His first appearance as a professional singer was at the concerts at Freemasons' Hall, where the compass and sweetness of his fine baritone voice raised him at once to the top of his profession. He was immediately engaged in the ancient concerts, and became eventually one of the proprietors and conductors at the Hanover-square rooms. He died in 1820, and was buried in the cloisters of Westminster Abbey, most of his professional associates of eminence attending the funeral. There is a handsome tablet erected there to his memory.

BARTOLOCCI (Julius), a learned monk, and professor of Hebrew at Rome, was born at Celano, in 1613; and distinguished himself by writing an excellent Latin catalogue of the Hebrew writers, in 4 vols. folio, a continuation of which was drawn up by Imbonati his disciple. He died in 1687.

BARTOLOMEO (Francisco), whose real name was Baccio, a celebrated painter, born at Savignano, near Florence, in 1469. He was the disciple of Cosimo Rosselli, but owed to the works of Leonardo da Vinci his extraordinary skill in painting. Raphael, after quitting the school of Perugino, studied perspective under him, with the art of managing and uniting colors. In 1500 he turned Dominican friar; and some time after was sent by his superiors to the convent of St. Martin, in Florence. He painted both portraits and histories; but his scrupulous conscience would hardly ever suffer him to draw naked figures, though nobody understood them better. He died in 1517, aged 48.

BARTOLOZZI (Francis), an eminent engraver, was born at Florence in 1728. His father was a silversmith, and he was intended for the

same business, but displayed so much taste and execution at the first handling of the graver, that he was placed at the Florentine academy, under Gaetano Biagio and Ignazio Hugford. Here Giovanni Cipriani was his fellow-pupil. He was subsequently articulated to Joseph Wagner, of Venice, who employed him too much in copying from inferior masters. When this engagement was expired, he married a respectable Venetian lady, and accepted the invitation of cardinal Bottari to repair to Rome. Here he engraved his fine plates from the life of St. Nilus, and the heads of painters for a new edition of Vasari. He returned to Venice, where Mr. Dalton, librarian to George III. employed him to engrave some of the drawings of Guercino, and, pleased with the execution of them, offered him £300 per annum to accompany him to England, and work on his account. Under this engagement he completed his beautiful collection of Guercinos. Afterwards he worked on his own account, and for Mr. Alderman Boydell. He was highly distinguished for the elegance of his designs for the benefit tickets of the higher performers of the Opera-house; and hearing that the celebrated Strange said he could execute nothing else, in a fit of emulation he produced his Clytie, and Virgin and Child, from Carracci and Carlo Dolci. About this time the red dotted or chalk manner became prevalent; and Bartolozzi contrived to execute it so beautifully as to assist in seducing the public taste from the superior and legitimate style of the line. He was elected a member of the Royal Academy, on its institution. In 1802 he accepted an invitation from the Prince Regent of Portugal, to superintend a school of engravers at Lisbon, with a pension of £100 per annum, a handsome house, and the produce of the engravings. It is said a pension of £400 was offered to him to remain in England; but that he would accept it only on condition that government would explain the matter to the prince Regent of Portugal. It is quite clear that all his past labors had left him in real need of one appointment or other. This interference being deemed improper, he bade England farewell, in his seventy-fifth year, and was received at Lisbon with great distinction. He died in that capital in his eighty-eighth year. Few artists have reached so distinguished a rank in every species of engraving, as Bartolozzi. His etchings in imitation of the drawings of the great masters, admirably represent the character and spirit of the originals; and his Marlborough gems, musical tickets, and prints for Boydell's Shakspeare, exhibit exquisite proofs of taste. He was so generous as to finish a plate left incomplete by Ryland, at the request of that unhappy man, while under sentence of death for forgery, and exhibited many other traits of a humane and benevolent united with a thoughtless character. Among the pupils of Bartolozzi were Sherwin, Tomkins, Cheeseman, and the two Vandramini.

BARTON-ON-HUMBER, a market-town and parish in the hundred of Yarborough, and county of Lincoln, 167 miles north from London; containing 2500 inhabitants. It is seated on the south side of the Humber, over which there is a ferry into Yorkshire, nearly six miles and a half

across. There is a great trade in corn and flour, as well as bricks and tiles, carried on, and a manufactory of Paris whitening. The town consists of several streets irregularly built, and has two parish churches, the livings of the two parishes being united. Market on Monday.

BARTON (Eliz.), commonly called The Maid of Kent, was a religious impostor in the reign of Henry VIII. She was originally a servant at Aldington, in Kent, who had long been troubled with convulsions, which distorted her limbs and countenance, and threw her body into the most violent agitations. After she recovered, she is said to have counterfeited the same appearances. Masters, the minister of Aldington, with other ecclesiastics, thinking her a proper instrument for their purpose, persuaded her to pretend that what she said and did was by a supernatural impulse, and taught her to act her part in the most perfect manner. Thus she would lie as it were in a trance, then, coming to herself, would break out into pious ejaculations, hymns, and prayer; sometimes delivering set speeches, sometimes uncouth monkish rhymes. She pretended to be honored with visions and revelations, to hear heavenly voices, and the most ravishing melody. Amongst other wickedness of the times, she declaimed against heresy and innovations; exhorting the people to frequent the church, to hear masses, to use frequent confession, and to pray to our lady, and the saints. This artful management, together with her great exterior piety, and austerity of life, not only deceived the vulgar, but the celebrated Sir Thomas More, bishop Fisher, archbishop Warkam, &c.: the last of whom appointed commissioners to examine her. She now declared, that the blessed Virgin had appeared to her, and assured her that she should never recover, till she went to visit her image, in a chapel of the parish of Aldington. Thither she accordingly repaired, processionally, and in pilgrimage, attended by above 3000 people, and many persons of quality of both sexes. She fell into one of her trances, and uttered many things in honor of the saints, and the popish religion: for herself, she said that by the inspiration of God, she was called to be a nun, and that Dr. Bocking was her ghostly father. Bocking was a canon of Christ's church, Canterbury, and most probably associate in carrying on the imposture. Meanwhile, the archbishop ordered her to be admitted into the nunnery of St. Sepulchre, Canterbury; where she had frequent inspirations and visions, and pretended to work miracles for all such as would make a profitable vow to our lady. The priests, her managers, having so far succeeded, now announced the great object of her mission, i. e. to proclaim, that 'in case the king should divorce queen Catherine of Arragon, and take another wife during her life, his royalty would not be of a month's duration, but he should die the death of a villain.' Bishop Fisher, and others in the interest of the queen, and of the Romish religion, hearing of this, held frequent meetings with the nun, the fathers and nuns of Sion, the Charter-house, Sheen, &c. Encouraged by the lenity of the government, the ecclesiastics in this conspiracy resolved to publish the revelations of the nun, in their sermons, throughout

the kingdom; they had communicated them to the pope's ambassadors, to whom also they introduced the maid of Kent; and they exhorted queen Catherine to persist in her resolutions. At length this confederacy began to be a very serious affair, and Henry ordered the maid and her accomplices to be examined in the star-chamber. Here they confessed all the particulars of the imposture, and afterwards appeared upon a scaffold erected at St. Paul's Cross, where the articles of their confession were publicly read in their hearing. Thence they were conveyed to the Tower, until the meeting of parliament; who, having considered the affair, pronounced it a conspiracy against the king's life and crown. The nun, with her confederates, Masters, Bocking, Deering, Able, &c. were attainted of high treason, and executed at Tyburn, April 20, 1534; where she confessed the imposture, laying the blame on her accomplices the priests, and craving pardon of God and the king.

BARTRAMIA, in botany, *pellitory*: a genus of the decandria monogynia class of plants; the calyx of which is a perianthium, cut into five parts; the corolla consists of five wedge-shaped petals; the fruit is globular, and the seeds are four in number, convex on one side, and angular on the other. It was so named in honor of a count of Bartram, in Carolina. Eight species are mentioned in the British botany.

BARTRAMIA, in botany, a genus of plants, named in honor of a learned and ornate friend, John Bartram, a native of Pennsylvania, order angiospermia. It belongs to the class dicotyledonae, calycerianthoneura, tetrandria, monogynia. STAM. filaments five, as long as the petals, anova ovate; style single, slender, five-angled, the capsule ovate: the seeds are four in number. The species are mostly perennials, and are distinguished by their peduncles, leaves, flowers, and fruit. *B. canadensis*, *B. alternis*, &c. are the most cultivated; *B. perfoliata*, a half-flowered *bartramia*, the seeds of which are used in the medicine *foliis oppositis*, &c. *Bartramia* is a name also given to *Bidifolia alpina*, euphratica herbacea, *Euphrasia rubra*, &c. *Charadryum maritimum*, &c. *Chenopodium alpinum*, &c. *B. rufifolia*, a yellow plant of onion, seu pedicularis. *Alpina bartramia*, native of Britain; but the *B. viscosa*, *capitata*, *latifolia*, seu *lectorophos*, &c. *Viscidifolia*, or yellow marsh eye-bright, native of Britain, is an annual. *B. viscosa*, marshy, or yellow marsh eye-bright, was found by Mr. J. Bartram in fogs and marshy places about Loch-Geil, near Loch-Long, in the district of Cowal in Argyll-shire. The plant is about ten or twelve inches high, with an erect stalk, downy and unbranched; the leaves are sessile, spear-shaped, and a little viscous; the flowers are yellow, and the plant dyes black. It is likewise found in marshy places in Cornwall in England.

BARYTH, the son of Nerith, the disciple and successor of the prophet Jeremiah. Josephus tells us he was one of a noble family; it is said in his prophecy that he wrote it at Babylon, but what time is uncertain.

BARYTH, in astrology, one of the apocryphal planets, and of the eleven of the Old Testament. It is sometimes reckoned part of Jeremiah's prophecies, but is generally rejected by the ancient

fathers as such. It is difficult to determine in what language it was originally written. There are three copies of it extant; one in Greek, the other two in Syriac.

BARULES, in church history, heretics who held that the Son of God had only a phantom of a body, that souls were created before the world, and that they lived all at one time.

BARUTH, an ancient town of Turkey, in Syria, by a Christian church of the Nestorian persuasion. It is situated in a fine fertile soil, but is inconsiderable now to what it was formerly.

BARUTH, an Indian measure, containing seven-teen gantans: it ought to weigh about three pounds and a half English avoirdupois.

BARWICK (John), an English divine of the seventeenth century, was born at Wetherslack in Westmoreland, in 1612. He studied at Cambridge, where he took his degrees of B. A. and M. A. in 1635 and 1638. When the civil war broke out he conveyed the university's plate, by their order, through bye roads to supply the king, who was then in great necessity. Through this, and other acts of loyalty, having rendered himself obnoxious to the parliament, particularly by keeping up a secret correspondence with the royal party, both before and after the king's death, he was at last committed to the tower, where he suffered great hardships for fifteen months, but was at last discharged, 1652, and, to the surprise of many, in better health than when he was incarcerated. Upon the restoration he was made dean of St. Paul's in 1661; in which station he repeatedly hurt his health, by his exertion in putting in order the archives of that church. He died of a pleurisy in 1664. His chief work was a Treatise Against the Covenant, which he published before the king's death.

BARWICK (Peter), physician to king Charles II. brother of the dean, was born in 1619, and studied also at Cambridge, where he took the degree of M. D. in 1655. Having settled in London, he soon rose to fame in his profession, by writing a defence of Dr. Harvey's discovery of the circulation of the blood. He was equally active and useful during the plague, and was no less successful in curing the small pox. He not only gave advice and medicines gratis to the poor, but also supplied their other necessities. He was particularly kind to the sufferers for royalty. He wrote the life of his brother in Latin, in 1671, which he deposited in the college library at Cambridge, and in 1693, when in his seventy-fourth year, added an appendix in defence of the *Eikon Basilike* of king Charles I. He died in 1705, aged eighty-six.

BARYPYCNI; *βαρυπυκνοι*; in the ancient music, such chords as formed the gravest notes of the several *spissas*. There were five barypycni in the scale. See PYCNI.

BARYTES, in chemistry, a genus of earths, which by Bergman, Lavoisier, and other eminent chemists, has been considered as a refractory metallic oxyd. This supposition has been confirmed by the experiments of Berzelius and Pontin, who, led by Sir H. Davy's decomposition of potash and soda by galvanism, subjected this earth to the same agent. Their experiments were

attended with complete success, and have been since verified by Sir H. Davy himself. To this metallic basis Davy gave the name of **BARUM**, which see.

'Pure barytes,' says Dr. Ure, 'is best obtained by igniting, in a covered crucible, the pure crystallised nitrate of barytes. It is procured in the state of hydrate by adding caustic potash or soda to a solution of the muriate or nitrate. And barytes, slightly colored with charcoal, may be obtained by strongly igniting the carbonate and charcoal mixed together in fine powder. Barytes obtained from the ignited nitrate is of a whitish-gray color; more caustic than strontites, or perhaps even lime. It renders the syrup of violets green, and the infusion of turmeric red. Its specific gravity by Fourcroy is 4. When water in small quantity is poured on the dry earth it slakes like quicklime, but perhaps with evolution of more heat. When swallowed it acts as a violent poison. It is destitute of smell. When pure barytes is exposed in a porcelain tube, at a heat verging on ignition, to a stream of dry oxygen gas, it absorbs the gas rapidly, and passes to the state of deutoxide of barium. But when it is calcined, in contact with atmospheric air, we obtain at first this deutoxide and carbonate of barytes; the former of which passes very slowly into the latter, by absorption of carbonic acid from the atmosphere.'

Again—'water at 50°, Fahrenheit, dissolves one-twentieth of its weight of barytes, and at 212° about one-half of its weight; though M. Thenard, in a table, has stated it at only one-tenth. As the solution cools, hexagonal prisms, terminated at each extremity with a four-sided pyramid, form. These crystals are often attached to one another, so as to imitate the leaves of fern. Sometimes they are deposited in cubes. They contain about 53 per cent. of water, or 20 prime proportions. The supernatant liquid is barytes water. It is colorless, acid, and caustic. It acts powerfully on the vegetable purples and yellows. Exposed to the air it attracts carbonic acid, and the dissolved barytes is converted into carbonate, which falls down in insoluble crusts. It appears from the experiments of M. Berthollet that heat alone cannot deprive the crystallised hydrate of its water. After exposure to a red heat, when it fuses like potash, a proportion of water remains in combination. This quantity is a prime equivalent = 1.125, to 9.75 of barytes. The ignited hydrate is a solid of a whitish-gray color, caustic, and very dense. It fuses at a heat a little under a cherry red; is fixed in the fire; attracts, but slowly, carbonic acid from the atmosphere. It yields carburetted hydrogen, and carbonate of barytes when heated along with charcoal, provided this be not in excess.'

'Sulphur combines with barytes, when they are mixed together, and heated in a crucible. The same compound is more economically obtained by igniting a mixture of sulphate of barytes and charcoal in fine powder. This sulphuret is of a reddish-yellow color, and when dry without smell. When this substance is put into hot water a powerful action is manifested.

The water is decomposed, and two new products are formed; namely, hydrosulphuret, and hydroguretted sulphuret of barytes. The first crystallises as the liquid cools; the second remains dissolved. The hydrosulphuret is a compound of 9.75 of barytes with 2.125 sulphuretted hydrogen. Its crystals should be quickly separated by filtration, and dried by pressure between the folds of porous paper. They are white scales, have a silky lustre, are soluble in water, and yield a solution having a greenish tinge. Its taste is acid, sulphurous, and, when mixed with the hydroguretted sulphuret, eminently corrosive. It rapidly attracts oxygen from the atmosphere, and is converted into the sulphate of barytes. The hydroguretted sulphuret is a compound of 9.75 barytes with 4.125 bisulphuretted hydrogen; but contaminated with sulphite and hyposulphite in unknown proportions. The dry sulphuret consists probably of 2 sulphur + 9.75 barytes. The readiest way of obtaining barytes water is to boil the solution of the sulphuret with deutoxide of copper, which seizes the sulphur while the hydrogen flies off, and the barytes remains dissolved. Phosphuret of barytes may be easily formed by exposing the constituents together to heat in a glass tube. Their reciprocal action is so intense as to cause ignition. Like phosphuret of lime, it decomposes water, and causes the disengagement of phosphuretted hydrogen gas, which spontaneously inflames with contact of air. When sulphur is made to act on the deutoxide of barytes, sulphuric acid is formed, which unites to a portion of the earth into a sulphate.' Its salts are all, more or less, white and transparent: the soluble sulphates make, with the soluble salts of barytes, a precipitate insoluble in nitric acid; and they are all poisonous except the sulphate. See the respective **ARTS**, for the most useful.

BARYTONO, in the Italian music, answers to our common pitch of bass.

BARYTONUM; from *βαρυς*, grave, and *φωνος*, accent; in the Greek grammar, denotes a verb, which having no accent marked on the last syllable, a grave accent is to be understood.

BARZILLAI; from *ברזיל*, iron, Heb.: 1. A Gileadite of Rogelim, who supplied David and his few faithful friends with provisions, while they lay at Mahanaim, during the usurpation of Absalom (2 Sam. xvii. 27—29); 2. A Simeonite of Meholah, the father of Adriel, one of Saul's sons-in-law (1 Sam. xviii. 19); 3. A priest who married a daughter of the hospitable Barzillai, and whose descendants returned from Babylon. Neh. vii. 63.

BAS, an island of France, on the coast of the department of Finisterre, to which department it belongs; it is about a league in length, and is situated two leagues north of St. Pal de Leon.

BAS (James Philip Le), a modern French engraver, by whom we have some excellent prints. His great force seems to lie in landscapes and small figures, which he executed in a superior manner. His style of engraving is extremely neat; he proves the freedom of the etching, and harmonizes the whole with the graver and dry point. We have also a variety of petty vignettes by this artist. He flourished about the middle of the

present century; but we have no account of the time of his birth or death.

BASAAL, in botany, an Indian tree which grows about Cochin.

BASALTES, a word used by Salmasius for **BASALTES**.

BASALT, **ARTIFICIAL**, or black porcelain, a composition, having nearly the same properties with the natural basalt, invented by Messrs. Wedgwood and Bentley, and applied to various purposes in their manufacture.

BASALT, or **BASALTES**; from basal, iron, or βασιλιζω, diligenter examino; in natural history, a heavy, hard stone, chiefly black or green, consisting of prismatic crystals, the number of whose sides is uncertain. The English miners call it cockle; the German schoerl. It abounds in gigantic masses in every part of Europe, and is now regarded by mineralogists as one of the most remarkable species of trap rocks. Basalt was originally found in columns in Ethiopia, and fragments of it in the river Tmolus, and some other places. We now have it frequently both in columns and small pieces, in Spain, Russia, Poland, near Dresden, and in Silesia; but the most magnificent ranges of basaltic columns in the world are those called the Giant's Causeway, in Ireland; and next to them, perhaps, those of Staffa, on one of the western isles of Scotland. Great quantities of basalt are likewise found in the neighbourhood of Mount Etna in Sicily, of Hecla in Iceland, of the volcano in the island of Bourbon, and in the old-vant province of Vivarais in the south of France. It is found therefore in the neighbourhood of active volcanoes, and one of the most questions that geologists are warranted to ask, is whether it does not always denote the existence of some extinguished volcano in its vicinity.

The columns of the Cyclops, in the neighbourhood of Staffa, and the very magnificent basaltic columns of this island composed of lava, on a scale far beyond any common nature; above which there is a more compact, combined with a certain quantity of iron matter, hard and crystalline, which is composed by the action of the same process. A piece of knotty basalt was taken from the same former period, and was found to consist of the deities were made of, and were of a very hard and porous material, and afterwards acquiring a softness as it cooled, having large interstices, which the air and water have been filled up with a soft, yellow matter. The island of Staffa, which is now a ruin, remains a perfect example of the Giant's Causeway, which appears to have been hewn by the action of the columns, at first in the form of a series of the Giant's Causeway, and is commonly met with: But in the present position, we find the difference, that the columns are numbered in groups of five or ten, and are of various sizes and forms; some being of a hexagonal, heptagonal, or octagonal form. It is also peculiar to this neighbourhood, that in some portions of the basaltic formation, the columns are of a cylindrical form, and are of various sizes, and are included in to

twenty feet; but these descriptions not being so well authenticated as some which we possess of basaltic nearer home, we may proceed to remark, that in Ireland the basalt forming the Giant's Causeway rises far up the country, runs into the sea, crosses at the bottom, and rises again on the opposite land. The immense pillars of it have been very particularly described and examined in a work entitled Letters concerning the northern coast of the county of Antrim; from which the following brief particulars are extracted:—
 '1. The pillars of the Causeway are small, not very much exceeding one foot in breadth, and thirty in length; sharply defined, neat in their articulation, with concave or convex terminations to each point. (**BASALTES**, fig. 5.) In many of the capes and hills they are of a larger size, more imperfect and irregular in their figure and articulation, having often flat terminations to their points. At Fairhead they are of a gigantic magnitude, sometimes exceeding five feet in breadth, and 100 in length; often apparently destitute of joints altogether. Through many parts of the country this species of stone is entirely rude and unformed, separating in loose blocks; in which state it resembles the stone known in Sweden by the name of trappe. 2. The pillars of the Giant's Causeway stood on the level of the beach, whence they may be traced through all degrees of elevation to the summit of the highest grounds in the neighbourhood. 3. At the Causeway, and in most other places, they stand perpendicular to the horizon. In some of the capes, and particularly near Ushet harbour, in the isle of Bagherly, they lie in an oblique position. At Doon Point, in the same island, and along the Balintoy shore, they form a variety of regular curves. 4. The stone is black, close, and uniform; the varieties of color are blue, reddish, and gray; and of all kinds of grain, from extreme fineness to the coarse granulated appearance of a stone which resembles imperfect granite, abounding in crystals of schorl, chiefly black, though sometimes of various colors. 5. Though the stone of the Giant's Causeway be in general compact and homogeneous, yet it is remarkable that the upper joint of each pillar, where it can be ascertained with any certainty, is always rudely formed and cellular. The gross pillars also, in the capes and mountains, frequently abound in these air-holes through all their parts, which sometimes contain fine clay, and other apparently foreign bodies: and the irregular basaltic beginning where the pillars cease, or lying over them, is in general extremely honey-combed; containing in its cells crystals of zeolite, little morsels of fine brown clay, sometimes very pure steatite, and in a few instances, bits of agate.'

In Staffa, one of the western isles of Scotland, the whole end of the island is supported by ranges of pillars, mostly about fifty feet high, standing in natural colonnades, according as the bays and points of land have formed themselves, upon a firm basis of solid unformed rock. Above these, the stratum, which reaches to the soil or surface of the island, varies in thickness, as the island itself is formed into hills or valleys, each full, which hangs over the valleys below, form-

GIANTS' CAUSEWAY.

PLATE I.

61. Shury sculp.

London, Published by Thomas Agitt, 73, Cheapside.

ing an ample pediment. Some of these, above sixty feet in thickness from the base to the point, are formed by the sloping of the hill on each side, almost into the shape of those used in architecture. Sir Joseph Banks observed that the bending pillars of Staffa differ considerably from those of the Giant's Causeway. In Staffa they lie down on their sides, each forming the segment of a circle; and in one place a small mass of them very much resembles the ribs of a ship. Those of the Giant's Causeway, which he saw, ran along the face of a high cliff, bent strangely in the middle, as if unable at their first formation, while in a soft state, to support the mass of incumbent earth.

Sir William Hamilton informs us, that in 1779 he picked up some fragments of large and regular crystals of close-grained lava or basalt, in the neighbourhood of Vesuvius, the diameter of which, when the prisms were complete, might have been eight or nine inches. He observes, that Vesuvius does not exhibit any lavas regularly crystallised, and forming what are called Giants' Causeways, except a lava that ran into the sea, near Torre del Greco, in 1631, which has a small degree of such an appearance. As the fragments of basaltic which he found on this mountain, however, had been evidently thrown out of the crater in their proper form, he puts the question, 'May not lavas be more ready to crystallise within the bowels of a volcano than after their emission? And may not many of the Giants' Causeways already discovered be the nuclei of volcanic mountains, whose lighter and less solid parts may have been worn away by the hand of time?' Mr. Faujas de St. Fond gives an example of basalt columns placed deep within the crater of an unextinguished volcano.

We suppose this writer to allude to the mountain of Aisa, called La Coupe, or the Col d'Aisa, situated near the village Entrague, in the Vivarais. This village, according to St. Fond, is placed on a kind of platform of volcanic matter above the torrent of the Volant, which has here excavated a bed of great depth and width, bordered on the right and left by grand ranges of basaltic columns. In the midst of a prodigious rampart of these columns, at different levels, may be seen a current of lava descending from a neighbouring mountain, and joining the columns that border the river. Here we see, in the most unequivocal and convincing manner, that the lava, under the form of hard and compact basalt, has flowed at several times from the mountain, and has formed the great causeways at different heights, to which the lava is still united and adhering. We may follow the current of basalt up the declivity of the mountain, which has a conical form and a great elevation, and is entirely volcanic from the base to the summit. According to St. Fond, it is the most remarkable and best characterised crater in all the Vivarais.

All the base of the conical mountain La Coupe is covered by porous and cellular lava in detached irregular masses, heaped on each other, so as to leave no doubt that they have been ejected in a liquid state by one or more formidable eruptions, and have taken their forms as they fell at the foot of the cone. On reaching the summit or edge of

the crater, we may see the whole mountain, which forms a regular cone resembling that of Vesuvius. The edges of the crater are steep, and formed in the shape of a tunnel; the greatest diameter being from 140 to 150 toises, and the depth about 600 feet. The lavas are colored, and converted into a kind of puzzolani, and mixed with great masses of black and sharp scoriae, which makes the descent difficult. At the bottom of this inverted cone is a magnificent plantation of chestnut-trees, which have flourished astonishingly in this ancient mouth of a volcano, having no other soil than the dry and friable puzzolani. It may be noticed, that the crater of Vesuvius was lined with lofty trees at the period of its eruption in 1631. At the bottom of the crater, in La Coupe, we may observe a breach or opening on the side facing the houses of the Col d'Aisa; there is a general inclination to this opening, which has served to give a passage to the lava. When we are arrived at the opening we may observe a stream of lava coming from the interior, and taking its course down the mountain, it descends in a waving direction amidst the porous lavas. This current is a true black basalt, compact and similar to that of the columns; in certain parts its surface appears blistered, and in other places it becomes porous. Following the current of lava, after it has crossed the path, which is at the foot of the mountain, we may trace its course to the bed of a torrent not far from the high road. There may be seen, says St. Fond, a spectacle most gratifying to the geologist; for the lava whilst still on the descent, and before it had reached the level ground, has effected a prismatic form; and the lava at the bottom has formed a beautiful colonnade.

There is a similar conical mountain in the Vivarais, with a distinct and much larger crater, called La Coupe de Jaujeac. The river Vignon flows at the foot of it. On its banks are immense ranges of basaltic columns, the most elevated of any in the Vivarais. They enclose the borders of the river on each side for more than a league. Some of the prisms rise in one shaft to the height of fifty feet; in other parts, the articulated columns form a kind of regular causeway. In some places the columns are bent, and above we see immense ramparts of basalt, of more than 140 feet in height, in several ranges, spreading out like a fan, and diverging in every direction. On the left, the current of basalt covers several little hills of granite, and is moulded upon them. In some parts the compact lava forms one solid mass; in other places it is arranged in great beds. Nothing can be more grand and varied, says St. Fond, than the course of the river Vignon to the Ardeche, where the great current of lava joins the streams that have flowed from the volcanoes of Thueys and Neyrac.—*Faujas St. Fond sur les Volcans éteints du Vivarais et du Velay.*

Having noticed the principal localities or basalt, we may now observe that the structure or form in which it appears, presents one of its most striking peculiarities. This would seem to be essentially the same in the various and immense stores of it yet discovered; so that the accurate description of one basaltic deposit might serve, as far as any purposes of science are concerned,

for that of any other. Mr. Hamilton, for instance, the author of the *Letters on Antrim*, describes the *Giant's Causeway* in language which might at once be applied to the picturesque pillars of Staffa; telling us that the pillars of the former, varying in their length and thickness from 30 feet to 100, and from one foot to five respectively, rise from the level of the beach, and ascend gradually into the greatest elevations of the neighbouring hills. These colonnades, we are also informed, are generally perpendicular to the horizon, and particularly at the causeway itself; but it is added that, in the vicinity, they are not unfrequently observed lying in an oblique position, and assuming a great variety of regular curves. The same facts are recorded in reference to the famed rocks of the Cyclops. The columns there, as at Staffa and Antrim, are of various sizes and forms, as we have indeed already noticed; some being four-sided, others hexagonal, heptagonal, octagonal, and even nine-sided; which last is the rarest form which basalt ever assumes. The position, too, is equally various; some standing erect, whilst others are laid on their sides, piled above one another like sacks of corn in a granary. The jointed columns too are of ever-varying lengths and joints; some a few inches, others many feet long, found occasionally bent, but generally nicely fitted up, as by the hands of a most skilful joiner.

Now, it is to be observed, that the basaltes owe their columnar form to fire and water; they stand, therefore, at rest, like lava, he observes; but this, when it comes to the water, was so difficult to be believed, that with the assistance of heat, he was obliged to suppose a coal-sea into regular prisms, and to consider the effect of mere distillation, or evaporation, in comparing its form with the expansion of air produced by fusion, and that the expansion of air being allowed very thin; but in that case the strata would be classy; whereas it is a regularity and devoid of cavities. Mr. Hamilton, however, says that it comes to pass that the water, when it is mixed with even water, have a softening effect on the mass of basaltes.

It is, however, a confirmation of this reasoning, that when the water is in the sea, it does in most cases actually assist in the basaltic structure being formed less perfectly; and it is worthy of particular observation, that all the columnar trap which has attracted any attention on account of its regularity or beauty, is either altogether insular or situated near the ocean.

As to its formation and analysis:—"Ten years ago," says Mr. Bergman, "it was a general opinion, that the surface of the earth, together with the mountains, had been produced by moisture. It is true that some declared fire to be the original cause, but the greater number paid little attention to this opinion. Now, on the contrary, the opinion that subterraneous fire had been the principal agent gains ground daily; and every thing is supposed to have been melted, even to the granite." My own opinion is, that both the fire and water have contributed their share in this operation; though in such proportion that the force of the former extends much farther than the latter; and, on the contrary, that the fire has only worked in some parts of the surface of the

earth. It cannot be doubted that there has been some connexion betwixt the basaltic pillars and subterraneous fire; as they are found in places where the marks of fire are yet visible; and as they are even found mixed with lava, tophus, and other substances produced by fire. As far as we know, nature makes use of three methods to produce regular forms in the mineral kingdom. 1. That of crystallisation or precipitation. 2. The crust- ing or settling of the external surface of a liquid mass while it is cooling: and 3. The bursting of a moist substance while it is drying. 1. The first method is the most common; but to all appearance, nature has not made use of it in the present case. Crystals are seldom or never found in any quantity running in the same direction; but either inclining from one another, or, what is still more common, placed towards one another in sloping directions. They are also generally separated a little from one another when they are regular. The nature of the thing requires this, because the several particles of which the crystals are composed must have the liberty of obeying that power which affects their constitution. The basaltic columns on the contrary, whose height is frequently from thirty to forty feet, are placed parallel to one another in considerable numbers, and so close together that the point of a knife can hardly be introduced between them. Besides, in most places, each pillar is divided into several parts or joints, which seem to be placed on one another. And indeed it is not uncommon for crystals to be formed one above another in different layers, while the solvent has been visibly diminished at different times: but then the upper crystals never sit so exactly upon one another as to produce connected prisms of the same length or depth in all the strata taken together; but each stratum, separately taken, produces its own crystals. Precipitation, both in the wet and dry way, requires that the particles should be free enough to arrange themselves in a certain order; and as this is not practicable in a large melted mass, no crystallisations appear, excepting on its surface or in its cavities.

Bergman found that the component parts of various specimens of Basaltes were, at a medium 52 parts silix, 15 alumina, 8 carbonate of lime, and 25 iron.

Several modern mineralogists have analysed basalt, and other trap rocks, to discover their affinity with one another, and to the lava of volcanos, of which they are all conceived to be only varieties. Indeed the facts we have already given of the basaltic formations in France, seem to put the question at rest. The following results obtained by Dr. Kennedy, are extracted from the *Edinburgh Philosophical Transactions*.

The basalt from Staffa contains in 100 parts

Silix	48
Argil	16
Oxide of iron	16
Lime	9
Soda	4
Muriatic acid	1
Loss	6

The lava of Catanea, Mount Ætna, contains in 100 parts,

Silex	51
Argil	19
Oxide of iron	14·5
Lime	9·5
Soda	4
Muriatic acid	1
Loss	1

100

The greenstone of Salisbury craig, contains in 100 parts,

Silex	46
Argil	19
Oxide of iron	17
Lime	8
Soda	3·5
Muriatic acid	1
Loss	5·5

100

The lava of Santa Venese, Mount Ætna, contains in 100 parts,

Silex	50·75
Argil	17·5
Oxide of iron	14·25
Lime	10
Soda	4
Muriatic acid	1
Loss	2·95

100

The greenstone of Calton hill, at Edinburgh, contains in 100 parts,

Silex	50
Argil	18·50
Oxide of iron	16·75
Lime	3
Soda	4
Muriatic acid	1
Loss	6·75

100

The amorphous basaltes, known by the name of Rowley Rag, the ferrillite of Kirwan, of the specific gravity of 2·748, afforded Dr. Withering 47·5 of silex, 32·5 of alumina, and 20 of iron, at a very low degree of oxidation. Klaproth gives, for the analysis of the prismatic basaltes of Hasenberg, silex 44·5, alumina 16·75, oxide of iron 20, lime 9·5, magnesia 2·25, oxide of manganese 0·12, soda 2·60, water 2. On a subsequent analysis, with a view to detect the existence of muriatic acid, he found slight indications of it, but it was in an extremely minute proportion.

On the whole, the affinity between lava and trap rock formations seems established, but for further information we would refer the reader to the interesting work of Dr. McCulloch, on the western isles; Dr. Boué's *Essai Géologique sur l'Ecosse*, Necker de Saussure; and the Geological Essays of Messrs. Buckland, Conybeare, and Daubing.

BASALTIC HORNEBLENDE, occurs usually in opaque six-sided single crystals, which sometimes act on the magnetic needle. It is imbedded

in basalt or wacke. Color velvet-black. Lustre vitreous. Scratches glass. Sp. gr. 3·25. Fuses with difficulty into a black glass. It consists of 47 silica, 26 alumina, 8 lime, 2 magnesia, 15 iron, and 0·5 water. It is found in the basalt of Arthur's Seat, in that of Fifeshire, and in the isles of Mull, Canna, Eigg, and Sky. It is found also in the basaltic and Hoetz trap rocks of England, Ireland, Saxony, Bavaria, Hungary, France, and Spain.

BASAN. See BASHAN.

BASANITE, in mineralogy, is a variety of silicious slate, commonly known under the name of touchstone, and has been used both in ancient and modern times, to determine the purity of gold and silver by the color of the streak which those metals leave when rubbed on it. The permanency or otherwise of the streak, under the application of nitric acid, is a further test of the purity of gold. Other stones have been occasionally applied to this purpose. See ASSAY.

BASANWOW, in the Celtic mythology, was the son of Diocles, the king of the Sicambrians. He disappeared suddenly, after having reigned thirty-six years, was supposed to have ascended to heaven, and was honored by the Germans as the god of armies.

BASARTSCHIK, a considerable town of European Turkey, in Romania. It is well built, and has clean and broad streets. It is situated on the river Maritz.

BASARUCO, in commerce, a small base coin in the East Indies, made of very bad tin. Of this coin there are two sorts; the base sort is one-sixth lower in value than the good. Three basarucos are equal to two rees of Portugal.

BAS-BRETON, the language of the natives of Bretagne, or Brittany.

BASCANIA, in antiquity, ridiculous or grotesque figures, hung up by the ancient smiths before their furnaces, as charms against envy.

BAS-CHEVALIER. See BACHELOR.

BASE, *v. n. & adj.*

Derived from *βασις*, that upon which we tread, stand, or go, from *βαινω*, BA'SELY, *βαινω*, to go. Thus it means, with regard to locality, any thing low;

the lower part of a pedestal, and the foundation on which it rests; any thing spurious or mixed. It is metaphorically applied to sounds; to dispositions of the mind; to actions; to general character. Thus it signifies whatever is lowered, degraded, disgraced, shameful, vile, mean, and worthless. It is, however, a stronger term of reproach than those employed to express its meaning: mean and vile, especially, convey a very inadequate sense of it. *Base* marks a high degree of moral turpitude; vile and mean denote, in different degrees, the want of all value or esteem; what is base excites our abhorrence; what is vile provokes disgust; what is mean awakens contempt. A base voice or sound, is a low deep voice or sound.

Mete the space from thy foote to the base of the toure.
Chaucer. Astrolabe.

And I will yet be more vile than this, and will be base in mine own sight.
2 Sam.

Upon this *base* a curious work is rais'd,
Like undivided brick, entire and one;
Though soft, yet lasting, with just balance pois'd;
Distributed with due proportion.

P. Fletcher. Purple Island.

Instead of music, and *base* flattering tongues,
Which wait to first salute my lord's uprise;
The cheerful lark wakes him with early song,
And birds' sweet whistling notes unlock his eyes. *Id.*
By him Andion pac'd of middle age,
His mind as far from rashness, as from fears;
Hating *base* thoughts, as much as desperate rage.
The world's loud thunderings he unshaken hears,
Nor will he death or life, or seek or fly;
Ready for both—He is as cowardly
Who longer fears to live, as he who fears to die. *Id.*
What if it tempt thee tow'rd the flood, my lord?
Or to the dreadful summit of the cliff,
That beetles o'er his *base* into the sea? *Shakspeare.*

If that rebellion

Came, like itself, in *base* and abject routs,
You, reverend father, and these noble lords,
Had not been here. *Id.*

It could not else be, I should prove so *base*
To sue and be denied such common grace. *Id.*

Why, bastard? wherefore *base*?

When my dimensions are as well compact
As honest madam's issue. *Id.*
The king is not himself, but *basely* led
By flatterers. *Id.*

Why brand they us

With *base*? with *baseness*? with *base*?
I have sounded the very *base*-string of mortality. *Id.*

Id. Henry VIII.

Men of weak abilities in order at place, are like little
boats set on great *base*s, made the less by their ad-
vancement. *Bacon.*

Descriptions of *base* people are commonly more
frequent in the Irish annals. *Id.*

Expire, the lower the note holes be, and the fur-
ther from the mouth of the pipe, the more *base* sound
it yields. *Id.*

The just and measured proportion of the air per-
tains to earth's *base*, or nobleness of tones, is
one of the greatest secrets in the contemplation of
music. *Id.*

His young brother hid him with his father in the
wild woods, and was a peasant. *Clarendon's Rem.*

A hour's *base* will give it up, as soon as Essex in
a year's *base* would. *Clarendon.*

If because I have envied me wealth, thieves have
robbed me, rather than have not I mine such revenues
as others have, that I am a younger brother *basely*
born, or an illegitimate, or an out-caste's son, and I
have not a better name than a bull, a lion, is
it not a *base* thing to say, that I should a man?
This is an *base* thing to say. *Ant. Melancholy.*

Swainth's being.

Nor did I ever see a man at his own feast,
But with a *base* and a *base* countenance.

Milton's Comus.

Phylissus was all in *base*, having his *base*s and
capricious rod. *Id.*

Some that pretend to be such in the party I love,
As the father of the man, come unto any unmovable
heart, shall that heart be raised up to such a height, be
content. *Id.*

What if the *base* of the world is not any man of the
Church of England? The same man is also a mem-
ber of the commonwealth, for any member of the
commonwealth which is not also of the Church of
England, is a *base* man. The *base* man, the *base*
man, is not the *base* man, and yet one and
the same man, and a *base* man and a *base* man; a

side simply; a *base* if it chanced to be the bottom and
underlie the rest: so, albeit, properties and actions of
one do cause the name of a commonwealth, qualities
and functions of another sort, the name of the church
to be given to a multitude, yet one and the self-same
multitude may in such sort be both.

Hooker. Eccles. Pol.

Which when the cruel Amazon perceiv'd
She began to storme, and rage, and rend her gall
For very fell despight, which she conceiv'd
To be so scorn'd of a *base*-born thrall,
Whose life did lie in her least eye-lids' fall. *Spenser.*

Such is the power of that sweet passion,
That it all sordid *baseness* doth expel. *Id.*

The silver-sounding instruments did meet
With the *base* murmur of the water's fall;
The water's fall, with difference discreet,
Now soft, now loud, unto the wind did call;
The gentle warbling wind low answered to all. *Id.*

If the lords and chief men degenerate, what shall
be hoped of the peasants and *base* people. *Id. On Ireland.*

Oh! she is the pride and glory of the world;
Without her all the rest is worthless dross;
Life a *base* slavery; empire but a mock;
And love, the soul of all, a bitter curse.

Rochester's Valentianian.

Nor shall it e'er be said that wight,
With gauntlet blue and *base*s white,
And round blunt truncheon by his side,
So caught a man at arms defy'd. *Hudibras.*

He, whose mind

Is virtuous, is alone of noble kind;
Though poor in fortune, of celestial race;
And he commits the crime who calls him *base*. *Dryden.*

At thy well-sharpen'd thumb, from shore to shore,
The trebles squeak for fear, the *base*s roar. *Id.*

Your soul's above the *baseness* of distrust,
Nothing but love could make you so unjust. *Id.*

We alleged the fraudulent obtaining his patent,
The *baseness* of his metal, and the prodigious sum to
be coined. *Swift.*

When a man's folly must be spread open before the
angels, and all his *baseness* ript up before those pure
spirits, this will be a double hell. *South.*

It is *base* in his adversaries thus to dwell upon the
excesses of a passion. *Atterbury.*

At the first grin he cast every human feature out
of his countenance; at the second he became the head
of a *base*-viol. *Addison.*

A guinea is pure gold, if it has nothing but gold in
it, without any alloy or *base* metal. *Watts.*

But see thy *base*-born child, thy babe of shame,
Who, left by thee, upon our parish came. *Gay.*

Those wise old men, those plodding grave state
pedants,

Forget the course of youth; their crooked Prudence,
To *baseness* verging still, forgets to take
Into their finespun schemes the generous heart,
That through the cobweb system bursting lays
Their labours waste.

Thomson's Tancred and Sigismunda.

When men of rank sacrifice all ideas of dignity to
ambition without a distinct object, and work with
low instruments for low ends, the whole composition
becomes low and *base*. *Burke.*

Oh, ye seven hills! awaken,
Ere your very *base* be shaken. *Byron.*

BASE. A game or play; to keep moving
about one spot of ground.

The first day of the challenge at *base*, or running,
the king won. *Burnet's Hist. of Reform.*

BASE, in architecture, is used for any body which bears another, but particularly for the lower part of a column and pedestal. The ancients, in the early times of architecture, used no bases. The doric columns in the temple of Minerva at Athens have none, but stand immediately upon the floor of the porch. Columns afterwards came to be supported on square pieces called plinths, and after that on pedestals. The base of a column, of whatsoever order, on a pedestal, is that part which comes between the top of the pedestal and the bottom of the shaft of the column; when there is no pedestal, it is the part between the bottom of the column and the plinth: some have included the plinth as a part of the base, but it is properly the piece on which the base stands, as the column stands upon that. The pedestal also has its base as well as the column, and the pilaster. The base of columns is differently formed in the different orders; but in general it is composed of certain spires or circles, and was thence in early times called the spire of a column. These circles were in this case supposed to represent the folds of a snake as it lies rolled up; but they are properly the representations of several larger and smaller rings or circles of iron, with which the trunks of trees, which were the ancient columns, were surrounded to prevent their bursting; these were rude and irregular, but the sculptor who imitated them in stone found the way to make them elegant. The base is different in the different orders: thus,

BASE, COMPOSITE, has an astragal less than the corinthian.

BASE, CORINTHIAN, has two toruses, two scotias and a fillet.

BASE, DORIC, has an astragal more than the Tuscan, though that was introduced by the moderns.

BASE, IONIC, has a large torus over two slender scotias, separated by two astragals: though in the most ancient monuments of this order there are no bases at all; which the architects are at a loss to account for.

BASE, TUSCAN, is the most simple of all others; consisting of a single torus besides the plinth.

BASE, in chemistry. See **BASIS**.

BASE, in fortification, the exterior side of the polygon, or that imaginary line which is drawn from the flanked angle of a bastion to the angle opposite to it.

BASE, in geometry, the lowest side of the perimeter of a figure.

BASE OF A CONIC SECTION, a right line in the hyperbola and parabola, arising from the common intersection of the secant plane and the base of the cone.

BASE OF A RECTANGLED TRIANGLE, the side opposite the right angle, i. e. the hypotenuse.

BASE OF A SOLID FIGURE, the lowest side, or that on which it stands.

BASE OF A TRIANGLE, any side thereof is occasionally so called; though properly it is the lowest side, or that which lies parallel to the horizon.

BASE, in gunnery, the least sort of ordnance, the diameter of whose bore is $1\frac{1}{4}$ inch, weight 260 pounds, length 4 feet, load 5 pounds, shot $1\frac{1}{4}$ pound weight, and diameter $\frac{1}{2}$ inch.

BASE COURT, in law, sometimes signifies any court not of record.—Such, is the Court-baron.

BASE ESTATES are such as base tenants have in their lands.

BASE FEE, a tenure in fee at the will of the lord, as distinguished from soccage, or free tenure; but, according to Lord Coke, a base fee is what may be defeated by limitation, or on entry, &c.

BASE TENURE (*bassa tenura*), holding by vilenage, or other customary service; as distinguished from the higher tenures in capite, or by military service.

BASE, in music, see **BASS**.

BASE, in trigonometry. See **ALTERN BASE**.

BASE KNIGHTS, the inferior order of knights, as distinguished from barons and bannerets, who were the chief or superior knights.

BASELLA, climbing nightshade, from Malabar. A genius of the trigynia order, belonging to the pentandria class of plants; and in the natural method ranking under the twelfth order, holoraceæ. The calyx is wanting; the corolla is seven-cleft, with the two opposite divisions broader and at last berried, there is one seed.

1. *B. alba*, with oval, waved, flaccid leaves, and small flowers and fruit. These plants will climb to a considerable height, and send forth a great number of branches; so they should be trained up to a trellis, or fastened to the back of the stove; otherwise they will twist themselves about whatever plants stand near them, which will make a very disagreeable appearance. 2. *B. rubra*, with red leaves and simple footstalks, has thick, strong, succulent stalks, and leaves which are of a deep purple color.—This plant will climb to the height of ten or twelve feet, provided it is kept in a stove; but in the open air it will not grow so large in this country; nor will the seed come to perfection unless in very warm seasons. The flowers of this plant have no great beauty, but it is cultivated on account of the odd appearance of its stalks and leaves, and the flowers of a whitish green color tipped with purple.

BASELLI or **BASELS**, in our old historians, a species of coin abolished by King Henry II. A. D. 1158.

BASEMENTS, in architecture. See **ARCHITECTURE**, Index.

BASE RING of a cannon, is the great ring next behind the touch-hole.

BASE ROCKET, in botany. See **RESEDA**.

BAS-EN-BASSET, or **BASSET**, a market town in the department of the Upper Loire, France, arrondissement of Issengeaux. It is the head of a canton and has 5000 inhabitants. Here are manufactures of blond lace, tobacco-pipes, and earthenware. It is three miles north-west of Monistrol, and twenty north-east of Le Puy.

BASNET, Fr. *bassinet*; Old Eng. *basnyl*; a little bowl, a small basin; a part of military equipage, a kind of helmet or head-piece, worn originally by the French men at arms.

Notwithstanding at the last the king made him put on his *basnet*; and then took a surd with both his hands, and strongly with a good will strake him on the necke, and the same day hee made three other citizens knights for his sake in the same place.

Stow, Ann. 1361. R. 2

Therefore he would her doe away all drowd,
And that of him shee mote assur'd stand,
He sent to her his *bascnet*, as a faithful band.

Spenser. Faerie Queene.

BASH, *v. n.*

BASH'FUU, *adj.*

BASH'FULLY, *adv.*

BASH'MENT, *n. s.*

BASH'FULNESS, *n. s.*

See To ABASH. This word, with all those of the same race, Dr. Johnson says, are of uncertain etymology. Skinner imagines them derived from base or mean; Minshew from *verlaeschen*, Dut., to strike with astonishment; Junius from *basus*, which he finds in Hesychius to signify shame. The conjecture of Minshew seems most probable. It is sometimes used as synonymous with modest and modesty; but not with a nice regard to accuracy. Modest signifies setting measure to ones estimate of oneself; but *bashful*, a lady to be abashed. Modesty is a habit or principle of the mind; *bashfulness* is a state of feeling. Modesty is at all times becoming; *bashfulness* is only becoming in females, or very young persons, in the presence of their superiors. Modesty discovers itself in the absence of every thing assuming, whether in look, word, or action; *bashfulness* betrays itself by a downcast look, and a timid air. A modest deportment is always commendable; a bashful temper is not desirable.—*Crabb.*

Are you not ashamed, *bash* your net to broach and set abroad, in the view and face of the world, such mockeries of religion? *Hill's Letters*, fol. 320.

It might be either for the sake of learning and good bringing up, or out of some common fault in great princes of Germany, or else for his *bashful* nature in youth, which property Xenophon wittily figured to be in Cyrus at like yeares, judging *bashfulness* in youth, to be a great token of virtue in age.

A French Report and Discourse.

He looked with a more *bashful* kind of modesty, as if he feared the eyes of men.

Sidney.

They *bashed* not to death, the victims of other men.

Behn's Revelations.

And see the air in rose, how sweetly shee

Doth first peep forth with *bashful* state,

That fairer shines the less ye see her may!

Lo! see soon after, how more bold and free,

Her faced bosom shee doth broad display!

Lo! see some later, how she fades and falls away.

Spenser.

His countenance was bold, and *bashed* not

For Gogon's looks, but scornful eye glance at him

Id.

I never thought her with word too large;

But, as I thought her a sister, show'd

Bashful shyness with a kindly love.

Shakspeare.

How *bashful* cunning!

And prompt me plain and holy innocence.

Id.

Another man, *bashful*, suspicion, and timorous, well conceiv'd, and loves darkness as his habit; and conceiv'd, or to sit in lightness, or to sit in lightness, he will neither sit in lightness, nor in darkness.

Anat. Act.

Her golden hair, like a crown, shee hid high,

Her eyes, like stars, shee hid high;

Her nose, like a mountain, shee hid high;

So shee hid all, and hid all her desire.

Behn's Purple Island.

There are a thousand ways to do other so much of this *bashful* way, and who ask every one's opinion.

Dryden.

Our next step is to the town of it,

And *bashful* eyes, and a white,

Is a beautiful sight.

Addison.

More *bashfulness* without merit is awkwardness. *Id.*

Doubtless there are men of great parts that are guilty of downright *bashfulness*, that by a strange hesitation and reluctance to speak, murder the finest and most elegant thoughts, and render the most lively conceptions flat and heavy.

Tatler, No. 252.

Our orators, with the most faulty *bashfulness*, seem impressed rather with an awe of their audience than with a just respect for the truths they are about to deliver; they, of all professions, seem the most *bashful* who have the greatest right to glory in their commission.

Goldsmith. Essay III.

So bright the tear in Beauty's eye,

Love half regrets to kiss it dry,

So sweet the blush of *bashfulness*,

Even pity scarce can wish it less.

Byron.

BASHAN, or BASAN, a kingdom beyond Jordan, mentioned in Scripture. By Josephus, Eusebius, and Jerome, it is called Batanæ. When the Israelites entered the land of Canaan, the whole country beyond Jordan, from that of the Moabites or Arabia, as far as mount Hermon and Lebanon, was divided into two kingdoms, viz. those of the Amorites, and the Bashanites: the former to the south, and the latter to the north. The kingdom of the Amorites extended from the river Arnon and the country of Moab, to the river Jabbok; which, running obliquely from the east, was at the same time the boundary of the Ammonites, as appears from Numb. xxi. 24. and Dent. ii. 37. and iii. 16. It fell to the lot of the Reubenites and Gadites, and Bashan, to the half tribe of Manasseh. To this was annexed a part of the hilly country of Gilead, and the district of Argob; yet so that Bashan continued to be the principal and greatest part: but after the Babylonish captivity Bashan was subdivided, so that only a part was called Batanea or Basan, another Trachonitis, a third Auranitis or Itureæ, and some part Gaulonitis; but to settle the limits of each of these parts is now impossible. Bashan was a country famous for its pastures, and breed of large cattle.

BASHAN, a mountain in the above kingdom, which seems to have retained its original name long after the Israelites were in possession of that country; at least is often mentioned with a reference to its original inhabitants, who were idolaters and enemies to Israel. In this respect bringing back from Bashan, signifies the deliverance from bondage, even death. Bashan is referred to in another view: the country is exceedingly fruitful, and is therefore used to represent a flourishing state.

BASHANITES, the people of Bashan.

BASHAR EBN MOTAMER, a principal man among the Motazalites, who varied in some points from the general tenets of the sect, extending man's free agency to a great length, even to the making him independent. He asserted, that God is not always obliged to do that which is best, for that, if he pleased, he could make all men true believers. Accordingly he taught that God might doom an infant to eternal punishment; but taught at the same time, that he would be unjust in so doing!

BASHARIANS, a sect of Mahomedans, a subdivision of the Motazalites, who maintain the tenets of Bashar Ebn Motamer. See last article.

BASHAW, PASHA, or PACHA, a Turkish go-

vernor of a province, city, or other district. All Egypt is, on the part of the grand seignior, governed by a bashaw, who has in reality but little power; but seems principally to be meant for communicating to his divan of beys, and to the divans of the several military ogiacs, the orders of the grand seignior, and to see that they be executed by the proper officers. When a bashaw farms a country of the grand seignior, the fines that are paid, when any life drops upon the lands, belong to him. Originally all the lands of Egypt belonged to the grand seignior; and he still looks on them as his own: but his power being now lost, they all go to the next heir; who must, however, be invested by the bashaw, and ne is therefore glad to compound for a small sum. The nature of the bashaw's office requires him to be ever attempting means to cut off such as are too aspiring, or engaged in designs that may be any way prejudicial to the Porte. This often occasions his own deposition; but he is unconcerned about that, as his person is always sacred; and his losing his post is only a step to higher preferment. Bashaws include beglerbegs, and sometimes sangiachegs; though a distinction is sometimes made, and the name bashaw is appropriated to the middle sort or such as have two ensigns or horse-tails carried before them. Those who have the honor of three tails, are called beglerbegs; and those who have only one, sangiachegs. The appellation of bashaw is also given by way of courtesy, at Constantinople, to the lords about the grand seignior's court, the officers in the army, and almost every person of any figure. A bashaw is made with the solemnity of carrying a flag or banner before him, accompanied with music and songs by the Miriam, an officer whose business it is to invest the bashaws. Bashaw, used absolutely, denotes the prime vizier; the others of that denomination being distinguished by the addition of the province, city, or the like, which they have the command of; as the bashaw of Egypt, of Palestine, &c. The bashaws are the emperor's sponges. We find loud complaints among the Christians who reside in Turkey, of their avarice and extortions. As they buy their governments, every thing is venal with them. When glutted with wealth, the emperor frequently makes them a present of a bow-string, and becomes heir to all their spoil. There are also sub-bashaws, or deputy-governors under the bashaws.

BASHAW, CAPTAIN, is the title of the Turkish high admiral.

BASHEE ISLANDS, five islands in the Chinese sea, and two islets, almost wholly rock, visited by Dampier in 1687, and so named from an agreeable intoxicating liquor found here, made from the sugar-cane. The principal one is Orange Island, being about twenty-two miles long, and six broad. The other are Monmouth, Grafton, Goats, and Bashee Proper. The soil is very fertile in the productions of these seas: in 1783 the Spaniards formed a settlement on the Bashee islands, in order to procure the gold which is said to be washed down by the torrents. The natives fabricate it into wire for ornaments.

BASHEMATI, the daughter of Ishmael, one of Esau's wives. It appears to have been also a

name of Adah, his first wife. See Gen. xxvi. 34. and xxxvi. 2.

BASEDOW (John Bernard), a celebrated writer, born at Hamburg, in 1723. After studying under Reimarus, he went to Leipsic; and in 1753 was chosen professor of moral philosophy and the belles lettres at Soroe, in Denmark. But having divulged some opinions in religion differing widely from Lutheranism, he was removed from this situation; upon which he formed a plan of reformed education, and raised considerable sums of money for perfecting it. His plan, however, after a partial trial, proved unsuccessful; and he died through intemperance and dissipation in 1790. His writings, though full of dogmatical assertions and fanciful opinions, show him to have been an ingenious man.

BASHILO, a river of Abyssinia, which separates Begamder from Amhara, and falls into the Bahr-el-Azergue, thirty miles south-east of Alata.

BASHKIRS, or **BASCHKIRS**, a people of the Russian empire. They call themselves Bashkourt; and derive their origin partly from the Nogay-Tartars, and partly from the Bulgarians. Probably they are Nogays, whom the Bulgares adopted among them: their country at least is a part of the ancient Bulgaria. They formerly roamed about the southern Siberia under the conduct of their own princes: but to avoid the molestations of the Siberian khans, settled in their present possessions, about the rivers Volga and Ural, and were subject to the Kazanian khanate. On the overthrow of that state by czar Ivan II. they voluntarily took refuge under the Russian sceptre: they afterwards, however, frequently revolted against the government, whereby their prosperity as well as their population has been considerably diminished. In the year 1770 they consisted of 27,000 families, having their homes in the governments of Usa and Perme. The Bashkirs have been long without khans; and all their nobility have been gradually destroyed in the civil wars. At present every tribe or wolost chooses for itself one or more ancients, or starschinis; and the whole nation composes thirty-four wolosts. The huts or houses, which they inhabit during winter, are built after the Russian fashion; the principal part, which the family commonly possesses, is furnished with large benches, which serve for beds; the chimney, of a conical form, and of the height of an ordinary man, is in the middle of this division, and so ill constructed, that they are very liable to smoke: on this account the Bashkirs are very subject to various complaints of the eyes. In summer this people inhabit what the Russians call jurtes; they are tents or covers of felt, which, like the huts, have several divisions and a chimney in the centre. A winter village contains from ten to fifty huts; but the summer encampment never exceeds twenty jurtes. These jurtes are a kind of barracks.

The bashkirs have some knowledge of the art of writing, and have schools; but as it is from their own nation that they elect their priests and the instructors of youth, they remain in the profoundest ignorance. With some knowledge of tillage, they retain a liking to the pastoral life; which spoils them for agriculture. They sow

but little grain; consequently their harvests afford them only few resources for the winter, being far from sufficient for their whole consumption. They apply with greater success to the cultivation of bees; making hollows in the trees to serve the purposes of hives: which, to secure from the attacks of the bears, they have invented a variety of ingenious contrivances, both as weapons and traps. One man, in frequent instances, is known to possess at least 500 hives. They have the art of finding out the mountains that contain mines; but, like the Tartars, they would think themselves disgraced by working them themselves. It must be owned, however, that they have not the strength of body which that labor requires. Their practice is to let them out for a term of sixty years to Russian contractors; assigning to them at the same time a tract of forest necessary for the forges. The poorest of them serve for wages in transporting the ore.

The women understand the art of weaving, fulling, and dyeing narrow coarse cloths; they likewise make the clothes for the whole family. They make a small quantity of linen of hemp; but they prefer weaving the filaments of the common nettle, as that plant requires no culture, and the linen they make of it is extremely coarse. They have not the unwholesome practice of steeping their hemp or their nettles in water, but leave them to dry in the air on the top of their huts during the autumn and winter; then stripping off the bark, they pound them in wooden mortars. The men follow the more difficult business of making felt, and of tanning leather. Both sexes wear shirts of the cloth made of nettles; they also wear wide drawers, which descend to the ankle-bone, and a sort of slippers, like people in the East. Both men and women wear a long gown, that of the men being generally of red cloth bordered with fur; this they bind round their middle with a girdle, or with the belt to which they fix their scimitar. The poor have a winter pelisse of sheep-skin, and the rich wear a horse-skin in such a manner that the mune covers their back and waves in the wind. The cap is of cloth like the frustum of a cone, and ten inches high; and that of the rich is usually ornamented with valuable furs. The gown of the wives is made of fine cloth or silk, buttoned before as high as the neck, and fastened by a broad girdle, which the richer classes have made of steel. Their necks and throats are covered with a sort of shawl, on which are several rows of coins, or a string of shells.

The principal wealth of this people consists in their flocks; it is especially from their horses that they derive the necessaries of life; meat, milk, vessels, ornaments. They have nearly as many and even their more sheep than horses; and their corn of cattle is about half as numerous; they also wear many species of coats, and only the rich have any. A man of the ordinary class has sometimes more than thirty and fifty horses, and more than 1000, 2000, and more than 3000 sheep. The broad-tailed species of sheep is the most common; the business of the shepherds is to keep the flock together

who dwell to the east of the Ural, and in the province of Isset. Some of them are owners of not less than 4000 horses, who fatten in the richest pastures: the wasps and gnats oblige them in the month of June to quit these fine meadows, and retreat to the mountains; the horses then lose their flesh and pine away, but regain their pristine vigor on coming down again to the plains in the month of July.

Though the Bashkirs experience a long and very severe winter, yet they abandon their flocks and droves to the inclemencies of the season. They have neither granaries nor barns; they only lay up a little hay, which they range in cocks round the trees, reserving it for the distempered cattle. Those that are healthy pick up a little grass or moss from beneath the snow, and are often reduced to the necessity of feeding on the bark of the young elms. No farther attention is paid to the camels than to wrap them in some wretched coverings of felt, which they sew about their body. The cattle towards the end of the winter are become lean, weak, and emaciated. Though the females are never kept apart from the males, they rarely bring forth out of season; because the exhausted state of the flocks and herds, during the winter, is unfavorable to generation. Neither the Bashkirs nor the Kalmucs suffer the colts and the calves to suck their dams except during the night, their practice being to milk them in the day-time for their own advantage; kumiss, prepared from mare's milk, being their favorite liquor. (See KUMISS.) They are also fond of a mixture of sour milk and meal, called arjan. In the spring they drink the sap of the birch, which they collect by means of deep incisions in the trees.

Their arms are the bow, the lance, the helmet, and coat of mail; from the Russians they obtain sabres, musquets, and pistols. A Bashkirian army presents a truly curious spectacle; observing no order in marching, they only form into ranks when they halt. Every one leads a horse in his hand, which carries all his provisions. The load, however, is not heavy; consisting only of cheese, some corn dried in the kiln, and a hand-mill to grind it to meal. With the meal they form a ball which they swallow, and which serves them for bread. Each warrior, dressed in his long gown, equips himself as he chooses or as he can. One has procured for himself the various kinds of arms, and carries a whole arsenal with him; the other scarcely possesses more than one ill-conditioned weapon. Such troops as these rendered the armies of the ancient Persians at once so numerous and so little formidable.

They are all well mounted, are skilful in drawing the bow, and dexterously manage their horses. A small number of Bashkirs are easily victorious over a numerous squadron of Kirghises; sometimes one of their regiments will traverse a whole horde of Kirghises, put to flight by their very looks all the enemies they meet, and return triumphant without having sustained the slightest loss. The military service which they are bound to perform, and the only point in which they are galled by the Russian yoke, consists in furnishing, in time of war, 3000 cavalry, which form thirty troops of 100 men each. The Bashkirians

are the most negligent and slovenly of the Tartars. In commerce they are the least intelligent; but, at the same time, they are the most hospitable, the most lively, and the most brave. Their diversions at any religious festival, or at a marriage, consist in numerous libations of sour milk, singing, dancing, wrestling, and horse-racing, in which they excel. In their songs they enumerate the achievements of their ancestors, or their own, and sometimes their amorous adventures. Their songs are always accompanied with gestures, which render them very theatrical. Among them old age meets with the greatest respect. In their entertainments, it occupies the place of honor; and the stranger, to whom compliments are paid, is always set among the old men. The language of these people is a Tartar dialect, very different from that spoken at Kasan. The Bashkirians are, like most of the Tartars, Mahomedans; but though they have their mosques, their molaks, and their schools, they are much addicted to superstition and sorcery. Their sorcerers challenge even the devil, and pretend to engage with him in combat; and thus they delude the credulous vulgar, who consult them in their distress, and particularly when they lose any of their mares. *Tooke's View of Russia*, vol. i. p. 473. *Chantreau's Travels*, vol. i. p. 281.

BASHUYSEN (Henry James Van), a learned and ingenious divine, born at Hanau, in 1679, where he became professor of the Oriental languages, and ecclesiastical history. He was afterwards professor of divinity, and member of the royal society at Berlin; and had a printing press in his house, from which he sent abroad some curious tracts, principally on rabbinical learning. He died in 1758.

BASIA ULTIMA. See **ULTIMA**.

BASIATRILIAGI, in botany, a name used by some for the common polygonum, or knot-grass.

BASIER, or **BASIRE** (Isaac), a learned and active divine in the seventeenth century, was born in the isle of Jersey, in 1607. For some time he was master of the college or free-school at Guernsey: but, at length, became chaplain to Thomas Morton, bishop of Durham, who gave him the rectory of Stanhope, and the vicarage of Eggescliff, in Durham. In July, 1640, he had the degree of D. D. conferred upon him at Cambridge, by mandate; and at Oxford the November following. About that time he was made chaplain in ordinary to king Charles I. and got several other preferments, but did not long enjoy them; for, in the beginning of the civil wars, being sequestered, plundered, and forced to fly, he repaired to king Charles at Oxford, before whom, and his parliament, he frequently preached. Upon the surrender of the Oxford garrison to parliament, unwilling to stay any longer in the British dominions, he resolved to go and propagate the doctrine of the English church in the East, among the Greeks, Arabians, &c. Leaving, therefore, his family in England, he went first to Zante, an island near the Morea, where he made some stay; and had good success in spreading among the Greek inhabitants the doctrines of the English church, the sum whereof he imparted to

several of them in a vulgar Greek translation of our Church Catechism. The effect of it was so remarkable, that it drew envy, and consequently persecution, upon him from the Latins. This occasioned his voluntary recess into the Morea, where the metropolitan of Achaia prevailed upon him to preach twice in Greek, at a meeting of some of his bishops and clergy, which was well taken. At his departure he left him a copy of the catechism above-mentioned. From thence, after he had passed through Apulia, Naples, and Sicily again (in which last, at Messina, he officiated for some weeks aboard a ship), he embarked for Syria; and after some months stay at Aleppo, where he had frequent conversation with the patriarch of Antioch, then resident there, he left a copy of the Church Catechism, translated into Arabic, the native language of that place. From Aleppo he went in 1652 to Jerusalem, and so travelled over all Palestine. At Jerusalem he received much honor, both from the Greeks and Latins. Returning to Aleppo, he passed over the Euphrates, into Mesopotamia, where he intended to send the Church Catechism in Turkish, to some of their bishops, who were mostly Armenians. This Turkish translation was procured at Constantinople. After his return from Mesopotamia, he wintered at Aleppo, where he received several courtesies from the consul, Mr. Henry Riley. In the beginning of 1653 he departed from Aleppo, and came to Constantinople by land, being 600 miles, without either servant, or Christian, or any man with him, that could so much as speak the Frank language: yet, by the help of some Arabic he had picked up at Aleppo, he performed that journey in the company of twenty Turks, who used him courteously because he was physician to them and their friends. After his arrival at Constantinople, the French Protestants there desired him to be their minister, though he declared to them his resolution to officiate according to the English liturgy, and promised to settle on him, in three responsible mens' hands, a competent stipend. Upon the Restoration, Dr. Basier was recalled by king Charles II. to England, in a letter written to Prince Ragotzi. But this unfortunate prince dying soon after, of the wounds he received in a battle with the Turks at G'ala, the care of his solemn obsequies was committed to the doctor by his relict, Princess Sophia, whereby he was kept a year longer out of England. At length, returning in 1661, he was restored to his preferments and dignities; and made chaplain in ordinary to king Charles II. He wrote several books on divinity. Having for many years after the Restoration, quietly enjoyed his large revenues, he died in 1676, aged sixty-nine. He wrote, 1. *Deo et Ecclesie Sacrum*, &c. 4to. Oxon. 1646; and 8vo. London, 1668. 2. *Diatriba de Antiqua Ecclesie Britannicæ Libertate*, 8vo. Brug. 1656, which was translated into English under the title of *The Ancient Liberty of the Britannic Church*, &c. 8vo. 1661. 3. *The History of the English and Scotch Presbytery*, 8vo. London, 1659, 1660. 4. *Oratio Privata, boni Theologi*. (speciatim Concinnatoris Practici) *Partes Præcipuas complectens*, 8vo. London, 1670. 5. *The Dead Man's Real Speech*, &c.;

a funeral Sermon on the Death of Dr. John Cosin, Bishop of Durham, 8vo. London, 1673.

BASIL, in botany. See *OCYMUUM*.

BASIL, or **BASEL**, a canton of Switzerland, see **BASLE**.

BASIL, in mechanics, the name, among joiners, for the sloping edge of a chisel, or of the iron of a plane. To work on soft wood, they usually make the basil twelve degrees, and for hard wood eighteen; it being remarked that the more acute the basil is, the better the instrument cuts; and the more obtuse, the stronger, and fitter it is for service.

BASIL, AMERICAN FIELD. See *MONARDA*.

BASIL (St.), the Great, one of the most learned and eloquent doctors of the church, was born at Casarea, in Cappadocia, about A.D. 328; and went to finish his studies at Athens, where he contracted a strict friendship with St. Gregory Nazianzen. He returned to his native country in 355, where he taught rhetoric. Some time after, he travelled into Syria, Egypt, and Lybia, to visit the monasteries of these countries; and the monastic life so much suited his disposition, that upon his return home he resolved to follow it, and he was the first institutor thereof in Pontus and Cappadocia. His reputation became so great, that, upon the death of Eusebius, bishop of Casarea, in 370, he was chosen his successor. It was with some difficulty that he accepted of this dignity; and no sooner was he raised to it than the emperor Valens began to persecute him, because he refused to embrace the Arian doctrine. He used his utmost endeavours to bring about a re-union between the eastern and western churches, who were then much divided, not only about points of faith, but with regard to Meletius and Paulinus, two bishops of Antioch; a dispute which was not terminated till nine months after his death. Basil had a share in all the disputes which happened in his time in the east, in regard to the doctrine of the church; and died January 1, 379.—There have been several editions of his works in Greek and Latin. The best is that of Father Garnier, printed in Greek and Latin, in three volumes folio. St. Basil's style is pure and elegant, his expressions are grand and sublime, and his thoughts noble and majestic. Erasmus places him among the greatest orators of antiquity.

BASIL (St.), order of. The most ancient of all the religious orders. See **BASILIAN**.

BASIL STONE. See *THYMUS*.

BASIL SYRIAN FIELD. See *ZIZIPHORA*.

BASIL, WILD. See *THYMUS*.

BASIL, a physician and heretic, whom Alexius Comnenus caused to be burnt alive in 1118. He held that God had another son besides Jesus Christ, called Sathanael, who, having revolted from his duty to his father, was expelled heaven, and cast to the earth, with the angels whom he had induced to take part with him; and that Jesus Christ was afterwards sent to destroy his power, who shut him up in hell, and altered his name by cutting off the last syllable. He allowed his followers every thing in common, not excepting their wives.

BASILIAN, one of the Philippine islands, in the midst of a cluster of smaller ones, off the

south-west extremity of Magindanao. It is mountainous, and about sixty miles in circumference, abounding in rice, sugar-cane, and bananas. Wild hogs and deer are the principal animals of the interior, which is watered by considerable streams, but thinly peopled. Distant eighteen miles from Magindanao. Long. 121° E., lat. 5° 50' N.

BASILARE OS, in anatomy, a barbarous denomination given to the os sphenoides, on account of its being situated at the bottom or basis of the skull; or because a great part of the brain rests hereon, as on its basis.

BASILEUS, βασιλευς, a title assumed by the emperors of Constantinople, exclusive of all other princes, to whom they give the title *rex*, king. The same quality was afterwards given by them to the kings of Bulgaria, and to Charlemagne, from the successors of which last they endeavoured to wrest it back again. The title *basileus* has been since assumed by other kings, particularly the kings of England, Ego Edgar totius Angliæ basileus confirmavi. Hence also the queen of England was intitled *basilea* and *basilissa*.

BASILEUS, in ornithology, a name by which several of the old authors called the *regulus cristatus*, or golden-crowned wren.

BASILIAN Monks, the religious of the order of St. Basil. That saint having retired into a desert in the province of Pontus, founded a monastery for the convenience of himself and his numerous followers; and for the better regulation of the new society, drew up in writing the orders and rules he would have them follow. This order soon spread all over the east; nor was it long before it passed into the west. The rule of St. Basil was approved by Pope Liberius, the same year in which it was written and published; and afterwards by several other popes; and, in these last ages, by Pope Gregory III. who approved the abridgment made of it by cardinal Bessarion, in the pontificate of Eugenius IV. Some authors pretend, that St. Basil, before he died, saw himself the spiritual father of more than 90,000 monks, in the east only. But this order, which flourished so greatly for more than three centuries, was afterwards considerably diminished by heresy, schism, and a change of empire. The greatest storm it felt was in the reign of Constantine Copronymus; who persecuted the monks of St. Basil, imprisoning some, and banishing others; insomuch that the monasteries were abandoned and spoiled of all their goods. The historians of this order tell us, that it has produced 1805 bishops; and beatified, or acknowledged as saints, 3010 abbots, 11,805 martyrs, and an infinite number of confessors and virgins. They likewise place among the religious of the order of St. Basil, fourteen popes, some cardinals, and a very great number of patriarchs, archbishops, and bishops; and they boast of several emperors and empresses, kings and queens, princes and princesses, who have embraced its rules. This order was introduced in the west in 1057; and was reformed in 1569 by Pope Gregory XIII. who united the religious of this order in Italy, Spain, and Sicily into one congregation; of which the monastery of St.

Saviour at Messina is the chief, and enjoys pre-eminence over the rest. Each community has its particular rule, besides the rule of St. Basil, which is very general, and prescribes little more than the common duties of a Christian life.

BASILIAN. See **BOGOMILI.**

BASILIC, or **BASILICI,** βασιλικη, a royal house, in the ancient architecture, denotes a kind of public hall or court of judicature, where the princes or magistrates sat to administer justice. The basilics consisted of a great hall, with aisles, porticoes, tribunals, and tribunals. The form was generally that of a parallelogram. The bankers had one part of the basilica allotted for their residence. The scholars also went thither to make their declamations, according to the testimony of Quintilian. In after times the denomination basilica was also given to other buildings of public use, as town-houses, exchanges, burses, and the like. The Roman basilicæ were covered, by which they were distinguished from the fora, which were public places open to the air. The first basilica was built at Rome by Cato the elder, whence it was called *Portia*; the second was called *opimia*; the third was that of Paulus, built with a great expense, and with much magnificence, whence it was called by some *regia Pauli*; another was built by Julius Cæsar, called *basilica julia*; of which Vitruvius tells us he had the direction. There are eighteen or twenty others.

BASILIC is also used in ecclesiastical writers, for a church. In this sense, the word frequently occurs in St. Ambrose, St. Austin, St. Jerome, Sidonius Appollinaris, and other writers of the fourth and fifth centuries. It is thought that the name was thus applied, from many of the ancient churches having been formed of the Roman halls. In reality, on the conversion of Constantine, many of the ancient basilicæ were given to the church, and turned to another use, viz. for Christian assemblies to meet in; as may be collected from the passage in Ausonius, where speaking to the emperor Gratian, he tells him, the basilicæ, which heretofore were wont to be filled with men of business, were now thronged with votaries praying for his safety: by which he must needs mean, that the Roman halls or courts were turned into Christian churches: and hence the name came to be a general name for churches in after ages.

BASILIC, is chiefly applied, in modern times, to churches of royal foundation; as those of St. John de Lateran, and St. Peter of the Vatican, at Rome, founded by the emperor Constantine.

BASILICS, among the ancient Franks, were little chapels built over the tombs of their great men, so called, as resembling the figure of the sacred basilicæ, or churches. Persons of inferior condition had only *tumbæ* or *porticuli* erected over them. By an article in the Salique law, he that robbed a *tumba* or *porticulus*, was to be fined fifteen *solidi*; but he that robbed a basilica, thirty *solidi*.

BASILICS, in literary history, a name supposed to have been given by the emperor Leo to a collection of laws in honor of his father Basilus I.

who began it A. D. 867, and in the execution chiefly made use of Sabbathius Protospatharius, who carried the work as far as forty books. Leo added twenty books more, and published the work in 880. The whole, thirty years after, was corrected and improved by Constantine Porphyrogenitus, son of Leo: whence many have held him the author of the basilica. Six books of the basilica were translated into Latin in 1557, by Gentian Hervetus. An edition of the Greek basilics, with a Latin version, has been since published at Paris, in 1647, by Amibal Fabrotus, in seven volumes. There are still wanting nineteen books, which are supposed to be lost. Fabrotus has endeavoured to supply in some measure the defect, from the synopsis of the basilica and the glosses, of which several had been made under the succeeding emperors, and contained the whole Justinian law, excepting the superfluities, in a new and more consistent order, together with the later constitutions of the emperors posterior to Justinian.

BASILICA, in anatomy, the interior branch of the axillary vein, running the whole length of the arm. It is one of the veins opened in bleeding.

BASILICA, or **BASILICUS,** in astronomy, a fixed star of the first magnitude, in the constellation Leo; called also *Regulus* and *Cor Leonis*.

BASILICA JULIA not only served for the hearing of causes, but for the reception and audience of foreign ambassadors. It was supported by 100 marble pillars in four rows, and enriched with decorations of gold and precious stones. In it were thirteen tribunals or judgment seats, where the prætors sat to despatch causes. See **BASILIC.**

BASILICA, MODERN. Palladio gives this name to the civil edifices which are found in many Italian cities, and the destination of which is entirely similar to the antique basilica. 'In imitation of the ancients,' says this celebrated architect, 'the cities of Italy construct public halls which may rightly be called basilicæ, as they form part of the habitation of the supreme magistrate, and in them the judges administer justice.' 'The basilicæ of our time,' he continues, 'differ in this from the ancient; that those were level with the ground, while ours are raised upon arches, in which are shops for various arts and merchandise of the city. There the prisons are also placed, and other buildings belonging to the public business. Another difference is, that the modern basilicæ have the porticoes on the outside, while in the ancient they were only in the interior. Of these halls there is a very noble one at Padua; and another at Brescia, remarkable for its size and ornaments.' The most celebrated of this kind is that of Vicenza; the exterior part of which was built by Palladio, and the whole so much altered that it may pass for his work. The body of the building is of much greater antiquity, though the date of it is unknown. Time, and various accidents had reduced this edifice to such a state of decay, that it was necessary to think seriously of preventing its total ruin: for this purpose the most eminent architects were consulted, and the design of Palladio was approved. He removed

the ancient loggias, and substituted new porticoes of a very beautiful invention. These form two galleries in height, the lower order of which is ornamented with Doric engaged columns, at very wide intervals, to answer to the internal pillars of the old buildings; the space between each column is occupied by an arch resting on two small columns of the same order, and a pilaster at each side against the large columns, which leaves a space between it and the small columns of two diameters. The upper portico of Ionic columns is disposed in the same manner, and a balustrade is placed in the archway. The entablature of the large orders is profiled over each column.

This edifice is about 150 feet long and sixty feet broad; the hall is raised above the ground twenty-six feet; it is formed by vaults supported on pillars, and the whole is covered with a wooden dome.

BASILICATA, a territory of Italy, bounded on the north by the provinces of Otranto, Bari, and Capitanata, on the west by the Principato, and a small part of the Tuscan Sea, on the south by Calabria, and on the east by the Gulf of Taranto. It is watered by several rivers; but as it is almost all occupied by the Appennine mountains, it is neither very populous nor fertile; however, it produces enough to maintain its inhabitants, and has a small quantity of cotton. The principal towns are Acerenza the capital, Melfi, Tursi, Rapolla, Muro, Lavello, Tricarico, Monte Peloso, and Venosa, which are all episcopal sees. Its extent is about 1,605,047 moggie; five moggie being equivalent to four English acres; and it has a population of nearly 330,000 souls. It is watered by the Basiento, and several other streams. In this province are the ancient ruined cities of Heraclea and Metapontum.

BASILICI, βασιλικοι, in the Greek empire, was a denomination given to the prince's mandatories, or those who carried his orders.

BASILICON, in pharmacy, a name given to several compositions to be found in ancient medicinal writers. At present it is confined to three official ointments, distinguished by the epithets black, yellow, and green. See PHARMACY, &c.

BASILICON, or **BASILICUM**, in pharmacy, is cullee tetrapharmacum, as being composed of four simples, viz. resin, wax, pitch, and oil of olive.

BASILICUS SINUS, in ancient geography, the gulf of Mellasso, in Asia Minor, which separates Lycia and Caria.

BASILIDES, an Egyptian, who lived near the beginning of the second century. He was educated in the Gnostic school, over which Simon Magus is once said to have presided; and with whom he agreed that Christ was a man in appearance, that his body was a phantom, and that he gave his form to Simon the Cyrenian, who was crucified in his stead. We learn from Eusebius, that this heresiarch wrote twenty-four books upon the gospel, and that he forged several prophets; to two of which he gave the names barcabi and barcoph. We have still the fragment of a Basilidian gospel.

BASILIDIANS, a denomination, in the second century, from Basilides, chief of the Egyptian Gnostics. They acknowledged, according to

ancient writers, the existence of one supreme God, perfect in goodness and wisdom, who produced from his own substance seven beings, or aions, of a most excellent nature. Two of these aions, called dynamis and sophia, i. e. power and wisdom, engendered the angels of the highest order. These angels formed a heaven for their habitation, and brought forth other angelic beings of a nature somewhat inferior to their own. Many other generations of angels followed. New heavens were also created, until the number of angelic orders, and of their respective heavens, amounted to 365, and thus equalled the days of the year. All these are under the empire of an omnipotent Lord, whom Basilides called Abraxas. The inhabitants of the lowest heavens, which touched upon the borders of the eternal, malignant, and self-animated matter, conceived the design of forming a world from that confused mass, and of creating an order of beings to people it. This design was carried into execution, and was approved by the supreme God, who to the animal life, with which only the inhabitants of this new world were at first endowed, added a reasonable soul, giving at the same time to the angels the empire over them.

These angelic beings, advanced to the government of the world which they had created, fell by degrees from their original purity, and soon manifested the fatal marks of their depravity and corruption. They not only endeavoured to efface in the minds of men their knowledge of the supreme Being, that they might be worshipped in his stead, but also began to war against each other, with an ambitious view to enlarge every one the bounds of his respective dominion. The most arrogant and turbulent of all these angelic spirits, was that which presided over the Jewish nation. Hence, the supreme God, beholding with compassion the miserable state of rational beings, who groaned under the contest of these jarring powers, sent from heaven his son Nus, or Christ, the chief of the aions, that, joined in a substantial union with the man Jesus, he might restore the knowledge of the supreme God, destroy the empire of those angelic natures which presided over the world, and particularly that of the arrogant leader of the Jewish people. The god of the Jews, alarmed at this, sent forth his ministers to seize the man Jesus and put him to death. They executed his commands; but their cruelty could not extend to Christ, against whom their efforts were vain. Those souls who obey the precepts of the Son of God, shall, after the dissolution of their mortal frame, ascend to the Father, while their bodies return to the corrupt mass of matter whence they were formed. Disobedient spirits, on the contrary, shall pass successively into other bodies. There are several gems still subsisting, inscribed with the name Abraxas, which were used by the Basilidians as amulets against diseases and evil spirits. See **ABRAXAS**.

BASILIGOROD, or **VASILIGOROD**, a town of Russia, seated on the Volga, where the Sara falls into it. The inhabitants are employed in agriculture and fishing. It is 112 leagues from Moscow.

BASILINEA, in entomology, a species of phalæna, a native of Austria.

BASILIPOTAMO, the ancient Eurotas, a

river of European Turkey, in the south of the Morea, which falls into the Gulf of Kolokythia, about four miles to the N. N. E. of the town of that name.

BASILIPPUM, in ancient geography, a town of Bætica, in Spain; now called Cantillana, a citadel of Andalusia, above Seville, on the Guadalquivir.

BASILISCUS, in alchemy, the sublimate mercury of the philosophers.

BASILISCUS, in ornithology, a name given by some of the old authors to the *regulus cristatus*, or golden-crowned wren. It is a diminutive of *basileus*, king, another of its names, because of its golden crown.

BASILISCUS, **BASILICUS**, in zoology, a species of *lacerta*, which, according to Linnæus, has the tail long and round, dorsal fin radiated, and back of the head crested. This is the basilisk of modern naturalists, and seems to unite the two genera of *lacerta* and *draco*. The remarks of Dr. Shaw, in the *Gen. Zool.* on this extraordinary creature, are highly interesting, and ought not to escape attention. It is, according to this writer, particularly distinguished by a long and broad wing-like process or expansion, continued along the whole length of the back, and to a very considerable distance on the upper part of the tail, and furnished at certain distances with internal radii, analagous to those in the fins of fishes, and still more so to those in the wings of the *draco volans*, or flying lizard. This process is of different elevations in different parts, so as to appear strongly sinuated and indented, and is capable of being either dilated or contracted at the pleasure of the animal. The occiput, or hind part of the head, is elevated into a very conspicuous pointed hood, or hollow crest.

‘Notwithstanding its formidable appearance,’ adds this author, ‘the basilisk is a perfectly harmless animal; and like many others of the lizard tribe, resides principally among trees, where it feeds on insects, &c. It has long ago been admirably figured in the work of Seba; and as it is an extremely rare species, has sometimes been considered, from the strangeness of its form, as a fictitious representation. There is, however, in the British Museum, a very fine specimen, well preserved in spirits, and which fully confirms the excellency of Seba’s figure; from which, in all probability, Linnæus himself, who never saw the animal, took his specific description. The color of the basilisk is a pale cinereous brown, with some darker variegations towards the upper part of the body. Its length is about a foot and a half. The young or small specimens have but a slight appearance either of the dorsal or caudal process, or of the pointed occipital crest. The basilisk is principally found in South America, and sometimes considerably exceeds the length before mentioned, measuring three feet, or even more, from the nose to the extremity of the tail. It is said to be an animal of great agility, and is capable of swimming occasionally with perfect ease, as well as of springing from tree to tree by the help of its dorsal crest, which it expands in order to support its flight.’

Among the French naturalists, the iguane is a distinct genus of the oviparous quadrupeds, in

which the Linnæan *lacerta basiliiscus* is included under the name of basilisk.

The basilisk of the ancients existed only in the glowing fancy of their poets: they feigned it to be the most malignant of all poisonous serpents; as a creature whose breath empoisoned the very air, and whose baneful glance would alone prove fatal to all other animals. A creature gifted with such extraordinary powers could have no common origin, and therefore it was asserted to be the produce of the egg of a cock brooded upon by a serpent. Galen says its color is yellowish, and that it has three little elevations on its head, speckled with whitish spots, that have somewhat the appearance of a crown. Ælian, Matthiolus, Pliny, Lucan, and others of the most distinguished ancients, relate many marvellous properties of this creature; but, notwithstanding their authority, the basilisk, as they represent it, is most unquestionably fabulous. It is needless to add to this article any of the fables of Jerome Lobo, although Dr. Johnson has received some of them with an unwarrantable degree of credulity. The learned Prosper Alpinus informs us, on the authority of some relations, which he seems to have credited, that near the lakes contiguous to the sources of the Nile, there is a number of basilisks, about a palm in length, and the thickness of a middle finger; that they have two large scales which they use as wings, and crests and combs upon their heads, from which they are called *basilisci* or *reguli*; that is, crowned, crested, or kingly serpents. And he says, that no person can approach these lakes without being destroyed by these crested snakes. Our traveller, Mr. Bruce, observes, that having examined the lake Goodeeroo, those of Court Ohha and Tzana, the only lakes near the sources of the Nile, he never saw one serpent there, crowned or uncrowned; and that he never heard of any: and, therefore, he believes this account as fabulous as that of the *acontia*, and other animals, mentioned by Prosper Alpinus, lib. iv. cap. 4. The basilisk is a species of serpent frequently mentioned in scripture, though never described farther than that it cannot be charmed so as to do no hurt, nor trained so as to delight in music; which all travellers who have been in Egypt allow is very possible, and frequently seen, Jerem. viii. 17.: Psalm ix. 13. However, it is the Greek text that calls this serpent basilisk; the Hebrew generally calls it *tsepha*, which is a species of serpent real and known. Our English translation very improperly renders it cockatrice, a fabulous animal that never did exist. The basilisk of scripture seems to have been a snake, not a viper; as its eggs are mentioned, Isaiah ix. 5: whereas it is known to be the characteristic of the viper to bring forth living young. *Bruce’s Travels in Abyssinia*, vol. v. p. 201.

BASILISK, *n. s.* Lat. *basiliscus*, from Gr *βασιλικος*, of *βασιλευς*, a king. A serpent, thus denominated either because its head is adorned with a tuft like a diadem, or because of its superior strength it is the monarch of the reptile tribes. To this creature is ascribed the power of fascinating its victims with its eyes. See the article **BASILISCUS**.

That sleth right as the *basilicok* sleth folk by a venime of his sight. *Chaucer, The Persones Tale.*

Basiliska! whose breath

Is killing poison, and whose looks are death.

Make me not sighted like the *basilisk*;

I've look'd on thousands who have sped the better

By my regard, but kill'd none so. *Shakspeare.*

Thine eyes, sweet lady, have infected mine.

LADY ANNE. Would they were *basilisks* to strike thee dead, *Id.*

The *basilisk* was a serpent not above three palms long, and differenced from other serpents by advancing his head, and some white marks or coronary spots upon the crown. *Brown's Vulgar Errors.*

BASILISK. A species of cannon or ordnance.

We practise to make swifter motions than any you have; and to make them stronger and more violent than your's are; exceeding your greatest cannons and *basilisks.* *Bacon.*

Your eyes, which hitherto have borne in them

Against the French, that met them in their bent,
The fatal balls of murdering *basilisks.* *Shakspeare.*

And thou hast talk'd

Of sallies, and retires; of trenches, tents.

Of palisades, frontiers, parapets;

Of *basilisks*, of cannon, culverin,

Of prisoner's ransom, and of soldiers slain. *Id.*

BASILISK, in military affairs, a piece of ordnance; thus denominated from its resemblance to the supposed serpent of that name. The *basilisk* has thrown an iron ball of 200 pound weight. It was much talked of in the time of Solyman, emperor of the Turks, in the wars of Hungary, but seems now out of use. Paulus Jovius relates the terrible slaughter made by a single ball from one of these *basilisks* in a Spanish ship; after penetrating the boards and planks in the ship's head, it killed above thirty men. Masses of *basilisks* made of brass, which we draw each by 100 yoke of oxen. Modern writ is also given the name *basilisk* to a much smaller and more sizeable piece of ordnance, which the Dutch make five feet long, and the French only four. It carries forty-eight pounds.

BASILISSA. See **BASILEUS.**

BASILEUS I. surnamed the Macedonian, emperor of the Greeks. He was a common soldier, and of an obscure family in Macedonia, and yet rais'd himself to the throne: for, having pleas'd the emperor Michael by his address in the management of his horses, he became his first eunuch, and then his great chamberlain. He at length assassinated the famous Bardas, and was associated to the empire in 849. He call'd the eighth general council at Constantinople, deposed the patriarch Photius, but in 868 rais'd him to the patriarchate; and deposed the last popes, who refused to admit him into their communion. He was dreaded by the emperor, whom he frequently vanquish'd; and loved by his subjects for his justice and clemency. He died in 879. Under his reign the Russians embrac'd Christianity, and the doctrine of the Greek church.

Constantine II. succeeded Romanus II. as emperor of Constantinople, A. D. 903, and reigned only a few days. His brother, Constantine IX., six years afterwards, was by some historians and writers of the age confounded with Basilus III. who was afterwards call'd Constantine.

BASILUS III. succeeded John Zimisces, emperor of Constantinople, A. D. 975, and reigned, along with his brother Constantine X., for no less a period than fifty years. His brother survived him three years, the one dying in 1025, and the other in 1028. See **CONSTANTINOPLE.**

BASILUZZO, one of the Lipari islands.

BASIN, *n.* } Fr. *basin*; Ital. *bacile, bacino*; but **BASINED.** } It is often written *bason*, but not according to etymology. It is a term which designates a vessel in common use. It is also applied to any hollow place capacious of liquids, and is technically employed by anatomists and artisans, to express any substance hollowed out, a round cavity, or a concave.

But let us go now to that horrible swering of adjuration and conjuration, as don these false enchauntours and nigromancers in *basins* full of water, or in a bright sword in a circle or in a fire, or in a sholder bone of a shepe: I cannot sayn but that they do cursedly and daumnably ayenst Crist, and all the feith of holy chirche. *Chaucer. The Persones Tale.*

After that he poured water into a *basin*, and beganne to wash his disciples feet. *Bible, 1551.*

Let one attend him with a silver *basin*,
Full of rose-water, and bestrewed with flow'rs.

Shakspeare.

We have little wells for infusions, where the waters take the virtues quicker and better than in vessels and *basins.* *Bacon.*

And send her home

Divested to her flannell in a cart,

And let her footman beat the *bason* afore her.

Ben Jonson, New Inn

With scornful sound of *bason*, pot and pan,
They thought to drive him thence, like bees in swarms. *Harr. Aristot.*

The jutting land two ample bays divides;

The spacious *basins* arching rocks inclose,

A sure defence from every storm that blows. *Pope.*

On one side of the walk you see the hollow *basin*, with its several little plantations lying conveniently under the eye of the beholder. *Spectator.*

If this rotation does the seas affect,

The rapid motion rather would eject

The stores the low capacious caves contain,

And from its ample *basin* cast the main.

Bluckmore.

From step to step, with sullen sound,

The forc'd cascades indignant leap;

Now sinking fill the *bason's* measur'd sleep;

There in a dull stagnation doom'd to slend.

Mason. Ode to a water-nymph.

Thy *basin'd* rivers and imprison'd seas.

Young's Night Thoughts.

BASING, a village of Hampshire, north of Basingstoke, near which, in 871, Alfred was defeated by the Danes. It is equally memorable for the protracted siege sustained here by John, the fifth marquis of Worcester, in his seat of Basing-house, against the forces of the Parliament. The investment commenced August 1643, and the answer made by the marquis to the first summons was, that 'if the king had no more ground in England than Basing-house, he would maintain it to the uttermost.' It stood out till October, 1645, when Cromwell took it by storm, and burnt it to the ground. A saying still exists in the neighbourhood, 'clubs trumps, as when Basing-house was taken;' and tradition refers this to the surprise of the garrison, who were at cards when finally assaulted. The mar-

quis had written with a diamond on every pane of glass, Ayme^z Loyaulté, which is still the family motto. The plunder obtained by the parliamentary forces amounted to £200,000, but their loss before the walls exceeded 2000 men. See Journal of the siege of Basing-house, Oxford, 1645.

BASINGE (John), more commonly known by the name of Basingstochius, or de Basingstoke, was born at Basingstoke, a town of Hampshire, and from thence took his surname. He was a person highly eminent for virtue and learning. For having very good natural parts, he so improved them by study, that he became a perfect master of the Latin and Greek languages, an eminent orator, a complete mathematician, a subtle philosopher, and a sound divine. The foundation of his great learning he laid in the university of Oxford, and, for his further improvement, went to Paris, where he resided some years. He then travelled to Athens, where he made many curious observations, and perfected himself in his studies, particularly in the knowledge of the Greek tongue. At his return to England, he brought over with him several curious Greek manuscripts, and introduced the use of the Greek numeral figures into this kingdom. He became also a very great promoter and encourager of that language, which was much neglected in these western parts of the world; and to facilitate it, he translated from the Greek into Latin a grammar, which he entitled *The Donatus of the Greeks*. He was archdeacon of London, and afterwards, of Leicester. He died in 1252.

BASINGSTOKE, a market town in Hampshire, which by means of a canal, begun in 1778, carries on an extensive trade. The navigation communicates with the Thames. The church is a vicarage, in the patronage of Magdalen college, Oxford. One of its vicars, Sir George Wheeler, the celebrated eastern traveller, annexed a library to the church. This town was the birth-place of Joseph and Thomas Warton, whose father was vicar. It lies sixteen miles north-east of Winchester, and forty-six from London.

BASIOGLOSSUS, a muscle arising from the base of the os hyoides. See **ANATOMY**.

BASIS. Lat. *basis*; βασις, from βασιω, I go. See **BASE**. The foundation or the first principle of any thing; the lowest of the three principal parts of a column, which are the basis, shaft and capital.

It must follow, that Paradise, being raised to this height, must have the compass of the whole earth for a *basis* and foundation.

Raleigh.

How many times shall Caesar bleed in sport,
That now on Pompey's *basis* lies along
No worthier than the dust! *Shakspeare.*

Ascend my chariot, guide the rapid wheels
That shake heaven's *basis*. *Milton.*

In altarwise a stately pile they rear;
The *basis* broad below and top advanc'd in air. *Dryden.*

—The friendships of the world are oft
Confederacies in vice, or leagues of pleasure;
Ours has severest virtue for its *basis*. *Addison.*

Or if no *basis* oar my rising name,
But the fall'n ruins of another's fame,
Then teach me, heaven! to scorn the guilty bays,
Drive from my breast that wretched lust of praise.

Pope. Temple of Fame

BASIS, in ancient music and poetry, denotes the equability of sounds proceeding in the same tenor, and stands contradistinguished from *arsis*, or elevation, as well as from *thesis* or depression.

BASIS, or **BASE**, in chemistry, any body which is dissolved by another body, which it receives and fixes, and with which it forms a compound, may be called the *basis* of that compound. Thus, for example, the bases of neutral salts are the alkaline, earthy, and metallic matters which are saturated by the several acids, and form with them these neutral salts. In this sense it is that these neutral salts are called salts with earthy bases, salts with alkaline bases, salts with metallic bases; also the appellations *basis* of alum, *basis* of nitre, *basis* of Glauber salt, *basis* of vitriol, &c. signifying the argillaceous earth, which, with the vitriolic acid, forms alum; the vegetable alkali, which, with the nitrous acid, forms nitre; the mineral alkali, which, with the vitriolic acid, forms Glauber's salt; and the metal which, with the vitriolic acid, forms a vitriol; because the substances are supposed to be fixed, unactive, and only yielding to the action of the acids, which they fix, and to which they give a body and consistence.

BASIS of **BASE**, in geometry. See **BASE**.

BASIS, in oratory, denotes the fourth member of a complete exordium, being that which succeeds the apodosis, and prepares the way for the proposition.

BASIS, in pharmacy, the principal ingredient in compound medicines.

BASIUM, Lat. a kiss, a word used by chemists, for an extemporaneous tincture of iron and copper, invented by Clossæus.

BASK, *v. a. & n.* } *Backeren*, Dutch, pro-
BASKING. } bably from the verb to
bake; to warm by exposure to heat, whether of the sun or fire; to lie in the warmth, used, says Johnson, almost always of animals; and, if in the term animals he includes man, he is not far from the truth; though it is sometimes applied to reptiles.

As I live by food, I met a fool,
Who laid him down, and *bask'd* him in the sun,
And rail'd on lady fortune in good terms,
In good set terms, and yet a motley fool.

Shakspeare.

Loue in her sunny eyes does *basking* play,
Loue walks the pleasant mazes of her hair;
Loue does on both her lips for ever stray,
And sows and reaps a thousand kisses there.

Cowley. The Change.

Then lies him down the lubber fiend,
And stretch'd out all the chimney's length
Basks at the fire his hairy strength.

Milton.

'Tis all thy business, business how to shun,
To *bask* thy naked body in the sun. *Dryden.*

About him, and above, and round the wood,
The birds that haunt the borders of his flood,
That bath'd within, or *bask'd* upon his side,
To tuneful songs their narrow throats applied. *Id.*

Some in the fields of purple æther play,
And *bask* and whiten in the blaze of day. *Pope.*
Unlock'd in covers let her freely run
To range thy courts, and *bask* before the sun.

Tickell.

O life! thou universal wish; what art thou?
Thou'rt but a day—a few uneasy hours:

Thy morn is greeted by the flocks and herds,
 And every bird that flutters with its note,
 Salutes thy rising sun : thy noon approaching,
 Then haste the flies, and every creeping insect,
 To *bask* in thy meridian ; that declining,
 As quickly they depart, and leave thy evening
 To mourn the absent ray : the night at hand,
 Then croaks the raven conscience of time mispent,
 The owl despair screams hideous, and the bat
 Confusion, flutters up and down :
 Life's but a lengthen'd day, not worth the waking for.

Howard's Charles I.

The naked negro, panting at the Line,
 Boasts of his golden sands and palmy wine ;
Basks in the glare, or stems the tepid wave,
 And thanks the gods for all the good they gave.

Goldsmith's Traveller.

Too late, all lost, for ever lost, he sees
 The envy'd saints triumphing from afar,
 And angels *basking* in the smiles of God. *Rowe.*
 Childe Harold *bask'd* him in the noontide sun
 Disporting there like any other fly.

Byron. Childe Harold.

BASKERVILLE (John), an eminent artist, especially in letter-founding and printing, was born in 1706, at Woverley in Worcestershire, and was heir to an estate of about £60 a year; the whole income of which he allowed to his parents till their deaths. In his early years he conceived a love for fine writing, and cutting in stone; and, being brought up to no particular profession, he commenced writing-master in Birmingham when about twenty years of age. The improvements in different manufactures there soon drew his attention, and he applied to the japan business, which he carried on for a long time with distinguished excellence and success. In 1750 he applied himself to letter-founding, the bringing of which to perfection cost him much labor and expense. In a few years he proceeded to printing; and his first work was an edition of Virgil, in royal 4to. which now sells for three guineas. He obtained leave from the university of Cambridge to print a bible in royal folio, and editions of the common prayer-book, in three sizes; for which he paid a large sum. He afterwards printed Horace, Terence, Catullus, Lucretius, Juvenal, Sallust, and Florus, in royal 4to; Virgil in 8vo.; and several books in 12mo. He published, likewise, some of the English classics. These performances are the best testimonies of Mr. Baskerville's merit; and his name is deservedly ranked among those who, in modern times, have brought the art of printing to its greatest perfection. Not meeting, however, with that encouragement from the booksellers, which he expected, he set up a letter-foundry for sale, a little before his death. He died without issue in 1775.

BASKERVILLE (Sir Simon), an eminent anatomist, and physician to King James I. and Charles I. was the son of Thomas Baskerville, apothecary, and born at Exeter in 1573. He studied at Oxford, where he early displayed his abilities, and at 18 took his degrees of B. D. and M. D. in 1611. He afterwards settled at London, where he became a member, and was for some time president of the college of physicians. His reputation for learning and medicine, attracted the attention and esteem of the two sovereigns

above-mentioned, the latter of whom knighted him. He wrote some memoirs of his own life and times, and died in 1641, aged sixty-eight.

BA'SKET, *n. s.* *busged*, welch; *bascauda*, Latin; perhaps, from the French *bosse*, or from some British word signifying *rush*; basket is a vessel or utensil formed of osiers, rushes, of twigs, splinters, or other slender bodies interwoven.

For I wol proche and beg in sondry londes,
 I wol not do no labour with min houdes,
 Ne make *baskettes* for to live there by,
 Because I wol not beggen idelly.

Chaucer. The Pardoner's Tale.

Here is a *basket*: he may creep in, and throw foul linen upon him, as if going to bucking. *Shakespeare.*

Set down the *basket*, villain!—Somebody call my wife:—You youth in a *basket* come out here. *Id.*

He threw out, to save life,

Your British *baskets*, with a thousand dishes.

Holyday's Juvenal.

Poor Peg was forced to go hawking and puddling; now and then carrying a *basket* of fish to the market.

Arbuthnot.

His puissant sword unto his side,
 Near his undaunted heart, was ty'd,
 With *basket*-hilt that would hold broth,
 And serve for fight and dinner both. *Hudibras.*

There was a time,

When other regions were the swain's delight;
 And shepherdless Britannia's rushy vales,
 Inglorious, neither trade nor labour knew,
 But of rude *baskets*, homely rustic gear,
 Woven of the flexile willow. *Dyer. The Fleece.*

BASKET, as a measure, denotes an uncertain quantity; as, a basket of medlers is two bushels, of assafœtida from twenty to thirty pound weight. The ancient Britons were noted for their ingenuity in making baskets, which they exported in large quantities. They were of very elegant workmanship, and bore a high price. Martial takes notice of them:—

Barbara de pictis veni bascauda Britannis,
 Sed me jam mavult dicere Rona suam.
 'A basket I, by painted Britons wrought,
 And now to Rome's imperial city brought.'

Baskets are generally made of osiers, stripped of their bark, and dressed according to the design of the basket. Large baskets or hampers are made without any preparation but soaking the wood, which is necessary for every size of basket. No great capital of money or ingenuity is requisite to follow the business of a basket-maker; yet some practice as well as dexterity would seem necessary in forming fruit baskets used on tables, work baskets, table mats, &c.

BASKET, CORBEILLE, in architecture, a kind of vase, or figure piece of sculpture, in form of a basket, filled with flowers or fruits, serving to terminate some decoration.

BASKET FISH a species of sea-star. See **AS-TERIAS**.

BASKET-MAKING, the weaving of reeds, twigs, or leaves together, for baskets, is an art in use among the rudest nations of the world; even an inferior specimen is seen among the natives of Van Diemen's Land, consisting of a bunch of rushes tied together at each end, and spread out in the middle. Other tribes of this neighbourhood make a basket of leaves interwoven, so skillfully executed, that it retains either milk or water

Very early in our history it is recorded that our ancestors made baskets, which were celebrated at Rome. At the same period, shields of wicker-work, plain or covered with hides, were common in Britain; wicker boats, &c. Herodotus speaks of boats of this kind, covered with bitumen, on the Tigris and Euphrates. Such boats, about seven feet in diameter, are said to be used at the present day on these rivers; and similar ones, we know, are employed in crossing the most rapid streams of India. They are generally of a shallow construction, from three to fifteen feet in diameter; some will carry thirty men. They are made thus:—A number of pieces of split bamboo, twenty for example, are laid on the ground, crossing each other near the centre, and there fastened with thongs; the ends of the bamboos are then elevated by several persons, and fixed asunder at due distance by means of stakes, in which position they are bound by other long slips of bamboo. The latter are introduced alternately over and under the pieces first crossed, and tied at the intersections to preserve the shape. This being completed, beginning from the bottom to the centre, the parts above the intended height or depth of the basket-boat are cut off, and it is liberated from the stakes reversed, and covered with half-dressed hides sewed together with thongs. Six men will make one of these boats in as many hours. They are navigated by paddles where the water is deep, or are pushed over a shallow bottom with long poles; and the passengers are kept dry by planks at the bottom. The basket-boats on the river Kristna, in Hindostan, are about twelve feet in diameter, and four feet deep. Armies have been enabled by these conveyances to continue their march, and even heavy artillery has been transported by them. Sometimes they are towed by bullocks. In other parts of the world, houses, cottages, fences, and gates, are formed of basket or wicker-work. On the continent, a two-horse carriage, called a Holstein waggon, of very considerable size, and fit to carry several persons, is composed of basket-work; the same is done in Great Britain with regard to the bodies of gigs; and an appendage of the stage-coaches, we know, is literally denominated the basket.

This is an art therefore, however numble in some of its branches, too extensively and too serviceably in exercise not to merit more attention than books of science have usually bestowed upon it. The materials employed have been very various. Twigs, branches, straw, and whalebone, rushes, roots of plants, the bowing bamboo, and the supple osier. The natives of some parts of South America make baskets of rushes, so closely interwoven as to hold water, and thousands of them are annually sold throughout the new republics. The Caffres and Hottentots are alike skilful with roots. Osiers or willows, however, are most adapted for this use. These are either taken entire, cut from the root, split asunder, or stripped of their bark, according to the work to be produced; in the latter case, they are previously well soaked. The stripping is performed by drawing the willows through an iron-edged instrument called brakes, which removes the bark, and the willows are then cleaned, so far as neces-

sary, by the manual operation of a sharp knife. Next they are exposed to the sun and air, and afterwards placed in a dry situation. But it is not less necessary to preserve willows with their bark in the same manner, for nothing can be more injurious than the humidity inherent in the plant; and previous to use, they must be soaked in water some days. The barked or white osier is then divided into bundles or faggots according to size; the larger being reserved to form the strong work in the skeleton of the basket, and the smaller for weaving the bottom and sides. Should the latter be applied to ordinary work, they are taken whole, but for implements of slight and finer texture, each osier is divided into splits and skeins; which names denote the different degrees of size to which they are reduced. Splits are osiers cleft into four parts, by means of a particular implement employed for that purpose, consisting of two edge tools placed at right angles, whereby the rod is longitudinally divided down the pith. These are next drawn through an implement resembling the common spokeshave, keeping the grain of the split next the wood or stock of the shave, while the pith is presented to the edge of the iron, which is set in an oblique direction to the wood: And, in order to bring the split into a shape still more regular, it is passed through another implement called an up right, consisting of a flat piece of steel, each end of which is fashioned into a cutting edge, like that of an ordinary chisel. The flat is bent round, so that the two edges approach each other at a greater or less interval by means of regulating screws, and the whole is fixed in a handle. By passing the splits between the two edges, they are reduced to skeins, the thickness of which is determined by the interval between the edges of the tool. All the implements required by a basket-maker are few and simple: they consist, besides the preceding, of knives, bodkins, and drills for boring, leads for keeping the work steady while in process, and where it is of small dimensions, a heavy piece of iron, called a beater, which is employed to beat the basket close as it is augmented.

In making an ordinary basket, the osiers are laid out in a length considerably greater than that of the finished work. They are ranged in pairs on the floor parallel to each other, at small intervals, in the direction of the longer diameter; and this may be called the woof, for basket work is in fact a web. These parallel rods are then crossed at right angles by two of the largest osiers, with the thick ends towards the workman, who places his foot upon them; and weaving each alternately over and under the parallel pieces first laid down, they are by that means confined in their places. The whole now forms what is technically called the slat or slate, which is the foundation of the basket. Next, the long end of one of the two rods is taken, and woven under and over the pairs of short ends all round the bottom, until the whole be woven in. The same is done with the other rod; and then additional long osiers are also woven in, until the bottom be of sufficient size, and the woof be occupied by them. Thus the bottom, or foundation on which the superstructure is to be raised, is finished; and

this latter part is accomplished by sharpening the large ends of as many long and stout osiers as may be necessary to form the ribs or skeleton. These are forced or plaited between the rods of the bottom, from the edge towards the centre, and are turned up in the direction of the sides; then other rods are woven in and out between each of them, until the basket is raised to the intended height, or, more correctly speaking, the depth it is to receive. The edge or brim is finished by turning down the perpendicular ends of the ribs, now protruding and standing up over each other, whereby the whole are firmly and compactly united. A handle is adapted to the work, by forcing two or three osiers sharpened at the end, and cut to the requisite length, down the weaving of the sides, close together; and they are pinned fast, about two inches from the brim, in order that the handle, when completed, may be retained in its proper position. The osiers are then either bound or plaited, in such fashion as pleases the taste of the artist. This is the most simple kind of basket; some are of finer materials, and nicer execution. The skeins are frequently smoked and dyed, of different colors, by intermixing which, a good effect is produced.

At Liverpool, where there is an asylum for the blind, this art has, from its happy simplicity, been extensively taught, and is practised with success. In the city of Edinburgh, a number of the blind find similar employment in a blind asylum.

Some of the best materials for basket-making have been imported into Great Britain from France and Holland; but the duration of the war induced the inhabitants of this country to endeavour to obtain a home supply; and Mr. Philips, of Ely, has received a premium from the Society of Arts, on account of his excellent observations on this subject. He also has been very successful in his cultivation of the osier. Of nine or ten species of osier, he remarks that only one, the grey or branched osier is of any use. See Transactions of the Society, and our article OSIER.

BASKING SHARK, in ichthyology, a species of Shark, the *squalus maximus* of Linnæus, so called from its lying in the sun on the surface of the water. This fish inhabits the Arctic and European seas, feeds on the smaller cetaceous animals, and grows to a prodigious size, but is not very fierce. The liver is very large, and produces much oil. See SQUALUS.

BASLE, BAILE, or BASIL. One of the nine-tenth cantons of Switzerland, which joined the confederacy in the year 1501. It is bounded on the south by the canton of Solothurn; on the north by the Brisgau; on the east by Fribourg; and on the west by part of Solothurn, the former diocese of Basle, and the Sundgau; being upwards of twenty miles in length, and about eighteen in breadth. It contains three towns, twenty-seven parishes, seven bailiwicks, and 130,000 inhabitants; the supposed area being about 131 square miles. Although the mountains are barren, the lower parts are fruitful in corn and wine, and fit for pasture; hemp also abounds here. It has many medicinal springs and baths, and the climate is wholesome and temperate. The people are protestants; both men and women for

the most part wear the French dress; but the language commonly spoken is German, though the French also is much used. By the constitution of 1803, the legislative power is vested in the large council of 135, elected from among the citizens at large; it assembles every half year in the town of Basle, and sits for a fortnight at a time. The executive power is intrusted to the small council of twenty-five, chosen from among the members of the large council, and having at its head two burgomasters, who preside, alternately. The whole canton is divided into the three districts of Basle (the town), Wallenburg, and Liestal, each of which is subdivided into fifteen corporations. Every inhabitant who rents land or houses to the value of 500 Swiss francs, has a seat in one of these corporations, and is by virtue of it entitled to vote at the election of members for the large council. This canton sends three representatives to the diet. Before the revolution its government was aristocratical; and its revenues arise chiefly from secularised abbeys, and imposts on goods carried through the country, to and from France, Italy, and Germany. Besides the military establishment of the city of Basle, there were two provincial regiments, consisting each of ten companies, and a troop of dragoons. At present the country furnishes two regiments of militia, each consisting of nine companies of fusileers, a company of grenadiers, and one of dragoons. Manufacturing establishments are found in every corner, particularly for those of silk, cotton, ribbons and paper. The clergy form in the capital a convention, and in the country three chapters; over all these the first pastor of the cathedral presides. Basle was the first canton which separated from the Helvetic confederacy, and adopted the new constitution; and here, it is said, the first paper of modern times was manufactured.

BASLE, or BAILE, the capital of this canton, is the largest city in Switzerland, having upwards of 200 streets, and six market-places or squares. Its environs are exceedingly beautiful, consisting of a fine level tract of fields and meadows. The city is divided into two parts by the Rhine, over which there is a handsome bridge; the larger on the side of Switzerland, the lesser on that of Germany. It is thought by some to have risen on the ruins of the old Augusta Rauracorum. For its name it is indebted to Julian the Apostate, who named it in honor of his mother Basilina. The houses are well built, but thinly peopled, Basle containing at present only 15,000 inhabitants, whereas in former times the town was crowded to excess. A hereditary enmity subsists between the inhabitants of the two divisions. The minster, or cathedral church, the town-house, and the arsenal, are objects worthy of attention. The university, founded here in 1459, has an excellent library, a cabinet of medals, and botanic garden; the town has given birth to a number of eminent characters, particularly Ecolampadius, Grynæus, Buxtorf, Wetstein, Hermann, the Bernouillis, and Euler; Erasmus too resided here for many years, and lies interred in the cathedral. The commerce is extensive and flourishing, and is maintained chiefly by the manufacture of silk ribbons. The other manufactures of consequence are, silk stuffs,

cotton, paper, linen, and gloves; there are also considerable bleachfields and dye-houses. The highest administrative power belongs to the large council of 280, out of which are chosen the members of the smaller council of 60. The Teutonic and Maltese orders have each a commander at Basle. It was remarked as a singularity in the clocks of this town, that they always struck an hour sooner than elsewhere; but this peculiarity no longer exists. Basle was formerly a city of the empire, and only ceased to be so on its joining the Swiss confederacy in 1501. Here was held a famous ecclesiastical council, between the years 1431 and 1444.

Basle was once the name of an independent bishopric, which had the Sundgau to the north, the canton of Basle to the east, that of Solothurn to the south, and Franche Comté to the west. The bishop was a prince of the empire, and had a seat and vote at the diet of the Upper Rhine. He was at the same time in alliance with the seven catholic cantons, but was never called to the meetings of the Swiss diet. His ordinary residence was at Porentrui. The whole bishopric contained, on 420 square miles, between 39,000 and 40,000 inhabitants. The nett revenue was valued at £20,000 sterling, to which the mines contributed between £3000 and £4000. In 1792 the French took possession of that part of the bishopric which belonged to the German empire, and formed it into a department of their republic, under the name of Mont Terrible, with which they soon after incorporated several of the other districts that were previously connected with Switzerland. After this it was included in the department of the Upper Rhine. In 1815 the bishopric of Basle, with the town and territory of Bienne, was united to the Swiss republic, by the congress of Vienna, and now forms part of the canton of Berne.

BASMAN, an island in the Persian gulf, five miles long, in the centre of which is a high hill. Lat. 25° 24' N.

BASNAGE (Henry), Sieur de Beauval, second son to Henry Basnage, and brother to James. He was admitted advocate in the parliament of Rouen, in 1679. He did not follow the bar immediately upon his admission; but went to Valencia, where he studied under M. de Marville. Upon his return, he practised with great reputation till 1687, when the revocation of the edict of Nantz obliged him to fly to Holland, where he composed the greatest part of his works, and died in 1710. His chief work is *Histoire des Ouvrages des Scavans*. Rotterd. 24 vols. in 12mo. This work was begun in September 1687, and continued till June 1709. When he arrived in Holland, Mr. Bayle, through indisposition, had been obliged to drop his *Nouvelles de la Republique des Lettres*, which induced Mr. Basnage to undertake a work of the same kind, under a different title.

BASSAGE (James), a learned author, and pastor of the Walloon church at the Hague, was born at Rouen in Normandy, in 1653. He was the son of Henry Basnage, one of the ablest advocates in the parliament of Normandy. At seventeen years of age, after he had made himself master of the Greek and Latin authors, as

well as the English, Spanish, and Italian languages, he went to Geneva, where he began his divinity studies under Mestrezat, Turretin, and Tronchin; and finished them at Sedan, under the professors Jurieu and Le Blanc de Beaulieu. He then returned to Rouen, where he was received as minister, September 1676; in which capacity he remained till 1685, when, the exercise of the Protestant religion being suppressed at Rouen, he retired to Rotterdam, and was a minister pensionary there till 1691, when he was chosen pastor of the Walloon church of that city. In the year 1709 Pensionary Heinsius got him chosen one of the pastors of the Walloon church at the Hague, intending not only to employ him in religious but in state affairs. He was employed in a secret negotiation with Marshal d'Uxelles, plenipotentiary of France at the congress of Utrecht; and he executed it with so much success, that he was afterwards entrusted with several important commissions, all which he discharged in such a manner as to gain a great character for his abilities and address; a celebrated modern writer has therefore said of him, that he was fitter to be a minister of state than of a parish. The abbe du Bois, who was at the Hague in 1716, as ambassador plenipotentiary from France, to negotiate a defensive alliance between France, England, and the States General, was ordered by the duke of Orleans, regent of France, to apply himself to M. Basnage, and to follow his advice; they accordingly acted in concert, and the alliance was concluded in January 1717; and in return for his services he obtained the restoration of all his property in France. The catholics esteemed him no less than the protestants; and the works he wrote, which are mostly in French, spread his reputation almost all over Europe; among these are, 1. The history of the Religion of the Reformed Churches. 2. Jewish Antiquities. 3. The History of the Old and New Testament; and many others. He died Sept. 12, 1723.

BASNET (Edward), dean of St. Patrick's, Dublin. He was born in Denbighshire, in Wales, and was preferred to the dean of St. Patrick's about 1537. He was a zealous promoter of the Reformation, and in 1539, when the rebellion of O'Neal broke out, he laid aside the dress of the dean for that of the soldier, and joined the army under the lord deputy. For his good services he was made a privy counsellor, and besides other marks of royal favor, had the lands of Kiltearn, in the neighbourhood of Dublin, assigned to him by the crown. He died in the reign of Edward VI.

BASNETUM, low Lat. a helmet. *Bailey*.

BASON, bassin, Fr. See **BASIN**.

BASON, in anatomy, pelvis. 1. A round cavity in form of a tunnel, situate between the anterior ventricles of the brain, descending from its base, and ending in the point at the glandula pituitaria. It is formed of the pia mater, and receives the pituita, which comes from the brain, and passes through the pituitary gland, and thence into the veins. 2. That capacity is also called pelvis, or bason, which is formed by the ossa ilia and os sacrum, and contains the bladder of urine, the matrix, and the intestines.

BASON, in glass-grinding, or dish. Glass-grinders use various kinds of basons, of copper, iron, &c. and of various forms, some deeper, others shallower, according to the focus of the glasses that are to be ground. In these basons, convex glasses are formed, as concave ones are on spheres or bowls. Glasses are worked in basons two ways. In the first, the bason is fitted to the arbor, or tree of a lath, and the glass, fixed with cement to a handle of wood, is presented and held fast in the right hand within the bason, while the proper motion is given by the foot of the bason. In the other, the bason is fixed to a stand or block, and the glass with its wooden handle moved. The movable basons are very small, seldom exceeding five or six inches in diameter; the others are larger, sometimes above ten feet diameter. After the glass has been ground in the bason, it is brought smoother with grease and emery, polished with tripoli, and finished with paper cemented to the bottom of the bason.

BASON, in hat-making, a large round shell or case, ordinarily of iron, placed over a furnace; wherein the matter of the hat is moulded into form. The hatters have also basons for the brims of hats, usually of lead, having an aperture in the middle, of a diameter sufficient for the largest block to go through.

BASON, in hydraulics, a reservoir of water, as the bason of a jet d'eau, or fountain; the bason of a port or harbour, of a bath, &c. Basons are made with clay, cement, or lead; but the diameter must be made four feet longer on each side than the bason is to be. This will be taken up by the walls of clay. For the same reason, it must be dug two feet deeper than the intended depth of the water; because it is to be laid over eighteen inches thick with clay, and six inches with gravel and paving. The wall is to be made with shards, rubbish, or flints, with the natural earth for mortar; and the clay must be well worked, and trod firmly down with the naked feet. The way of making them with cement is, to allow one foot nine inches every way for the work; then cut the banks perpendicularly, and raise a wall of masonry a foot thick, made of pebble stones, or the like, laid in a mortar of lime and sand; the bottom is then to be covered to the same thickness; and then the solid lining of the cement is to be backed up against the walls, and over the bottom. This is to be made of small flints in beds of mortar, made of lime and cement. When this solid is eight inches thick, it must be plastered over the whole surface with cement, well sifted, before it be mixed with the lime; and with this it is to be wrought over smooth with a trowel. The proportion of this cement should be two-thirds of the cement, or powdered tile, to one-third of lime; and this cement has the property of hardening so under water, that it will become like stone or marble, and it will not be subject to decay for a long time. After the finishing, the bason should, for four or five days, be anointed over very often with oil, or bullock's blood, to keep it from flaking or cracking in the drying; and after this, the water should be let in as soon as may be. The leaded basons are made with walls a foot

thick, and a bottom of half a foot. These must be of rubble stones cemented with plaster; for the lime will injure and eat the lead. The sheets of lead are to be spread over these walls and bottom, and seamed with solder. These basons, however, are but little in use now, from the expense of making them, and the danger of the lead being stolen. The waste pipes of fountains ought always to be made large enough for fear of choking. When the waste water is to be carried off in common sewers, it may be carried away in drains, or earthen pipes; but when it is to serve for basons that lie below it, it is to be conveyed in leaden ones.—There are divers sorts of basons; as

1. **BASON EN COQUILLE**, that shaped like a shell.

2. **BASON, FIGURED**, that whose plane or circumference makes several turns and returns, either straight, circular, or the like. Such are most of the basons of fountains at Rome.

3. **BASON WITH A BALUSTRADE**, that whose cavity is surrounded with a balustrade of stone, marble, brass, or the like.

4. **BASON WITH A TRENCH**, bassin a rigole, that whose border being of marble, or other stone, has a trench cut in it, whence, at certain distances, springs out a thread of water, which lines the trench, and forms a kind of nape or gargle around the balustrade. Such is that of the fountain of the rock of the Belvidere at Rome.

BASON, in ship-building, a circular dock for the reception of ships.

BASON, SALE BY THE, at Amsterdam, is used for the public sales made under the direction of the *vendu meester*; so called, by reason that, before adjudging the lot or commodity to the last bidder, they strike a brass bason, to give notice of it.

BASONS OF A BALANCE, two pieces of brass, or other matter, fastened to the extremities of the strings; the one to hold the weight, the other the thing to be weighed.

BASOUDHIA, a town of Hindostan, in the district of Bilsah. Long. 78° 13' E., lat. 23° 54' N.

BASQUE ISLAND, an island in the river St. Lawrence, near the coast of Lower Canada. Long. 68° 52' W., lat. 48° 15' N.

BASQUES LES, or FRENCH BISCAY, a district of Gascony, France, which has the Bay of Biscay on the west, the river Adour and the Landes on the north, Bearn on the east, and the Pyrenees on the south. It was formerly subdivided into the three territories of Labour, Lower Navarre, and Soule, and is now included in the department of the Lower Pyrenees. It is very mountainous, and rather barren; it rears, however, a number of cattle. The inhabitants use a dialect which resembles that of the Spanish Biscayans, and is supposed to be a variety of the Celtic. The agility of the inhabitants is proverbial. It is not easy to imagine more grace and expression than they display in their motions, or the spirit and activity of their dances.

BASQUES, RIO DE, a river in the province and government of Costa Rica, kingdom of Guatimala, which falls into the Atlantic.

BASQUEVILLE, or **BAQUEVILLE**, a town of France, in Lower Normandy, with 2190 inhabitants. Here are manufactures of serge, mattresses, and woollen stuffs. It had the title of county before the revolution, and is now the head of a canton, in the department of the Lower Seine, arrondissement of Dieppe. It is ten miles S. W. of Dieppe, and twenty-eight N. of Rouen.

BASRAH. See **BASSORA**.

BASRODE, a town of the Netherlands, in Flanders, on the Scheldt, near Dendermonde. It contains 2150 inhabitants.

BASS, } This is the word from which
Ba'ssock, } basket is supposed to be derived ;
our gardeners even now call the soft sedge or
rush with which they bind plants *bass*, which is
the meaning of the word in the following cita-
tion from Mortimer.

Having woollen yarn, *bass* mat, or such like, to
bind them withal. *Mortimer's Husbandry*.

BASS, *n. s.*, in Cumberland, a river-fish, of
the perch kind ; in Hampshire, a sea perch.

Bass, in gardening, a soft kind of sedge or
rush, used in binding plants, &c.

Bass, in geography, an insulated rock, about
a mile in circumference, in the mouth of the
Frith of Forth, at a small distance from the town
of North Berwick, in East Lothian. It is steep
and inaccessible on all sides, except on the
S. W. and even there it is with great difficulty
that a single man can climb up with the help of
a rope or ladder. It was formerly kept as a
garrison. A party of the adherents of James
VII. surprised it at the revolution, and it was
the last place in the three kingdoms that sub-
mitted to the new government ; upon which its
fortifications were ordered to be neglected. In
summer this remarkable rock, which rises to a
great height above the water, in form of a cone,
is quite covered with sea-fowl, which come hither
to breed. The chief of these are the solan geese,
(See **BASSANUS**), which arrive in June, and retire
in September. At that period these birds are so
numerous that they almost darken the air ; and
the surface of the Bass is so covered with nests,
eggs, and young, that it is difficult to walk
without treading on them. The ruins of the old
castle, which was once the state prison for Scot-
land, are situated at the north end of the pre-
cipice, which overhangs the sea in a tremendous
manner. The Bass also contains a small warren
for rabbits, and pasture for a few sheep. There
is a beautiful spring of water in the centre, high
on the rock. The force of the tides has now
almost worn a hole through this rock. Long.
2° 15' W., lat. 56° 3' N.

Bass, in music, of uncertain etymology ;
whether from the Greek word *βασικ*, a founda-
tion ; or from the Italian adjective *basso*, low ;
the lowest of the four parts of music, but the
most important, as it is upon that the chords
proper to constitute a particular harmony are
determined. Hence the maxim among musicians,
that when the bass is properly formed, the har-
mony can scarcely be bad. It is the part of the
concert which is the most heard, which consists
of the gravest and longest sounds ; or which is
played on the largest pipes or strings of a common

instrument, or an instrument larger than ordi-
nary, for the purpose. Musicians generally hold
the bass the principal part of a concert, and the
foundation of the composition ; though others
will have the treble the chief part. The late in-
genious Dr. Franklin, in his very curious letter
to Lord Kaimes on this subject, declares it to be
his opinion that the bass is unnecessary to some
tunes, and gives some reasons in support of it,
which the curious may see there. *Exper. Obser-
serv. &c.* 4to. fifth edit. p. 489. Rousseau ap-
pears to have been of the same opinion. See
Dict. de Musique, an. 1768.—Bass cliff, or F

cliff, the character is marked thus. 

BASS, COUNTER, is a second or double bass,
where there are several in the same concert.

BASS HARBOUR, a harbour in the Eastern seas,
formed by several small islands ; off the coast of
Malacca, forty-five miles W. of Queda.

BASS ISLAND, an island in Lake Erie, four
miles N. of Sundusky.

BASS RIVER, a river of East Greenland, which
runs into the sea. Long. 50° 10' W., lat. 64°
30' N.

BASS-RELIEF. Whatever figures or repre-
sentations are cut, stamped, or otherwise wrought,
so that not the entire body, but only part of it,
is raised above the plane, are said to be done in
relief, or relievo ; and when that work is low,
flat, and but little raised, it is called *bass* or low
relief. When a piece of sculpture, a coin, or a
medal, has its figure raised so as to be well dis-
tinguished, it is called *bold*, and we say its relief
is strong. Bass-reliefs of the Trajan and Antoi-
nine columns have been copied by Bartoli, and
explained by Bellori, &c. Those of the arch of
Severus by Suaresius. Some have also made
maps of prospects of countries in *basso-relievo*.
Phil. Trans. No. 6, p. 99. See **BASSO RILIEVO**.

BASS, THOROUGH, is the harmony made by
the bass-voils, or theorbos, continuing to play
both while the voices sing and the other instru-
ments perform their parts, and also filling up the
intervals when any of the other parts stop. It is
played by figures marked over the notes, on the
organ, spinet, harpsichord, &c. and frequently
simply and without figures on the bass-viol and
bassoon.

BASS-VIOL, a musical instrument of the same
form with that of a violin, but much larger. It
is struck with a bow, as that is ; has the same
number of strings ; and has eight stops, which
are subdivided into semi-stops : its sound is
grave, and has a much nobler effect in a concert
than that of the violin.

BASS STRAIT, so called from the name of its dis-
coverer, separates Van Diemen's Land from New
Holland, and is not more than fifty leagues wide.
It contains a chain of small islands, which run
north and south. Van Diemen's land, which
was hitherto supposed to be a part of New Hol-
land, is thus ascertained to be a detached island ;
as, proceeding through this strait, Mr. Bass ac-
tually circumnavigated it. This discovery is not
only interesting, as it establishes this geographi-
cal fact, but may be useful, as it expedites the

passage from the Cape of Good Hope to Fort Jackson. See VAN DIEMEN'S LAND.

BASSA. See BASHAW.

BASSA, or GRAND BASSA, a country on the west coast of Africa, about 400 miles south of Sierra Leone, where the American colonization Society has obtained a grant of land from the king for a settlement. One of their agents describes the Bassas as living in small villages, or clusters of cottages, in each of which there is a head-man, who has a plurality of wives, and is the owner of all the people in his town. The inhabitants of each village cultivate the ground in common, which is chiefly done by the women and boys; the men employ themselves in fishing, hunting and trade, and in directing those under them. The adults wear a piece of narrow cloth about their loins; but the children are not burdened with any kind of clothing. They are very fond of beads and various other ornaments; and are represented as good-natured people, but extremely ignorant and superstitious, depending solely upon their gree-grees and devil worship, to whom they make daily sacrifices, and even dedicate a part of their regular food.

BASSAC, a town of France, in the Angoumois, department of the Charente, arrondissement of Cognac, where was formerly an abbey. The number of inhabitants is about 1000. On the 13th of March, 1569, a battle was fought near this place between the Catholics and Protestants, in which the latter were defeated, and a prince of Condé was killed. It is on the right bank of the Charente, not far from Jarnac, and fifteen miles E. S. E. of Saintes.

BASSAD, or BESP, an Arabian name for the purple fucus of the Greeks, used by the women to paint their cheeks, and by the dyers of cloths. It has been misunderstood by late authors, and interpreted coral; but the error of this is evident, since coral has none of these properties. See MARGIAN.

BASSAN (Giacomo de Pont), or LE BASSAN, a celebrated Venetian painter, born in 1510. His subjects generally were peasants and villagers, cattle, landscapes, and historical designs; the figures were well designed, and the animals and landscapes have an agreeable resemblance of simple nature. His compositions cannot boast of much elegance; but they have abundance of force and truth. His local colors are well observed, his ornaments brilliant, and the chiaroscuro and perspective well understood. His touch is free and spirited, and the distances in his landscapes are always true, but sometimes too dark in the nearer parts. His works are spread all over Europe; many of them were purchased by Titian; and there were several in the late French king's cabinet, the royal palace, and the Hotel de Toulouse. They are readily known from the sun-burnt of characters and countenance in the figures and animals, &c., and particularly from a violet or purple tint that predominates in the mail. But the genuine pictures of his own hand are not so easily ascertained; because his sons were mostly employed in copying the works of their father, which he sometimes retouched. As he lived to be very old, he finished a great number of pictures; yet from this circumstance his genuine pictures are not

commonly met with. But the true pictures of Giacomo always bear a considerable price. He was also a lover of music and gardening, and used to intermingle among his plants figures of serpents, drawn so much to the life that his visitors were apt to mistake them for real ones. Hannibal Caracci himself, when he went to see him, was so far deceived by the figure of a book upon the wall that he went to take it off the supposed shelf. He died in 1520.

BASSANO (Leander and Francis), sons of Giacomo, inherited their father's genius for painting, and distinguished themselves in the art; but unfortunately they also inherited a species of lunacy from their mother, which shortened their lives and their usefulness.

BASSANI (Giovanni Battista), maestro di capella of the cathedral church of Bologna, about the middle of the last century, was a very voluminous composer of music, having published no fewer than thirty-one different works. He is equally celebrated as a composer for the church and for concerts; and being also a celebrated performer on the violin, he taught Corelli. His compositions consist of masses, psalms, motets with instrumental parts, and sonatas for violins: his fifth opera in particular, containing twelve sonatas for two violins and a bass, is much esteemed; it is written in a style wonderfully grave and pathetic. He was one of the first who composed motets for a single voice, with accompaniments of violins; a practice liable to objection, as it assimilates church-music too nearly to that of the chamber. Two of his operas, viz. the eighth and thirteenth, were printed in London, by Pearson, above fifty years ago, with the title of *Harmonia Festiva*.

BASSANO, a flourishing town of Italy, on the river Brenta, in the Venetian territory. It is scarcely one Italian mile in circuit, but has spacious suburbs, and contains, according to the last French enumeration, 11,500 inhabitants. A stone bridge, 182 feet in length, connects it with the large village of Vicentino. The neighbourhood is highly favorable to the cultivation of the vine and olive, and a good trade is carried on in silk, cloth, and leather. The extensive printing-office of Remontini issues a number of elegant publications. In the kingdom of Italy this town belonged to the department of the Tagliamento: Buonaparte erected it into a duchy, with £2,500 sterling annual revenue, which he conferred in 1809 on Maret, his minister for foreign affairs. It is twelve miles north of Vicenza, and twenty west of Treviso. Long. 11° 43' E., lat. 45° 46' N.

BASSANO, or BASSANELLA, a small town in the Papal states, the head of a duchy, belonging to the house of Colonna. It gives name to the lake of Bassano, from which issues the river La Barca, the ancient Cremera. Here was born the celebrated Venetian printer, Aldus Manutius. Three miles west of Orta.

BASSANO (ST.), a small town of Italy, in the duchy of Milan, and district of Lodi.

BASSANUS, in ornithology, a species of *Pelecanus*, as large as a common goose, with a wedge-shaped tail; body white; bill and primary quill-feathers black; and face blue. Gmelin. Latham, &c.

This is the common gannet, or solan goose, a bird found in great plenty on all the northern coasts of Britain, but rather less common to the southward. The adult birds have the plumage nearly all white; but during the first years it is of a dusky color, and only speckled with white. The bill is bluish-ash color, about six inches in length, and has the nostrils placed in a furrow; the mouth within is black; the throat is bare; and the skin very dilatible, forming a pouch of sufficient size to contain five or six herrings; the legs are black, marked with a stripe of pea-green before; and the claw of the middle toe is pectinated. The males and females are very much alike in plumage. The gannet is particularly abundant in the isle of Ailsa in the firth of Clyde; the rocks adjacent to St. Kilda; the stalks of Soulliskerry, near the Orkneys; the Skelig isles off the coasts of Kerry, Ireland; and the Bass island in the firth of Edinburgh. Dr. Hervey gives some account of the latter in these words. 'There is a small island, called by the Scotch Bass island, not more than a mile in circumference; the surface is almost wholly covered during the months of May and June with nests, eggs, and young birds; so that it is scarcely possible to walk without treading on them; and the flocks of birds in flight are so prodigious as to darken the air like clouds; and their noise is such that you cannot without difficulty hear your next neighbour's voice. If you look down upon the sea from the top of the precipice, you will see it on every side covered with infinite numbers of birds of different kinds, swimming and hunting for their prey; if in sailing round the island you survey the hanging cliffs, you see in every cragg or fissure of the broken rocks innumerable birds of various sorts and sizes, more than the stars of heaven when viewed in a serene night; if from afar you see the distant flocks either flying to or from the island, you would imagine them to be a vast swarm of bees.

'The gannet,' observes Dr. Latham, 'inhabits the colder parts of this kingdom, and more especially several of the northern isles, and in particular that of Bass in Scotland, whence the name. It generally first makes its appearance in March, and after making a circuit of the island, departs in October or November. This race seems to be in pursuit of the herrings and pilchards, whose motions it watches; and the fishermen know the coming of these fish by the appearance of the birds. That this is the inducement seems probable, as they are likewise seen, in the month of December, as far south as the coast of Lisbon and Gibraltar, plunging for sardine. The gannet is also common on the coasts of Norway and those of Iceland, and now and then met with on the southern coast of Greenland. In America it is found on the coasts of Newfoundland, where it breeds, migrating in winter as far as Carolina: said also to have been met with frequently in the southern ocean; but we are not clear whether the sort meant by them is the common gannet, or the lesser one.'

'The gannets,' Mr. Pennant remarks, 'are birds of passage. The first appearance in those islands being in March, and their continuance

till August or September, according as the inhabitants take or leave their first egg; but in general the time of breeding and that of their departure seems to coincide with the arrival of the herring, and the migration of that fish, which is their principal food, out of those seas.' 'I have in the month of August,' he adds in another place, 'observed in Caitliness their northern migrations. I have seen them passing the whole day in flocks, from five to fifteen in each. In calm weather they fly high, in storms they fly low and near the shore; but never cross over land, even when a bay with promontories intervenes, but follow at an equal distance the course of the bay, and regularly double every cape. I have seen many of the parties make a sort of halt for the sake of fishing; then, darting headlong into the sea, make the water foam and spring up with the violence of their descent: after which they pursued their route. I enquired whether they ever were observed to return southward in the spring, but was answered in the negative; so that it appears, they annually encircle the whole island.'

They are well known on most of our coasts by different names. In Cornwall and in Ireland they are called gannets, and by the Welsh gan. It comes on the coasts of Cornwall in the latter end of the summer or beginning of autumn, hovering over the shoals of pilchards that come up through the St. George's channel from the north sea. The gannet seldom comes near the land, but is constant to its prey; and when the pilchards retire, which happens about the end of November, they are seen no more.

The nest of the gannet is composed of various materials, such as grass and water plants, intermixed with any thing the birds find floating on the water. Each bird, if undisturbed, would lay only one egg in the year; but if that be taken away they will lay another, and if that be taken away also, they will lay a third, but no more. The young gannets, as well as the eggs, are eaten. Martin assures us, that the inhabitants of St. Kilda consume annually no less than 22,600 young birds of this species, besides an amazing quantity of their eggs; these being their principal support throughout the year: they preserve their eggs and fowls in pyramidal stone buildings, covering them with turf ashes to protect them from moisture. This is a dear-bought food, and earned at the hazard of their lives, either by climbing the most difficult and narrow paths, where to appearance they barely cling, and that too at an amazing height above the raging sea; or else, being lowered down from above, they collect their annual provision, thus hanging midway in the air, and placing their whole dependence on the uncertain footing of one person who holds the rope by which they are suspended at the top of the precipice. The young birds are a favorite dish with the north Britons in general, during the season they are constantly brought from the Bass isle to Edinburgh, and are roasted and served up a little before dinner as a whet: the price they are sold for in the markets is twenty-pence a piece.

The following account of the gannets in the isle of St. Kilda is given by Mr. Macauley:

The rocks are in summer totally covered with the solan geese and other fowls, and appear at a distance like so many mountains covered with snow. The nests of the solan geese, not to mention those of other fowls, are so close, that when one walks between them, the hatching fowls on either side can always take hold of one's clothes; and they will often sit till they are attacked, rather than expose their eggs to the danger of being destroyed by the sea gulls: at the same time an equal number fly about, and furnish food for their mates that are employed in hatching; and there are, besides, large flocks of barren fowls of the different tribes that frequent the rocks of St. Kilda.

The solan geese, almost equal the tame ones in size. The common amusement of the herring-fishers shows the great strength of this fowl. The fishers fix a herring upon a board, which has a small weight under it to sink it a little below the surface of the sea: the solan goose observing the fish, darts upon it perpendicularly, and with so much force, that he runs his bill irrecoverably through the board, and is taken up directly by the fishers.

The solan geese repair to St. Kilda in the month of March, and continue there till after the beginning of November. Before the middle of that month they, and all the other sea-fowls that are fond of this coast, retire much about the same time into some other favorite regions; so that not a single fowl belonging to their element is to be seen about St. Kilda from the beginning of winter down to the middle of February. Before the young solan geese fly off, they are larger than their mothers, and the fat on their breast is sometimes three inches deep. Into what quarter of the world these tribes of wild fowl repair, after winter sets in, whether into the northern ocean, the native country and winter-quarters of herrings in general, or into some other region near the sun, or whether they be of the sleeping kind, they who pry into the mysteries of natural history, or have conversed much with writers of voyages, can best explain. I shall only pretend to say that these different nations of the feathered kind are taught to choose the most proper habitations and feeding places, and to shift their quarters seasonably by the unerring hand of God.

From the account given above of the multitudes of sea-fowls that seek their food on this coast, we may justly conclude that there must be inexhaustible stores of fish there. Let us for a moment confine our attention to the consumption made by a single species of fowls. The solan goose is almost insatiably voracious; he flies with great force and velocity, toils all the day with little intermission, and digests his food in a very short time; he disdains to eat any thing worse than herring or mackerel, unless it be in a very hungry place, which he takes care to avoid or abandon. We shall take it for granted that there are a hundred thousand of that kind around the rocks of St. Kilda; and this calculation is by far too moderate, as no less than twenty thousand of this kind are destroyed every year, including the young ones. We shall suppose, at the same time, that the solan geese sojourn in

these seas for about seven months in the year; that each of them destroys five herrings in a day, a subsistence infinitely poor for so greedy a creature, unless it were more than half supported at the expence of other fishes. Here we have 100,000,000 of the finest fish in the world devoured annually by a single species of the St. Kilda sea-fowls, &c.

It is proper to observe that le grand fou of Brisson and Buffon, and great booby of Catesby, an inhabitant of the sea-shores of Florida, is supposed to be the young or at least a variety of pelecus bassanus; and that observed by navigators so common on Ascension island, pelecus piscator, a different species.

BASATERRE. See **BASSE-TERRE.**

BASSEE, LA, in geography, a town of France, in the department of the North, the ci-devant French Netherlands, remarkable on account of the many sieges it has sustained. It is seated on a canal which falls into the river Deule; eighteen miles south-west of Lille. Its principal commerce is in cattle, linen, and turf. Population about 2200.

BASSE, in ichthyology, the English name of the sea-wolf, the lupus piscis of authors. The Greeks have called this labrax; and some of the later writers, as Paulus Jovius and others, spigola. It is properly a species of perch, and is distinguished by Artedi by the name of the perch with thirteen rays in the second fin of the back, and fourteen in the pinna auri. See **LUPUS, MARINUS.**

BASSE, in writers of the middle age, a collar for cart-horses, made of flags. Hence also the round, matted cushion of flags, or hassock, used for kneeling in churches, is called basse; in Kent a trush.

BASSE-COUR, in building, a court separated from the principal one, and destined for the stables, coach-houses, and livery servants. In the country it is applied to the yard, or place where the cattle, fowls, &c. are kept.

BASSE ENCIENTE, or **BASSE ENCLOSURE,** in fortification, a false trench, made to hide a real one.

BASSEEN, a sea-port of Hindostan, the province of Aurungabad, separated from the island of Salsette by a narrow strait, in long. 72° 54' E., lat. 19° 18' N. The district around is in a very improved state of cultivation, although under a Mahratta government. Many of the cultivators are Roman Catholics. The Teak forests, which supply the marine yard at Bombay, lie along the western side of the Ghaut mountains, to the north and north-east of Basseen. In 1780 it was taken from the Mahrattas by the British, but restored in 1782. Distant 27 miles north of Bombay, and 152 south of Surat.

BASSEIN, or **PERSAÏM,** a city in the south-west part of Pegu, where the British formerly had a factory; but the Burmans now prevent any European vessel from entering this branch of the river Irrawaddy. Long. 95° E., lat. 16° 50' N.

BASSEN, or **BASSUM,** a small town, castle, and lordship of Germany, in the county of Hoya, in Westphalia, with a Lutheran abbey. It belongs to Hesse Cassel; but the abbey stands under the sovereignty of Hanover. Sixteen miles west of Hoya.

BASSES, a numerous cluster of islets, called the Thousand isles by Maurelle, off the north-west point of New Guinea. The most south is in long. 139° 27' E., lat. 1° 40' S.

BASSET, or **BASSETTE**, a game at cards, said to have been invented by a noble Venetian, for which he was banished. It was first introduced into France by Signior Giustiniani, ambassador of Venice, in 1674. Severe laws were made against it by Louis XIV., to elude which they disguised basset under the name of *pour et contre*, that is, 'for and against,' which occasioned new arrests and prohibitions of parliament. The parties concerned in it are a dealer or banker; his assistant, who supervises the losing cards; and the punter, or any one who plays against the banker. The other terms used in this game are: 1. The *fasse* or *face*, which is the first card turned up by the *tailleur* belonging to the pack, by which he gains half the value of the money laid down on every card of that sort by the punters. 2. The *couch*, or first money which every punter puts on each card; each person that plays having a book of thirteen several cards before him, on which he may lay his money, more or less, at discretion. 3. The *paroli*, which is, when a punter having won the first stake, and having a mind to pursue his good fortune, crooks the corner of his card, and lets his prize lie, aiming at a *sept et le va*. 4. The *masse*; when having won the first stake, the punter is willing to venture more money on the same card. 5. The *pay*; when the punter having won the first stake, be it a shilling, half-crown, guinea, or whatever he laid down on his card, and not caring to hazard the *paroli*, leaves off, or goes the *pay*: in which case, if the card turn up wrong, he loses nothing, having won the *couch* before; whereas, if it turn right, he by this adventure wins double the money staked. 6. The *alpieu*; much the same with *paroli*, and used when a *couch* is won by turning up or crooking the corner of the winning card. 7. *Sept et le va*, the first great chance or prize, when the punter, having won the *couch*, makes a *paroli*, and goes on to second chance; so that if his winning card turns up again, it comes to *sept et le va*, which is seven times as much as he laid down on his card. 8. *Quinze et le va* is the next higher prize, when the punter, having won the former, is resolved to push his fortune, and lay his money a second time on the same card by crooking another corner; in which case, if it comes up, he wins fifteen times the money laid down. 9. *Trent et le va* is the next higher prize, when the punter, crooking the fourth corner of his winning card, if it turn up wins thirty-three times the money he first staked. 10. *Soixant et le va* is the highest prize, and entitles the winner to sixty-seven times his first money; which, if it were considerable, stands a chance to break the bank: but the bank stands many chances first of breaking the punter. This cannot be won but by the *tailleur's* dealing the cards over again. The rules of the game of basset are as follows: 1. The banker holds a pack of fifty-two cards, and having shuffled them, he turns the whole pack at once, so as to discover the last card; after which he lays down all the cards by couples. 2. The

punter has his book of thirteen cards in his hand, from the king to the ace; out of these he takes one card, or more, at pleasure, upon which he lays a stake. 3. The punter may, at his choice, either lay down his stake before the pack is turned, or immediately after it is turned, or after any number of couples are down. 4. Supposing the punter to lay down his stake after the pack is turned, and calling 1, 2, 3, 4, 5, &c. the places of those cards which follow the card in view, either immediately after the pack is turned, or after any number of couples are drawn. Then, 5. If the card upon which the punter has laid a stake comes out in any even place, except the first, he wins a stake equal to his own. 6. If the card upon which the punter has laid a stake comes out in any even place, except the second, he loses his stake. 7. If the card of the punter comes out in the first place, he neither wins nor loses, but takes his own stake again. 8. If the card of the punter comes out in the second place, he does not lose his whole stake, but only one-half; and this is the case in which the punter is said to be faced. 9. When the punter chooses to come in after any number of the couples are down, if his card happens to be but once in the pack and is the last of all, there is an exception from the general rule: for though it comes out in an odd place, which should entitle him to win a stake equal to his own, yet he neither wins nor loses from that circumstance, but takes back his own stake. This game has been the object of mathematical calculations. M. de Moivre solves this problem: to estimate at basset the loss of the punter under any circumstance of cards remaining in the stock when he lays his stake, and of any number of times that his card is repeated in the stock. From this solution he has formed a table, showing the several losses of the punter in whatsoever circumstances he may happen to be. From this table it appears, 1. The fewer the cards are in the stock, the greater is the loss of the punter. 2. That the least loss of the punter, under the same circumstances of cards remaining in the stock, is when his card is but twice in it; the next greater when but three times; still greater when four times; and the greatest when but once. The gain of the banker upon all the money adventured at basset is 15s. 3d. per cent.

BASSET (Peter), a gentleman of a good family, was chamberlain, or gentleman of the privy-chamber, to Henry V. a constant attendant on that brave prince, and an eye-witness of his most glorious actions at home and abroad; all which he particularly described in a work entitled, *The Acts of King Henry V.* which remains in MS. in the college of heralds.

BASSE-TERRE, the chief town of St. Christopher's, in the West Indies, situated at the south-east end of the island, and at the mouth of a river opening into a bay called Basse-Terre road. It consists of a long street, containing 800 houses is a place of considerable trade, and defended by three batteries. Long. 62° 36' W., lat. 17° 24' N.

BASSE TERRE, FORT DE LA, a castle of the island of Guadeloupe, on the west coast. It is also the name of a part of the island, between a point of which, called *Grosse Morne*, to that of

Antigua in the Grande Terre, the basin called the Great Cul de Sac is five or six leagues in length, and affords safe riding for ships.

BASSETING, in the coal mines, denotes the rise of the vein of coal towards the surface of the earth, till it comes within two or three feet of the surface itself. This is also called by the workmen cropping; and stands opposed to dipping, which is the descent of the vein to such a depth that it is rarely, if ever followed to the end.

BASSETTO, a bass viol of the smallest size.

BASSEVILLE (Citizen), secretary to the French legation at Rome, one of the many victims to the French revolution, but who fell, not by the hands of the zealots of liberty, but by the demons of despotism and priestcraft, in March 1793. Having received orders from the Convention to put up the arms of the republic over the consular house, instead of those of the *ci-devant* royalty, the popular furor was excited; and, though Basseville himself, being a man of moderate principles, was against the measure, the blind zealots of superstition stabbed him in the belly with a razor, in the house of Moutte the banker, which they afterwards plundered and burnt, calling out 'Long live the pope!—Long live religion!' &c. Basseville died in thirty-six hours; and the convention decreed a pension to his widow, with reversion to his child, whom they also decreed to be educated at the public expense.

BASSI (Laura), a celebrated Italian lady, of the eighteenth century. She received a liberal education, not only in the branches considered as belonging to her sex, but in the languages and sciences; and such was her progress in learning, that in 1732, she got the title of Doctor of Philosophy. In 1745 she read lectures on experimental philosophy, and continued to do so during her life. She married Dr. Verati, and preserved an excellent character, as the practiser of every virtue. She died in 1778.

BASSIA, a genus of the monogynia order, belonging to the dodecandria class of plants, the characters of which are: The cal. is quadriflorous; the cor. octofid, with the tube inflated; the stam. are fifteen; and the drupe is quinquesperous. There is but one species, viz. *B. longifolia*, native of Malabar.

BASSIGNY, a district of France, belonging, before the revolution, to Upper Champagne, and the duchy of Bar. At present it is included in the department of the Upper Marne, with the exception of some small portions which are in the departments of the Vosges and Meuse. There is in it a small town of the same name, but the chief places are Chagny, and Vaucouleurs.

BASSINGTHWAITE, or **BASSINTHWAITE**, WATER, a lake in Cumberland, four miles long, and one broad, having on one side the vale of Basingthwaite, and on the other Skiddaw, and on the other the steep woody mountains of Withop.

BASSO, in music, or by similes the bass, but sometimes a species of music for several voices, the singing bass is more particularly so called. Thus also,

BASSO CONCERTANTE, or **RICHIANTE**, implies the bass of the little chamber, which plays throughout the whole piece.

BASSO CONTINUO, the continual or thorough bass, distinguished with figures over the notes, for the organ, harpsicord, or theorbo. It originally meant the accompaniment to the higher parts of a sonata, &c. in whatever cliff it was written.

BASSO RILIEVO. Italian. In sculpture, a modern term for that kind of sculpture in which the figures do not stand out from the ground in their full proportion. The term belongs exclusively to later times. Pliny (xxxiii. 11.) applies the word *αναγλυπτα* to workmanship of this kind; but it is a term by no means so distinctive as the Italian *basso-rilievo*. All works in sculpture are classed as *bassi rilievi* when the subjects represented are not isolated, but adherent to the ground, whether they are of a similar or different material, and applied or fixed to the ground, or form a part of the material in which they are wrought. There are three sorts of relief in sculpture, alto rilievo, mezzo rilievo, and basso rilievo. Strictly taken, alto rilievo is that relief in which the figures are entire, or nearly so, being attached only in a few places, and are relieved from the ground like the metopes of the Parthenon; mezzo rilievo is that in which half the figure stands clear from the ground, and the other appears buried therein; and basso rilievo that in which the figures lose their projecture, and are represented as nearly flat, like the Panathenæic procession of the same temple. Custom, however, has nearly abolished two of these terms; and basso rilievo is often applied to each sort, be the projections what they may.

The true basso rilievo, which has but small projection, requires more skill in the sculptor than that in which the projection is more considerable; because it is extremely difficult to give a natural effect to a figure which is of its proper height and size, but falls short of its real thickness. What is more difficult even than this, in the style of sculpture now under consideration, is picturesque composition in grouping the figures, because the artist cannot, as in painting, employ different backgrounds remote from each other; and as the shadows in sculpture are real, and not imitative, he must calculate his composition, and arrange its form for the light in which it is to be placed.

The ancients used *bassi rilievi* in decorating architectural designs, and in ornamenting their domestic furniture. All nations, however, in the history of the arts have used them, and they resemble in style that of their other works. The Egyptians ornamented their temples with an innumerable quantity of figures and hieroglyphics, of which the greater part have the outlines only sunk, and the area thus formed only painted; but many of them are of the class *bassi rilievi*. (See Denon's Travels in Egypt, Captain Norden, and Dr. Pococke; also the Egyptian sculptures in the British Museum, those brought to Europe by Belzoni, &c.) Their manner of executing these sculptures is singular: they first channelled an outline in the stone, and sunk it round the figure, so that it did not project beyond the original face; being in fact more a species of engraving than sculpture. The cabinet of the royal library at Paris possesses a very curious Egyptian sculpture thus wrought, and many of

the same description are found in Egypt, principally on the frontispieces of the temples where the Scarabeus extends his reign. The Persians were also partial to the use of bassi rilievi, as in the walls of Tschelminar, the ancient Persepolis. (See PERSÉPOLIS.) They are executed in very high relief.

The Etruscans also used bassi rilievi; but Winckelman errs in attributing to this people all those works in which the figures are clothed in draperies, with straight square folds, designed in a stiff formal style like the antique altar of the Cardinal Albani, on which is represented their twelve principal gods. On the contrary, every well informed archæologist allows these and other similar monuments of art to belong to the very earliest period of the Greeks. Some bassi rilievi of clay, painted in water colors, found near the country of the Volscii, which are preserved in the cabinet of Cardinal Borgia, and published under his patronage, prove, beyond a doubt, that the Etruscans, like the Greeks, often painted their sculptural figures.

The bassi rilievi used by the ancients were often formed of baked clay: sometimes of ivory and various metals, but oftener of marble.

Among the most celebrated Greek bassi rilievi of antiquity are those which Phidias carved in ivory, upon the shield and the base of the statue of Minerva at Athens. Those which ornamented the throne of Jupiter Olympus, executed by Alcamenes; those of Apollo, at Amyclæ, in Læonia; the bassi rilievi of the temple of Hercules, at Thebes, executed by Praxiteles; those of the temple of Delphos, the joint work of Praxias and Androstenes; the celebrated funeral monument of Mausolus, called the mausoleum, executed by Scopas, Bryaxis, Timotheus, and Leochares; the thirty-six columns of the temple of Diana, at Ephesus, &c.

The sculptures in the metopes and pediments of the parthenon at Athens, which were entire in the time of Spon, who has described them, are in alto rilievo, like statues affixed to a back ground of marble. Their great size and height preserved them from those accidents to which they would have been liable in a lower situation, and to which, on the same account, they gave a less projection. Many of these invaluable relics of the brightest days of Grecian art, were brought to England by Lord Elgin, and are preserved in the British Museum.

As the greater part of the antique bassi rilievi, now remaining, are executed in marble, they form the principal criterion by which we can judge of the excellency of their sculptors. Many of the best preserved were used to ornament their altars, as is seen in those which are in the museum capitulinum. One of these represents the education of Jupiter, and the others the labors of Hercules. They were also used as decorations to the bases of statues, and oftener to their tombs; and even sometimes to the pedestals or stones on the margin of wells, as may be seen on one belonging to the last-named museum, representing the education of Achilles; and a beautiful one of nymphs and fawns, in the British Museum.

The Romans made use of bassi rilievi to commemorate victories and embellish columns,

triumphal arches, &c. But the greater number now preserved were attached to sarcophagi. The custom of burning their dead had fallen into disuse, partly from a scarcity of fuel, and partly because they had acquired many of the religious opinions of the eastern nations, from whom they adopted the mode of occasionally interring the bodies of their dead in coffins of marble, and other valuable materials. Their numbers at length became immense, both in the city and in the environs of Rome, if we may judge only from those which are to be found in the cabinets of the curious. The bassi rilievi, with which these sarcophagi are ornamented, are usually wrought with little care, and by sculptors of minor talents; but they preserve to us many of the finest compositions of their greatest artists, which were the admiration of antiquity. In many of the Greek bassi rilievi, the face of the deceased only is finished, and many antiquaries, from this circumstance, have conjectured that it was a sort of manufacture in Greece, to make sarcophagi for the Romans, and that they were to be finished after they were sold. The bad style of these sculptures is no reason for supposing that these marbles were not carved in Greece, because in the time of the emperors, the best Grecian artists were removed to Rome, and those of meaner talents remained at home. From the great quantity of marble that Attica, and indeed all Greece, possessed, it is natural to suppose that those sculptors who remained behind in their country would execute bassi rilievi for sarcophagi, when so ready a sale was found for them at Rome. Many archæologists have supposed that the greater part of the compositions which are found on these sarcophagi, were copied from the great masters, of which the originals (as the paintings of Panæus and Polignotus in the Pœkile, &c.) perished, when the cities of Greece were pillaged and ransacked.

The study of the ancient bassi rilievi is of great service in the history of the arts; as from them may be collected many important facts of the mythology, customs, costume, &c. of the ancients. The finest collections of bassi rilievi now existing, are those of the British Museum, formerly the Townly collection; the Elgin marbles in the same museum; the collections of Mr. Thomas Hope, and Mr. Soane, the professor of architecture in the Royal Academy of London; and several fine casts in the Royal Academy. In Paris they had some fine antique bassi rilievi in the Royal Museum; in the museum of the Augustins; and many private collections. The application of bassi rilievi among the moderns is the same as among the ancients; being used to decorate public buildings, palaces, churches, triumphal arches, theatres, concert rooms, and private houses; furniture, tombs, and other subjects of ornamenta. architecture. The most celebrated specimens of bassi rilievi (properly so called) of modern art in England, are those of the tympanum of the pediment of the East India house, by Bacon; the monument of Captain Millar in a pannel of St. Paul's cathedral, by Flaxman. Several others on the public monuments, erected in that cathedral, and in Westminster abbey, by Bacon, Banks, Bacon, jun. Rossi, Chantrey, Kendrick,

Hopper, and Westmacott And on the continent, most of the sculptures are thus decorated, and embrace the names of the most celebrated artists. The French critics particularly admire the bassi rilievi on the Porte St. Denys, begun by Girardon, and finished by Michel Anguier, and those on the Fountain of the Innocents, called the Nymph's Fountain, by the celebrated Jean Goujon.

BASSO RIFIENO, the bass of the ground chorus, or that which plays only in particular places.

BASSO VIOLINO, the bass for the bass viol.

BASSOON, *bas son*, Fr. low sound; an instrument which forms the natural base to the hautbois. It is played like that instrument, with a reed, and forms a continuation of its scale downwards. The reed is fixed to a crooked mouth-piece issuing from the side of the bassoon. Three keys communicate to the ventages which otherwise are too remote for fingering. The Italian name *fagotto* is derived from its appearance; it consists of four tubes bound together so as somewhat to resemble a fagot. Its compass is three octaves, from double AA in the base, to a in the second space of the treble.

BASSORA, **BALSORA**, **BOSSORA**, or **BASRA**, a city between Arabia and Persia, situated in the extremity of the deserts of Irak, a little west of the Tigris, where it is navigable for vessels of 500 tons, and not far from its junction with the Euphrates. It was built by the khaliff Omar, in the fifth year of the Hegira, for the sake of carrying on more commodiously an extensive commerce between the Syrians, Arabians, Persians, and India. It is at present a famous emporium of Eastern commerce, and stands upon a thick stony soil, as the name imports. That mouth of the Tigris which empties itself into the Persian Gulf after passing the town, is called from it, the Bay of Bassora. The circumjacent country is regarded by the Arabs as one of the most delightful spots in Asia, and is certainly one of the most beautiful tracts in the world; however, the hot winds that frequently blow here are very troublesome to travellers, and sometimes overwhelm them with sand. The city is inhabited by Nestorians, Jews, Mahomedans, and Chaldean Christians, or Christians of St. John, which last are pretty numerous. The walls are about seven miles in circuit, and twenty-five feet thick. The city is entered by five gates; but much of this space is occupied by plantations and gardens, interspersed with canals, which are cleansed by the tide flowing into them twice every day, to the height of nine or ten feet. The city is indifferently built: the houses very mean, and constructed chiefly of clay; the streets are irregular, and notwithstanding the advantage of the canals, are kept in a filthy state. Even the bazaars, though containing the richest products of the East, are but miserable edifices. The English factory is the best building in the city. The abbe Raynal describes its trade as consisting of rice, sugar, plain striped and flowered muslins from Bengal, spices from Ceylon and the Molucca islands, coarse white and blue cottons, from Coromandel, cardamum, pepper, sanders-wood, from Malabar, gold and silver stuffs, turbans, shawls, indigo, from Siam, pearls from

Baharin, and coffee from Mocha, iron, lead, and woollen cloth, from Europe. Some of these commodities are shipped on board small Arabian vessels; but the greater part is brought by European vessels. Yet all European commodities are dear here; a decided preference is given to articles of English manufacture, especially broad cloth and watches. Many of the products of other countries are re-exported, and an extensive traffic is carried on in horses, which, being very strong and beautiful, are exported by the English. Its population was estimated by Mr. Parsons, who was here in 1775, at 200,000; but it is now thought not to exceed 60,000; but it is still the second city of the pachalic of Bagdad. It fell into the hands of the Turks, (who took it from the Persians) in 1688; was re-taken by Persia in 1777, but resigned to the Turkish army the following year. The Arabs expelled the Turks in 1787, but the latter, under Soliman Pacha of Bagdad, regained it shortly after, and have held it ever since. It is distant from Ispahan 210 miles south, 903 from Alexandretta, and 1815 south-east from Constantinople. Long. 44° 46' E., lat. 30° 32' N.

BASSOVIA, in botany, a genus of plants of the class pentandria, and order monogynia. Its generic characters are, CAL. perianth one-leaved: cor. one-petalled: STAM. filaments five; anthers ovate: PIST. germ ovate; style short; stigma thickish: PER. berry ovate; seeds very many.—The only species is the *B. sylvatica*, a perennial, native of Guiana.

BASS VIOL. See Bass.

BASSUM, a district in the province of Nandere, in the Nizam's dominions, Hindostan. It has an uneven hilly surface, intersected by several small streams, which flows into the Godavery; and it lies between the twenty-first and twenty-second degrees of north latitude. The chief town is Bassan, which is situated six miles from the Gunga. Very little is known respecting this part of Nandere.

BAST, lime tree bark made into ropes or mats.

BASTAGA, from *βασαζειν*, portare, to carry, the office of carriage or conveyance.

BASTAGARII, in ecclesiastical antiquity, those who carry the images of saints at processions.

BA'STARD, *v. n. & adj.* } *Bastard*, Welch,
BA'STARDIZE, } *bastarde*, Fr. of low
BA'STARDLY, } birth, from base,
BA'STARDY. } and ord. A. S., the
 one signifies mean, disgraceful; and the other source and origin; thus *bastard* means base-born. It is also applied to any thing not proceeding from a legitimate source; to whatever is spurious or mixed. In the earlier writers it is not uncommon to meet with *bast* without the termination *ard*.

When he was arjued, he sent to Harald,
 And said that a *bastard* no kyngdom suld hold.

R. Brunne.

And so shee (queen Anne) putting in obliuion the *bastardyn*g of her daughter, deliuered into king Richard's hands her five daughters, as lambs once again committed to the custodie of the rauencous wolfe.
 Grafton. Richard III.

And oer this he (Sir H. Bolyngbrooke) hadde of *bast*, whiche after were made legyttymat, by dame Katheryne Swynforde iii sonnys.

Fabyan. Ann. 1386. R. 2.

When thou shalt find the catalogue enroll'd
Of thy misdeeds, there shall be writ in text,
Thy *bastarding* the issues of a prince.

Ford's Love's Sacrifice.

Peace is a very apoplexy, lethargy, insensible, a
getter of more *bastard* children than war's a destroyer
of men. *Shakspeare.*

I should have been what I am, had the maiden-
liest star in the firmament twinkled on my *bastard-*
izing. *Id.*

Once she slandered me with *bastardy*;
But whether I be true begot or no,
That still I lay upon my mother's head. *Id.*

Words

But rooted in your tongue; *bastards* and syllables
Of no allowance to your bosom's truth. *Id.*

Score a pint of *bastard*.—
Then your brown *bastard* is your only drink. *Id.*

We are bastards all;

And that most venerable man, which I
Did call my father, was I know not where
When I was stamp't; some coiner with his tools
Made me a counterfeit: yet my mother seem'd
The Dian of that time: so doth my wife
The nonpareil of this. *Donne.*

Good seed degenerates, and oft obeys
The soil's disease, and into cockle strays;
Let the mind's thoughts but be transplanted so
Into the body, and *bastardly* they grow. *Id.*

She lived to see her brother beheaded, and her
two sons deposed from the crown, *bastarded* in their
blood, and cruelly murdered. *Bacon.*

He

That kills himself t' avoid misery, fears it,
And at the best shows but a *bastard* valour.

Massinger.

Of all passions, as I have already proved, love is
most violent, and of those bitter potions which this
love-melancholy affords, this *bastard* jealousy is the
greatest, as appears by those prodigious symptoms
which it hath, and that it produceth.

Burton's Anatomy of Melancholy.

In respect of the evil consequents, the wife's adul-
tery is worse, as bringing *bastardy* into a family.

Taylor.

Him to the Lydian king Lycimnia bare,
And sent her boasted *bastard* to the war.

Dryden.

Men who, under the disguise of publick good,
pursue their own designs of power, and such *bastard*
honours as attend them. *Temple.*

Not more of simony beneath black gowns,
Not more of *bastardy* in heirs to crowns. *Pope.*

A *bastard*, by our English laws, is one that is not
only begotten, but born, out of lawful matrimony.

Blackstone's Commentaries.

And these are men, forsooth!

Heroes and chiefs, the flower of Adam's *bastards*.

Byron.

BASTARDS; in the English law. The cele-
brated Blackstone observes in his Commentaries
on the difference between our common and the
civil and canon law. The civil and canon laws
do not allow the child to remain a *bastard*, if the
parents afterwards intermarry: and herein they
differ most materially from our law; which,
though not so strict as to require that the child
should be begotten, yet makes it an indispensable
condition that it should be born after lawful wed-

lock. And the reason of our law, he continues,
is surely much superior to that of the Roman, if
we consider the principal end and design of
establishing the contract of marriage, taken in a
civil light, abstractedly from any religious view;
which has nothing to do with the legitimacy or
illegitimacy of the children. The main end and
design of marriage, being to ascertain and fix
upon some certain person, to whom the care, the
protection, the maintenance, and the education
of the children, should belong: 1. Because of
the very great uncertainty there will generally be,
in the proof that the issue was really begotten by
the same man; whereas, by confining the proof
to the birth, and not to the begetting, our law has
rendered it perfectly certain what child is legiti-
mate, and who is to take care of the child. 2.
Because by the Roman law a child may be con-
tinued a *bastard*, or made legitimate at the option
of the father or mother, by a marriage *ex post facto*;
thereby opening a door to many frauds and par-
tialities, which by our law are prevented. 3.
Because by those laws a man may remain a *bas-*
tard till forty years of age, and then become legiti-
mate by the subsequent marriage of his parents;
whereby the main end of marriage, the protection
of infants, is totally frustrated. 4. Because this
rule of the Roman law admits of no limitation as
to the time, or number, of *bastards* to be so legiti-
mated; but a dozen of them may, twenty years
after their birth, by the subsequent marriage of
their parents, be admitted to all the privileges of
legitimate children. This is plainly a great dis-
couragement to the matrimonial state; to which
one main inducement is usually not only the
desire of having children, but also the desire of
procreating lawful heirs. Whereas our constitu-
tion guards against this indecency, and at the
same time gives sufficient allowance to the frail-
ties of human nature.

By the law of Scotland, following the canon
law, *bastards* may be legitimated, or made law-
ful, 1. By the subsequent intermarriage of the
mother of the child with the father; and this legiti-
mation entitles the child to all the rights of law-
ful children. The subsequent marriage, which
produces legitimation, is considered by the law
to have been entered into when the child legiti-
mated was begotten; and hence, if he be a male,
he excludes, by his right of primogeniture, the
sons procreated after the marriage, from the suc-
cession of the father's heritage, though these sons
were lawful children from the birth. Hence,
also, those children only can be thus legitimated,
who are begotten of a woman whom the father
might at that period have lawfully married. 2.
Bastards are legitimated by letters of legitima-
tion from the sovereign

A *bastard*, as such, is excluded by the Scottish
law. 1. From his father's succession; because
law knows no father who is not marked out by
marriage. 2. From all heritable succession,
whether by the father or mother; because he can-
not be pronounced lawful heir by the inquest, in
terms of the brief. And, 3. From the movable
succession of his mother; for though the mother
be known, the *bastard* is not her lawful child,
and legitimacy is implied in all succession con-
ferred by law. Yet a *bastard*, though he cannot

succeed *jure sanguinis*, may succeed by destination, where he is specially called to the succession by an entail or testament.

Every attempt to introduce the civil law, in this respect, into England, by declaring children legitimated by a subsequent marriage, has been steadily rejected. It was upon an occasion of this kind, that the barons of England, assembled in the parliament of Merton, A. D. 1272, made that famous answer, '*Nolumus leges Angliæ mutare.*' 20 Hen. III. cap. 9.

From what has been said it appears, that all children born before matrimony are bastards by our law: and so it is of all children born so long after the death of the husband, that, by the usual course of gestation, they could not be begotten by him. But this being a matter of some uncertainty, the law is not exact as to a few days. But if a man dies, and his widow soon after marries again, and a child is born within such a time as that by the course of nature it might have been the child of either husband: in this case, he is said to be more than ordinarily legitimate; for he may, when he arrives at the years of discretion, choose which of the fathers he pleases. To prevent this, among other inconveniences, the civil law ordained, that no widow should marry before she was lactans; a rule which obtained so early, that even in Augustus, if not of Romulus; and the same constitution was probably brought down to our early ancestors from the Romans, being their law in this island: for we find that the Saxon and Danish laws were not different from the Roman law in this respect.

Bastards may be born before the coverture of the mother is begun, or after it is determined; and so children born during wedlock, and in legitimum matrimonium, are bastards. As if the husband, out of the kingdom of England, or as the law books express it, extra quatuor maria, be absent three months, so that no access to his wife be had in that time, her issue during that period is illegitimate. But generally during coverture, the issue of the husband shall be presumed, unless the contrary shall be shown; which is such a presumption, as can only be proved by showing him to be disowned: for the general rule is *presumptio pro legitimatione*. But modern customs have considerably narrowed this rule. It is now held that the husband's being within the country is not conclusive evidence of the legitimacy of the child, and it is left to a jury to determine whether the husband had access or not. 11 W. 3. 275. 2 Str. 925. And evidence may be given, that the husband was from the country, and that he was in that case impotent. 2 Stra. 940. 10 W. 3. 112. 1 S. dk. 123. But in this latter case, the access itself must be proved, and not a presumption of it. In a divorce, *a mensa et thoro*, the issue of the children they are bastards; for the husband and wife continue to be separated, and the husband and wife continue to be in the absence of separation, unless access is proved; and in a voluntary separation by mutual consent, the husband and wife continue to be together, and the husband and wife continue to be in the presence of separation, unless access is proved. So also if there be an apparent access, but no cohabitation, on the part of the husband, the issue shall be only eight years old, or under that age, at the issue of the wife shall be illegitimate, in case of divorce in the

spiritual court a vinculo matrimonii, all the issue born during the coverture are bastards; because such divorce is always upon some cause that rendered the marriage unlawful and null from the beginning.

As to the rights and incapacities which appertain to a bastard: the former are very few, being only such as he can acquire; for he can inherit nothing, being looked upon as the son of nobody, and sometimes called *filius nullius*, sometimes *filius populi*. Yet he may gain a surname by reputation, though he has none by inheritance. All other children have their primary settlement in their father's parish: but a bastard in the parish where born, for he hath no father. However, in case of fraud, as if a woman be either sent by order of justices, or comes to beg as a vagrant, to a parish which she does not belong to, the bastard shall, in the first case, be settled in the parish from whence she was illegally removed; or in the latter case, in the mother's own parish, if the mother be apprehended for her vagrancy. Bastards also born in any licensed hospital for pregnant women, are settled in the parishes in which the mothers belong. The incapacity of a bastard consists principally in this, that he cannot be heir to any one; for being *nullius filius*, he is therefore of kin to nobody, and has no ancestors from whom any inheritable blood can be derived. Therefore, if there be no other claimant upon an inheritance than such illegitimate child, it shall escheat to the lord. And as bastards cannot be heirs themselves, so neither can they have any heirs but those of their own bodies. For as all collateral kindred consists in being derived from the same common ancestor, and as a bastard has no legal ancestors, he can have no collateral kindred; and consequently can have no legal heirs, but such as claim by a lineal descent from himself. And therefore, if a bastard purchases land, and dies seised thereof without issue, and intestate, the land shall escheat to the lord of the see. A bastard was also, in strictness, incapable of holy orders; and though that were dispensed with, yet he was utterly disqualified from holding any dignity in the church; but this doctrine seems now obsolete; and in all other respects there is no distinction between a bastard and another man. And really any other distinction but that of not inheriting, which civil policy renders necessary, would, with regard to the innocent offspring of his parent's crimes, be odious, unjust, and cruel, to the last degree; and yet the civil law, so boasted of for its equitable decisions, made bastards in some cases incapable even of a gift from their parents. A bastard may, lastly, be made legitimate and capable of inheriting by the transcendent power of an act of parliament, and not otherwise: as was done in the case of John of Gaunt's bastard children, by a statute of Richard II.

The principal duty of parents to bastard children, by the English law, is that of maintenance. For though bastards are not looked upon as children to any civil purposes; yet the ties of nature, of which maintenance is one, are not so easily dissolved; and they hold indeed as to many other intentions; as particularly that a man shall not marry his bastard sister or daughter, &c. The

method in which the English law provides maintenance for them is as follows: When a woman is delivered, or declares herself with child, of a bastard, and will by oath before a justice of the peace charge any person with having got her with child, the justice shall cause such person to be apprehended, and commit him till he gives security, either to maintain the child, or appear at the next quarter-sessions to dispute and try the fact. But if the woman dies, or is married, before delivery, or miscarries, or proves not to have been with child, the person shall be discharged; otherwise the sessions, or two justices out of the sessions, upon original application to them, may take order for the keeping of the bastard, by the charging of the mother or the reputed father with the payment of money or other sustentation for that purpose. And if such putative father, or lewd mother, run away from the parish, the overseers by direction of two justices may seize their rent, goods and chattels, in order to bring up the said bastard child. Yet such is the humanity of our laws, that no woman can be compulsively questioned concerning the father of her child till one month after her delivery; which indulgence is, however, very frequently a hardship upon parishes, by giving the parents opportunity to escape.

By the stat. 18 Eliz. c. 3, two justices may take order for the punishment of the mother and reputed father; but what that punishment shall be, is not therein ascertained: though the contemporary exposition was, that a corporeal punishment was intended. By stat. 7 Jac. I. c. 4. a specific punishment, viz. commitment to the house of correction, is inflicted on the woman only. But in both cases, it seems that the penalty can only be inflicted if the bastard becomes chargeable to the parish; for otherwise the very maintenance of the child is considered as a degree of punishment. By the last mentioned statute the justice may commit the mother to the house of correction, there to be punished and set on work for one year; and in case of a second offence, till she find surety never to offend again. It was enacted by statute 21 Jac. I. c. 27. that if any woman be delivered of a child, which if born alive, should by law be a bastard, and endeavours privately to conceal its death, by burying the child or the like; the mother so offending shall suffer death, as in the case of murder, unless she can prove by one witness at least that the child was actually born dead. This law is to be met with also in the criminal codes of many other nations of Europe; as the Danes, the Swedes, &c. but it has been repealed by 43 Geo. III. c. 58. called Lord Ellenborough's act. Women can only be convicted of murder in this case on proof of the child being actually born alive: but in all cases when a child would have been a bastard, are punishable for concealment of birth, whether the child be born alive or otherwise, by imprisonment for two years.

BASTARDS, in history, a troop of banditti who rose in Guienne about the beginning of the fourteenth century, and joining with some English parties, ravaged the country, and set fire to the city of Saintes. Mezeray supposes them to have consisted of the natural sons of the nobility of Guienne, who being excluded the right of inhe-

riting from their fathers, put themselves at the head of robbers and plunderers to maintain themselves.

BASTARDS, in the sea language, large sails of a galley, which will make way with a slack wind.

BASTARD CEDAR TREE, called guazuma in the West Indies.

BASTARD FLOWER PENCE. See ADENANTHERA. The flowers of this plant bruised and steeped in breast milk are a gentle anodyne, for which purpose they are often given in the West Indies to quiet very young children. The leaves are used in Barbadoes and the Leeward islands. In Jamaica the plant is called Sena.

BASTARD HEMP. See DATISCA

BASTARD ROCKET. See RESED.

BASTARD SCARLET is a name given to red dyed with bale-madder, as coming nearest the bow-dye, or new scarlet.

BASTARD STAR OF BETHLEHEM. See ALBUCA.

BASTARDY, according to Eustathius, was held among the Greeks as honorable as legitimacy, down even to the time of the Trojan war; but the course of antiquity seems against him. The ancient Greeks indeed, appear to have been proud of their reputed descent from the gods, but Potter and others show that there never was a time when bastardy was not a disgrace. In the time of our William the Conqueror, however, it seems not to have implied any reproach, that monarch himself not scrupling to assume the appellation of bastard. His epistle to Alan, count of Bretagne begins, Ego Willielmus, cognomento bastardus.

BASTARDY, in relation to its trial in law, is distinguished into general and special.

BASTARDY GENERAL, is a certificate from the bishop of the diocese, to the king's justices, after inquiry made, whether the party is a bastard or not, upon some question of inheritance.

BASTARDY SPECIAL, is a suit commenced in the king's courts, against a person that calls another a bastard.

BASTARDY, ARMS OF, should be crossed with a bar, fillet, or traverse, from the left to the right. They were not formerly allowed to carry the arms of their father, and therefore they invented arms for themselves; and this is still done by the natural sons of a king.

BASTARNÆ, or BASTERNÆ, a people of German original, manners, and language, who extended themselves a great way to the east of the Vistula, the east boundary of Germany among the Sarmatæ, as far as the mouth of the Ister and the Euxine, and were divided into several nations.

BASTARNICÆ ALPS, in ancient geography, mountains extending between Poland, Hungary, and Transylvania, called also the Carpets, and now the Carpathian mountains.

BASTAVOE, a bay on the east side of Yell, one of the Shetland islands. Long. 1° 16' W., lat. 60° 59' N.

BASTE',
 BASTINA'DE, v. & n. } Participle pass. *basted*,
 BASTINA'DO, v. & n. } or *basten*. Fr. *bastonner*.
 BASTINA'DO, v. & n. } *Bazata*, in the Armorick
 dialect, signifies to strike with a stick; from
 which perhaps *baston* a stick, and all its deriva-
 tives, or collaterals, may be deduced; to strike,

beat, bang, bethwack with a cudgel; so *Cotgrave*.
Applied to noisy abuse with the tongue.

What cannoneer bogot this lusty blood?
He speaks plain cannon, fire, and smoke and bounce;
He gives the *bastinado* with his tongue;
Our cars are cudgell'd; not a word of his
But buffets better than a fist of France.
Zounds! I was never so bethump'd with words
Since I first call'd my brother's father dad.

Shakspeare.

But this courtesy was worse than a *bastinado* to
Zelmane; so with rageful eyes she bade him defend
himself. *Sidney.*

I am not apt upon a wound,
Or trivial *basting*, to despond;
Yet, I'd be loth, my days to curtail.

Hudibras.

The beaten soldier proves most manful,
That like his sword endures the anvil,
And justly's held more formidable,
The more his valour's malleable.

But he that fears a *bastinado*,
Will run away from his own shadow.

Id.

Quoth she, I grant it is in vain
For one that's *basted* to feel pain;
Because the pangs his bones endure
Contribute nothing to the cure.

Id.

Bastings heavy, dry, obtuse,
Only dulness can produce;
While a little gentle jerking
Sets the spirits all a-working.

Swift.

Nick seized the longer end of the cudgel, and with
it began to *bastinado* old Lewis, who had slunk into a
corner, waiting the event of a squabble. *Arbuthnot.*

In Turkey, says Montesquieu, where little regard
is shown to the lives and fortunes of the subject, all
causes are quickly decided. The bashaw, on a sum-
mary hearing, orders which party he pleases to be
bastinadoed, and then sends them about their business.

Blackstone's Commentaries.

BASTE, v. To baste meat; to drop butter, or
any thing else upon it as it turns upon the spit.
This was formerly with a stick covered with fat,
and it is therefore probable, that the term to
baste, to strike with a stick, came at length to be
thus employed.

Sir, I think the meat wants what I have, a *basting*.
Shakspeare.

The fat of roasted mutton falling on the birds, will
serve to *baste* them, and so save time and butter.

Swift.

BASTE, v. *Basten.* To sew or stitch together
slightly. *Fr. baster,* to stitch.

And on her legs the painted buskins wore,
Basted with bands of gold on every side;
And mailes betweene; and laced close afore.

Spenser. Faerie Queene.

Shall the proud Lord

That *bastes* his arrogance with his own seam,
And never suffers matter of the world
Enter his thoughts; save such as do revolve
And ruminat himself, shall he be worshippt;
Of that we hold an idol more than he.

Shakspeare. Troilus and Cressida.

BASTERNA, a kind of vehicle, or chariot,
used by the ancient Roman ladies. Papias thinks,
that *Basterna* was first written for *vesterna*, but
the word seems better derived from the Greek
βαστα, porto, I carry. Salmasius observes, that
the *basterna* succeeded the *lectica*, or litter; from
which it differed very little, except that the litter
was borne on the shoulders of slaves, and the
basterna drawn by beasts. The inside they cal-

led the *cavea*, or cage: it had soft cushions of
beds, and glasses on each side like our chariots.
Basternæ passed from Italy into Gaul, and thence
into other countries; and to this we owe our
chariots, which, though we call them *currus*, yet
they have no conformity to the ancient *currus*,
but are in effect *basternæ* improved. The *bas-
terna* appears also to have been used in war, for
carrying baggage.

BASTI, in ancient geography, a town of the
province of *Batica* in Spain, situated to the west
of the *Campus Spartarius*, now called *Baza* in
Granada.

BASTIA, a sea-port town of *Albania*, in *Thu-
rkey* in Europe, over against the island of *Corfu*.

BASTIA, a town of the island of *Corsica*, on
the north-east coast, seated on a hill, in the form
of an amphitheatre. It is ill built, and has nar-
row streets, but is defended by a citadel, and has
a safe but not very commodious harbour. The
inhabitants carry on a considerable trade in wine,
skins, pulse, oil, and figs, and the stiletos made
here are much valued by the Italians. In 1745,
it was bombarded and taken by the English, but
restored to the Genoese the following year. The
Austrians and Piedmontese besieged it unsuccess-
fully in 1748. It was annexed to France in 1768,
and with the exception of a short period after its
capture by the English in 1794, has remained
ever since in the hands of that power. It con-
tained a population of 11 or 12,000 souls, and
before the French revolution it was the capital of
the island, the seat of the governor, and of the
principal offices of state, and courts of justice.
It was also the see of the bishop of *Marian* and
Acci. On the new modelling of the French terri-
tory in 1791, it was created the capital of the
department of the *Golo*, and subsequently the head-
quarters of the twenty-third military division.
It is now the chief town of an *arrondissement* in
the department of *Corsica*, the residence of a sub-
prefect, and the seat of a civil and a commercial
tribunal. Thirty-three miles E.N.E. of *Calvi*,
and fifty-eight north-east of *Ajaccio*. Long. 9°
26' 30" E., lat. 42° 41' 36" N.

BASTIDE DE CLERENCE LA, a town of *Lower
Navarre*, France, the head of a canton in the
department of the *Lower Pyrenees*, *arrondissement*
of *Bayonne*. It is about six miles E. S. E. of
Bayonne, and has 2000 inhabitants.

BASTIDE, LA, a town of France, in *Quercy*,
the head of a canton in the department of the
Lot, *arrondissement* of *Gourdon*, with 1200
inhabitants, ten miles south-east of *Gourdon*.

BASTIDE DE SERON, LA, a town of France, in
the county of *Foix*, department of the *Arriege*,
arrondissement of *Pamiers*, with 1760 inhabitants,
nine miles W. N. W. of *Foix*, and twelve north-
west of *Tarason*.

BASTILLE, or } *Bastille, Fr., bastide, Sp.*
BASTILE, } from French *bastir*, to build,
BASTILLIONS. } probably from the Greek
and Latin *basis*, q. d. *basitare*, i. e. to raise upon
a basis or foundation; applied to military for-
tresses, and to places of special defence, and of
confinement.

These lodes caused *bastiles* to be made rounde
about the cytic, with which they troubled their ene-
mies and assaulted the walles. *Hall. King Henry VI.*

The same season there was a capytayne at Calais, Sir Johan DeLarnes, who receyued the byshoppe and his company with grete ioye; and so they landed lytell and lytell, and all their horses and baggage, and so lodged in Calais, and thereabout in *bastylles* that they made dayly. *Froissart. Cronycle, v. i. c. 329.*

Our soldiers rose at the call of their captains, and removed their munitions farr from the wall, providing to fight more close and short along the high *bastiles*, or countermures, which now, that they were finished, overtopped the walls. *Holland. Amnicianus.*

Thus fortune fares her children to empound,
Which on her wheel their *bastiles* bravely becd.
Mirror for Magistrates.

Near which these stands

A *bastile* built to imprison hands. *Hudibras.*

BASTILE, anciently used as a common name for a prison, under the feudal system in our own country, was a name particularly applied to several state prisons in France: but that which was termed the *bastile*, by way of distinction, was situated near the gates of Paris, on the road to St. Anthony. The building was originally commenced by order of Charles V., and finished in 1383 under the reign of his successor. The original projector was Hugh d' Aubriot, mayor of Paris, who laid the first stone of the foundation on the 22d of April, 1370. Descended from an obscure parentage, this person had been raised by his merit into the favor of his sovereign, and so unqualified was the confidence reposed in him, that the charge of the capital was committed exclusively to his care.

The *bastile*, as planned by d' Aubriot, consisted only of two round towers, one on each side of the road leading into Paris, from the suburbs of St. Anthony, and united by means of a strong high wall, in the centre of which was the gate of the town. Several additional towers were afterwards erected, and in the succeeding reign two complete courts were formed by means of intervening walls, which composed the body of the edifice. The road itself turned off to the right of the castle, and left the whole building enclosed by a deep ditch, and secured by a counterscarp of nearly thirty-six feet from the bottom. The usual entry into the *bastile* was from St. Anthony street. Above the first gate was an armoury, and on the right side of the entrance a guard room. The first enclosure, from which a gate led to the arsenal, contained barracks for the garrison, coach houses and stables for the governor and officers, shops for the sutlers, &c. A draw-bridge led from the court into the second enclosure, on entering which, was a guard-room to the left, and the governor's house to the right; and at the end a terrace, on which stood a pavilion, with beautiful walks, shaded with rows of trees. Opposite the governor's house was the entrance into the castle, and between the two were kitchens and other conveniences, erected on a blind bridge thrown across the ditch. From the second court was a draw-bridge, which led into the castle, and within the gate was another guard-room. The first court was 102 feet long, and seventy-two broad. It had six towers, and was terminated by a modern building, on the ground-floor of which was the council chamber and library, and over it the apartments of the Lieutenant du Roi, the surgeon, major, and other

officers, together with some rooms appropriated for prisoners of distinction. The second court was seventy-two feet long, and forty-two broad, containing two towers, and lodgings for persons belonging to the castle.

The prisoners were chiefly confined in the towers of the *bastile*, the entrances to which were secured by double doors of oak, and conducted to a winding stair-case, lighted by narrow grated windows, which led to the rooms above, and the dungeon below. The dungeons had no fire place, and instead of windows a small crevice towards the ditch, that served the twofold purpose of letting in air and light. They were arched, paved, and lined with stone, and were said to be places for the temporary punishment of those unhappy persons who might attempt to make their escape. In these dungeons the unfortunate princes of Armagnac, sons of James, who was beheaded, were confined by Louis XI., the oldest of whom lost his senses in prison, and the youngest, obtaining his liberty on the death of the tyrant, related a tale of suffering which, if it were not corroborated by the most unqualified evidences, would almost exceed belief. Above each of these dungeons were four stories, containing each a single room, some of them having a small dark closet adjoining them, indented in the thickness of the wall. The rooms had each one window, glazed within, and doubly grated, one near the centre of the wall, and again at its exterior surface. Each room had a fire place and stove, the vents of the chimneys being secured by strong iron grates. The double doors were secured by several locks and bars, and many of the rooms had double ceilings; the first was composed of lath and plaster, and the second of oak, supporting the floor of the room immediately above. The walls and ceilings of these apartments were all plastered and white-washed, and the floors laid with tile or stone; they were perfectly dry, owing to the extreme thickness of the building, being nearly seven English feet in diameter at the top, and gradually increasing downwards to the foundation. The three first stories were irregular polygons of about eighteen feet in diameter, and as many in height; but the fourth, or top room, called *calotte*, was neither so large nor so high as the others, and was arched to support the stone roof or platform with which it was overlaid.

Such was the place of horror, in which hundreds were confined at the caprice of an arbitrary monarch, or minister; and so rigidly were the wretched victims concealed, that many have been shut up for years, cut off from all communication with mankind, except the turnkeys and keepers of the prison, and neither friends nor relations have known what was become of the persons so mysteriously lost.

The officers who had the charge of the *bastile* were a governor, lieutenant du roi, a mayor, two adjutants, a surgeon and his assistant, a chaplain, and four turnkeys: these, with a company of invalids and officers, lodged in the castle; besides whom, a physician, two priests, a keeper of records, a clerk, a superintendent of buildings, and an engineer, who lodged in the town, his services being only occasionally required.

The king allowed the governor a daily sum for the maintenance of each prisoner, according to his rank in Society; namely,

	Livres.
For a prince of the blood	50 per day.
For a marshal of France	36
For a lieutenant-general	24
For a person of quality or a member of parliament	15
For an ordinary judge, a priest, or persons in the finances	10
For a respectable citizen	5

which, together with an additional salary for firing, candles, washing, &c., more than indemnified him for the expensos of the prison.

The mode of arresting prisoners was by lettres de cachet, which were sometimes signed by the king himself, and always countersigned by the minister of Paris, or one of the secretaries of state. We subjoin the following as a copy of one of these fatal instruments.

‘MON COUSIN,

‘Etant peu satisfait de votre conduite, je vous fais cette lettre, pour vous dire, que mon intention est qu’ aussitôt qu’ elle vous aura été remise, vous ayez à vous rendre en mon château de la Bastille, pour y rester jusqu’ à nouvel ordre de moi. Sur ce je prie Dieu qu’il vous ait, mon Cousin, en sa sainte garde. Ecrit à Versailles, 25 Juin, 1748.

‘Signé, Louis,

‘Voyer d’ Argenson.’

The above was inscribed,

‘A mon Cousin, le Prince de Monaco, Brigadier en mon Infanterie.

Every prisoner, on coming to the Bastille, had an inventory made of every thing about him. His trunks, clothes, linen, and pockets, were searched, to discover whether there were any papers in them relative to the matter for which he was apprehended. It was not usual to search persons of a certain rank; but they were asked for their knives, razors, seissors, watches, canes, jewels, and money. These were put into a box, and labelled, with the tower and number of the chamber in which he was to be confined, and by which he was afterwards called: so that the name of a prisoner was never pronounced, nor even known, among the inferior officers of the Bastille, the appellation being No. 1, de la B. raudiere; No. 2, du Trésor; No. 3, de la Liberté, &c.

After this examination of his person, the prisoner was usually conducted to his apartment, where he was carefully locked up, and an invalid soldier appointed to attend him, who slept near him and waited upon him. The unhappy victim soon found that in this castle all was mystery, trick, artifice, and treachery; the attendant conveyed all his words to the police, while the officers, turnkeys, valets, &c. used every effort to draw him on to speak against government, merely for the purpose of getting a reward for revealing what was said. On a prisoner’s first entrance, he was not permitted to write to any person, not even the lieutenant of the police. When a per-

son had obtained permission to write to the latter gentleman, he might solicit the indulgence of being allowed to address a letter to his family, and receive their answers, which on some occasions was granted; but letters when sent were commonly intercepted, and seldom delivered to the friends. The officers of the staff took the charge of conveying the letters of the prisoners to the police, by whom they were sent regularly twice a day, and suitable answers were addressed to the major, who communicated them to the prisoner; but if no notice was taken of any request contained in the letter of the prisoner, it was to be considered as a refusal. A criminal might ask to see the lieutenant of the police when he came to the Bastille, and in that case the conversation always turned upon the cause of his confinement. This gentleman would sometimes ask for written and signed declarations, and on these occasions nothing that the prisoner wrote or said was forgotten. A person confined in the Bastille was never anticipated in any thing—he must ask for every thing; even for permission to be shaved, an office always performed by the surgeon; who also furnished sick or indisposed persons with sugar, coffee, tea, chocolate, confections, and the remedies necessary for their complaints. Their hour of dining was eleven, and of supping, six; and the time allowed for walking was commonly one hour in the day, sometimes an hour in the morning and an hour in the evening, in the great court of the fortress.

To give the reader some imperfect idea of the internal discipline of the Bastille, under its mildest regime, we shall quote a short extract from the account of a prisoner, once confined there.—‘About five in the morning,’ says he, ‘on the 2d of April, 1771, I was awaked by a violent knocking at my chamber door, and was commanded in the name of the king to open it. I did so, and an exempt of the police, three men and a commissary, entered my room. They desired me to dress myself, and began to search the apartment. They ordered me to open my drawers; and having examined my papers, they took such as they chose and put them into a box, which, as I understood afterwards, was carried to the police-office. The commissary asked me my name, my age, the place where I was born, how long I had been at Paris, and the manner in which I had spent my time. The examination was written down; a list was made of every thing found in the room, which, with the examination, I was desired to read, and sign. The exempt then told me to take all my body-linen, and such clothes as I chose, and to come with them. Having shut and sealed the drawers, they desired me to follow; and in going out they locked the chamber door, and took the key. On coming into the street I found a coach, into which I was desired to go, and the others followed me. After sitting for some time, the commissary told me they were carrying me to the Bastille, and soon afterwards I saw the towers. They did not go the shortest and direct road: the coach stopped at the gate in the street of St. Anthony. I saw the coachman make signs to the sentinel, and soon after the gate was opened; the guard was under arms, and the gate shut again. On coming

to the first draw-bridge, it was let down, the guard there also being under arms. The coach went on and entered the castle, where a third guard was stationed. I was conducted to a room that I heard named the council chamber. After an examination similar to that of the commissary, I was desired to empty my pockets, and lay what I had in them on the table. My handkerchief and snuff-box being returned to me, my money, watch, and indeed every thing else, were put into a box, and an inventory having been made, were sealed up in my presence. The major then called for the turnkey, whose turn of duty it was, and asked what room was empty. He said the *calotte de la Bertaudiere*. He was ordered to convey me to it, and to carry thither my linen and my clothes. The turnkey having done so, left me and locked the doors. The weather was still extremely cold, and I was glad to see him return soon after with fire-wood, a tinder-box, and a candle. He made my fire, but told me, on leaving the tinder-box, that I might in future do it myself when so inclined. At eleven the turnkey entered with my dinner. Having spread the table with a clean napkin, he placed the dishes on it, cut the meat, and retired, taking away the knife; the dishes, plates, fork, spoon, and goblet were of pewter. The dinner consisted of soup and bouillie, a piece of roasted meat, a bottle of good table wine, a pound loaf of the best kind of household bread. In the evening at seven he brought my supper, which consisted of a roast dish, and a ragout. The same ceremony was observed in cutting the meat, to render the knife unnecessary to me. He took away the dishes he had brought for dinner, and returned at eight next morning to remove the supper things. Fridays and Saturdays, being fast or *maigre* days, the dinners consisted of soup, a dish of fish, and two dishes of vegetables; the suppers of two dishes of garden-stuff, and an omelet, or something made with eggs and milk. The dinners and suppers of each day in the week were different, but every Friday was the same; so that the ordinary class of prisoners saw in the course of the first week their bill of fare for fifty years, if they staid so long. I had remained in my room about three weeks, when I was one morning carried down to the council chamber, and again examined by the commissary. He then asked if I had any knowledge of some works he named, meaning those which had been written by me, if I was acquainted with the author of them, whether there were any persons concerned with him, and if I knew whether they had been printed? I told him that as I did not mean to conceal any thing, I should avoid giving him needless trouble; that I was myself the author of the works he had mentioned, and guessed I was there on that account; that they never had been printed; that the work which I conceived was the cause of my confinement had never been shown to any, but one person, whom I thought my friend, and having no accomplices, the offence, if there was any, rested solely with myself. He said my examination was one of the shortest he had ever been employed at, for it ended here. I was carried back to my room, and the next day was shaved for the first time since my confine-

ment, it being usual never to shave a prisoner till after his first examination. A few days afterwards I wrote to the lieutenant of the police, requesting to be indulged with the use of books, pen, ink, and paper, which was granted; but I was not allowed to go down to the library (a collection of about 500 volumes, founded by some prisoner in the early part of the eighteenth century) to choose the books. Several volumes were brought to me by the turnkey, who, when I desired it, carried them back and brought others.

After my last examination I was taken down almost daily, and allowed to walk about an hour in the court within view of the sentinel; but my walks were frequently interrupted, for if any one appeared the sentinel called out '*au cabinet!*' and I was then obliged to conceal myself hastily in a kind of dark closet in the wall.

The sheets of my bed were changed once a fortnight. I was allowed four towels a-week, and my linen was taken to be washed every Saturday. I had a tallow candle daily, and in the cold season a certain number of pieces of fire wood. After being detained above eight months I was informed that an order had come to discharge me. I was desired to go down to the council chamber, every thing I had brought with me was returned, together with the key of my apartment, which I found exactly in the state I left it. During my confinement I wrote many letters to several of my friends, which were always received with civility, but not one of them had been delivered.

The above was a case of uncommon indulgence, and displays a lenity unusual in the Bastille. In common cases the course pursued was as follows:—The prisoner, a few days after his entrance into the Bastille, was brought down to the council chamber, where a commission of interrogatory was executed by the lieutenant of the police, a counsellor of state, a master of requests, a counsellor or a commissioner of the Chatelet. When the lieutenant of the police did not himself interrogate, he casually came at the end of the examination. These commissioners were mere tools. Frequently they attempted to frighten a prisoner: laying snares for him, and employing the meanest artifices to draw a confession from him. With this insidious view, it was customary to pretend proofs, and exhibit papers without suffering him to read them; asserting that they were instruments of unavoidable conviction. Their interrogatories were always vague, and turned not only on the prisoner's own words and actions, but on his most secret thoughts, and on the discourse and conduct of persons of his acquaintance, whom they likewise wished to bring into question. The examiner usually told the prisoner that his life was at stake; that on that day his fate depended on himself; that if he made a fair declaration, they were authorised to promise him a speedy release; but if he refused to confess he would be given up to a special commission: that they were in possession of decisive documents, and authentic proofs, more than sufficient to ruin him; that his accomplices had discovered all; that the government had unknown resources, of which he could have no suspicion. The pri-

soners were thus beguiled by varied and infinitely multiplied interrogatories; by promises, caresses, menaces, &c. If the prisoner made the required confession, the commissioners then told him that they had no precise authority for his engagement, but they had every reason to expect it; that they were going to solicit it, &c. The prisoner's confession, far from bettering his condition, usually gave occasion to new interrogatories, often lengthened his confinement, drew in the persons with whom he had connexions, and exposed himself to new vexations. But although there were rules adapted to all occasions, yet every thing was subject to exceptions arising from influence, recommendation, protection, intrigue, &c. Very frequently, persons confined on the same account were treated very differently, according as their recommendation was more or less considerable. The falsest things were told the prisoners with an air of sincerity and concern; as 'it is very unfortunate that the king has been prejudiced against you. His majesty cannot hear your name mentioned without being irritated. The affair for which you have lost your liberty is only a pretext. They had designs against you before, you have powerful enemies' These discourses were the etiquette of the place. It was in vain for a prisoner to ask leave to write to the king, for he never could obtain it. What constituted the perpetual and most insupportable torment of this cruel and odious inquisition, was the vague, indeterminate, false, or equivocal promises, inexhaustible and constantly deceitful hopes of a speedy release, exhortations to patience, and blind conjectures, of which the lieutenant of the police and his officers were very lavish. To cover the odium of the barbarities exercised here, and slacken the zeal of relations or patrons, to obtain justice for incarcerated innocence, the most absurd and contradictory slanders against the prisoner were frequently published; whilst the true causes of imprisonment, and real obstacles to his release, were concealed. These resources, so infinitely varied, were inexhaustible. When a prisoner who was known and protected had entirely lost his health, and his life was thought in danger, he was always sent out: the ministry not choosing that persons well known should die in the Bastille. Whenever a prisoner happened to die there, he was interred in the Parish of St. Paul, under the name of a domestic; and this falsity was also written in this register of deaths, in order to deceive posterity. But there was another register in which the true names of the deceased were entered; though it was not without great difficulty that extracts could be procured from it: and when this indulgence was granted, the commissary of the Bastille was first to be informed of the use the family intended to make of the extract.

SINGULAR DISTRESS OF AN AGED PRISONER IN THE BASTILLE. Nowhere else on earth, perhaps, has human misery, by human means, been rendered so lasting, so complete, or so remediless, as within the dire walls of the Bastille of France. This the following case, the particulars of which are translated from that elegant and energetic writer M. Mercier, may sufficiently show. The heinous offence which merited an imprisonment

surpassing torture, and rendering death a blessing, though for obvious reasons not specified by our author, is known from other sources to have consisted in some unguarded expression of disrespect towards the Gallic monarch Louis XV. Upon the accession of his late unfortunate successor, the ministers then in office, moved by humanity, began their administration with an act of clemency and justice: they inspected the registers of the Bastille, and set many of the prisoners at liberty. Among the number was an old man, who had groaned in confinement, for a period of forty-seven years, between four thick and cold stone-walls. Hardened by adversity, which strengthens both the mind and the constitution, when men are not overpowered by it, he had resisted the horrors of his long imprisonment with an invincible and manly spirit. His locks, white, thin, and scattered, had almost acquired the rigidity of iron; whilst his body, envired for so long a time by a coffin of stone, had borrowed from it a firm and compact habit. The narrow door of his tomb, turning upon its grating hinges, opened not as usual by halves; and an unknown voice announced his liberty, and bade him depart. Believing this to be a dream, he hesitated; but at length rose up and walked forth with trembling steps, amazed at the space he traversed: the stairs of the prison, the halls, the court, seemed to him vast, immense, and almost without bounds. He stopped from time to time, and gazed around like a bewildered traveller: his vision was with difficulty reconciled to the clear light of day: he contemplated the heavens as a new object: his eyes remained fixed, and he could not even weep. Stupified with the newly acquired power of changing his position, his limbs, like his tongue, in spite of his efforts, refused to perform their office; at length he got through the formidable gate which so long before had closed upon him. When he felt the motion of the carriage designed to convey him to his former habitation, he screamed out, and uttered some inarticulate sounds; and as he could not bear this new movement, he was obliged to descend. Supported by a benevolent arm, he sought out the street where he had formerly resided: he found it, but no trace of his house remained: one of the public edifices occupied the spot where it had stood. He now saw nothing that brought to his recollection, either that particular quarter, the city itself, or the objects with which he had formerly been acquainted. The houses of his nearest neighbours, which were fresh in his memory, had assumed a new appearance. In vain were his looks directed to all the objects around him; he could discover nothing of which he had the smallest remembrance. Terrified, he stopped and fetched a deep sigh. To him, what did it import that the city was peopled with living creatures? none of them were alive to him; he was unknown to all the world, and he knew nobody: and whilst he wept, he regretted his dungeon. At the name of the Bastille, which he often pronounced, and even claimed as an asylum, and the sight of his clothes that marked a former age, the crowd gathered round him: curiosity, blended with pity, excited their attention.

The most aged asked him many questions, but had no remembrance of the circumstances he recapitulated. At length accident brought in his way an ancient domestic, now a superannuated porter, who, confined to his lodge for fifteen years, had barely sufficient strength to open the gate: he did not even know the master he had served; but informed him that grief and misfortune had brought his wife to the grave thirty years before, that his children were gone abroad to distant climes, and that of all his relations and friends none now remained. This recital was made with the indifference which people discover for events long passed, and almost forgotten. The miserable man groaned, and groaned alone. The crowd around, offering only unknown features to his view, made him feel the excess of his calamities even more than he would have done in the dreadful solitude that he had lately quitted. Overcome with sorrow, he presented himself before the minister, to whose humanity he owed that liberty which was now a burden to him. Bowing down, he said, 'restore me again to that prison from which you have taken me: I cannot survive the loss of my nearest relations; of my friends; and, in one word, of a whole generation. Is it possible in the same moment to be informed of this universal destruction, and not to wish for death? This general mortality, which to the rest of mankind comes slowly and by degrees, has to me been instantaneous, the operation of a moment. Whilst secluded from society, I lived with myself only; but here I neither can live with myself nor with this new race, to whom my anguish and despair appear only as a dream. There is nothing terrible in dying; but it is dreadful indeed to be the last.' The minister was melted; he caused the old domestic to attend this unfortunate person, as only he could talk to him of his family. This discourse was the single consolation that he received: for he shunned all intercourse with a new race, born since he had been exiled from the world; and he passed his time in the midst of Paris in the same solitude as he had done whilst confined in a dungeon for almost half a century. But the mortification of meeting no person who could say to him, 'we were formerly known to one another,' soon put at end to his existence.

The man with the mask was the most astonishing prisoner ever known to have been within the walls of the Bastille; of whom, notwithstanding all the curiosity and conjecture that have been employed to ascertain his quality and pedigree, nothing authentic has transpired to the present time. In 1698 he was brought from the island of St. Marguerite by Mons. de St. Mars, the newly appointed governor of the Bastille, was attended with the greatest respect, maintained a sumptuous table, and had every possible indulgence shown him till the time of his death in Nov. 19, 1703. This mysterious prisoner, on his removal to the Bastille, was carried in a litter, accompanied by several men on horseback, who had orders to put him to death if he made the smallest attempt to show his face or otherwise discover himself. His face was concealed by a mask of black velvet with springs of steel, which were so contrived

that he could eat without taking it off. A physician of the Bastille, who had often attended him, said he had never seen his face, though he had frequently examined his tongue and other parts of his body; but added, that he was admirably well made, that his skin was brown, his voice interesting; that he was very accomplished, read much, played on the guitar, and had an exquisite taste for lace and fine linen.

The pains taken for his concealment shows that he was a person of considerable quality and importance, and from the following circumstances it appears singular that he was never discovered. Whilst at St. Marguerite, he one day wrote something with his knife on a silver plate, and afterwards threw the plate through the window towards a boat which lay near the tower. A fisherman took up the plate and brought it to the governor, who, with great astonishment, asked the man if he had read the writing or shown it to any other person; and, although he answered in the negative, put him into confinement till he was perfectly satisfied, after which he dismissed him, saying, 'It is lucky for you that you cannot read.' The abbé Papon says, in the year 1778 I had the curiosity to visit the apartment of this unfortunate prisoner: it looks towards the sea. I found in the citadel an officer in the independent company there, seventy-nine years of age. He told me that his father had often related to him that a young lad, a barber, having seen one day something white floating on the water, took it up. It was a very fine shirt, written almost all over; he carried it to Mons. de St. Mars; who, having looked at some parts of the writing, asked the lad, with an appearance of anxiety, if he had not had the curiosity to read it. He assured him that he had not, but two days afterwards the boy was found dead in his bed.

Mons. de Jonca, for many years Lieutenant du Roi, kept an exact journal of all that passed in the Bastille. He thus records the death of the black mask. 'Monday, Nov. 19, 1703. The unknown prisoner, whom Mons. de St. Mars brought with him from the island St. Marguerite, where he had been a long time under his care, and who has always been masked with a mask of black velvet, found himself worse yesterday in coming from mass and died this evening at ten o'clock, without any great illness. The smell, however, is not less offensive. Mons. Girault, our chaplain, confessed him yesterday, his death being sudden he had not an opportunity of taking the sacraments; but our chaplain exhorted him a few minutes before he expired. He was buried on Tuesday, the 20th of November, in the burying-place of our parish of St. Paul. His burial cost forty livres.'

Immediately after the prisoner's death his apparel, linen, clothes, mattresses, and every thing that had been used by him, were burnt; the walls of his room were scraped, the floor was taken up, and every precaution used that no trace of him might be left behind; and yet there are traces. When he was on the road from St. Marguerite to his last residence, Mons. de St. Mars was overheard to reply to a question of the prisoner, relative to any design against his life. 'No, prince, your

life is in safety; you must only allow yourself to be conducted.' A prisoner told Mons. la Grange Chancel that he was lodged, with other prisoners, in the room immediately over this celebrated prisoner, and found means of speaking to him by the vents of the chimney; but he refused to inform them who he was, alleging, that it would cost his own life, as well as the lives of those to whom the secret might be revealed. Various have been the individuals supposed to be the masked prisoner; particularly the duke de Beaufort, the count de Vermandois, a foreign minister, and the duke of Monmouth, have been conjectured in turn. Collateral facts, nevertheless, demonstrate that neither of these could have been the person. Voltaire, who has expressly written on this mysterious affair, says, that the secret was known to Mons. de Chamillard, and that the son-in-law of that minister conjured him on his death-bed, to tell him the name of the man with the mask; but he replied that it was a secret of state which he had sworn never to divulge. The most singular circumstance of the whole, perhaps, is, that during the confinement of this man with the mask no person of importance was missing in Europe; whence it has been thought that he was the twin brother of Louis XIV., whose birth was concealed by the advice of cardinal Richelieu, but himself preserved, lest, by the death of his brother, it should be necessary to avow him.

Upon the whole, after a long series of oppressions, the horrors of the Bastille became so notorious that in July, 1789, the people made an attack upon the building, which held out a few hours and afterwards surrendered. The governor was seized, carried through the streets, and afterwards beheaded. The major, aid-major, and lieutenant of the invalids, were killed in the streets. One soldier was killed and four wounded in the defence; but numbers were wounded, another killed, and two hanged, at the Grève, by the populace, as soon as they gained possession; the prisoners were feasted and made public spectacles in Paris, the governor's house and adjacent buildings were levelled, and the mayor afterwards decreed that the whole edifice should be demolished. See Boulanvilliers' *Histoire de l'ancien Gouvernement*, tom. iii.; *Memoires du Maréchal Duc de Richelieu*. The *History of the Bastille*, Lond. 1790, 8vo.

BASTIMENTOS, several small islands near Terra Firma, in South America, at the mouth of the bay of Nombre de Dios, east of Porto-Bello. These islands form a very good port which serves as a watering-place for smugglers. Here admiral Hosier lay with a British squadron many years ago, and the station being unhealthy it proved fatal to himself and the greater part of his men. Long. 79° 40' W., lat. 9° 32' N. It was on this circumstance that Glover, the author of *Leonidas*, grounded his spirited ballad of Hosier's Ghost.

BASTINADĪ, **BASTONADĪ**, or **BASTONADO**, the punishment of beating a criminal with a stick. It was in use among the ancient Greeks, Romans, and Jews, and still is among the Turks. The Romans called it *fustigatio*, *fustium admonitio*, or *infructus casti*; which differed from the flagellatio, as the former was done with a stick, the

latter with a rod, or scourge. The fustigation was a lighter punishment, inflicted on freemen; the flagellation more severe, and reserved for slaves. It was also called *tympanum*, because the patient here was beaten with sticks, like a drum. It is much used in the East to this day. The method there practised is this: the criminal being laid on his belly, his feet are raised, tied to a stake, and held fast by officers for the purpose, in which posture he is beaten by a cudgel on the soles of his feet, back, chine, &c. to the number of 100 or more blows. Dr. Shaw suggests (*Travels*, p. 253.), that it was probably in this manner that St. Paul was 'thrice beaten with rods.'

BASTION, *n. s.* Fr. *bastion*. A huge mass of earth, usually faced with sods, sometimes with brick, rarely with stone, standing out from a rampart, of which it is a principal part, and was anciently called a bulwark.

And with five bastions it did fence,

As arming one for every sense.

Marvell.

To ward : but how ? ay there's the question :

Fierce the assault, unarm'd the bastion.

Prior.

BASTION, in fortification, a large mass of earth at the angles of a work, connecting the curtains to each other. It is formed by two faces, two flanks, and two demigorges. The two faces form the salient angle, or angle of the bastion; the two flanks form with the faces, the epaulés or shoulders; and the union of the other two ends of the flanks with the curtains, forms the two angles of the flanks. There are various kinds of bastions: such as,—*Bastion composé*, when two sides of the interior polygon are very unequal, making the gorges also unequal. *Bastion cut*, or *Bastion with a tenaille*, is that whose point is cut off, and which instead thereof has a re-entering angle, or an angle inwards, with two points outwards. It is used either when without such a contrivance the angle would be too acute, or when water or some other impediment hinders the carrying on the bastion to its full extent. *Bastion deformed*, is when the irregularity of the lines and angles throws the bastion out of shape; as when it wants one of the demigorges, one side of the interior polygon being too short, &c. *Bastion flat*, is one built in the middle of the curtain, when it is too long to be defended by the usual bastions of the extremities. *Bastion half*, or *Demi-bastion*, also called an epaulement, has but one face and flank. *Bastion solid*, is one entirely filled up with earth to the height of the rampart, without any void space towards the centre. *Bastion void*, or *hollow*, has the rampart and parapet ranging only round the flanks and spaces, so that a void space is left within towards the centre, where the ground is so low that if the rampart be taken, no retrenchment can be made in the centre, but what will lie under the fire of the besieged.

BASTOGNE, or **BASTOGNAC**, a large town of the duchy of Luxemburg, in the Netherlands. It carries on a considerable trade in corn and cattle, and was formerly much more flourishing than at present; but is still, after Luxemburg, the best town in this part of the Netherlands. The French took it in 1688, and demolished the fortifications. Twenty-two miles north-west of Luxemburg, and thirty-five south of Liege.

BASTON, BATON, or BATTON, in heraldry. See **BATTON**.

BASTON, BATOON, in architecture, a moulding in the base of a column, called also **torus**. See **ARCHITECTURE**, **Index**.

BASTON, in law, one of the servants to the warden of the Fleet-prison, who attends the king's courts with a red staff, for taking into custody such as are committed by the court. He also attends on prisoners who are permitted to go at large by licence.

BASTON (Robert), a Carmelite monk, prior of the convent at Scarborough, and poet laureate and public orator at Oxford, in the fourteenth century. Edward I. in his expedition into Scotland in 1304, took Baston with him to celebrate his victories over the Scots; but the poet being taken prisoner, was obliged to change his note, and sing the successes of Robert Bruce. He wrote several books in Latin, on the Wars of Scotland, the Luxury of Priests, Synodical Sermons, &c.; and also a volume of Tragedies and Comedies in English. He died about A. D. 1310.

BASTONIER, or BATONIER, one who keeps the staff of a community, and carries or follows it in processions.

BASTWICK (Dr. John), born at Writtle, in Essex, in 1593. He was educated at Emanuel College, Cambridge, from whence he went to Padua, where he took his degree of M. D. He afterwards practised physic at Colchester; but being a man of warm imagination, and a good Latin scholar, he used great freedom in writing against popery. About 1633 he printed in Holland a Latin treatise, entitled *Elenchus religionis Papisticae, with Flagellum Pontificis et Episcoporum Latialium*, in which the English prelates, thinking themselves aimed at, he was fined £1000 in the high commission court, excommunicated, prohibited from practising physic, his books ordered to be burnt, and himself to remain in prison until he recanted. Instead of recanting, he wrote in prison, *Apologeticus ad præules Anglicanos*; and another book called, *The Litany*; wherein he severely exclaimed against the proceedings, and taxed the bishops with an inclination to popery. He was now condemned by the star-chamber to pay a fine of £5000, to be pilloried, lose his ears, and endure perpetual imprisonment. The parliament in 1640 reversed these proceedings, and ordered Dr. Bastwick a reparation of £5000 out of the estates of the commissioners who had prosecuted him.

BAT, v. & n. **Bat**, Sax. This word seems **BAT'LE**, } to have given rise to a great
BAT'ON, } number of words in many lan-
BAT'TER. } guages; as, *battre*, Fr. to beat;

baton, *battle*, *beat*, *batty*, and others. It probably signified a weapon that did execution by its weight, in opposition to a sharp edge; whence whirlbat and brickbat; a heavy stick or club: the citation of Spenser gives another meaning, which agrees with the provincial usage of the word in Sussex, where a walking-stick is called a *bat*; the *bat* is also now a common word for what was once the stick in driving back the ball at the game of cricket.

But while he spake, lo Judas, oon of the twelve
came, and with him a greet company with swerdis
and battis. *Wicliffe. St. Matt. xxvi. 47.*

Here were we first ybatred with the dartes
Of our owne feers from the hye temples top.

Surrey.

But neither sword nor dagger he did beare;
Seemes that no foes revengement he did feare;
Instead of them a handsome *bat* he held,
On which he leaned, as one far in elde. *Spenser.*
Estsoones the ape himself gan to vpreare
And on his shoulders high his *bat* to beare,
As if good service he were fit to doe. *Id.*

Nay, come not near the old man, keep out, che vor'
ye, or I'se try whether your costard or my *bat* be the
harder. *Shakespeare.*

And I remember kissing of her *batlet* [a handle
used in beating linen when taken out of the buck] and
the cows' dugs that her pretty chopped hands had
milked. *Id.*

They were fried in arm chairs, and their bones
broken with *bats*. *Hakewill.*

We came close to the shore and offered to land;
but straightway we saw divers of the people with
bastons in their hands, as it were forbidding us to
land. *Bacon.*

Get me a *baton*; 'tis twenty times more court-like,
and less trouble; and yet you wear a sword.

Beaumont and Fletcher. Elder Brother.

That does not make a man the worse,
Although his shoulders with *baton*

Be claw'd and cudgell'd to some tune. *Hudibras.*

BAT, } Skinner's conjecture that
BAT'EYED, } this word is derived from the
BAT'TISH, } old Saxon word *bat*, a boat,
BAT'FOWLER, } because the creature it de-
BAT'FWOLING, } scribes, with its wings ex-
BAT'TY. } panded, resembles a boat

impelled by oars, is more ingenious than solid. Our ancestors were accustomed to denominate the animal *bat*; it is called so in Huloet's old dictionary; that and *reremouse* appear to have been the usual words for it; 'the other face had wings like a backe or flindermouse.' See *Knight. Tryal of Truth*, 1580, fol. 96; from hence, probably, Dr. Jamieson's derivation of *backie-bird*, its modern name in Scotland; we know not the reason for the change into *bat*.

See the *bat* hath flown

His cloister'd flight, ere to black Hecate's summons
The shard-borne beetle with his drowsy hums
Hath sung night's yawning peal, there shall be done
A deed of dreadful note. *Shakespeare.*

Wool of *bat*, and tongue of dog,
Adder's fork and blind worm's sting,

Lizard's leg and owl's wing,

For a charm of powerful trouble,

Like a hell-broth boil and bubble. *Id.*

GON. You are gentlemen of brave mettle; you would lift the moon out of her sphere if she would continue in it five weeks without changing.

SEB. We would so, and then go a *bat-fowling*.

Id. Tempest.

Yet could his *bat-ey'd* legions eas'ly see

In this dark chaos. *Fletcher. Purple Island.*

But then grew reason dark; that she no more
Could the fair forms of good and truth discern;

Bats they became, that eagles were before;

And this they got by their desire to learn. *Davies.*

Some animals are placed in the middle betwixt two kinds, as *bats*, which have something of birds and beasts. *Locke.*

Where swallows in the winter season keep,
And how the drowsy *bat* and dormouse sleep. *Gay.*

Bodies lighted at night by fire, must have a brighter lustre than by day,—as sacking of cities, *bat-fowling*. *Peacham.*

Far different there from all that charm'd before,

The various terrors of that horrid shore;

Those matted woods where birds forget to sing,

But silent *bats* in drowsy clusters clin. *Goldsmith.*

The birds of passage would in a dark night immediately make for a light-house, and destroy themselves by flying with violence against it, as is well known to *bat-fowlers*.

BAT, BATCU, BATE, or BATZ. See BATZ.

BAT-FOWLING, a particular manner of bird-catching in the night-time, while they are at roost upon perches, trees, or hedges. They light torches or straw, and then beat the bushes: upon which the birds, flying to the flames, are caught either with nets or otherwise.

BAT, in zoology. See VESPERTILIO.

BAT-HORSES, or BAW-HORSES, in military affairs, baggage-horses belonging to the officer when on actual duty. Bat-men, or Baw-men, originally servants hired in war time to take care of the horses belonging to the artillery, &c. The same name is now given to those who are excused regimental duty for the express purpose of attending to the horses belonging to the officers.

BATA, in botany, the *Musa Paradisiaca* of Linnaeus.

BATACOLO, a small fort and garrison on the east of the island of Ceylon. Lat. 7° 45' N., long. 81° 50' E. This place has little or no connexion with the south and west parts of the island, the harbour being inconvenient. Here is also an uncommonly bold shore, and immense rocks of very grotesque figures, such are the Friar's Hood, the Elephant, and the Pagoda Rocks.

BATANY, BATANG, or BATANY Hook, a seaport town on the east coast of the island of Gilolo, where cruising vessels were formerly kept by the Dutch for the prevention of smuggling. There is a spacious natural fortress on a point of land of very difficult access, and containing several houses and gardens. The whole area thus surrounded is about three miles in circumference.

BATARDEAU, in bridge building. See COUVER-DAMS.

BATATAS, in entomology, a species of acarus, found on the potatoe in Surinam, and some other parts of South America. It is rather rough and sanguineous; anterior legs as long as the body.

BATAVA, in ancient geography, a citadel of Vindelicia, so called from the Colors Batava, in garrison under the commander in Rhatia; now Passau; being called Batav, from the Batavi; then Bassau, and Passau; situated in Bavaria, at the confluence of the Danube, Inn, and Iltz. See PASSAU.

BATAVI, the ancient Batavians, a branch of the Catti, who, in a domestic sedition, being expelled their country, occupied the extremity of the coast of Gaul, or the modern Holland, at that time uninhabited, together with the island, called from them *Insula Batavorum*, situated among shoals. Thus, Lucan, l. 1, v. 131.

Vandios: *Batavique truces, quos are recurvo*

Stridentis nervis iustis.

Their name Batavi they carried with them from Germany, there being some towns in the territory of the Catti, called Battenberg, and Battenhausen. The bravery of the Batavi, especially the

horsemen, procured them not only great honor from the Romans, being called their brothers and friends; but an exemption from taxes, being obliged only to furnish men and arms.

BATAVIA, a city on the north coast of the island of Java, the capital of the Dutch settlements in the East Indies. It stands at the mouth of the river Jacatra, in the bosom of a large commodious bay, which is one of the safest harbours in India. Lat. 6° 12' N., long. 107° 4' E. The Jacatra passes through the midst of the town, and forms various canals of running water, all faced with freestone, and adorned with trees: over these canals are upwards of fifty bridges, besides those which lie without the town. The streets are all perfectly straight, and each, on an average, thirty feet broad. The houses are built of stone. The city is about a league and a half in circumference, and has five gates; but there are far more houses without than within them.

A circular range of islands protects the harbour of Batavia from any heavy swell, and renders it safe anchorage, these are Onrust, Edam, Cooper's Isle, and Purmerend, containing warehouses, hospitals, and naval arsenals. From the roadstead there are scarcely any of the buildings of Batavia visible, except the great church, the rest being hid by the palms and other high spreading trees.

Batavia is well fortified, and the approaches both by sea and land are secured by strong outworks. On an island, at the entrance of the harbour, there is a fort which commands that passage, and protects the extensive dock-yards. The citadel, on the east bank of the Jacatra, is a regular fortress, built of coral rock: it contains the house of the governor-general of the Indies, and the principal authorities. The great church is said to have cost £80,000; but the public buildings, generally, are inferior. There are besides five other Christian churches, a mosque, and a temple belonging to the Chinese; the stadt-house, bridewell, infirmary, orphan-house, and two public hospitals, one of which is in the island of Purmerend. Here are also arsenals and magazines, well stocked with military stores and ammunition. The government consists of a council formed by the governor-general of the East Indies, who is president, the director-general, or governor of Java, nine members, and two secretaries. The power of this body is absolute; and the governor-general may, on his own responsibility, adopt any measures rejected by the others. The police and criminal magistracy is under a Fiscal, who can levy fines and inflict punishments at discretion. The regulation of all matters relating to navigation are under the marine fiscal; and a *Sháh-bender*, or captain of the port, acts as consul-general for all nations. A garrison of about 5000 men was maintained by the Dutch, in Batavia, before it was captured by our troops, under Sir Samuel Auchmuty in 1811. At that period the number of inhabitants was 47,217.

In 1792 this city contained upwards of 5000 houses liable to be rated; and a population of 115,960 souls, of which 6000 were citizens, 22,000 Chinese, and 17,000 slaves! The total

population of Batavia and its immediate dependencies, is estimated at 150,000 souls. The last census of the town is as follows:

Europeans, 543; Arab, 318; Javanese, 3331; Bali-men, 7720; Moluccans, 82; native Dutch, 1485; Malays, 3155; Macassars, 4115; Sumbayans, 237; Timorotes, 24; Chinese, 11,854; Slaves, 14,239.

The principal articles imported are cloths, drugs, and opium, from Bengal; camphor, benzoin, birds-nests (*hirundo esculenta*), coal-lin, and ivory, from Sumatra; garden-seeds, butter, Madeira and Constantia wines, from the Cape of Good Hope; porcelain, tea, silks, nankeens, alum, borax, sulphur, cinnabar, mother of pearl, paper, sweetmeats, and tobacco, from China; copper, sword-blades, camphor, soy, porcelain, lackered ware, and silks, from Japan. The exports from Batavia are pepper, sugar, rice, coffee, and arrack; sanchú, (*burnt wine*.) a kind of Chinese arack. To China, besides these articles, they send birds-nests, of the edible swallow, *bicho do mar*, sea-slug, or holothuria; cotton, spices, tin, rattans, sapan-wood, sago, and wax. To Borneo and the Moluccas, piece-goods, opium, and a few European articles. To the other Dutch settlements, rice. Bullion was the principal article imported from Europe before the French revolution.

Batavia has always been unhealthy; and the mortality in the garrison of the fort is almost incredible. This arises evidently from the peculiar position of the town, and its injudicious ornaments. The plain around is flat, and filled with rice grounds, which must necessarily be often laid under water; while the streets have each its canal and row of evergreens, which at once occasion pestiferous exhalations, and prevent a free circulation of the air. A part of the plain, also, on the left of the fort, is an impracticable morass. The thermometer at Batavia is seldom above 90°, and usually as low as 84°: hence it is not excess of heat that makes it so unhealthy, yet such is the mortality, that one-fifth of the European inhabitants die annually.

Amongst other causes of this, however, the intemperance of the mode of living must not be overlooked. The vile habits of the Pagan and Mahomedan natives are but too contagious with the Europeans. The multitude of domestic slaves is a source of the worst habits: and most of the female part of society are a degenerate, debased race, lost in indolence and sensuality.

‘Notwithstanding the republican form of the Dutch government,’ says Mr. Hamilton, ‘in no part of the world is the distinction of ranks so minutely and frivolously attended to as at Batavia, and the salaries allowed to the Dutch Company’s servants being inadequate to the support of the establishment they think necessary for the support of their dignity, corruption and bribery are universal. In society every individual is as stiff and formal, and as feelingly alive to every infringement of his privileges, as if his happiness or misery depended on the due observance of them. Nothing is more particularly attended to at entertainments by the master of the house, than the seating of every guest, and drinking their healths in the exact order of precedence.’

VOL. III.

To provide against future disputes on the subject of precedence, the respective ranks of all the company’s servants were ascertained by a resolution of government, which was revised and renewed in 1764. The act by which these rules were first established consists of 131 articles, and enters into the most minute details respecting the carriages, horses, chairs, servants, &c. &c. of the company’s servants.

‘By the eighth article, little chaises for children, drawn by the hand, must not be gilt or painted but in exact proportion to the rank of the parents. Ladies whose husbands are below the rank of counsellors of the Indies, may not wear at one time jewels more in value than six thousand six dollars: wives of senior merchants are limited to four thousand; others to three, two, and one thousand six dollars.

‘Article forty-ninth permits ladies of the higher ranks to go abroad with three female attendants, who may wear ear-rings of single middle sized diamonds, gold hair pins, petticoats of cloth, of gold, or silver gauze; chains of gold and of beads, and girdles of gold; but they must not wear diamonds, pearls, nor any kind of jewels in their hair. Wives of senior merchants may have two, and ladies in an inferior station one female attendant, who may wear ear-rings of small diamonds, gold hair pins, a jacket of fine linen, and a chintz petticoat; but no gold or silver stuffs or silks, or any jewels, true or false pearls, or any ornament of gold. The eighty-third article recommends to the Dutch East India Company’s servants in Bengal, not to surpass their predecessors in pomp of dress and appearance; and the 110th permits the director of the factory at Surat, when he goes abroad in state, to carry among other things, four fans, made after the fashion of the country, with the feathers of the bird of paradise and cow-hair, with gold cases and hands. It is remarkable, that in these regulations the tax on carriages increases downwards, from the higher to the lower ranks, and penalties are attached to the infraction of these statutes.’

The Chinese, who are the most effective part of the population, are indefatigably industrious, but notorious at the same time for cunning and dishonesty. ‘The Dutch,’ they say, ‘have only one eye, but the Chinese have two.’ All the mechanic trades are carried on by them; and the more wealthy are merchants, some of whom farm the customs and taxes. They inhabit a separate town, or *campong*, close to the city; it is thronged with men and pigs, of which the Chinese keep some hundred thousands. The Malays, who are Mahomedans, have a bad character; but they have been misrepresented by the Dutch, whose narrow, tyrannical policy has alienated the affections of most of the natives. The Amboynese, generally employed as builders, are bold and turbulent.

The foundations of Batavia were laid in 1619 by the Dutch commodore Koen, and so prompt and successful were his companions, that it soon became the metropolis of the East India possessions. In 1629 it compelled an army of 200,000 Javanese to retire, after a siege of several months. Not long after, the viceroy rebelled against the emperor of Java: the Dutch

did not fail to turn this circumstance to their own advantage; and at length contrived to get these sovereigns completely into their power. Their avarice and injustice, however, made the natives very anxious to emancipate themselves, and in 1722 a general conspiracy was discovered, only just in time to prevent its execution. In 1740, not twenty years afterwards, 12,000 Chinese were massacred in one day, by order of the governor, on the plea, real or pretended, of a similar movement.

In 1798 a new camp at Welte Freden was established in a woody plain, a league and a half up the country. The road to it is along a fine causeway, with country seats on one side, and on the other a navigable canal. The barracks, which are built of wood and stone, occupy a third of the ground on the opposite side of the entrance. The Tannabang, a large Malay village, in which there are several Chinese families, stands on a height two leagues and a half from the city. Mester Cornelis is a small fort, a league beyond Welte Freden, surrounded by small Javanese, Malay, and Chinese villages. The ground rises insensibly to Mester Cornelis, which is seen half a mile off. This fort lies in a hollow, on the bank of the great river, commanded by a small height. On the right and left of the road are bamboo barracks for the Maduran artillery, of which this is the depôt. The fort is built of stone, but is not strong, the demi-bastions being scarcely two feet thick, by four high, and surrounded by a dry ditch. The entrance is by a stone bridge, within which is the guard-house, and near to it another house occupied by the European artillery. The fort is quitted by another bridge on the opposite side, communicating with a range of wooden barracks, in which are the artillery officers and companies under training.

The whole of the Dutch policy here has been wretchedly arbitrary and severe; and although Sir Stamford Raffles, the British governor, during our possession of the place, very successfully reformed their system, the new authorities are said to have returned to it. But Sir Stamford observes, 'of the splendor and magnificence which procured for this capital the title of the Queen of the East, little is now to be found. Streets have been pulled down, canals half filled up, forts demolished, and palaces levelled with the dust. The stalt-house, where the supreme court of justice and magistracy still assemble, remains; merchants transact their business in the town during the day, and its warehouses still contain the richest productions of the island, but few Europeans of respectability sleep within its limits.'

BATAVIA, the ancient name of Holland. See **BATAVORIUM**.

BATAVIAN REPUBLIC, one of the late democratic states, formed upon the plan of the French republic, out of the clevant United Provinces, or States of Holland. The Stadtholdate was abolished in 1795; a republic established March 1796. On the 24th of May 1806, it was incorporated into a kingdom, in 1815 united with Belgium, and in 1830 again separated. See **BELEGIUM**.

BATAVORIUM *Oppidum*, in ancient geogra-

phy, a town in the island of Batavia, mentioned by Tacitus: some suppose it to be Nimeguen.

BATCALAE, or **BATACOLE**, a sea-port on the coast of Malabar, Hindostan, where the East India Company formerly had a settlement. In 1670 all the settlers were murdered by the natives; but it was again ceded to the company. Twenty miles north from Barcelore.

BACHELOR'S PEAR, a name given to a species of nightshade. See **SOLANUM**.

BATCH, the past participle of *bakan*, to bake; any entire quantity; a batch of bread is the bread baked at the same time.

How now, thou core of envy,

Thou crusty *batch* of nature, what's the news?

Shakspeare.

Except he were of the same meal and *batch*.

Ben. Jonson.

BATCHIAN ISLAND, one of the Moluccas, separated from Gilolo by a narrow strait, and situated between the equator and the first degree of south latitude. It is of an irregular shape, in length about fifty-two miles, by twenty the average breadth. In 1775 the Sultan of Batchian claimed dominion over the islands of Ooby, Ceram, and Goram, but was himself entirely subject to the influence of the Dutch. The inhabitants of Batchian are Malay Mahommedans.

BATE, } Dr. Johnson thinks it is con-
BATABLE, } tracted from debate; Skinner
BATEFUL. } imagines that it is derived from
Ang. Sax. *beatan* to beat to strike; Todd says positively it is from the Saxon *bate*, contention, strife or a make-bate.

Among which foolcs (mark Baldwine) I am one,

That would not stay myself in mine estate;

I thought to rule, but to obey to none,

And therefore fell I with my king at *bate*.

Mirror for Magistrates.

Naked as from the wombe we came, if we depart,

What toyle to seeke that we must leve? what *bate*
to vex the heart?

What lyef leade testey men, they that consume their
days

In inwarde frets, untemper'd *bates*, at stryef with
sum alwaies. *Surrey. Eccles. chap. iv.*

Pletyng the lawe

For ev'ry strawe,

Shall prove a thrifty man,

With *bate* and strife,

But by my life

I cannot tell you whan. *Sir Thos. More*

Breeds no *bate* with telling of discreet stories.

Shakspeare.

An honest, willing, kind fellow, as ever servant
shall come in house withal; and I warrant you no
tell-tale nor no breed-*bate*. *Id.*

This sour informer, this *bate*-breeding spy,

This canker that eats up love's tender spring,

This carry-tale, dissensious jealousy,

That sometimes true news, sometimes false, doth
bring. *Id. Venus and Adonis.*

These appear unto us like unto the *batable* ground
lying betwixt England and Scotland, (whilst as yet
two distinct kingdomes) in so dubious a posture it is
hard to say to which side they do belong.

Fuller. General Worthies.

Batable ground is terra pugnabilis *Batable* ground
seems to be the ground heretofore in question, whether
it belonged to England or Scotland, lying between
both kingdomes. *Conwell.*

He knew her haunt, and haunted in the same,

And taught his sheep her sheep in food to thwart;

Which soon as it did *bateful* question frame,
H^o might on knees confess his guilty part. *Sidney.*

BATE, } Contracted from *abate*, old
BATE'LESS, } Saxon; to beat down; to de-
BATE'MENT, } press; to lessen; to diminish;
BA'TING. } to sink; or causc to sink; to
cut off; to take away; to remit.

Shall I bend low, and in a bondsman's key,
With *bated* breath, and whisp'ring humbleness,
Say this? *Shakespeare. Merchant of Venice.*

GOV. Sir, we were talking, that our garments seem
now as fresh, as when we were at Tunis, at the mar-
riage of your daughter: who is now queen.

ANT. And as the rarest thing that e'er came there,
Bate, I beseech you, widow Dido. *Id. Tempest.*

Bardolph, am not I fallen away vilely since this
last election? Do I not *bate*? Do I not dwindle?
Why my skin hangs about me like an old lady's loose
gown. *Id. Henry IV.*

Yet I argue not

'Gainst Heaven's hand or will, nor *bate* a jot
Of heart or hope; but still bear up and steer
Right onward. *Milton.*

Abate thy speed, and I will *bate* of mine. *Dryden.*
When the landholder's rent falls, he must either
bate the labourer's wages, or not employ or not pay
him. *Locke.*

To *abate*, is to waste a piece of stuff: instead of
asking how much was cut off, carpenters ask what
batement that piece of stuff had.

Moxon's Mechanical Exercises.

But I hate disputes; and (therefore *bating* religious
points, or such as touch society,) I would subscribe to
any thing which does not choak me in the first pas-
sage, rather than be drawn into one. *Sterne.*

BATE, *v.* a term in falconry; to flutter the
wings, as preparing for flight, particularly at the
sight of prey: probably from *battre*. *Fr.*

All plumed like estridges that wing the wind;
Bated like eagles having lately bathed.

Shakespeare. I. Henry IV.

Hood my unmann'd blood *bating* in my cheek.
Id. Romeo and Juliet.

It is a natural action with birds, after bathing,
to shake the moisture from their wings; also
when desirous of their food or prey, as in the
following passage:

No sooner are we able to prey for ourselves, but
they brail and hood us so with sour awe of parents,
that we dare not offer to *bate* at our desires.

Albumazar. Old Play vii. 179.

The true meaning of the word is beautifully
exemplified in the following passage of Bacon:

Wherein (*viz.* in matters of business) I would to
God that I were hooded, that I saw less; or that I
could perform more; for now I am like a hawk that
bates, when I see occasion of service; but cannot fly
because I am ty'd to another's first.

BATE (George), an eminent physician, born at
Maid's Morton, near Buckingham, in 1608.
In 1629 he obtained a licence, and for some
years practised in and about Oxford; chiefly
among the Puritans. In 1637 he took his de-
gree of M. D., and became so eminent, that when
king Charles I. kept his court at Oxford he was
his principal physician. When the king's affairs
declined, Dr. Bate removed to London, where he
became physician to the Charter-house, fellow of
the college of physicians, and afterwards princi-
pal physician to Oliver Cromwell. Upon the
Restoration he again got into favor with the royal
party, was made principal physician to king

Charles II., and fellow to the Roya. Society;
and this, as we are told by Wood, owing to a
report raised by his friends that he gave the pro-
tector a dose which hastened his death. Dr.
Bate wrote in Latin a history of the civil wars in
England, and some other tracts on physical sub-
jects. He died at his house in Hatton-garden,
and was buried at Kingston-upon-Thames in
Surrey.

BATE (John), prior of the monastery of Car-
melites at York in the fifteenth century, was born
in Northumberland, and educated at York and
Oxford. Bate abundantly answered the hopes
conceived of him, and became an eminent philo-
sopher and divine, remarkable for his skill in
the Greek tongue. He took the degree of D. D.
at Oxford, and afterwards distinguished himself
as an author. The Carmelites of York were so
sensible of his merit, that, upon a vacancy, they
offered him the government of their house;
which he accepted, and discharged that office
with great prudence and success. He died in
1423, in the beginning of the reign of Henry IV.

BATE (Julius), a voluminous author, and an
intimate friend of the celebrated Hutchinson; by
whose recommendation he obtained from Charles,
duke of Somerset, a presentation to the living of
Sutton in Sussex. His publications were: 1. An
Essay towards explaining the first Chapter of
Genesis, in answer to Mr. Warburton, 1741, 8vo.
2. The Philosophical Principles of Moses as-
serted and defended against the Misrepresenta-
tions of Mr. David Jennings, 1744, 8vo. 3.
Remarks upon Mr. Warburton's Remarks, shew-
ing that the Ancients knew there was a Future
State, and that the Jews were not under an equal
Providence, 1745, 8vo. 4. The Faith of the
Ancient Jews in the Law of Moses, and the Evi-
dence of the Types, vindicated in a Letter to Dr.
Stebbing, 1747, 8vo. 5. Micah, v. 2. and Mat-
thew, ii. C. reconciled, 1749, 8vo. 6. An He-
brew Grammar, formed on the Usage of the
Words by the Inspired Writers, 1750, 8vo. 7.
The Use and Intent of Prophecy, and History of
the Fall, cleared, 1750, 8vo.; this was occasioned
by Middleton's Examination of Sherlock. 8. The
Blessing of Judah and Jacob considered, and the
Æra of Daniel's Weeks ascertained, in two Dis-
sertations, 1753, 8vo. The Integrity of the He-
brew Text and many Passages of Scripture
vindicated from the Objections and Misconstruc-
tions of Mr. Kennicot, 1755, 8vo. 10. A Reply
to Dr. Sharp's Review, and Defence of his Dis-
sertations on the Scripture Meaning of Eloim
and Berith, 1755, 8vo. 11. A Reply to Dr.
Sharp's Review and Defence of his Dissertation
on the Scripture Meaning of Berith; with an
Appendix in Answer to the Doctor's Discourse
on Cherubim, Part II., 1755, 8vo. 12. Remarks
upon Dr. Benson's Sermon on the Gospel Method
of Justification, 1755, 8vo. 13. Critica Hebræa,
or a Hebrew English Dictionary without Points,
&c. 1764, 4to. 14. A new and literal Transla-
tion from the original Hebrew of the Pentateuch
of Moses, and of the Historical Books of the Old
Testament, to the end of II. Kings; with Notes
critical and explanatory, 1737, 4to. This learned
writer died April 7th, 1771.

BATE, or BHATTA ISLE an island of the pro-

vince of Gujrat, Hindostan, at the south-west extremity of the gulf of Cutch. It possesses a good harbour, and a fort, but is very barren. The town consists of about 2000 houses, principally inhabited by Hindoos. Long. 69° 21' E., lat. 22° 22' N.

BATECUMBE, or BADECOMBE (William), an eminent mathematician, supposed to have flourished about 1420, in the reign of Henry V. He studied at Oxford, where he applied himself to natural philosophy, but chiefly to the mathematics, in which he made a very great proficiency. His writings are: 1. Of the Formation and Use of the Concave Sphere. 2. Of the Solid Sphere. 3. Of the Use of the Astrolabe. 4. Philosophical Conclusions.

BATEMAN (William), bishop of Norwich in the fourteenth century, was born at Norwich. In 1328 he was collated to the archdeaconry of that see: soon after, he went to Rome, where he so distinguished himself that he was promoted by the pope to the place of auditor of the palace. He was likewise advanced by him to the deanery of Lincoln; and sent twice as nuncio to endeavour to procure a peace between Edward III. and the king of France. In 1343 he appointed him bishop of Norwich, and consecrated him with his own hands. In 1347 bishop Bateman founded Trinity-hall in Cambridge, for the study of the civil and canon laws; and another hall dedicated to the Annunciation of the Virgin Mary, for the study of philosophy and divinity. He was often employed by the king and parliament in affairs of the highest importance. In 1354 he was, by order of parliament, despatched to the court of Rome, with Henry duke of Lancaster, and others, to treat, in the pope's presence, of a peace. This journey proved fatal to him; for he died at Avignon, where the pope resided, in 1354, and was buried with great solemnity in the cathedral church of that city.

BATEMITES, a sect of apostates from Mahomedanism dispersed through the East, who fell into the same abominable practices with the Ismaelians and Karmatians. The word properly signifies esoteric, or people of inward or hidden light; they are also called Batemians.

BATES (William), D. D. an eminent nonconformist divine, born in November 1625, was admitted of Emanuel college, Cambridge, and thence removed to King's college in 1644. He was one of the commissioners, at the conference in the Savoy, for reviewing the Liturgy, and was concerned in drawing up the exceptions against the Common Prayer; however, soon after the Restoration, he was appointed chaplain to king Charles II., and became minister of St. Dunston's in the west, but was deprived of that benefice for nonconformity. He bore a very high character; and was honored with the friendship of the lord keeper Bridgman, the lord chancellor Finch, the earl of Nottingham, and archbishop Tillotson. At the Restoration he was offered the deanery of Litchfield, which he refused. He published *Select Lives of illustrious and pious Persons*, in Latin. His works, except his *Select Lives*, have been printed in one volume in folio. He died July 14th, 1699. Dr. Bates was well acquainted not only with theology, but with

poetry and the belles lettres; his style has been much and justly praised for its elegance; and has obtained for him the appellation of the silver-tongued Bates.

BATH, one of the most elegant cities in the kingdom, and a bishop's see; is situated in a delightful vale, and on the acclivity of a hill, facing the south and south-east, in the north-east extremity of Somersetshire, near the borders of Gloucester and Wilts. It is twelve miles from Bristol, nineteen from Wells, thirty-eight from Salisbury, forty-two from Gloucester, sixty from Oxford, and 105 from London, by way of Chippenham, or 107 through Devizes; surrounded by an amphitheatre of hills, of considerable elevation, it enjoys, by means of the river Avon, which is here of considerable magnitude, and passes through a great portion of the city, a direct communication with the Bristol channel: the Kennet and Avon canal, which here falls into the Avon, completes the inland communication, by water, from London.

This was very early a favorite station of the Romans, and called by them *Aqua Solis*, *Fontes Calidi*, *Badinia*, and *Thermæ Achamannum*. In 1755 the abbey-house or priory was taken down, and, about twenty feet below the surface, were discovered the remains of numerous Roman baths and sudatories, or sweating rooms, circular, semi-circular, and oblong; paved with smooth flagstones, with appropriate apartments adjoining, beautifully ornamented with tessellated pavements, &c. Such were the *frigidarium*, or outer room, where the bathers undressed; the *tepidarium*, or warmer apartment, within, and the *oleothesion*, a small room containing oils, ointments, and perfumes; under these were vaults, ingeniously contrived to convey and retain the warmth required for the apartments above. In 1444, when the Romans left this country, the city extended 12,000 feet in length, and 1150 in breadth; and was surrounded by a wall nine feet thick, and twenty feet high; some remains of which are now to be seen. The several gates have been taken down at different times (the west gate lately), to open and improve the approaches.

Various other vestiges of this people are in the possession of private individuals, but most of them are preserved and classed in a building erected for that purpose, by the corporation; amongst these are the remains and fragments of columns, cornices and capitals, of a magnificent temple, dedicated to Minerva, by Julius Agricola, on the present site of the great pump-room.

The coins which have been found, are chiefly those of Claudius, Vespasian, Trajan, Adrian, Antoninus Pius, Severus, Maximian, Carausius, and Constantine. Near the burial places of the soldiery, under Lansdown, quantities of urns, fibulæ, armillæ, and chains, have been dug up.

By the Saxons, Bath was known as *Acemannes-ceapen*, the city of sick men; *Acemannes-þeni*, and *Leþaðun*. It was a burgh town of the kingdom of Wessex. In 775 it was seized by Offa, king of Mercia, who established here a college of secular canons. During the incursions of the Danes in the eighth century, Bath was almost destroyed; but, in the reign of Athelstan,

it once more recovered its grandeur. Coins were at this time struck, and the grants to the monastery here augmented. King Edgar was inaugurated here, and gave many privileges to the town. Many of the Danish monarchs resided here. In the early part of the Confessor's reign it was held by his consort Editha; but it reverted to the crown after her father's death, and was attached to the royal demesnes in the time of William the Conqueror. In the reign of William Rufus, during the insurrection of Odo, bishop of Bayeux, and the Norman lords who espoused the cause of the unfortunate Robert, it was plundered and burnt. The city owes its restoration to the liberality of John de Villula, a native of Tours, who purchased it of William II. for 500 marks, and obtained leave to remove the bishop's seat from Wells hither, uniting it to the monastery and church. He may indeed be considered as its second founder; all the public edifices were rebuilt by him; and, becoming bishop of the see in the reign of Henry I., he bestowed large endowments on the monastery. The monks, at this and subsequent periods, are said to have greatly encouraged manufactures of woollen cloth. Corruption, however, crept among them, along with the rest of the religious orders; and, in the reign of Henry VII., bishop King was compelled to introduce several regulations to correct their excesses. Bath is indebted to this prelate for her beautiful Abbey-church, &c., dedicated to St. Peter and St. Paul, built in the form of a cross, and considered to be one of the finest specimens extant of the pure Gothic architecture. It was begun by him in 1495, and finished in 1532. The dimensions of the windows are nearly uniform; they are large and beautifully formed: from the centre of the cross rises a tower 162 feet high, crowned with light open battlements. The body of the abbey is 210 feet long from east to west, and 126 from north to south; and the breadth of the body and aisles is seventy-two feet. The principal entrance at the west is through a fine arched doorway, and the attention of visitors is forcibly arrested by the excellent proportion and beautiful symmetry of this noble pile. In the interior is a handsome altar-tomb to the memory of bishop Montague. The vestry contains a small library, founded by bishop Lake. Bath has four parishes, each of which has its church. The abbey church is in the parish of St. Peter and St. Paul; the names of the three others are St. James's, a freestone building, erected in 1768, at the west end of which is a square tower, containing eight bells: St. Michael's, which was begun in 1734, has a fine dome, and is of the Doric order: Walcot church is dedicated to St. Swithin, and was rebuilt in 1780; this parish has a church entirely devoted to the accommodation of the lower orders, and contains four chapels of ease. In the reign of Elizabeth, the several parishes of Bath were consolidated into one rectory.

Here are also two reading-schools, many public libraries, and literary and philosophical institutions, the West of England Agricultural Society, &c.

Nor is Bath deficient in charitable establish-

ments. Here is a great hospital and infirmary, capable of receiving 150 patients, who have advice and the use of the waters gratis; Bellot's hospital, and the Black alms; the Stranger's Friend Society; the Eye Infirmary, and the Puerperal, or Child-bed Society. The free Grammar-school, and Blue-coat school, are also well-conducted establishments. The places of divine worship for dissenters are numerous; that belonging to the Roman Catholics was formerly the theatre.

By the census returned to parliament in 1832, Bath contained 7327 houses and 38,811 inhabitants; exclusive of the out-parishes of Bathwick, Bathampton, Bathaston, and Bathford. The city was at one time governed by a steward; but, in 1590, queen Elizabeth granted it a charter, declaring it a city, sole in itself, and vesting the government in a mayor, recorder, ten aldermen, and twenty-four common-council; from the body of aldermen the mayor is elected, and from the council are chosen the chamberlain, two bailiffs, and two constables, annually. It sends two members to parliament, who are elected by the corporation. The see of Bath and Wells comprehends the whole county of Somerset, except a few churches in Bristol, and contains 388 parishes, and 503 churches and chapels. Sixty of the parishes are inappropriate. The bishop's palace is at Wells. The vicarage of the abbey is included in the rectory of Bath, and Walcot is a rectory. Bath races are held in September, on Lansdown, one of the highest hills near the city, about three miles in extent. On this down is also held an annual fair, on the 10th of August, for cheese, cattle, horses, and all kinds of merchandise, and a fair is also held in Holloway, on the other side of the city, May 14th; two other fairs are held in the town.

By far the largest and finest part of this beautiful city is without the walls, particularly Queen Square, in the midst of which is a garden with gravel walks, and having an obelisk in the centre. Another principal ornament of this part of the town is the King's Circus, with three openings at equal distances, leading into as many streets. The fronts of the houses are adorned with three rows of columns, in pairs of the Doric, Ionic, and Corinthian orders, standing over each other, and the frieze is embellished with sculpture. In the centre is a large covered reservoir of water, filled from springs rising in the adjacent hills, and serving for the supply of the neighbourhood.

The Royal Crescent is another striking object: the whole extensive front is of an elliptical form, consisting of thirty-one noble stone houses, uniformly built, with rustic basements, surmounted with columns of the Ionic order. It stands on an eminence, with an open and gentle declivity or lawn of twenty acres before it, down to the Avon, commanding delightful and uninterrupted prospects of the city, the vale below, and the river as it meanders towards Bristol; as well as of the opposite hills, and numerous villas, hamlets, and roads, which intersect and adorn it. Behind this crescent rise St. James's Square, Lansdown Crescent, Somerset Place, Camden Place, Portland Place, Catherine Place, Mount

Zion, a large extent of buildings on the summit of Beacon Hill; Cavendish Crescent and Place, Lansdown Grove, Lansdown Place, and Belle Vue. Besides these are Belvidere, Belmont, and Paragon Buildings, Marlborough Buildings, Burlington Place, and many other intervening streets and buildings. Nothing indeed can be more picturesque than the appearance of this part of the town.

Across the Avon, on the eastern side of the city, stands Pulteney Bridge, an elegant structure, of one arch, covered on each side with shops, and leading immediately from High Street, in the centre of the city, to Bathwick, where several elegant new erections have lately arisen. Laura Place, which is a square, built in the form of a lozenge, is peculiarly beautiful; and passing through the centre of this place diagonally, in a direct line from the bridge, is Great Pulteney Street, of considerable length, uniformly built, and lighted with gas. At the distant extremity of this street, in front, is Sydney Gardens, or Vauxhall, which range and expand up the side of Claverton Hill, and are very tastefully laid out. Here also runs the Kennet and Avon canal, ornamented with two cast-iron bridges in the Chinese style. At the top of the hill is an extensive plantation of firs. Around Sydney Gardens extends Sydney Place, an admirable specimen of architecture, forming an area, of which the gardens are the centre. In one of the wings of this is the late majestic queen Charlotte, residing during her illness in 1817; and near it stands the elegant new parish church of Bathwick, built in the modern gothic style, and dedicated to St. Mary.

In the south-east part of the town is Orange Grove, a spacious area, planted with elms, and having an obelisk in its centre; adjoining to this are the walks where the Old Assembly Rooms are situated, and near to them are the North and South Parks. These are two elegant rows of houses, each 530 feet long, elevated on arches, and uniformly built, with paved terraces in front, fifty-two feet wide; whence are extensive and commanding views of Prior Park, the magnificent seat of the late Ralph Allen, esq. Beechen Hill, with its hanging woods, and Claverton Hill, nobly diversified with villas and enclosures, and crowned with an ornamental castellated structure, which is surrounded with a plantation of oaks, to a considerable extent. In the gardens below the South Parade, on the banks of the Avon, is now building an elegant new square, to be called Kingston Square, which, with the adjoining new streets, and a spacious esplanade next the water, will occupy the whole space of ground between the city and the river on that side. On the lower side of the town are many ranges of buildings, which, in most other places, would be deemed fine; among these are St. James's Parade, and Westgate Buildings, and adjacent to Kingsmead Square are New King Street, Green-Park Place, east and west; forming two sides of a triangle, the base or hypotenuse of which opens to the river, and Brunswick Terrace, and Kingsmead Terrace, pleasantly overlooking the meadows, and commanding views of the surrounding country.

Chiefly on the eastern extremity of the town, at

the entrance from the London Road, are many new ranges of magnificent buildings, with paved terraces, called Kensington, Piccadilly, Grosvenor Place, and Walcot Terrace.

The amusements of Bath are under the superintendance of two masters of the ceremonies, who are elected to that office by the subscribers to the assemblies, balls, &c., one of whom presides at the Upper Rooms, and the other at the Lower Rooms. Besides these, there is a third appointed to preside at the city assemblies at the Town Hall. The lodging-houses are numerous and commodious, and adapted to all ranks who may be induced to seek benefit from these salutary waters. Sedan-chairs are established here, the fares of which are settled by the mayor and justices; and here are also hackney-coaches and chariots, regulated as in London. Besides the Assembly Rooms and Pump Room, which are the usual promenades for persons of fashion, in wet or unfavorable weather; and the Riding Schools, which are the resort of equestrians on similar occasions; the neighbourhood of Bath abounds with beautiful walks and rides, and particularly Claverton Down, and Lansdown for the latter, affording the most salubrious air, and the most extensive prospects.

The old bridge over the Avon is a handsome structure, with stone balustrades. The intercourse between Bath and Bristol is very great, and besides carriages for the conveyance of goods, and private carriages of every description, there are not less than forty stage-coaches, that regularly pass forward and backward between the two cities. The whole city of Bath is amply supplied with the most excellent spring-water, brought from the neighbouring hills, and distributed to every house by means of leaden-pipes.

The Guildhall, situate on the east side of High Street, is worthy of such a city. Besides the Vestibule and the Public Hall, for the city sessions, court of record, justices' meetings, court of conscience, and other public business, is a record-room, the town-clerk's and other offices, and above stairs is a noble banqueting and ball-room, with a music-gallery, tea-room, drawing-room, &c. Behind this elegant structure is the market-place, which is exceedingly commodious, spacious, well paved, and under cover. The markets are held daily for all kinds of provision; and in point of supply and regulation are excelled by none in England. The principal days for butchers' meat, are on Wednesday and Saturday; and for fish, Monday, Wednesday, and Friday. The city prison is a handsome edifice, built of freestone, near the river in Bathwick.

After this general outline of the place, the several public baths next claim attention—these are, the King's, the Queen's, the Cross, the Hot, and the Corporation baths, which are the property and under the superintendance of the corporation; besides which are the Kingston, or Abbey baths, now the property of lord Manvers, which are commodiously fitted up, and where invalids are accommodated at any hour of the day or night. The taste of the waters is pleasant impregnated with a vitriolic principle, which yields, upon evaporation, a small portion of neutral salt, with a calcareous earth and iron. They prove highly serviceable in bilious com-

plaints, as well as in nervous, paralytic, rheumatic, and gouty disorders. The King's bath is a large basin of sixty-five feet by forty, and contains rather more than 346 tons of water, when filled to its usual height. A brass hand-rail, of an octagonal form, encloses the centre: under it is a large reservoir, into which the main spring rises with great force, and from whence the water is conveyed, in its greatest purity, by means of pipes, to the pumps above, for drinking, as well as distributed with more equable heat throughout the bath, in which the main spring has its source; the sides of the bath are surrounded by a handsome colonnade of the Doric order, to shelter the bathers from the inclemency of the weather. Two commodious rooms are connected with this bath, fitted up with pumps and pipes to direct the hot water to any particular part of the body. The Queen's bath, which is attached to the King's, and opens into it, forms a square of twenty-five feet, and is furnished with similar conveniences; its temperature is somewhat lower. The Cross bath received its appellation from a cross erected in its centre by the earl of Melfort, in the time of James II. which is now removed. It is situate at the western extremity of Bath-street, about 150 yards from the two former, is of a triangular form, and has a small neat pump-room attached to it. Fahrenheit's thermometer rises in it to between 93 and 94.

The Hot bath stands about forty yards south-west of the King's, and is so called from the superior heat of its waters, which approaches to 117 of Fahrenheit. This structure, which is about fifty-six feet square, was built under the direction of John Wood, Esq. The usual time of bathing in the King's and Cross baths is between six and ten in the morning, after which time the water is discharged, and the springs afford a fresh supply of water for the next day. The seasons for bathing are the spring and fall.

Dr. Higgens has proved that a Winchester gallon of Bath water contains.

	oz.	dwt.	gr.
Calcareous earth combined with vitriolic acid in the form of selenite	0	0	319 $\frac{1}{10}$
Calcareous earth combined with acidulous gas	0	0	22 $\frac{8}{10}$
Marine salt of magnesia	0	0	22 $\frac{10}{10}$
Sea salt	0	1	14 $\frac{4}{10}$
Iron combined with acidulous gas	0	0	0 $\frac{1}{11}$
Acidulous gas, besides that which is contained in the above earth and iron	12	0	0
Atmospheric air	2	0	0

Dr. Monro gives the highest degree of heat attributed to them by

	Dr. Howard.	Dr. Charlton.	Dr. Lucas.

Cross bath .				

and states that on evaporation, a gallon has been found to contain of iron $\frac{3}{7}$ or $\frac{3}{8}$ parts of a grain; calcareous earth 22 $\frac{1}{2}$ grains, selenite 31 $\frac{1}{2}$ grains, Glauber's salt 25 $\frac{1}{2}$ grains, sea salt 51 $\frac{1}{2}$ grains, which were mixed with an oily matter, but not more so than is common to all waters. From this it appears that the Bath waters are acidulous chalybeates, in which iron and earth are kept suspended by means of aerial acid; and that they are impregnated with a small portion of selenite, sea salt, and muriated magnesia. They were for a long time esteemed sulphureous; but they clearly are not, for they do not affect the color of silver or metallic solutions, nor produce any other effect of water impregnated with sulphur. There is some probability that azotic gas is an active ingredient in them, but this has not been properly ascertained. Dr. Gibbes has lately added to their impregnations the silicious earth. But their contents have never been sufficiently investigated to account for all their effects. They operate powerfully by urine, and promote perspiration; if drank quickly and in large draughts they purge, but if taken slowly and in small quantities have an opposite effect. These waters are adapted to atonic gout, to visceral obstructions, nephritic complaints, dyspepsia, and to weak and exhausted constitutions; they relieve externally in all the complaints for which the more stimulant power of the balneum is employed. To the young and plethoric they are frequently injurious; and unless some evacua-

tions are premised, they often disagree with the patient, occasioning headache, heat in the hands, drowsiness, and giddiness.

The other public buildings in Bath are the upper and lower assembly rooms. The former, in the immediate vicinity of the circus, was finished in 1791, at the expense of £20,000; the ball room is 105 feet long, forty-three wide, and twenty-two high; one of the card rooms is an octagon, forty-eight feet in diameter, the other is seventy feet by twenty-seven; these, with the tea and coffee rooms, library, billiard room, and other appropriate apartments, form the most superb suite of rooms dedicated to pleasure, in the kingdom. The lower assembly rooms, near the parades, are also very elegantly fitted up, and both are appropriated chiefly to public meetings, promenades, balls, concerts, cards, and other amusements, during the winter and spring seasons. The pump room presents unrivalled attractions; it was built in 1797, is eighty-five feet long, forty-six wide, and thirty-four high; the interior is adorned with columns of the Corinthian order, crowned with a rich entablature. In a recess at the west end is a music gallery, and at the other end is a marble statue of Beau Nash; here the company promenade and drink the waters from eight or nine till three, attended by an excellent band of music. The theatre, on the south side of Beaufort-square, was opened in 1805, and in point of size, elegance of structure, and magnificence of decoration, is superior to

any provincial theatre. The company of performers have long been esteemed the best out of the metropolis.

BATH, a town of Berkely county, Virginia. It is situated at the foot of a small mountain, known by the name of the Warm Spring mountain. Contiguous are springs much celebrated. The country round is agreeably variegated with hills, and the soil rich and well cultivated. It is thirty-five miles from Winchester, twenty-five from Martinsburg, and 269 from Philadelphia.

BATH, a large mountainous county of Virginia, sixty miles in length, and fifty in breadth. It is bounded on the east by Augusta, on the west by Green-brier county, on the north by Pendleton, and on the south by Botetourt. In this county are two springs remarkable for their medicinal quality. They are called the warm and hot spring, and rise near the foot of Jackson's mountain, but more generally known by the name of the Warm-spring-Mountain. The hot spring, so called from its possessing a greater degree of heat than the warm spring, has frequently been so hot as to have boiled an egg. Some believe its heat to be now diminished. The stream which issues from it is small. A fountain of common water, which rises near its margin, gives it a striking appearance. The warm spring rises about six miles from the former, and issues with a bold stream sufficient to turn a grist mill, and to keep the water of its basin, which is nearly 100 feet in circumference, at the vital warmth. The water is strongest in the hottest weather, which occasions their being visited in the months of July and August. They remove rheumatisms and various other complaints. It rains here four or five days every week.

BATH, a town of the United States, New York, in the county of Steuben, handsomely situated on the east side of the river Conhocton. It contained in 1813, when its trade and population were rapidly increasing, fifty houses and stores, besides the country buildings. The Conhocton is here seventy-five feet wide, and is navigable for boats to the Tioga. It is forty-two miles southeast from Williamsburgh, and 200 north from Philadelphia.

BATH, a small town of Hyde county, North Carolina; situated near a bay which sets north from the river, eleven miles east by south of Washington, and sixty-one south by west of Raleigh.

BATH, a village in the island of Jamaica, so named from a famous hot spring in its vicinity. The water is sulphureous, and too hot to admit of its being held in it.

BATH, in Jewish antiquity. Some distinguish five kinds of Hebrew measures so called, viz. the greater bath containing eighty pounds of water, or, according to Josephus, 1440 Roman ounces; the second bath containing 100 ounces; the third, 60 ounces; the fourth containing 25 ounces; and the fifth, 12 ounces of water. Some have estimated the greater bath at half as much again as the common one; but there is no sufficient authority for this estimation. The word, in Hebrew, signifies literally a daughter. See **BATH-KOL**.

BATH, in metallurgy, is used to signify the action of a soluble matter in certain operations.

In refining or cupelling, for example, the metals are said to be in bath when they are melted: thus, bath of gold signifies melted antimony when gold is purified in it; and bath of the king is the title given to melted antimony by alchemists, who style gold the king of metals, because gold only can resist the action of antimony.

BATH, KNIGHTS OF THE, a military order of England, concerning the origin of which antiquaries differ. The most probable account is that the ancient Franks and inhabitants of Lower Germany, with whom it is highly probable the Saxons, who invaded England, had the same descent, introduced it, with other customs, upon their settling here. These ancient Franks, when they conferred knighthood, practised bathing amongst other rites, before they performed their vigils; and they were hence denominated Knights of the Bath. Henry IV., on the day of his coronation in the tower of London, conferred the degree upon the forty-six esquires, who had watched all the night before, and had bathed themselves. From that time it was customary with our kings to confer this dignity preceding their coronations, the coronations of their queens, the births and marriages of the royal issue, &c.; several knights of the bath were made at the coronation of king Charles II. in 1661; after which the order was neglected until 1725, when George I. revived it, and ordered a book of statutes for the government of it. By this the number of knights is fixed to thirty-eight, viz. the sovereign, and thirty-seven knights-companions. The apparel of a knight of the bath is a red fur coat, lined and edged with white, girded about with a white girdle, without any ornament thereon; the mantle is of the same color and lining, made fast about the neck with a lace of white silk, having a pair of gloves tyed therein, with tassels of silk and gold at the end; which mantles are adorned upon the left shoulders with the ensign of the order, being three imperial crowns, or, surrounded with the ancient motto of this knighthood, *Tria juncta in uno*, wrought upon a circle gules, with a glory or rays issuing from the centre, and under it the lace of white silk heretofore worn by the knights of the bath. They have red breeches and stockings, and have white hats, with a plume of white feathers in them. The king allowed the chapel of king Henry VII. to be the chapel of the order; and ordered that each knight's banner, with plates of his arms and styles, should be placed over their several stalls, in like manner as the knights of the garter's in St. George's chapel in the castle of Windsor; and he allowed them supporters to their arms. The dean of Westminster for the time being is dean of the order; the other officers are, bath king at arms, a genealogist, registrar, secretary, gentleman usher, and messenger. These several officers have their particular duties assigned them by the statutes. The office of genealogist is a distinct office of record, for the pedigrees of the knights of the order and their esquires, which are entered in a regular series, from 1399, the period at which the order was originally instituted, to the present time.

An esquire of the order is allowed to hunt and fish in the king's royalty, and is exempt not only from serving the office of high sheriff, but any

parochial office. To prevent any abuses in the claiming these privileges and exemptions, the following notification was inserted in the gazette in 1803, previously to the installation of twenty-two knights, attended by their esquires, sixty-six in number.

It is hereby notified, that no exemplificate will be issued to any esquire, from his royal highness the duke of York, after the ensuing installation, until it shall be certified to his royal highness, by the genealogist, that the pedigree and coat armour of the several knights and their respective esquires have been entered in the genealogical books of the order, in obedience to the said statutes. Given at the Horse Guards, this 13th day of May 1803; FREDERICK, acting as great master of the said most honorable military order of the bath.

We need hardly add, that, both in the number of knights and the brilliancy of its appearance, this order maintained its full splendor at the coronation of the fourth sovereign of the House of Brunswick.

BATH METAL is a preparation of copper with zinc, which gives a more beautiful color than the calamine used in the preparation of the common brass. See **PRINCE'S METAL**.

BATHS, in ancient architecture, buildings of various descriptions erected for the purpose of bathing. Baths made a part of the ancient gymnasia, though they were frequented more for the sake of pleasure than health. The most magnificent among the Romans, were those of Titus, Paulus Æmilius, and Dioclesian, of which there are some ruins still remaining. It is said that at Rome there were 856 public baths. Fabricius adds, that the excessive luxury of the Romans appeared in nothing more visibly than in their baths. Seneca complains, that the baths of plebeians were filled from silver pumps; and that the freedmen trod on gems. Statius has pleasantly described one in his poem upon the baths of Claudius Etruscus, the steward of the emperor Claudius.

*Nil ibi plebeium; nusquam Temesæa videbis
Æra, sed argento felix propellitur unda,
Argentoque cadit, labrisque nitentibus instat,
Delicias mirata suas, et abire recusat.*

Macrobius tells us of one Sergius Oratus, a voluptuary, who had pendent baths hanging in the air. According to Dion, Mæcenas was the first who made a bath at Rome; yet there are instances of public baths prior to this; but they were of cold water, small, and poorly decorated. Agrippa, in his ædileat, built a number of baths, where the citizens might be accommodated, either with hot or cold water, gratis. After his example, Nero, Vespasian, Titus, Domitian, Severus, Gordian, Aurelian, Maximian, Dioclesian, and most of the emperors who studied to gain the affections of the people, erected baths laid with the richest marble, and wrought according to the rules of the most delicate architecture. The rich had baths at home, and frequently very magnificent ones, especially after the time that the practice of pillaging provinces had begun; but they only used them on extraordinary occasions. The great men, and even emperors them-

selves, sometimes bathed in public with the rest of the people. Alexander Severus was the first who allowed the public baths to be opened in the night during the heats of summer.

Dioclesian is said to have erected baths which would accommodate 1800 bathers. According to Alberti, in the eighth book of his architecture, the extent of an ancient Roman bathing establishment was at least 100,000 square feet. Now, if we consider the great extent of their ruins, the number of their apartments, courts, and halls, which were enclosed and served for recreation and exercise, Alberti does not err on the side of excess. They were generally of a square or oblong form, and surrounded with walls; this space had three enclosures, each of which surrounded the building, as it were, one placed within the other. The first, or what surrounded the exterior, contained the halls in which the philosophers gave their instructions, and those which were used by the *athletæ*. The second division contained open places, planted with trees, for the exercise of the youths. In the third division, situated in the middle of the building, were the baths, surrounded with porticoes and open courts. Sometimes the entire building was enclosed by a park, like that of Alexander Severus, which contributed greatly to the embellishment of the whole structure.

They were careful to place their public baths in a warm situation; to protect them from the north winds, and expose them to the south or south-west as much as possible, that they might receive heat from the sun during the hours in which the bath was generally used. In the baths of individuals, especially in towns or cities, they sometimes made a distinction between summer and winter baths. In the first, they placed the cold bath towards the north, and in the winter baths, towards the south.

The Greek baths were usually annexed to *palestræ* or *gymnasia*, of which they were considered as a part. These baths consisted of seven different apartments, usually separated from each other, and intermixed with other buildings belonging to the other sorts of exercises. These were, first, the cold bath, *frigida lavatio*; secondly, the *oleothesium*, or room where they were anointed with oil; thirdly, the *frigidarium*, or cooling room; fourthly, the *propigneum*, or entrance of the hypocaustum, or stove; fifthly, the vaulted room, for sweating in, or vapor bath, called *concamerata sudatio*, or *tepidarium*; sixthly, the *laconicum*, or dry stove; seventhly, the hot bath, called *callida lavatio*. The baths separate from the *palestræ* appear to have been usually double, one for men, the other for women; but so near, that the same furnace heated both. The middle part was possessed by a large basin that received water by several pipes, and was surrounded by a balustrade, behind which there was an area for the reception of those who waited to use the bath. They were vaulted over, and only received light from the top. In the Roman baths, the first part that appeared, was a large basin, called *κολυμβήθρα* in Greek, and *natatio* or *piscina* in Latin. In the middle was the hypocaustum, which had a row of four apartments on each side, called *balnearia*; these were the stove, the

bath, cold bath, and tepidarium. The two stoves, called laconicum and tepidarium, were circular and joined together. Their floor was hollow and suspended, in order to receive the heat of a large furnace, which was communicated to the stoves through the vacuities of their floor. This furnace also heated another room called vasarium, in which were three large brazen vessels called millaria, respectively containing hot, warm, and cold water; which were so disposed, that the water might be made to pass by syphons and pipes out of one or other of them into the bath, in order to adjust its temperature. The description is given by Vitruvius.

The baths or thermæ of the Romans, as well as the gymnasia of the Greeks, were sumptuously decorated with bassi rilievi, statues and paintings; the basins were of marble, the pavements of mosaic, and the cupolas splendidly decorated. The remains of those at Rome prove, more than any other of their architectural ruins, the love of magnificence and luxury which characterised the ancient Romans; and as the public baths were intended to collect together a great number of people, they were divided into so many various apartments, which afforded their architects an ample field for the display of taste and splendor of ornament. Agrippa ornamented the apartments of his bath with encaustic painting, and covered the walls of the caldarium with slabs of marble, in which were inserted small paintings. In the earlier period of the Roman history, before the arts and luxuries of Greece were much known to, or practised by, the Romans, their baths were small and simple, only calculated for the mere act of bathing, like that of

Scipio Africanus, described by Seneca. While the ruins of the baths of Titus, Caracalla, Nero, Dioclesian, and Antoninus, are the most splendid examples of these kinds of buildings, and anciently contained the finest statues that were brought from Greece. The Laocoon was found in the baths of Titus, and the Farnese Hercules in those of Caracalla.

In Italy and the east, baths on a large scale are still constantly seen. Denon, in his Egypt, describes the hot vapor baths of the countries through which he passed; and in St. Petersburg, at Florence, and in several European capitals, these are coming much into use.

BATHE (Henry De), a learned knight and justiciary of the thirteenth century, born at Bathe House, in Devonshire, the family seat. In 1238 he was appointed justice of the Common Pleas; and within the succeeding twelve years, an itinerant justice for eight different counties. In 1251 he lost the royal favor, and being accused of accepting bribes, perverting justice, &c. and, above all, of seditiously alienating the affections of his majesty's subjects, Henry III. became so irritated against him, that De Bathe, either from his innocence, or popularity, being acquitted of the crimes laid to his charge, Henry is said to have declared from the throne, that whosoever should kill Henry De Bathe, should have a royal pardon for him and his heirs!—Not long after, however, by the mediation of friends, and the payment of 2000 marks to the king, he was restored to favor, and all his former offices, along with that of justice of the king's bench, which he enjoyed till his death in 1261.

BATHING.

BATHE, } *Ang.-Sax. bathian, Dut. and*
 BATH, } *Ger. baden, Swed. bada.* To wet,
 BATHING, } to immerse in water or other liquid. A bath, the receptacle of the fluid, in which subjects are covered or immersed, is either hot or cold, either of art or nature. It is also a technical term in chemistry.

The sleep of himself yet saw I there,
 His herte-blood bath bathed all his here.

Chaucer. The Knightes Tale.

Quod he,

Breune hire right in a bath with flames rede,
 And as he bade right so was don the dede,
 For in a bath the gone hire fast shetten,
 And night and day gret hire they under batten.

Id. Second Nonnes Tale.

And whilst he slept she over him would spread
 Her mantle, colour'd like the starry skyes,
 And her soft arms by underneath his head,
 And with ambrosial kisses bathe his eyes.

Spenser.

For if they meant to bathe in reeking wounds,
 I cannot tell.

Shakspeare. Macbeth.

Sleep,

The bath of each day's life, sore labour's bath,
 Bath of her criminals.

Id.

Therefore, belike, this humour of melancholy is called bath, or diaboli, the Devil's bath; the devil seizing his opportunity of such humours, drives them

many times to despair, fury, rage, &c. mingling himself among these humours.

Burton's Anatomy of Melancholy.

But lo! the day is ended with my song,

And sporting bathes with that fair ocean maid.

Fletcher. Purple Island.

Others on silver lakes and rivers bath'd

Their downy breast; the swan, with arched neck,

Between her white wings mantling proudly, rows

Her state with oary feet. *Milton.*

Mars could in mutual blood the centaurs bathe,

And Jove himself give way to Cynthia's wrath.

Dryden.

She rear'd her arm, and with her sceptre struck

The yawning cliff from its disparted height;

Adown the mount the gushing torrents ran,

And cheer'd the vallies; there the heav'nly mother

Bath'd, mighty king, thy tender limbs.

Prior. First Hymn of Callim.

Queen lilies: and ye painted populeae,

Who dwell in fields, and lead ambrosial lives;

In morn and ev'n'ing dew, your beauties bathe,

And drink the sun. *Young.*

Constantine survived that solemn festival about ten months; and, at the mature age of sixty-four, after a short illness, he ended his memorable life at the palace of Aquyriion, in the suburbs of Nicomedia, whither he had retired for the benefit of the air, and with the hope of recruiting his exhausted strength by the use of the warm bath. *Gibbons.*

BATHING, for medicinal or salutary purposes, demands consideration under several distinct heads; in the first place, as the temperature of the bath may be concerned: thus we have cold, hot, and tepid or temperate baths. Secondly, as the mode may vary in the application of the media employed; for immersing the body, pouring water over the whole, or part of its surface, the use of sponges or cloths to the naked body, immersing the body in or exposing it to vapor, and letting water fall from a greater or less height upon the head and shoulders, are, in fact, all varieties of bathing. We have, thirdly, also to consider the question of specific qualities in the agencies employed; some substances, as we shall see in the sequel, being used for the impregnation of baths which are supposed to operate with positive powers of a medicinal kind. And, lastly, it may be remarked, that the material itself varies beyond the circumstance of temperature or peculiar quality; for besides water and vapor, air and earth have been brought into requisition as subservient to the purposes for which the practice of bathing was instituted.

The term COLD BATH is generally made to include the whole range of temperature, from a little above thirty-two to eighty degrees of Fahrenheit's thermometer; by sudden immersion in water, of this low temperature, the whole surface becomes contracted, the bulbs of the hair, as a modern author states, are made conspicuous, and the skin, resembling that of a newly picked goose, has been styled cutis anserina. The debility and tremor are considerable, a sense of weight is felt in the head, the respiration is quick and laborious. These appearances are followed by a very different series. A glow soon returns to the surface, the weight in the head is almost instantaneously relieved, and every function appears to be carried on with increased activity. If a person stays for a longer period in the bath, the glow will be slighter and will soon disappear, while every previous symptom of debility will return and continue.

If this immersion be repeated at due intervals, and the stay in the bath be not improperly continued, the general health and spirits are greatly improved, the different necessary evacuations properly carried on and supported, and the body and mind appear to act with increased vigor.

The explanation of these phenomena, says the author from whom we extract, is not difficult: the cold, by its sedative powers, represses the circulation in the extreme vessels, and the fluids are accumulated in the larger arteries and veins: and he goes on to state, that re-action is set up to produce the subsequent glow; this after-glow, however, and indeed the immediate impression of the cold water, are probably more complicated operations than those persons imagine who readily receive the explication of the circumstances as referrible to a sort of mechanical action and re-action. The cold plunge seems to affect not merely by directing the blood inwardly upon the large blood-vessels and viscera, but there may be a constricting agency produced through the whole series of capillary vessels; and the con-

sequent diminution of the capacity of these vessels, or of their diameter, must, as is well remarked by another writer on the subject, necessarily increase that part of the resistance to the blood's motion which is derived from its friction against the sides of the vessels, and must therefore tend materially to lessen its velocity. He might have added, that, upon this principle, the generation of cold, or rather the subduction of the sensation of heat is probably in a greater measure than would be the consequence of the mere cold immersion, had not this mode of applying cold some constricting as well as mere sedative power; this term sedative, we may here incidentally remark, has been employed by physiological and pathological writers with too much laxity of signification.

In considering the phenomena directly and indirectly produced by cold bathing, reference ought likewise to be had to the sensations; for it will be found that both the first and subsequent effects are very materially regulated, both as to their degree and duration, by the condition of the percipient power. That sensation has a great deal to do, both with the principle of its operation and the salutary or injurious effects of cold bathing, has been shown with a great deal of ingenuity by the late Dr. Currie, in his experiments on cold water as a febrifuge power; and that the glow which succeeds to the first sensation of cold, may be ascribed in a great measure to the increased sensibility of the nerves after a partial torpor, cannot be denied. At the same time it must be admitted, that there is not only a relative but an actual increase of heat on the surface of the body, during the re-action following the temporary torpor; and it is probable, we are told, the causes concerned in the production of animal heat are called up into a more vigorous exertion in a strong constitution, whenever they are required for the purposes of life; so that they at first supply the superficial parts of the body, during the immersion, with as much heat as is necessary to overcome the painful sensation of cold; and afterwards, by a continuation of the same action, occasion an actual elevation of temperature above the natural standard.

It is worthy of remark, that re-action, as it is called, or heat following exposure to cold water, sometimes occurs, even when there has been no prior depression of temperature. Dr. Currie found that during the affusion of a bucket of cold salt water on the heads and whole bodies of two healthy persons, no depression of temperature was observable; but, in a minute or two afterwards, although they remained without motion, the mercury rose two degrees; and in a third person, of feebler constitution, although the temperature remained equally unchanged during the affusion, it sunk in a minute after, half a degree. These effects seem to be almost entirely independent of any change in the state of the circulation, which must be rather retarded than accelerated, while the generation of heat is increased. It is true that the heart might be called into more powerful action at the same time that the pulsation of the wrist became feeble, from the permanent contraction of the

radial artery; but the action of the heart would still be exhibited by the carotids, undisguised by this modification; and the carotids have not been observed to beat more strongly in the cold bath than at other times, although Dr. Currie has remarked, that when the pulse could hardly be felt at the wrist, the heart pulsated with great steadiness and due force.

Much, it must be confessed, is wanting in the way of physiological experiment before we can satisfactorily explain the laws of temperature of the human body, or the vascular changes that are concomitant with, or perhaps in some measure the causes of, these changes; and indeed it is not easy to say precisely upon what principles cold bathing, when it proves a sanative or salutary process, operates the beneficial purpose: *a priori*, we should scarcely have supposed that a temporary suspension, to be followed by excitation, that excitation itself proving but transient, would have been attended with much benefit to the constitution; and yet we do see that much and unequivocal good occasionally, nay frequently, follows the temperate and judicious employment of the agent now under consideration. Much mischief is also the result of its indiscriminate or injudicious use, and we shall now proceed to point out in what cases and circumstances cold bathing is desirable or admissible; where it is contra-indicated; and in what mode it is best administered.

It has already been intimated that cold bathing may be used with advantage under certain modifications of febrile heat; it is, however, of the utmost importance to attend to certain precautions which its use demands, when employed as a febrifuge. Dr. Currie tells us that cold bathing or affusion, in fever, can only then be had recourse to with safety and good effect, when the heat of the body is steadily above the natural standard, when there is no sense of chilliness, and especially when there is no general nor profuse perspiration. If used during the cold stage of fever, even though the heat be higher than natural, it brings on interruption of respiration, a fluttering, weak, and extremely quick pulse, and certainly might be carried so far as to extinguish animation entirely. (See MEDICINE, article FEVER, &c.)

In another affection, very opposite to fever, viz. tetanus, cold bathing has been used with decidedly beneficial effect; and, in this case, it may be remarked that the principle of its operation must be different; the shock given to the sensations, and the whole order of organic movements, being temporarily changed, having more seemingly to do with its healing influence than any circumstances abstractedly connected with change of temperature. The observation is as old as Hippocrates, that the remedy under remark is best adapted to these convulsive disorders when they are the result rather of general mobility of a morbid kind, than connected with local affection: *αρε ελαος* is the expression of the Coan sage, and we attribute it partly because it is contradictory of what we are immediately to advance on the objectionable circumstances to cold bathing in other complaints and tendencies.

But it will not be requisite or proper in this

article (which is intended rather for popular than for professional direction), to go through the various disorders in nosological order, for which the practice of cold bathing has been instituted; suffice it to say, that it has generally been used and recommended in those conditions of fibrous debility which are under the grade of actual disease, and in which those medicinal agencies are demanded which pass under the name or tonic. Such states are marked by irregularities in the displays of nervous power, by tremors, by more than natural sensibility to cold, by the easy excitation of profuse discharges from the skin, by head-aches, listlessness, and febricula, with lowness of spirits, irregular appetite, deficient digestion, and torpid bowels. Individuals, in this condition of the nervous and muscular powers, may be greatly benefited by the daily employment of cold water to the surface, in the manner immediately to be pointed out.

But it may be right first to dismiss the much agitated and very interesting question respecting the propriety of bathing or washing children; and this, perhaps, will be best done by extracting from a modern writer on consumption, 'Immersion in cold water,' says Dr. Reid, 'during the period of infancy, has been very generally recommended, and too frequently had recourse to in an indiscriminate manner, to preserve health and insure hardiness. The author has remarked several instances where sensible and sometimes serious injury has arisen from neglecting to observe the precautions necessary to regulate the employment of this important agent in very early years. In infancy, danger to the lungs from cold bathing has been stated to exist in a very inferior degree; and by the practice of dipping infants in cold water, susceptibility to the injurious impression of cold in succeeding years has been thought to be materially diminished. This principle, in the abstract, is undoubtedly correct; and, with the exception and precautions now to be mentioned, may be pursued with propriety and advantage. Two infants may be supposed of one family, with reverse constitutions; in the one, a general torpor, debility, and great susceptibility to the impression of cold shall prevail; in the other, comparative vigor, activity, and warmth. To pursue, without discrimination, the same course with respect to immersion in water with each of these children, would be obviously improper. That degree of cold which would refresh and invigorate the one, would confirm debility, and augment torpor, in the other. A bath which is not cold to the sensations must, in the first instance, at least, be resorted to for the weaker infant; and in neither case should immersion in cold water be practised when the external temperature of the body is inferior in degree to its general standard, when after immersion the body appears to be chilled, or when returning heat is attended with febrile languor, instead of the grateful and genial warmth characteristic of the appropriate action of exciting powers. If the practice of immersion be guided by a cautious observance of these particulars, it may be pursued with safety, and will be attended with success; but a total neglect of bathing were greatly preferable to the severe and

incautious manner in which infants are frequently exposed to these violent and rapid changes in temperature.

We may further remark, that, both in the states of infancy and youth, cold bathing must be cautiously, and only under professional permission, employed, when the constitution is decidedly of a scrofulous cast; and more especially when, with that general condition of the organisation to which the term *scrofula* would be applied, tendencies manifest themselves of local or topical disorder. Under the somewhat mechanical notion of hardening the frame, as some inanimate bodies are hardened by being plunged into cold media, cold bathing has been employed, and persevered in, to a deleterious extent; and under the circumstances of consumptive disposition, or verging towards any internal or visceral disorder, the shock, and irregular impulses, and internal rushes, if we may so say, which the frequent plunges into cold water imply, instead of strengthening, irritate the feeble frame, and assist the constitutional bias towards structural and irremediable disorder. Dr. Beddoes presents an important and instructive example of this principle and practice, on the authority of the late Dr. Pulteney. 'T. C. was *rickety in his infancy*, and very weakly for several years after. In the winter of 1759 he had pleuretic symptoms; a rheumatic fever left him next summer afflicted with chronic rheumatism; he was advised to go into the cold bath; he did so; but on coming out again felt such an increased load, fainting, and anxiety, about the precordia, that he thought he should hardly recover the shock it gave him. Nevertheless he ventured in again a day or two afterwards, but experienced the former symptoms in an aggravated degree, and from this time dated the disorder that terminated his life.'

As mischievous mistakes have occasionally arisen in the practice of cold bathing, from too abstractly considering it a tonic or strengthening process, so much error has connected itself with the mode and circumstances of immersion. It has been too generally considered that to be fitted for immersion, the body should be cooled down nearer to the temperature of the bath, than after a little exercise it is made; and that if a person have hurried to the side of the water into which he is about to plunge, he ought to rest until part of the artificial heat he has produced from exercise, be dissipated in the surrounding air. This is an erroneous motion, which Dr. Currie was the first fully to refute and rectify; it is singular how it should have arisen, since our own feelings, as well as our observation on the instinct of animals, seem to direct to a different conclusion and practice. The opposite doctrine, too, was taught by the ancients. 'When we are fatigued or dried up by exercise (says Galen, as quoted by Dr. Young) the bath restores us to comfort, and defends us from fevers. A strong young man in the country will plunge into cold water at once, when heated, and be much refreshed by it. Animals also, wash themselves when they are hot, by a natural instinct, as they eat when they are hungry, and seek warmth when they are cold. In fevers, if we had sufficient powers of discrimi-

nation, we might probably sometimes derive material advantage from the use of the cold bath, without premising the hot; and some persons have been actually benefited by this remedy. But without a more intimate knowledge of diseases than we possess, we cannot generally venture on the practice; and least of all in hectic fevers, where there is not strength enough to bear the shock. A stout young man having a fever in warm weather, without visceral inflammation, would, bring on a salutary perspiration by bathing in cold water; and if he were in the habit of cold bathing, he might have recourse to it with more confidence; but for hectic, it is unsafe, especially where there is much emaciation; thus in a hot and dry summer, those who have travelled far, and are become thin and weak, have no need of being cooled, nor would it be safe for them to use the cold bath, without first going into the warm. For we seem to be hardened by the cold bath, like iron when heated first; and if we previously warm ourselves by exercise, the effect is the same.'

We have extracted these observations of Galen, because their practical inference is precisely the same, as that to which the good sense and philosophic acumen of Dr. Currie have brought us; and because they are strongly contrasted with the vulgar conceit, which, almost universally, and still too generally, prevails. It is well observed by the writer from whom we now borrow (see supplement to the *Encyclopædia Britannica*), that Dr. Currie's relation, of an adventure of his own, might almost be supposed to have been intended as a commentary on these remarks of Galen. 'On the first of September, 1778, two students of medicine at Edinburgh, set out on foot on a journey, a considerable part of which lay along one of the rivers of Scotland. They started by sun-rise, and proceeded with alacrity in the cool of the morning. At the end of eight miles they breakfasted, rested for an hour, and then resumed their journey. The day grew warm as it advanced, and after a march of eight miles more, they arrived heated, but not fatigued, on the banks of the river above mentioned, about eleven in the forenoon. Urged by the fervor of the day, and tempted by the beauty of the stream, they stripped instantly and threw themselves into the river. The utmost refreshment followed, and when they retired to a neighbouring inn, this was succeeded by a disposition to sleep, which was indulged. In the afternoon they proceeded, and travelling sixteen miles further, at a single stretch, arrived at the inn where they were to sleep a little after sunset. The afternoon had been warm, and they perspired profusely; but the evening was temperate and rather cool. They had travelled for some miles slowly, and arrived at the end of their journey, stiffened and wearied with exercise. The refreshment which they had experienced in the morning from bathing induced, however, one of them to repeat the experiment, and he went perfectly cool into the same river, expecting to relax his limbs in the water, and afterwards to enjoy profound sleep. The consequences were very different. The Tweed, which was so refreshing in the morning, now felt extremely cold, and he left the water

hastily. No genial glow succeeded, but a feverish chill remained for some time, with a small frequent pulse, and flying pains over the body. Warm liquids, and frictions at length brought on considerable heat, and towards morning, perspiration and sleep followed. Next day, about noon, they proceeded on foot, but the traveller who had bathed was extremely feeble; and though they had to perform a journey of a single stage only, as some part of it was difficult and mountainous, he was obliged to take the assistance of a carriage, which overtook them on the road. It was several days before he recovered his usual vigor.

It is generally known that the Russian goes recking from a bath, heated almost to the highest pitch of endurance, and immediately, without staying to cool himself, rolls his naked body in snow: and the experiments made some time since by Fordyce and Blagden prove that a rapid transition from high heat to cold may, under some circumstances, be made with the utmost safety. So erroneous is the notion we are now combating, that the body requires to be cooled in order to render it fit for a chilling medium. Still, there are certain facts connected with the action of cold and heat on the living system, which prove that we must not take too precipitately, or in too unqualified a manner, the reverse rule for our guide through all circumstances. As an example, says a modern writer, of the injurious tendency of a precipitate application of cold when the body is heated, in a more than ordinary degree, the sufferings of the Macedonian conqueror, from plunging into the river Cydnus, have frequently been adduced. Dr. Currie, however, has endeavoured to prove, that the situation of Alexander, previously to bathing, was different from that more commonly imagined; and that his subsequent illness, as related by his historian, is referrible to circumstances exactly opposite to those to which they are generally attributed. From the length and difficulty of the march, it is natural to suppose that he must have been cooled as well as debilitated, by excessive perspiration and fatigue; and under such circumstances, immersion in the cold and rapid Cydnus was followed by the consequences which we should expect from the principles already laid down.

Other circumstances, however, have been arrayed as evidences against the propriety and safety of a sudden application of cold subsequently to violent heat. Many well attested instances are on record, of instantaneous death, or violent disorders, which have terminated fatally, following imprudent exposure to cold, while the body has been overheated; and in some of these, the application of the noxious cause has confessedly been made previously to the production of fatigue or coldness. It is by no means uncommon for violent inflammation of the stomach or lungs to be occasioned by large draughts of cold water, incautiously taken to abate thirst, consequent upon excessive heat; and the injurious effects of the external application of cold water, both to the whole surface, and merely to a part of the body, have been amply and fully proved, in order to invalidate or qualify the many and too common

(says Reid), on this very interesting subject, may perhaps be in some measure reconciled by the following considerations:—

The state of the body, in relation to its susceptibility of being acted on by cold media, has more reference to the kind than degree of previously existing heat; or, more correctly speaking, although an equal quantity of heat may be present in the system, such heat may be abstracted with greater or less facility and safety, according to the mode in which it has been generated. The increase of temperature occasioned by what is termed an inflammatory action pervading the whole system, such as is sometimes observed in violent inflammation of the lungs; that attended with an extremely debilitated state of the vital power, as in instances of what has been termed improperly putrid fever; the heat consequent upon violent exercise, and that produced by communication from without, as in the example of hot baths, or exposures to other sources of great heat, while the body continues inactive; are all essentially different in their nature: and, although in each case the quantity may be equal, and the thermometer applied to any part of the body shall indicate the same temperature, yet from such temperature alone it would be improper to form a judgment of the expediency and safety of the sudden application of cold. In the author's recollection a case occurred, of violent inflammation of the whole thoracic viscera, which speedily terminated in death, almost immediately following a large draught of cold water, when the body had been heated from unusual exercise. The deceased was previously to the event a strong and healthy man, in the prime and vigor of life. In this case the injury appeared to arise, not from the sudden abstraction of heat, but from the precipitate interruption of those actions by which the increase of temperature had been generated. Had the same quantity of water equally cold been suddenly swallowed by a person oppressed and debilitated by febrile heat and irritation, these fatal consequences would not have succeeded, because in this latter case the cold fluid would have operated in deducting from the superfluous quantity of generated and oppressive heat, and the refreshing sensation excited in consequence would have stimulated the languid frame. The same principle likewise applies in the application of cold media, either partial or general, to the external surface. Dr. Beddoes relates the case of an obstinate eruptive affection being produced on the face, in consequence of the immersion of that part in cold water, when the subject of the affection was heated and thrown into perspiration by play. Had this immersion immediately succeeded to hot bathing, or been made during the existence of dry febrile heat, the injurious effects would not have resulted; for this reason, that the action of the cutaneous vessels would not in the latter cases have been injuriously interrupted, and thus indirectly stimulated into inordinate excitement.

The seeming contrarieties of speculation on the subject of temperature, may, perhaps, likewise, in some measure, have arisen from the very important circumstances of cooling applications

and its apparently contradictory deductions,

acting through successive moments, or by successive quantities. If a person in a heated state drink half a pint of cool liquid, that may not sensibly reduce him below the natural healthy state. But if he put down double that quantity at once, the last half pint may be regarded as operating upon the system reduced by the first, and sinking into a dangerous chilliness. So immersion for a moment in a sunny river may strengthen and refresh, as many pedestrian travellers have experienced; whereas delay in the water would be attended with great hazard, on account of the continued operation of a heat-abstracting medium upon a system sufficiently reduced in its temperature and action by the first plunge. Whatever might have been the actual condition of Alexander, when he plunged into the Cydnus, the injurious effects of his bathing unquestionably originated from the sudden reduction of heat below the standard of health. 'Vixque ingressi subito horrore artus rigore ceperunt: pallor deinde suffusus est, et totum propemodum corpus vitalis calor reliquit.' In this case, perhaps, an exposure to cool air, or immersion in water of a superior temperature, but which would nevertheless have abstracted a certain degree of heat from the languid frame, would have displayed effects exactly contrary to what the historian here relates. In like manner, the Russian, who reeking from his vapor bagnio, immediately rolls in snow; or, who, after immersion in a bath which has been heated almost beyond endurance, instantaneously plunges into contiguous cold water, requires that the medium to which he is first exposed be extremely great, or the succeeding cold application would debilitate, and perhaps destroy. Upon this principle, likewise, the statement of Dr. Fordyce is explained, that a person passing from a violent degree of heat to much cold, will gradually return to his proper standard of temperature, while from a sudden change from heat to cold, when the heat has not been so high, diseases will often be generated.

To revert to the subject more especially under our present consideration, we may remark, that cold bathing will in general be found applicable to those conditions of nervous and muscular lassitude and weakness, in which, though the powers of the system are thus below their due grade, there is sufficient energy to insure a healthy re-action; while its use is objectionable and fearful, where local and especially visceral irritation of a vascular kind accompanies the general debility; and this condition of the frame, it is right to remark, is of more common occurrence than is sometimes suspected; the topical affection often being masked, as it were, or concealed under the systematic weakness; and the detection of that something which is thus preying upon the vitals requiring frequently the nicest tact, and most extended experience. It will have been remarked, that the two highest of the ancient authorities in medicine, speak of local and hectic circumstances as contra-indicating the propriety of cold immersion; and it will be recollected, that we gave a case in point, as substantiating the propriety of these cautions—cautions, however, which on the other hand, must not be con-

ceived and acted upon with too much nicety, lest we lose sight altogether of radical weakness; and fear to stimulate and excite, where excitation may prove abundantly serviceable.

In regard to the mode and times of using the cold bath, the following directions, taken from Dr. Willich, may be worthy attention. '1st, Every cold bath applied to the whole body ought to be of short duration; all depends upon the first impression the cold makes on the skin and nerves, it being this impression which hardens us against the effects of rough and cold weather. 2d, The head should be always first wetted, either by immersion, by pouring water upon it, or the application of wet cloths, and then plunging over head into the bath. 3d, The immersion ought always to be sudden; not only because it is less felt than when we enter the bath slowly and timorously, but likewise because the effect of the first impression is uniform all over the body, and the blood in this manner is not propelled from the lower to the upper parts. Hence the shower bath possesses great advantages, as it pours the water suddenly upon the whole body, and thus in the most perfect manner fulfils the three rules above specified. 4th, The due temperature of the cold bath can only be ascertained in relation to individual cases, as it extends from 33° to 56° of Fahrenheit, except in partial bathings, where the degree of cold may, and often ought to be, increased by ice, nitre, alum, salt, sal-ammoniac, or other artificial means. 5th, Gentle exercise ought to precede the cold bath, to produce some re-action of the vascular system upon entering it; for neither complete rest nor violent exercise is proper, previously to the use of this remedy. 6th, The morning or forenoon is the most proper time for cold bathing, unless it be in a river; then the afternoon or towards the evening, when the water has been warmed by the sun, and the dinner has been digested, are the most eligible periods of the day; a light breakfast will not be detrimental before using the bath. 7th, While in the water we should not remain inactive, but move about in order to promote the circulation of the blood from the centre of the body to the extremities. 8th, After immersion, the whole body ought to be wiped as quickly as possible, with a dry and somewhat rough cloth. Moderate exercise out of doors, if convenient, is proper, and indeed necessary.'

We now proceed to the consideration of *hot or warm bathing*, from the temperature of ninety to above a hundred degrees, about which much of what is erroneous in theory has also been conceived. As cold immersion was supposed to harden, by constringing and contracting the fibres of the body, so has it been thought that immersion in warm water would tend to soften and relax the material fabric of which the frame is made up. That there may be something of foundation, in fact, for these notions, we would not *in toto* deny; but it seems more consistent with the laws that govern organised existence to refer the effects to excitation, directly or indirectly induced, than to imagine the fibres of the body capable, or rather susceptible, of those mutations that take place in inanimate matter;

and, in point of fact, we find that some individual or individuals in some circumstances, after a reiterated use of warm or hot water to the whole or part of the body's surface, shall be rendered firmer and more robust than they were prior to the employment of this relaxing agency.

Another effect has also been attributed to the use of hot water, or vapor, as a bath, about which there is some reason also to doubt the full legitimacy of the inferences that have been deduced: viz. its expanding or rarefying qualities, displayed upon the fluids of the body, more especially upon the blood; and some writers have reasoned upon the operation of the hot bath from beginning to end under this assumption; we are told, however, by experimenters, that the blood is very little expansible by heat under any circumstances; and it has been observed, that the mean temperature of all the fluids of the body is seldom elevated more than a degree or two by a bath of any kind; and even if the elevation were ten degrees, the expansion of all the circulating fluids would not exceed the bulk of a single additional ounce of blood or of water. So that to a certain sort of stimulation, rather than to mechanical or chemical impulse, are we to attribute the internal changes that occur in the fluids and solids of the body, from alterations of exterior temperature. That these changes to some extent do occur, is, however, pretty certain; and the swelling of the veins, with, indeed, the temporary increase of bulk in the feet, when immersed in hot water, would seem attributable either to an entrance of some of the fluid from without in among the fluids of the body (the possibility of which, as we shall immediately see, is questioned), or to an altered state of the fluids and secretions, and perhaps of the solids, induced by a modification and mixture of exciting and expanding agency; which, in our present state of knowledge respecting the laws and limits of vital forces in their contest with inanimate matter, would appear not sufficiently explained.

In observing upon the conditions of the body in which warm bathing is likely to prove salutary on the one hand, or is open to objections on the other, it may be remarked, that some of the circumstances which render cold bathing fearful, cause warm bathing to be objectionable likewise. Thus, in apoplectic fulness, in tendencies to hæmorrhage from the lungs, or from the head, in some species of asthma, and in many of the disorders ranged under the division of phlegmasia by systematic writers, we should equally avoid both the hot and cold bath; and were the old doctrines of reaction and expansion permitted to explain our objections, we should say that, in the first case, rarefaction of fluids and consequent distension of vessel constituted the points of objection; while in the other, the rush of fluids into vessels already in a condition of over excitement rendered the practice dangerous; and to some extent, it does, we repeat, appear to us, in spite of most refinements in theory, that we should be correct in our reasoning.

There is one curious circumstance connected with the effects of warm bathing upon the system, which is, that it may, by proper management, be brought to regulate the inordinate heat

of fever; and Dr. Currie has particularly recommended it with this view, in cases where objections might lie against the employment of cold water for the same purpose; the possession of this property and influence may be taken in full proof that much remains still to be explained on the subject of living temperature; it should be observed that the effect in question is often operated without reference to perspiration, or at least before perspiration appears externally upon the body; and Dr. Currie has proposed an ingenious explanation of the fact, by suggesting whether the secretion of the perspirable fluid, before it is poured out upon the surface, may not occasion an absorption of heat and consequent reduction of temperature, by the greater capacity that the matter of perspiration has for heat than the blood had from which it was formed. See TEMPERATURE (*Animal*), and PHYSIOLOGY.

From the mode and kind of excitation which warm bathing produces, it might be supposed that chronic rheumatism, that old-standing affections of a paralytic kind, that contracted limbs from arthritic disorders, that spasms and obstructions in the bowels, that many maladies which implicate the nervous organisation without producing plenitude of vessels, and that morbid conditions of the external surface, whether of the skin merely, or whether the cutaneous affection have had to do with the state of internal membranes and visceral derangement, would materially be benefited by its judicious employment—and this we find to be the case. In several of the functional disturbances that are incident to children, arising from the extreme mobility of the frame common to the infantile period of existence, warm bathing, by equalising the circulation, and determining, as it is expressed, to the surface, often proves conspicuously, and very speedily serviceable; but in instances of the occurrence of disorder, whether croupal, convulsive, or intestinal, it is often necessary to premise purging or blood-letting, especially should the child be of a full habit, otherwise the stimulating, and, if we may be permitted to say so, expanding power of the heated water might tend to the production of vascular plenitude to a dangerous excess. It must be allowed that the tendency of warm bathing to occasion copious perspiration is calculated, in some measure, to obviate the objection now preferred against its indiscriminate use; but then the mischief is sometimes done before the system shall have been thus relieved; and we have ventured upon this intimation, because we think, in the general way, too little regard is given in domestic medicine to the circumstances calculated at once to promote the efficacy and insure the safety of the measure under consideration.

Without reference to actual or positive disease, it may be stated, generally, that warm bathing is serviceable in those low conditions of the nervous and vascular and muscular energy, in which the same use of cold water would prove rather injurious than useful; it is a common, and occasionally a good practice, to premise its employment when it is eventually intended that the individual shall go into the cold bath; the

stimulus of the former being of such kind and extent as to insure against the hurtful tendency of the latter; and the good which results from this method would prove that the idea is erroneous, which supposes an individual more liable to take cold, as it is called, while using the warm bath than when not subjected to these changes of temperature. The ancients were in the practice of gradual transition from the hot bath or caldarium, to the tepidarium or cooler, and thence to the frigidarium or cold; but if there be any correctness in the principles above propounded, respecting the innoxious nature of cold immediately upon heat, these precautions in reference to successive temperatures, were unnecessary; and, indeed, in some cases might be worse than useless.

With respect to the tepid bath very little need be said on the present occasion, since water from eighty to ninety degrees is very seldom employed except as a mere abluent; unless, indeed, in those instances of natural or artificial waters which are impregnated with substances that are conceived to have a specific agency of a medical nature. In some disorders of the skin, indeed, and in other chronic ailments, tepid bathing may occasionally be advisable when circumstances forbid the employment of water of either a very low or very high temperature.

The modes of using cold water are, first, by plunging, which is the best calculated, perhaps, to insure all the good of bathing; secondly, by affusion, or pouring water over the head and neck, which is especially applicable to those states of nervous weakness, and vascular fulness and head-disorder, in which the common bath might be objectionable; and, thirdly, by sponging the whole surface of the body immediately upon rising from bed; which last practice may, in the case of most individuals, be pursued with safety and convenience. The writer of these remarks, since he has been accustomed to daily ablution in this way, has found himself much less liable to catarrhal disorder than before; and it may be observed, that he tried, some years since, cold bathing by immersion, without the same agreeable or salutary consequences; but part of this difference of effect he is disposed to attribute to a recent improvement in constitutional energy, which would probably insure, at the present time, more steady re-action, and better general effect than formerly followed immersion.

BATHS WITH MEDICINAL IMPREGNATIONS.

In the article *WATERS*, we purpose to enter into a somewhat lengthened detail on the virtues that have been ascribed to the several medicinal springs that are resorted to by the invalid, and which are used as remedies, some in the way of internal administration, exclusively, others both externally and internally. We mean here principally to confine ourselves to one or two remarks, bearing upon the much agitated and still unsettled question, respecting the degree of efficacy that may be expected to attend immersing the body in water, containing particular impregnation, or applying such water in any manner to the external surface.

This question involves in it the very interesting one of cutaneous absorption, as it has been called; in other words, the enquiry, whether, while the outer skin be whole and entire, any substances, however subtle, can be made to penetrate through it; it must, however, be recollected, that the negating of this proposition would not imply the denial of all influence from exterior applications, since the materials used may be of such a stimulating or irritating quality as to produce a sort of abrasion of the scarf or outer covering; and since some of them being of a volatile kind, and surrounding the subject of the experiment with their fumes, the lungs may be the media through which the whole system may become impregnated with their qualities.

Now several authors, who have written on the subject of bathing, have all along assumed the permeability of the outer skin to the water employed; and one of them, Dr. Marcard, states that the sufferings of Tantalus will not be rated very highly by the naturalist. We have already said that the bulk of a limb, which is immersed in hot-water, is for a time augmented; and this has been attributed by those who reason on the supposition of cutaneous inhalation, or imbibing, to the actual penetration, through the skin, of some portion of the fluid. Many experiments, however, have been instituted, which seem to prove that there is some fallacy in this conclusion, and that the weight of the whole body is not at all added to by total immersion, for some length of time, in water even of a high temperature.

Seguin, Rousseau, Currie, and others, have pursued a series of experiments, to which more particular allusion will be made in the article *PHYSIOLOGY*; and from which they infer, that, while the skin is uninterfered with, either by mechanical pressure or by actual abrasion, no matter whatever, solid or fluid, medicinal or otherwise, can be received from without, the scarf skin being impenetrable to the most subtle material; in the words of Dr. Currie, 'though the exhalants of the skin pierce the epidermis (scarf skin), and come in contact with the external air, the mouths of the absorbents terminate under it, and are covered by it; and while it remains unirritated and entire, no absorption of solid, liquid, or aeriform elastic fluid takes place on the surface. In the instances,' he adds, 'that are supposed to favor the contrary opinion, it will be found that the article absorbed is forced through the epidermis by mechanical pressure; or that the epidermis has been previously destroyed by injury or disease; or, if sound, that the article applied to it is of an acrid nature, which first irritates and erodes this tegument, and then, coming in contact with the mouths of the lymphatics under it, is of course absorbed. Seguin's words, expressive of this fact and principle, are equally decided and forcible: 'The epidermis is a barrier which no kind of virus (and he includes all internal matters) can pass while that tissue is in a sound state and perfectly whole; nor can they be absorbed by the skin.'

For a more detailed discussion of this interesting topic we must refer, as above intimated, to the article *PHYSIOLOGY*. Under the word *MEDI-*

CINE, too, facts in support of, and against the doctrine of cutaneous inhalation will call for notice and comment; we must here limit ourselves to stating that the anti-absorptionists have at least proved a great deal, so much so, that it may be very fairly doubted whether inferences respecting impregnations of the system by baths have not been deduced too hastily and empirically. But, on the other hand, it cannot be doubted that there are substances employed which have the power of forcibly permeating the outer skin by their irritating and eroding quality; and are in this way either actually absorbed into the system generally, or by the sympathy which the true skin constantly keeps up with internal organs; the influence of the remedy may in this manner be transmitted to the interior without any actual conveyance of matter. There is still another way in which medicinal substances may act upon the frame without being actually received into it, viz. either by corrugating and strengthening, or relaxing and mollifying the fibres of the body; thus, chalybeate may be more tonic than common water, by the tonic influence it exerts exteriorly. From what we have already advanced, however, in another part of the present paper, it will be understood that this principle of agency is of somewhat equivocal admission; and that it is at any rate much modified and limited by the laws of life.

It will not be proper to dismiss this part of our investigation without adverting to one particular mode of exciting interior movements, through the medium of exterior medicinals, viz. by the use of mineral acids applied to the surface of the body; which, whether they act through the medium of the absorbing power, or whether their agency be effected by means of the nervous system, and that sympathetic relation which we have already stated the skin maintains with internal parts; certain it is that they do display an influence upon the frame which gives them a fair claim of admission into the catalogue of therapeutic agents. From Dr. Good's recently published volumes, entitled the Study of Medicine, we shall extract an account of the bath to which we now refer.

'There is yet another remedy,' says Dr. G. 'for affections of the biliary organs, &c. which of late years has excited great attention, and is now surmounting an ungenerous prejudice that was at first very extensively directed against it—and that is the diluted aqua regia bath, invented by Dr. Scott of Russell Square. For nearly thirty years he has been in the habit of using this preparation, and has tried it in almost every variety of strengths, and almost every variety of proportions which the two acids that enter into the composition may be made to bear to each other. He commenced his experiments in India, where, on account of the greater degree of torpidity the liver is apt to acquire than in more temperate climates, he was in the habit of forming his bath stronger, and making it deeper than he has found it proper to do in our own country; and where, upwards of twenty years ago, he plunged the duke of Wellington into one up to his chin, for a severe hepatic affection he was then laboring under, and thus restored him to health in a short time.'

In England it is not often that he finds it necessary to raise the bath much above the knees—and he frequently contents himself with a mere foot-bath or common wash-hand basin alone. In both which cases, however, the attendants on the patient should sponge him at the same time with the diluted aqua regia over the limbs, and occasionally over the body.

The aqua regia should be compounded of three parts in measure of muriatic acid and two of nitric acid; and, in preparing them for use, a pint of the combined acid is to be mixed with the same measure of water. It should, however, be observed by those who are inclined to form this mixture extemporaneously at their own houses, that, if either of the acids be poured immediately on the other a large volume of very offensive gas will be disengaged; on which account it will be better to pour them separately and slowly on their proper measures of water.

If the acids be of adequate strength, the mixture, subdiluted for bathing, will, to the taste, have the sourness of weak vinegar, and perhaps prick the skin slightly, if very delicate, but not otherwise, after it has been applied to the surface for half an hour. But since these acids vary much in their degree of concentration, as distilled by different chemists, there will be some variation in their power. The strength of the bath, however, should not be much greater at any time than the proportion here laid down; for otherwise it may excite a troublesome rash, and give a yellow hue to the nails and skin of the feet, or whatever other part is exposed to its action. A narrow tub, for a knee-bath, just wide enough to hold the feet and reach the knees, should contain three gallons of the prepared bath liquor, and consequently about nine ounces in measure of the diluted aqua regia. For a foot bath half a gallon may be sufficient, and a common wash-hand basin may be employed as a vessel for the purpose. The feet should remain in the bath for twenty minutes or half an hour, and the legs, thighs, and abdomen, be in the mean time frequently sponged with the same. In the winter the water may be used warm; but this is not necessary in the summer. The baths may be employed first daily for a fortnight or three weeks, and afterwards every other day, or only twice a week.

Dr. Scott affirms that he has employed this process with decided advantage in almost all cases dependent upon a morbid secretion of bile, whether the secretion be superabundant, defective, or depraved. He finds it often, within a few hours of the first bathing, increase the flow of bile and ameliorate its character; and, in consequence hereof, excite an expulsion of dark-colored feces, bright colored bile, or bile of a green brown or black color, like tar mixed with oil. He has told me, also, that when employed in the midst of a paroxysm of severe pain from spasm of the biliary ducts, or the passing of a gall-stone, he has often known it to operate like a charm, and produce almost immediate ease.

'This account,' continues Dr. Good, 'may be rather overcharged from the ardent mind of its intelligent inventor; but the process is worth following up, and varying in other proportions, as well as employing in other families of dis-

ease. My own use of it is at present too limited to speak with decision; yet so far as I have tried it, it has certainly appeared to me to allay irritation, and produce a tonic effect. In two or three instances the advantage has been decisive; and patients who had hitherto been seldom two months without a severe return of the complaint, have entirely escaped, and apparently lost the morbid predisposition. In a few other cases it has completely failed.

Under the head of specific, as opposed to common bathing, it may perhaps be right to mention the *sea water*, which is generally imagined to possess some superior, and even different, efficacy from fresh water of the same temperature. It is a vulgar notion that exposure to sea water, in the way of accident or otherwise, does not so readily engender catarrhal disorder as would the like exposure to ordinary water; and if this be a well-founded notion, there would seem to be some faculty possessed by the saline impregnation, capable of counteracting its otherwise injurious influence. How this operates, it does not seem very easy to understand, and we are disposed to suspect that there is some fallacy in the conclusion altogether; it may be that external circumstances, that habit, that the superior robustness of those individuals who are mainly exposed to sea water, may assist in its comparative negation of deleterious influence, and that the appendages to sea bathing may likewise act in aid of its superior salubrity, to a greater extent than is usually conceived. While we throw out these intimations, we would not, at the same time, wish to be thought unjustifiably sceptical with regard to the greater power of sea, than of common bathing; and it may be, that the recent project of causing 'the waters of the ocean to come galloping up to London,' is not mere quackery or chimera. . .

Dr. Parr observes that 'bathing in the sea is on the whole preferable to common bathing, as the heat is more uniform. It is, also, perhaps from the agitation of the water, more refreshing. Other causes of preference have been assigned; one is the greater pressure of the water impregnated with salt; the other the stimulus of that salt left on the skin. Each may have some effect, and the latter ground of preference is assuredly more certain than the former. We cannot easily conceive how the momentary increase of pressure can have any considerable effect, except by the increase of momentum; and the stay in the sea is too short to expect much advantage from this source.'

VAPOR BATHS can scarcely be considered as specifically different from those of water, heated to an extremely high temperature. This mode of bathing, though lately used in this country more than formerly, has been more freely and generally employed on the continent, and especially in Russia, where it constitutes one of the principal luxuries of the inhabitants of all ranks: and it is there employed for a multitude of diseases. It conveys heat more gradually than immersion in water; at the same time, more heat can be applied to the body, and its application may be continued for a longer time. The vapor bath was used by the ancient Romans, as it is by the

modern Russians; but the former, as we have observed in a former part of the present article, did not practise the sudden transition which is common with the latter. See VAPOR.

AIR BATH. The celebrated Franklin, by his recommendation of reducing the temperature of the skin, in exposing the naked body to the air for some minutes, and thus causing a healthy excitation and pleasant feeling, in place of febrile irritation and morbid heat, has brought the practice of air bathing into pretty general employ. It merely consists in getting out of bed without any clothing, and walking for a time on the cold floor, and then either putting on the clothes, or what is better, returning to the warm bed, and lying for some time previously to dressing. This may, indeed, be practised at any time of the night with safety, when the individual is restless and uncomfortable from feverish heat; the effect of it, by the way, proves that the irritation connected with febrile heat has reference to something beyond the mere augmentation of temperature, since the re-action after returning to bed often brings with it as great, though not so uncomfortable, a measure of heat as that which prevailed previously to the exposure to cold; a mild and gentle perspiration sometimes also succeeds, which likewise shows that the capillary vessels of the surface are brought into a very different condition of being, from what was their state prior to the temporary reduction of temperature.

ON DRY BATHS, as they have been called, we have very little to offer. Some time since a good deal of attention was excited to a proposal, which indeed was put in practice, of burying the body in earth up to the chin, under the notion that its attractive or absorbing powers would draw morbid taints from the body, and thus restore health. In the commentaries of Van Swieten, on the aphorisms of Boerhaave, the following account is given of this practice:—'I have heard from a person most deserving of credit, that through the whole kingdom of Grenada, they have a method of curing phthisis by an earth bath; and I have since read the same account in the works of Francisco Solano de Luge, who caused a pit to be dug in the earth, where no plants had been sown; and into this pit he put his patients up to the neck, and then covered them with the same earth which had been dug out, and there left them till they began to shiver, when he caused them to be taken out and wrapped in linen cloths, wetted with rose water.' A Dr. Graham, too, an empiric, who gained some celebrity, proposed and employed earth bathing; a practice (says a modern writer), which in the way he used it, consigned some of his patients to a perpetual mansion under the ground.

Sailors have been in the practice of employing warm sand baths for scurvy, and the ancients adopted many modes of exciting perspiration by dry heat; it is said moreover to be a practice at this day, in some parts, to cover the body with horse dung, for several chronic ailments; but these expedients are not in general thought available by individuals of the present period, who make physiology and pathology the ground-work of their remedial plans; and we are not, there

fore, called upon to engage in any further disquisition respecting their alleged efficacy, or supposed modes of operation.

BATHING AMONG THE TURKS.—In modern Turkey, as well as among the ancients, bathing makes a part of diet and luxury; so that in every town, and even village, there is a public bath. Indeed the necessity of cleanliness, in a climate where one perspires so copiously, has rendered bathing indispensable; the comfort it produces preserves the use of it; and Mahomet, who knew its utility, reduced it to a precept. Of these baths, and the manner of bathing, particularly at Cairo, the following account is given by Savary, in his Letters on Egypt: 'The first apartment one finds, in going to the bath, is a large hall, which rises in the form of a rotunda. It is open at the top, to give a free circulation to the air. A spacious estrade, or raised floor, covered with a carpet, and divided into compartments, goes around it, on which one lays one's clothes. In the middle of the building, a jet d'eau spouts up from a basin, and agreeably entertains the eye. When you are undressed, you tie a napkin round your loins, take a pair of sandals, and enter into a narrow passage, where you begin to be sensible of the heat. The door shuts to; and at twenty paces off, you open a second, and go along a passage, which forms a right angle with the former. Here the heat increases. They who are afraid of suddenly exposing themselves to a stronger degree of it, stop in a marble hall, in the way to the bath properly so called. The bath is a spacious and vaulted apartment, paved and lined with marble, around which there are ten closets. The vapor, incessantly rising from a fountain and cistern of hot water, mixes itself with the burning perfumes. These, however, are never burnt except the persons who are in the bath desire it. They mix with the steam of the water, and produce a most agreeable effect. The bathers are not imprisoned here as in Europe, in a sort of tub, where one is never at one's ease. Extended on a cloth spread out, the head supported by a small cushion, they stretch themselves freely in every posture, whilst they are wrapped up in a cloud of odoriferous vapors, which penetrates into all their pores. After reposing there some time, until there is a gentle moisture over the whole body, a servant comes, presses you gently, turns you over, and when the limbs are become supple and flexible, he makes all the joints crack without any difficulty. He masss (i. e. touches delicately), and seems to knead the flesh without making you feel the smallest pain. This operation finished, he puts on a stuff glove, and rubs you a long time. During this operation, he detaches from the body of the patient, which is running with sweat, a sort of small scales, and removes even the imperceptible dirt that stops the pores. The skin becomes soft and smooth like satin. He then conducts you into a closet, pours the oil of perfumed soap upon your head, and wit draws. The ancients did more honor to their guests, and treated them in a more capacious manner. Whilst Telemachus was at the court of Nestor, the beautiful Polycesta, the handsomest of the daughters of the king of Pylos, led the son of Ulysses to the bath; washed

him with her own hands; and, after anointing his body with precious oils, covered him with rich habits and a splendid cloak.' Pisistratus and Telemachus were not worse treated in the palace of Menelaus. 'When they had admired its beauties, they were conducted to basins of marble, where a bath was prepared; beautiful female slaves washed them; and, after anointing them with oil, covered them with rich tunics and superb pellices.' The closet to which one is conducted is furnished with a cistern and two cocks; one for cold, the other for hot water. There you wash yourself. Soon after the servant returns with a depilatory pomatum, which in an instant makes the hair fall off the places it is applied to. Both men and women make general use of it in Egypt. It is composed of a mineral called rusma, which is of a deep brown. The Egyptians burn it lightly, knead it with water, mixing it with half the quantity of slacked lime. This grayish paste applied to the hair, makes it fall off in two or three minutes, without giving the slightest pain. After being well washed and purified, you are wrapped up in hot linen, and follow the guide through the windings that lead to the outer apartment. This insensible transition from heat to cold prevents one from suffering any inconvenience from it. On arriving at the estrade, you find a bed prepared for you; and scarcely are you laid down before a child comes to press every part of your body with his delicate fingers, in order to dry you thoroughly. You change linen a second time, and the child gently grates the callosity of your feet with pumice stone. He then brings you a pipe and Moka coffee. Coming out of a stove where one was surrounded by a hot and moist fog, where the sweat gushed from every limb, and transported into a spacious apartment, open to the external air, the breast dilates, and one breathes with voluptuousness. Perfectly massed, and, as it were regenerated, one experiences an universal comfort. The blood circulates with freedom; and one feels as if disengaged from an enormous weight, together with a suppleness and lightness to which one has been hitherto a stranger. A lively sentiment of existence diffuses itself to the very extremities of the body. Whilst it is lost in delicate sensations, the soul sympathising with the delight, enjoys the most agreeable ideas. The imagination, wandering over the universe, which it embellishes, sees on every side the most enchanting pictures, every where the image of happiness. If life be nothing but the succession of our ideas, the rapidity with which they then recur to the memory, the vigor with which the mind runs over the extended chain of them, would induce a belief that in the two hours of that delicious calm that succeeds the bath, one has lived a number of years.' Such are the baths, the use of which was so strongly recommended by the ancients, and which are still the delight of the Egyptians. It is by means of them that they cure rheumatisms, catarrhs, and such cutaneous disorders as are produced by want of perspiration. There are no people who make more frequent use of them than the Egyptians, and there is no country where there are fewer asthmatic people. The asthma is hardly known there. The women are passionately fond of these baths, frequent

them at least once a week, and take with them slaves properly qualified to assist them. More luxurious than the men, after undergoing the usual preparations, they wash their bodies, and above all, their heads, with-rose water. It is there that female head-dressers form their long black hair into tresses, which they mix with precious essences instead of powder and pomatum. There they blacken the edge of their eye-lids, and

lengthen their eye-brows with coliel, a preparation of tin burnt with gall-nuts; and stain the finger and toe nails with the leaves of henne, a shrub common in Egypt, which gives them a golden color. The linen and clothing they make use of are passed through the sweet steam of the wood of aloes; and when the work of the toilet is at an end, they remain in the outer apartment, and pass the day in entertainments.

BATHING OF HAWKS, OR FALCONS, is done when they have been thoroughly reclaimed; they are then offered water to bathe in where they may stand up to the thighs, choosing a temperate clear day for that purpose. By the use of bathing, a hawk gains strength, with a sharp appetite, and so grows bold.

BATH-KOL, i. e. the daughter of a voice, an oracle among the Jews, frequently mentioned in the Talmud. It was a fantastical way of divination invented by the Jews, though called by them a revelation from God's will, which he made to his chosen people, after all verbal prophecies had ceased in Israel. It was in fact a method of divination similar to the sortes Virgilianæ of the Heathens. For, as with them, the first words they happened to dip into, in the works of that poet, were a kind of oracle whereby they predicted future events; so, with the Jews, when they appealed to Bath-kol, the first words they heard from any man's mouth were looked upon as a voice from heaven, directing them in the matter they were anxious to enquire about.

BATHMUS, *Βαθμος*, from *βαίνω*, I move; in anatomy, an appellation given to such cavities of bones as receive the prominences of other bones into them.

BATHRUM, a name given by ancient surgeons to a kind of stool or bench proper for the reduction of dislocated bones. This is called *βαθρον Ἱπποκρατειον*, or the hypocratic stool. Its description and use are represented at large by Sculterus. *Arm. Chir.* p. i.

BATHISHEBA, or **BATSHUA,** the daughter of Eliam, or Ammiel, wife of Uriah the Hittite. She was the mother of four sons by David, of whom Solomon and Nathan are reckoned in the genealogy of Jesus Christ.

BATHURST (Allan), earl of Bathurst, one of the most celebrated statesmen of queen Anne's reign, was born in 1684. His studies and his education were equally conducive to the brilliant figure he was destined to make in social life and in the senate, as a polite scholar, and a patriot. These talents he had an opportunity of displaying as early as 1705; when, at the request of his father, Sir Benjamin, and of the constituents of Cirencester, he was returned to parliament for that borough. He distinguished himself particularly in the struggles and debates relative to the union with Scotland, and firmly supported that measure. Though he consented to act a subordinate character in the opposition planned by Mr. Harley and St. John, to the measures of the duke of

Marlborough, he was of infinite service to his party, and the loss of the battle of Almanza seconded his efforts to dispel the intoxication of former successes. Amidst the storms of politics he steadily maintained a personal regard for Lord Somers, president of the council; and when that nobleman was divested of office, Mr. Bathurst preserved his esteem. In consideration of his zeal and services, the queen advanced him in 1711, to the dignity of a peer, by the title of baron Bathurst, of Battledsen, in Bedfordshire. He continued, however, to speak his sentiments with an undaunted freedom in the upper house; and was a formidable opponent to the court measures during the whole of Sir Robert Walpole's administration. The acrimony of the prosecution carried on against the earl of Oxford, lord Bolingbroke, and the duke of Ormond, particularly stimulated his indignation and his eloquence; and on this occasion he observed, 'that the king of a faction was but the sovereign of half his subjects.' The South Sea scheme having infected the whole nation with a spirit of avaricious enterprise, an infinite number of families were involved in ruin. Lord Bathurst publicly impeached the directors, whose arts enabled them to amass surprising fortunes; and moved for having them punished by a forfeiture of their estates. When the bill of pains and penalties against Atterbury, bishop of Rochester, was brought into the house of lords, among the many friends the bishop's eloquence and ingenuity had procured him was Lord Bathurst. He spoke against the bill with vehemence, and declared, he 'could hardly account for the inveterate malice some persons bore to the ingenious bishop of Rochester, unless it was that they were infatuated, like the wild Americans, who believe they inherit not only the spoils, but the abilities of the man they destroy.' Sir Robert Walpole, having, after obstinate struggles, been forced to resign all his employments, Lord Bathurst was sworn of the privy council, and made captain of the gentlemen pensioners, which post he resigned in 1744. He was appointed treasurer to the Prince of Wales in 1757 and continued in the list of privy counsellors at the accession of George III. Lord Bathurst's integrity gained him the esteem even of his opponents; and his humanity and his benevolence, the affection of all that knew him more intimately. He added to his public virtues all the good breeding, politeness, and elegance, of social intercourse. Congreve, Vanburgh, Swift, Prior, Rowe, Addison, Pope, Arbuthnot, Gay, and most men of genius in his own time, cultivated his

friendship, and were proud of his correspondence. Pope thus addresses him, in his Epistle on the Use of Riches:

‘O teach us, Bathurst, yet unspoil’d by wealth!
That secret rare, between th’ extremes to move,
Of mad good nature, and of mean self-love.’

And Sterne, in his letters to Eliza, thus speaks of him: ‘This nobleman is an old friend of mine: he was always the protector of men of wit and genius; and has had those of the last century always at his table. The manner in which his notice began of me, was as singular as it was polite. He came up to me one day as I was at the Princess of Wales’s court; ‘I want to know you, Mr. Sterne; but its fit you should know also who it is that wishes this pleasure: you have heard, continued he, of an old Lord Bathurst, of whom your Popes and Swifts have sung and spoken so much: I have lived my life with geniuses of that cast, but have survived them; and despairing ever to find their equals, it is some years since I have closed my accounts, and shut up my books, with thoughts of never opening them again: but you have kindled a desire in me of opening them once more before I die, which I now do; so go home, and dine with me.’ At eighty-five, he continues, ‘he has all the wit and promptness of a man of thirty; a disposition to be pleased, and a power to please others beyond whatever I knew!’ In the latter part of his life, he preserved his cheerfulness, and was always accessible, hospitable, and benevolent. He delighted in rural amusements; and enjoyed the shade of many a lofty tree which he had planted himself. Till within a month of his death, he constantly rode out on horseback two hours before dinner, and drank his bottle of claret or Mallem after it. He used to declare in a coarse manner, he never could think of adopting Fr. Carloan’s regimen, as Dr. Cheyne had assured him, fifty years ago, he would not live seven years longer, unless he abridged himself of his wine. Pursuant to this maxim, having invited several of his friends to spend a few cheerful days with him at his seat, and being one evening very loth to part with them; on his son the late chancellor’s objecting to their sitting up any longer, and adding, that health and long life were best secured by regularity, he suffered him to retire; but as soon as he was gone, the cheerful father said: ‘Come, my good friends, since the old gentleman is gone to bed, I think we may venture to crack another bottle.’ He was elevated to the dignity of earl in 1772; living to see the above nobleman, his eldest son, several years, had high chancellor of Great Britain, and peer of Great Britain in 1771, by the title of Baron Apsley. Lord Bathurst married Catharine, daughter of Sir Peter Apsley, by whom he had two sons and five daughters. He died, after a few days illness, at his seat near Cirencester, in 1775, aged ninety-one.

BATHURST, Ralph, M. D. an eminent physician and divine, born in 1620. He studied anatomy in Trinity College, Oxford; but the times of confusion coming on, he applied himself to physics. He took the degree of M. D. and was first a gentleman, that he was, in the time

of the usurpation, appointed physician to the state. Upon the Restoration he quitted physic; was elected F. R. S. and president of his college; and having entered into holy orders, was made chaplain to the king, and afterwards dean of Wells. Soon after, he served as vice-chancellor of Oxford, and was nominated by king William and queen Mary to the see of Bristol, but refused to accept it. He was an orator, a philosopher, and a poet: he possessed an inexhaustible fund of wit, and at eighty years of age, was a facetious companion. Ridicule was a weapon which he had always at hand. His poetical pieces in the *Musæ Anglicanæ* are excellent. He wrote several poems in English and Latin; and died in 1704, aged eighty-four.

BATHURST, the chief town of a new settlement near the Great Fish River, on the eastward of the colony of the Cape of Good Hope. It is rapidly increasing. A large inn has been already built for the accommodation of visitors; and as the site has been well chosen, Bathurst is expected very soon to become one of the first towns in the colony.

BATHURST, also a new British settlement on the island of St. Mary, at the mouth of the Gambia, on the western coast of Africa. Sir George Collier, in his second report, on the settlements of this coast, says, ‘The island of St. Mary, upon which Bathurst, the capital, is rising with the same rapidity that the most healthful climate, and most fruitful and productive country could desire, is a barren, sandy spot, in many places scarcely above the level of the sea. Buildings, combining neatness and beauty, are appearing; and St. Mary bids fair to rival every spot on the lengthened line of coast of western Africa, in commerce and industry.’

BATHURST, in entomology, a species of papilio (Pleb. *Rur.*), with entire black wings, glossed with blue; beneath white, with numerous black dots, and a continued fulvous band. Fabricius. Inhabits Austria. It is the papilio battus of Schmetterl, and papilio telephii of Esper.

BATHYCHRUS COLOR, in painting, a term used by the Greeks to express what the Romans call *austerus color*.

BATHYERGUS, from *βαθυεργειν*, to work deeply in the earth; in zoology, a genus of animals belonging to the order rodentia, class mammalia. Its generic character is, incisor teeth large, not covered by the lips, and wedge-shaped; canine none; grinders four on either side, above and below, the posterior sloping deeply outwards; muzzle broad; eyes small; auricles none; tail short and bristly; toes five on each foot, short and armed with thin flat nails. The two species are, 1. *B. maritimus*, Illig. *Cur.*; *mus maritimus*, Lin.; *la grande taup du cap*, Buff.; African rat, Pen; sand mole of the Dutch; about the size of a rabbit, and of a cinereous brown color; having a large head without auricles, and the nose slightly flattened, wrinkled, and black; the legs are short, with four toes, long claws, and a thumb, with a short claw on the anterior extremities. The hind legs are long, having five toes armed with short claws. It inhabits the Cape, where it is known by the name of sand mole. It burrows near the shore, and renders travelling on

horseback dangerous. Pennant says, they sometimes let a horse sink in them up to the shoulders! 2. *B. capensis*, Cur.; *mus capensis*, Lin. Pall.; *taup du cap de Bonne Esperance*, Buff, Cape rat; Pen. About seven inches long, of a dusky rufous ash brown color, with a white stripe round the eye and ear, and on the vertex; muzzle black. It is very common in the gardens at the Cape, and called, 'bless moll.'

BATHYLLUS and **PYLADES**, inventors of pantomime entertainments on the stage. Bathyllus succeeded in representing comedy; Pyades in tragedy. The art consisted in expressing the passions by gestures, attitudes, and dumb show; not, as in modern times, in machinery, and the fooleries of harlequin. They flourished at Rome, under Augustus, about A. D. 10. Each of them kept scholars, who perpetuated their master's name: the followers of Bathyllus, who excelled in the comic calling themselves Bathylli; and those of Pyades, who excelled in the tragic, calling themselves Pyladæ.

BATILDA (St.), commonly called St. Badour, a Saxon princess, was carried away from England by pirates, and sold to Archambaud, mayor of the palace, where she was seen by Clovis II., who married her, and had by her Clotarius III., Childeric II., and Thierrî III. She administered the government with great wisdom after his death, and after founding several abbeys, died about 680, in a monastery.

BATINDA, a small district in Hindostan, in the north-west quarter of the province of Delhi, comprehending the Lachy jungle, celebrated for its breed of excellent horses, said to be descended from some of the Persian horses stolen from the camp of Nadir Shah, in the year 1739.

BATIS, in botany, a genus of the tetrandria order, belonging to the diœcia class of plants, the characters of which are: of the male, the amentum is four ways imbricated, and both the calyx and corolla are wanting; of the female, the amentum is ovate, the involucrem dyphyllous; calyx and corolla wanting; the stigma is bilobate and sessile; the berries condumate and four-seeded. There is but one species; viz. *B. mantima*, a native of Jamaica.

BATIS, in botany, the name by which Pliny and some authors call the sea-plant samphire.

BATIS, in ichthyology. See **BATOS**, and **RATA**.

BATISCAN, a river of Lower Canada, rising in the ridge of mountains that run westerly into the interior from Quebec. It falls into the St. Lawrence, about fifty-four miles above that city. At its mouth, it is 350 yards broad, but is so shallow as not to be accessible for boats higher than six or seven miles up the stream, which is also interrupted by many falls and rapids.

BATISTE, in commerce, a fine white kind of linen cloth manufactured in Flanders and Picardy. There are three kinds of batiste; the first very thin; the second less thin; and the third much thicker, called Holland batiste, as coming very near the goodness of Hollands. The chief use of batiste is for neck-cloths, head-cloths, surplices, &c.

BATMAN, in commerce, a kind of weight used at Smyrna, consisting of six okes. Forty

batmans make a camel's load, and amount to about 720lb. in English weight.

BATMAN, **PERSIAN**, or **BATTAMENT**, is of two kinds: one called the king's weight, batman de chahi, or chera, used for weighing most of the necessaries of life, equivalent to about 12½lb. Paris weight: the other called batman of Tauris, equal to 6lb. 4oz. Paris or Amsterdam weight. These are the proportions given by Tavernier. Chardin rates the Persian batmans somewhat lower, viz. the former at 12lb. 12oz. and the latter at 5lb. 14oz.

BATMAN, **TURKISH**, is also of two kinds; the larger, containing six okes, ocques, at 3½lb. Paris weight the ocque; so that the batman amounts to about 22½lb. the smaller, composed likewise of six ocques, at 15 oz. the ocque, amounting to 5lb. 10 oz.

BATMANSON (John), prior of the Carthusian monastery, in the suburbs of London. He was some time a student at Oxford, and intimately acquainted with Edward Lee, archbishop of York, at whose request he wrote against Erasmus and Luther. He died in 1531, and was buried in the chapel belonging to the monastery. Bale says he was a proud forward person; and that Erasmus, in a letter to the bishop of Winchester, calls him an ignorant fellow. But Pitts gives him the character of a man of genius, zeal, piety, and learning. He wrote, 1. *Animadversiones in Annotationes Erasmi in Nov. Testamentum*. 2. *A Treatise against some of Luther's works*. These two he afterwards retracted. 3. *Commentaria in Proverbia Solomonis*. 4. *In cantica Canticorum*. 5. *De unica Magdalena*. 6. *Institutiones Noviciorum*. 7. *De Contemptu Mundi*. 8. *De Christo duodenni*. 9. *On the words Missus est, &c.*

BATONI (Pompeo), a celebrated Italian painter, born at Lucca in 1708. He gained great fame by his productions, which were eagerly sought after by persons in the highest stations. So that honors and riches were heaped upon him; the emperor Joseph granted him a patent of nobility. He died in 1787. One of his most admired pieces, is a representation of Simon the magician contending with St. Peter, in the great church dedicated to the apostle at Rome.

BATNEER, a town of Battie, and province of Delhi, in Hindostan. It is situated on the borders of a sandy desert, and was formerly a place of great consequence. It was taken by the celebrated Timur, or Tamerlane, in the year 1398, who put all the inhabitants to death, and burned the city. Long. 74°. 45'. E., lat. 29°. 28' N.

BATON, in botany, a name by which some authors call the true turpentine tree.

BATON, in military affairs, a staff.

BATON A DEUX BOUTS, a quarter-staff.

BATON DE COMMANDEMENT, an instrument of particular distinction, which was formerly given to generals in the French army. Henry III. before his re-ascension to the throne, was made generalissimo of all the armies belonging to his brother Charles the IX., and publicly received the baton, as a mark of high command.

BATON ROUGE, a flourishing post town of Louisiana, on the east bank of the Mississippi,

about 140 miles above New Orleans. The population is estimated at 5000 or 6000 persons.

BATOON, in military affairs, a truncheon, or marshal's staff

BATOONS OF ST. PAUL (*Bastoncini di San Paolo*), in natural history, a name given by some of the Italian writers, as Augustino Scilla, and others, to the lapides Judaici, or other spines of echini. These are found in vast abundance in the island of Malta; and, like almost every thing else there, are denominated from St. Paul.

BATORI (Stephen), king of Poland. He was born of a noble family in Transylvania, and elected prince of his native country in 1571; after which he gained such reputation, that upon the deposition of Henry, duke of Anjou, by the Poles, his party prevailed over that of Maximilian; and, having married the princess Anne, he was crowned in 1576. He proved an excellent prince, and successfully opposed both Russia and Sweden; while he gained great honor to himself by his merciful conduct in the midst of the most horrible cruelties on the part of his enemies. He died in 1586.

BATOS, in ichthyology, the name given by Aristotle, and all the old writers, to the skait. They have generally called the male batos, and the female latis. It is a species of the raia, and distinguished by Ardeï by the name of the variegated ray, with the middle of the back smooth, and one row of spines on the tail. Albertus calls it the rayte, and rubus.

BATRACHIA, in zoology, one of the orders or great divisions of the class Reptiles.

BATRACHIAS LAPIS, from *βατραχος*, a frog; the frog-stone, a name applied by different writers to two very different substances; some understanding by it lumps of common flint, accidentally formed into this figure; and others, those pieces of amber which contain either a whole frog; or any part of one.

BATPAZBOMYOMACHIA, from *βατραχος*, a frog; *μαζα*, a mouse, and *μαχηα*, a battle; the battle of the frogs and the mice, the title of a fine burlesque poem generally ascribed to Homer.

BATRACHUS, from *βατραχος*, a frog; in zoology, the frog fish. A genus of animals belonging to the family percæ, order acanthopterygii, class pisces. The generic character is head flat and horizontal, larger than the body; ventral fins straight, attached under the throat; first dorsal fin short, supported by three spinous rays; second dorsal long and soft, opposite to which the anal fin also soft; mouth and gills very large; all the spines; lips sometimes bearded. This genus was established by Schneider in his 1793 ichthyology, and named from the immense size of the head, resembling that of the frog. The species inhabit the southern hemisphere, and are separated into two divisions, those with and those without beards or cirri on the head. The principal are, 1. With beards, *B. indicus*; two fingered frog fish, inhabits America; *B. n. toledanus*; Garden states that this name is applied by the inhabitants of Carolina to the frog fish; by the French it has been called *le crapaud de mer*. Its habits are very little known, but it is generally held to be voracious.

It is found in hot climates, and is taken on the coasts of Carolina. *B. grunniens*, Schneid.; *cottus grunniens*, Lin. Bloch; grunting bull head, Shaw; grunting frog fish. This animal is about ten inches long; of a brown color marked with white on the sides; inhabits America and the Indian Seas. 2. Without beards. *B. Surinamensis*. *B. Indicus*, are founded by Bloch, the *cottus insidiator*, and *B. guayana* of the Havannah.

BATSCII (Augustus John George Charles), was born at Jena in 1761. He became professor of philosophy in the university of his native place, where he founded a society for the study of natural history, of which he was president. He died in 1802. His works are—1. *Elenchus Fungorum*, 8vo. 2. *An Introduction to the Knowledge and History of Vegetables*, 8vo. 3. *Essays on Botany and Vegetable Physiology*, 8vo. 4. *Botany, for Ladies and Amateurs*, 8vo. 5. *Introductory Essay to the Knowledge of Animals and Minerals*, 8vo.

BATSEN, or **BACS**, a county and town of Hungary; the county is bounded on the north by that of Scholt, on the south by Bodrog, on the east by little Camania and the Theyss, and on the west by the Danube, which separates it from Selavonia. It is inhabited by Hungarians and Rascians, and a few Germans. After being united with that of Bodrog, it was separated from it for several years, but was re-united by Joseph II. Since the introduction of the Spanish breed of sheep the trade in wool has been very considerable. This county has been frequently the theatre of war between Austria and Turkey. The capital, which was formerly more considerable than at present, and was the see of a bishop, suffragan of Colocza, is situated four miles from the north side of the Danube, and twenty from the conflux of the Danube and Drave. Twenty miles north-east of Funfkirchen, and seventy-five south of Buda. Long. 19°. 10' E., lat. 46°. 18' N.

BATTA, a country of Sumatra, stretching along the south-western shore between the Sinkeli and Tabuyong, runs across the whole island. This is one of those districts that have become known to us principally by the modern missionary exertions. In the autumn of 1821 Mr. Burton visited the interior, opposite to the East India Company's settlement at Natal, and found it composed of rugged hills, covered with thick forests, and separated by ravines which often formed the beds of rapid rivers. His journey extended as far as Mora Summa, a station which has lately been chosen by the Company's resident at Natal, for the purpose of maintaining a freer communication with the Battas. This station is situated about the middle of the range of lofty mountains seen in a north-easterly direction from Natal hill, and within three days walk of the Mendeeling country, which is spoken of in the highest terms by the princes nearer the shore, who have visited it; and is supposed to contain a population of 100,000 individuals. Mr. Burton says, 'The country round here is the most beautiful I have seen on Sumatra. It is cultivated chiefly with labangs, for several miles in every direction. There is no sawah ground. The

Batta people of this place, unlike their neighbours, and unlike Batta people of other places, live on their respective farms, and not collected together in dusuns (villages). The houses scattered upon the surrounding hills, reminded me much of my favorite Gloucestershire, as I viewed them at a distance.'

The chief products of this country are pepper, plantains, Indian corn, camphor, cotton, indigo, cassia, and gum benzoïn. Gold and sulphur are among its mineral treasures; the first of which Mr. B. had an opportunity of seeing the Battas procure from the beds of the rivers, in the same way nearly as in South America. Among the animal tribes, monkeys, elephant, and tigers, are numerous; but there are very few birds.

The Battas Mr. Burton describes as fine, tall, stout, good-looking people, superior in appearance to the generality of the Malays. They have a peculiarly fierce and independent look, are well dressed in cotton cloths, manufactured by the women, and wear English beads as ornaments. 'These people,' he remarks, 'are perfectly independent; they have no idea of their own inferiority to any people on earth, and their carriage and behaviour tell you so. They are very polite in their own way, are good speakers, and know perfectly well how to manage every point of an argument, so as to turn it to their own advantage.'

The Battas have a settled language, which is extensively written and understood, and many neatly executed books. The whole population is estimated at a million, 2 or 300,000 of whom can read. 'I have begun to read their language,' says Mr. B., 'and find there is nothing to fear relative to its acquisition, the character is remarkably simple, and every sound having its representative mark, the language may be pronounced correctly by any person who has acquired the character, though he may not understand what he reads.' Mr. Prince, the Company's Natal resident, drew up a brief account of the religion of these people, at the request of Sir T. S. Raffles, from which it appears to be compounded of the most ridiculous and barbarous superstitions. They do not, however, worship images, but believe in the existence of certain deities, whose attributes indicate a much greater degree of knowledge and civilisation at some former period. Dee Battah Assee Assee is the Creator and Father of all things, and is supposed to have appointed three brothers as his agents to instruct mankind. Bataragourou, the god of justice; Seeree Padah, the god of mercy; but Mahalabhoolan, the third brother, soon disagreed with the other two, separated from them, and propagated tenets directly in opposition to theirs. He is therefore described as the source of 'discord and contention—the instigator of malice and revenge—the inciter of anger—the source of fraud, deceit, lying, hypocrisy, and murder.' He has the chief influence among the Battas, and they acknowledge that petitions are seldom offered to either of the others. The only semblance of a priest among them, is a person named Dattoo, who is skilled in all their superstitions; and there is generally one of these to every village;

but the only religious ceremonies the existence of which Mr. Prince could ascertain, appeared to consist in an invocation of the manes of the dead. 'The influence of the Dattoos over the deluded Battas is such,' says Mr. P., 'that they will not engage in any undertaking, however trifling, without first consulting them. They expound all their religious books, and, according to their interpretation, a day is chosen as propitious to the accomplishment of the desired object, whether it be a suit, a journey, or war. The moral conduct of these people appears to be influenced by all the vile passions of an irregular and irritable constitution. Truth is seldom regarded when in the way of their interests or feelings; and honesty is never founded on principle, but on the fear of detection. The general tenor of their lives has obliterated the recollection and practice of the laws of Seeree Padah and Bataragourou, and they have no priesthood or rajah to recall them, or to reprove their obstinate adherence to the principles of Mahalabhoolan, who is certainly no other than the devil.'

One of the amusements of this people is a peculiar and very cruel one, thus described by Mr. Burton. 'In one of the bazars,' he says, 'were about 100 persons amusing themselves with a most cruel game. They drive a small stake into the earth, and round it draw a circle, which they divide into four equal parts; in each of the partitions different individuals put equal sums of money; to the stake is tied a young fowl, whose throat being cut, it flutters about for a short time, and then expires. The person whose money happens to be in the partition where the fowl lies after death, sweeps the stakes. The circle may be divided into as many parts as there are persons who wish to follow the amusement. The man officiating as cut-throat was the imam, or priest, of the place.'

BATTĀ, a people of ancient Germany, formerly inhabitants of what is now called Hesse. Being dissatisfied with their situation there, they settled on the island formed by the Vahalis and the Rhine, which from them took the name of Batavia, or Batavorum Insula. Their government was a mixture of monarchy, aristocracy, and democracy. Their chief was, properly speaking, nothing more than a principal citizen, whose business was rather to advise than to command. The principal men who exercised jurisdiction, and commanded the troops, in their respective districts, were chosen, as well as the kings, in an assembly of the people. A hundred persons, selected from among the people, presided over every county, and acted as chiefs in the different hamlets. The whole nation was, in some measure, an army always in readiness. Each family composed a body of militia, which served under a captain of their own choosing. See BATAVI and BATAVORUM INSULA.

BATT'AIL, v. & n. Fr. *bataille*, Ital. *bat-*
BATTAIL'ANT, } *taglia*, Span. *battala*.
BATTAIL'OUS, } From the ancient Saxon
BATTAL'ION, } *beatan*, to fight, or to
BATTAL'IA. } strike. *Battailous* is hav-
ing the appearance of a battle; *battalia* is the order of battle; and *battalion* signifies the division of an army, and formerly an army itself.

Sir Edward also some per gile gan he knowe,
Dight him to *bataile* bone, his trumpes did he blowe.

R. Brunne.

Lest any time it were assail'd,
Ful wel about it was *battailed*,
And round environ (ke were set,
Ful many a rich and fair turet.

Chaucer. Romaunt of the Rose.

At many a noble armee hadde he be ;
At mortal *battailes*, hadde he ben fiftene ;
And foughten for our faith at Tramisene ;
In listes thries—and aye slain his foe. *Id.*
Soon after this I saw an elephant,
Adorn'd with bells and bosses gorgeously,
That on his backe did beare (as *batteillant*)
A gilden towre which shone exceedingly.

Spenser. Vision of the World's Vanities.

But deeds of armes must I at last be faine,
And ladies love, to leave so dearely bought ?
What need of armes where peace doth aye remaine,
Said he, and *battailes* none are to be fought ?
As for loose loves they are vaine, and vanish into
nought. *Id.*

He started up, and did himself prepayre,
In sun-bright armes, and *battailous* array ;
For with that pagan proud he combatt will that day.

Id.

When sorrows come, they come not single spies,
But in *battalions*. *Shakespeare. Hamlet.*

A fiery region, stretch'd

In *battailous* aspect, and nearer view
Bristled with upright beams innumerable
Of risid spears and helmets throng'd. *Milton.*

Next morning the king put his army into *battalia*.
Clarendon.

The pierc'd *battalions* disunited fall
In heaps on heaps ; one fate o'erwhelms them all.

Pope.

BATALIA, an army ranged in order of battle, or ready for engagement. The word seems formed from the Latin *batalia*, sometimes also written *batalia*, denoting a sort of military or gladiatorial exercise, as fighting with foils, or tilting at a post. In this sense, we meet with the depth of a *battalia*; to march in *battalia*, with the baggage in the middle; to break the *battalia*, &c. In the Roman *battalia*, the *bastati* made the front. It further implies an army or considerable detachment of troops drawn up in order of battle, or in any other proper form to attack the enemy. See **BATTLE**.

BATTALION, in the British army, is an undetermined body of infantry in regard to number, generally from 600 to 1000 men. The royal regiment of artillery has consisted of ten *battalions*, exclusive of the invalid or veteran *battalion*. Sometimes regiments consist each of one *battalion* only; but if more numerous are divided into several *battalions*, according to their strength; so that every one may come within the number mentioned. A *battalion* of one of our marching regiments consists of 1000 and sometimes of 1200 men, officers and non-commissioned included. When there are companies of several regiments in a garrison to form a *battalion*, those of the oldest regiment post themselves on the right, those of the second on the left, and so on till the youngest falls into the centre. The officers take their posts before their companies, from the right and left, according to seniority. Each *battalion* is divided into four divisions, and each division into two subdivisions, which are again divided

into sections. The companies of *grenadier*s being unequal in all *battalions*, their post must be regulated by the commanding officer. See **REGIMENT**.

The *Triangular BATTALION* of ancient military history, was a body of troops ranged in the form of a triangle, in which the ranks exceeded each other by an equal number of men. If the first consisted of one man only, and the difference between the ranks was only one, then its form was that of an equilateral triangle: and when the difference between the ranks was more than one, its form was an isosceles, having two sides equal, or scalene triangle.

The *Round BATTALION*, is that in which the soldiers are ranged in concentric circles. This was much used by the Romans, and called *in orbem*. *Cæsar*, in his Commentaries, has given many instances.

The *Square BATTALION*. *M. Folard* shows at large, in his book de la Colonne, the weakness of the square *battalion*, and decries the modern method of ranging *battalions* so shallow as to render them weak, and unable to support each other: so that they are easily penetrated or broken; an essential fault in tactics. The real strength of a corps, according to this author, consists in its thickness, or the depth of its files, and their connexion and closeness. This depth renders the flanks almost as strong as the front. He adds, that it may be laid down as a maxim, that every *battalion* ranged deep, and with a small front, will beat another stronger than itself ranged according to the usual method. (*Polyb. tom. i. p. 7.*) But this opinion of *Folard* has not been adopted in modern practice; and his theory has been vigorously attacked by French tacticians. They admit the superior strength of his column to that of a modern *battalion*, if the action were to be decided with pikes and swords; but where fire arms must be used, *M. Folard's* column is so very ill disposed for this purpose, that it must infallibly be destroyed.

BATTECOLLAH, **BATUCATA**, a large open town on the sea coast of the British district of North Canara. The name signifies the round town. It stands in lat. 13° 56' N., long. 74° 37' E, on the north bank of a small river, which waters a very beautiful valley, surrounded on every side by hills, and in an excellent state of cultivation. Eight dams are yearly made, at the public expense, in order to water the rice grounds, which are constructed of earth, and only intended to collect the stream. *Battecollah* contains two mosques, one of which receives an allowance of 100 pagodas from the Company, and the other half as much. Many of the *Mahomedans* are wealthy, and their commercial speculations extend to different parts of the coast. Here are a great many *guddies*, or temples, belonging to the followers of *Viyas*; and two *Jain* temples, the only remains of sixty-eight that were formerly in the place.

BATTEL, *v. n. & adj.* It may be from the Sax. *batan*, to bait, says *Mr. Todd*. But *Mr. Stevens* thinks, that *bat* is an ancient English word for increase. Perhaps it is from

the Goth. *ga-batnan*, to advantage. *Batful* is a compound of the two participles, *bat* and *full*. The verb appears to be founded upon the noun, and to signify to grow fat, to get flesh, to render fertile and fruitful. *Battable*, is capable of cultivation. To *battel* (the verb neuter) is to stand indebted in the college books at Oxford, for what is expended at the buttery in the necessities of eating and drinking. At Cambridge *size* is used in a similar sense. Hence in the former university there is a student named a *batteler* or *battler*; in the latter a sizer. At Eton, *battel* is used to describe the small portion of food, which, in addition to the college allowance, the pupils receive from their dames. But in every application the word has reference to increase.

This is the grayne of mustard sede whiche when it was so fine and so little that the unlearned sort of English mē could scarce possibly fele or see it, ye of your exceeding charitic and zele towards your country folkes did in such wise helpe to some in the field of Englande, and did so cherishe with the sable *batling* yearth of the paraphrase, that where before it was in the eyes of the unlettered, the least of al sides, it is now shot up, and growē much larger in bredth thē any other herbe of ye field. *Udall. Luke, Preface.*

The best advizement was of bad, to let her Sleepe out her fill, without encumberment; For sleepe (they said) would make her *battel* better. *Spenser. Faerie Queene.*

For in the church of God sometimes it cometh to pass, as in over *battle* grounds, the fertile disposition whereof is good; yet because it exceedeth due proportion, it bringeth forth abundantly, through too much ranknesse, things lesse profitable. *Hooker. Eccles. Pol.*

Massinissa made many inward parts of Barbarie and Numidia in Africk (before his time incult and horrid) fruitful and *battable* by this means. *Burton's Anatomy of Melancholy.*

Thomas Sorrocold, or Sorocold, was born in Lancashire, became a *battler* or student of Brazen-nose college, in 1578, aged 17 years or thereabouts. *Wood. Athenæ, Oxon.*

Eat my commons with a good stomach, and *battled* with discretion. *Puritan. Malone's Supplement.*

The *batful* pasture fenc'd, and most with quickest mound,
The sundry sorts of soil, diversity of ground. *Drayton. Polybion.*

BATEL, in law, or TRIAL BY WAGER OF BATEL, now disused. See APPEAL.

BATTEL ABBEY. See BATEL.

BATTELMA, a town of Syria, the ancient Daphne; the scene, according to classical writers, of the transformation of the nymph of that name into a laurel. At a short distance these trees are numerous. It is said that temples dedicated to Daphne, Apollo, and Diana, stood on this spot; and that Gallus built a church at a later period, which Dr. Poccoke conjectures may have been the remains of that of Apollo. He saw the remains of a Christian church, with Greek inscriptions on the walls, and supposed that it might have received the bones of Babybas, bishop of Antioch, and those of several other martyrs. There are fountains, and the remains of foundations, walls, and aqueducts, about Batelma, which is five miles south-west of Antioch.

BATTELY (John), an English divine, born at St. Edmund's Bury, in Suffolk, in 1647, and

educated at Trinity college, Cambridge. Archbishop Sancroft made him his chaplain, and gave him the rectory of Adisham in Kent, and the archdeaconry of Canterbury. He wrote *Antiquitates Rutupinæ*, and *Antiquitates Edmundburgi*. He died in 1708.

BATTEN, *v. a. & n.* A word, says Johnson, of doubtful etymology. Probably of the same derivation as *battle*, as it seems to have succeeded it, and to have the same meaning. It is, however, with its predecessor, growing fast into desuetude. It signifies to fatten, or make fat; to feed plentifully; to fertilise; and to live in indulgence.

CORIO. Follow your function, go and *batten* on cold bits. *Shakespeare.*

A man may *batten* there in a week only, with hot loaves and butter, and a lusty cup of muscadine and sugar at breakfast, though he make never a meal all the month after. *Ford. Perkin Warbeck.*

We drove afield,
Batt'ning our flocks with the fresh dews of night. *Milton.*

Burnish'd and *batt'ning* on their food, to show
The diligence of careful herds below. *Dryden.*

Twa mice, full blythe and amicable,
Batten beside erle Robert's table. *Prior.*

The meadows here, with *batt'ning* ooze enrich'd,
Give spirit to the grass; three cubits high
The jointed herbage shoots. *Philips.*

While ardent Sirius shoots a thirsty ray,
And autumn yet withholds retreating day,
They range at large, and gambol through the stream,
Frisk on the beach, or *batten* in the beam. *Brooke.*

Go thou; the moan of woe demands thine aid;
Pride's licens'd outrage claims thy slumbering ire;
Pale genius roams the bleak neglected shade,
And *battening* avarice mocks the tuneless lyre. *Beattie.*

BATTEN is chiefly used by joiners, in speaking of doors and windows of shops, &c. which are not framed of whole deal, &c. with stiles, rails, and pannels like wainscoat; but are made to appear as if they were, by means of these battens, bradded on the plain board round the edges, and sometimes cross them and up and down.

BATTENS OF THE HATCHES, in sea language, are nailed along the tarpaulings, and serve to keep their edges close down to the hatches, in order to prevent the water which washes over the deck from penetrating into the lower apartments of the ship.

BATTENBERG, a small town of Germany, in the grand duchy of Hesse, on the Eder, with an old castle, a bailiwick, and 720 inhabitants. Twenty-five miles north of Giessen.

BATTENHAUSEN, an ancient town of Germany, in the territory of the Catti.

BATTENKIL, a small river of North America, in the state of Vermont, which rises in Bennington county, and running south-west, afterwards turns directly west into the state of New York, where it falls into the Hudson, nearly opposite to Saratoga.

BATTER, *v. & n.* } *Fr. battre*; *Ital. battere*;
BATTERER, } *Germ. batten*; of the same
BATTERING, } etymology as *battail*, viz.
BATTERY. } ancient Saxon *beatan*: applied to things it signifies to beat down, to shatter. The substantive designates a mixture of several

ingredients beaten together with some liquor; so called from its being so much beaten. Applied to persons, it describes the urmoils and violence through which they have passed, and the worn-out condition in which they are left.

Man stondesth the sinne of contumelic or strif and cheste, and *battereth* and forgeth by vilians reprevings.
Chaucer. The Persones Tale.

When Cupid scaled first the fort
Wherein my hart lay wounded sore,
The *battry* was of such a sort,
That I must yield or die therefore.

Horace. Uncertain Authors.

For now were the walls beaten with the rams, and many parts thereof shaken and *battered*: and at one place above the rest, by continual *batterie* there was such a breach, as the towne lay open and naked to the enemy.
Holland's Livius, fol. 397.

Moreover take but three sextares or quarts of it being steeped, and it will yield a measure called *modius*, of thicke grewel or *batter*, called in Latin *puls*.
Id. Plinie, vol. i. p. 558.

They all that charge did fervently apply,
With greedy malice and importune toyle,
And planted there their huge artillery,
With which they daily made most dreadful *battery*.

Spenser.

Scence call you it? so you would leave *battering*.
I had rather have it a head.
Shakspeare.

Many men neglect the tumults of the world, and care not for glory, and yet they are afraid of infamy, repulse, disgrace, they can severely contemn pleasure, bear grief indifferently: but they are quite *battered* and broken with reproach and obloquy.

Burton, Anat. Mel.

Others to a city strong,

Lay siege encamp'd; by *battery*, scale, and mine,
Assaulting.
Milton.

Crowds to the castle mounted up the street,
Batt'ring the pavement with their coursers' feet.

Dryden.

One would have all things little, hence has try'd
Turkey poultis fresh from th' egg in *batter fry'd*.

King.

If you have a silver saucepan for the kitchen use, let me advise you to *batter* it well; this will shew constant good housekeeping.

Swift's Directions to the Cook.

As the same dame, experienc'd in her trade,

By names of toasts retails each *batter'd* jade. *Pope.*

The ordinary machines invented to *batter* or undermine the walls, were rendered ineffectual by the superior skill of the Romans.

Gibbon.

BAT'LER, v. n. A word used only by workmen.

The side of a wall, or any timber, that bulges from its bottom or foundation, is said to *batter*. *Mozon.*

BAT'LER. In law, a violent striking of any man. In an action against a striker, one may be found guilty of the assault, yet acquitted of the *battery*. There may therefore be assault without *battery*; but *battery* always implies an assault.

Why does he suffer this rude knave now to knock him about the sence with a dirty shovel, and will not tell him of his action of *battery*? *Shakspeare.*

Sir, quo' the lawyer, not to *batter* ye,

You have as good and fair a *battery*

As heart can wish, and need not shame

The proudest man alive to claim. *Hudibras.*

BATTERING, in the military art, is the attacking a fortified place or work with heavy

artillery. To *batter* in breach, is to play furiously on a work, as the angle of a half moon, to demolish and make a gap in it. In doing this, they never fire a piece at the top, but all at the bottom, from three to six feet from the ground. See **BATTERY**.

BATTERING RAM, in antiquity, a military engine used to *batter* and beat down the walls of places besieged. It is said to have been invented by Artemorus of Clazomene, a Greek architect, who flourished A. A. C. 441. It is thus described by Josephus: A vast beam, like the mast of a ship, strengthened at the one end with a head of iron, resembling that of a ram, whence it took its name, was hung by the middle with ropes to another beam, which lay across two posts; and hanging thus equally balanced, it was by a great number of men drawn backwards and pushed forwards, striking the wall with its iron head. But this engine did most execution when it was mounted on wheels, which is said to have been first done at the siege of Byzantium under Philip of Macedon.

BATTERING RAM, in military affairs. See **ARIES**.

BATTERING RAM, in heraldry, a bearing or coat of arms resembling the military engine above described.

BATTERSEA, a village in Surrey, which gives the title of baron to the St. John family. Population about 5000. In the church is a monument of Henry St. John, viscount Bolingbroke, who was born here, and his second wife, who was a niece of Madame de Maintenon. On another to the memory of Sir Edward Winter, who lived in the neighbourhood, it is related that being a captain in the East India company's service, in the reign of Charles II., he was attacked in the woods by a tiger, when, placing himself on the side of a pond, as the tiger flew at him, he caught him in his arms, and falling back with him into the water, got upon him and kept him down till he was drowned. On the site of Bolingbroke House, which was pulled down in 1775, has been erected a horizontal windmill of very large dimensions. The height of the main shaft is 120 feet, and the diameter at the bottom fifty-two. In 1771, a wooden bridge was built over the Thames at Battersea, under the direction of Mr. Holland, at an expense of £22,500.

BATTERY, in electricity, is a combination of coated surfaces of glass, commonly jars, so connected together, that they may be charged at once, and discharged by a common conductor. Mr. Galath, a German electrician, was the first who contrived to increase the shock, by charging several phials at the same time. Dr. Franklin, after he had analysed the Leyden phial, and found that it lost at one surface the electric fire which it received at the other, constructed a battery of panes of large sash glass, coated on each side, and connected in such a manner that the whole might be charged together, and with the same labor as one single pane; and by bringing all the giving sides into contact with one wire, and all the receiving sides with another, he contrived to unite the force of all the plates, and to discharge them at once. Dr. Priestley describes a still more complete battery, of which he says,

that after long use he sees no reason for wishing the least alteration in any part of it. This battery consists of sixty-four jars, each ten inches long, and two inches and a half in diameter, coated within an inch and a half of the top; forming in the whole thirty-two square feet of coated surface. The wire of each jar has a piece of very small wire twisted about the lower end of it, to touch the inside coating in several places; and it is put through a pretty large piece of cork, within the jar, to prevent any part of it from touching the side, which would tend to promote a spontaneous discharge. Each wire is turned round, so as to make a hole at the upper end; and through these holes a pretty thick brass rod with nobs passes, each rod serving for one row of the jars. The communication between these rods is made by laying a thick chain over them, or as many of them as may be wanted. The bottom of the box, in which the jars stand, is covered with a plate of tin, and a bent wire touching the plate passes through the box, and appears on the outside. To this wire any conductor designed to communicate with the outside of the battery is fastened, and the discharge is made by bringing the brass knob to any of the knobs of the battery. When a very great force is required, the quantity of coated surface may be increased, or two or more batteries may be used. But the largest and most powerful battery, is that which was employed by Dr. Van Marum, to the amazing large electrical machine constructed for Teyler's Museum at Haarlem. This grand battery consists of a great number of jars, coated as above, to the extent of about 130 square feet; and the effects of it, which are truly astonishing, are related by Dr. Van Marum, in his description of this machine, and of the experiments made with it, at Haarlem, in 1785.

BATTERY GALVANIC. See **GALVANISM**.

BATTERY, in law, is the unlawful beating of another in breach of the peace. The least touching of another's person wilfully, or in anger, is a battery; for the law cannot draw the line between different degrees of violence, and therefore totally prohibits the first and lowest stage of it; every man's person being sacred, and no other having a right to meddle with it, in the slightest manner. Upon a similar principle, the Cornelian law, *de injuriis*, prohibited pulsation as well as verberation; distinguishing verberation, which was accompanied with pain, from pulsation, which was attended with none. But battery is in some cases justifiable or lawful; as, first, where one who hath authority, a parent or master, gives moderate correction to his child, his scholar, or his apprentice; second, in self-defence; if one strike another, or only assault him, he may strike in his own defence; and, if sued for it, may plead, *son assault demesne*, that it was the plaintiff's original assault that occasioned it: third, in defence of goods or possessions, if one endeavour to deprive another of them, he may lay hands upon him to prevent him; and in case he persist with violence, may beat him away: fourth, in the exercise of an office, as that of church-warden or beadle, a man may lay hands upon another to turn him out of church, and prevent his disturbing the congregation: and if sued for this or the like bat-

tery, he may set forth the whole case, and plead that he laid hands upon him gently, *molliter manus impositus*, for this purpose. On account of these causes of justification, battery is defined to be the unlawful beating of another: for which the remedy is, as for assault, by action of trespass *vi et armis*; wherein the jury will give adequate satisfaction in damages.

BATTERY, in metalline manufactures, or battery works, includes pots, sauce-pans, kettles, and the like vessels, which, though cast at first, are to be afterwards hammered or beaten into form. Some make battery for the kitchen, *batterie de cuisine*, comprehend all utensils for the service of the kitchen, whether of iron, brass, copper, or other matters. Others take the term in a narrower sense, and restrain it to utensils of brass or copper. A society for the mineral and battery work of England, was incorporated by queen Elizabeth.

BATTERY, in the military art, is a parapet thrown up to cover the gunners, and men employed about the guns, from the enemy's shot. This parapet is cut into embrasures, for the guns to be fired through. The height of the embrasures on the inside is about three feet; but they slope lower to the outside. Their width is two or three feet; but they open to six or seven on the outside. The mass of earth betwixt two embrasures, is called the merlon. The platform of a battery is a floor of planks and sleepers, to keep the wheels of the guns from sinking into the earth; and is always made sloping towards the embrasures, both to hinder the recoil, and to facilitate the bringing back of the gun. The powder magazines, from which the batteries are to be served, ought not to be far distant from them, nor from each other. The general one about sixty feet in the rear of the battery, and the small ones about half that distance. The magazines are made either to the right or left of the battery, as the officer may think fit for deceiving the enemy: they are commonly built five feet under ground; taking care to secure the sides and roof with boards, and cover them with earth, clay, or some such substance, lest fire should get in to the powder. The balls are generally piled up beside the merlons, between the embrasures, to be in readiness. Though in England engineers are employed to construct batteries, the officers of artillery, who are daily practising the different branches of their profession, would seem to be the fittest persons to direct the situation and to superintend the construction of their own batteries. Batteries are of various kinds, *viz.*

BATTERIES CROSS, are batteries which play athwart one another upon the same object, forming there an angle, and causing more destruction; because what one bullet shakes the other beats down.

BATTERY A RICOCHET is adapted to the method of ricochet, or duck and drake firing, first invented by Vauban, at the siege of Aeth, in 1692: the guns are loaded with small charges, and elevated so as to fire over the parapet; and the shot is thus made to bound along the opposite rampart, like a stone skimmed along the water. In a

siege they are generally placed at about 300 feet before the first parallel, perpendicular to the faces produced, which they are to enfilade. This method has since been applied to mortars and howitzers with great success, which are of singular use in action to enfilade the enemy's ranks; for when the men perceive the shells bounding about with their fuzes burning, expecting them to burst every moment, the bravest among them will hardly have courage to wait their approach.

BATTERY BOXES, square boxes to be filled with earth or dung, for the purpose of making batteries, where gabions and earth cannot be had.

BATTERY, COMRADE, or JOINT BATTERY, is when several guns play at the same time upon one place.

BATTERY, COFFER, is that where the sides of the wall and merlons only are formed of fascines, and all the cavities or included spaces filled with earth.

BATTERY, COVERED, or MASKED, is when the guns and men are covered by a bank made of fascines and earth, of about eighteen or twenty feet thick, and seven or eight feet high. The guns are generally from nine to eighteen pounders; sometimes twenty-four pounders are used.

BATTERY D'ENFILADE, is one that scours or sweeps the whole length of a straight line.

BATTERY DE REVERS, that which plays upon the rear of the troops.

BATTERY EN ECHARPE, is that which plays obliquely.

BATTERY EN ROUAGE, is that used to dismount the enemy's cannon.

BATTERY NAILS, pins used for fastening the planks that cover the platforms, and not made of iron but of the toughest wood, because iron might be dangerous, by the iron-work of the wheels striking against them in recoiling, &c.

BATTERY OF A CAMP is usually surrounded with a trench and palisades, at the bottom, and with a parapet on the top, having as many holes as there are pieces of artillery, and two redoubts on the wings, or places of arms, capable of covering the troops, which are appointed for their defence.

BATTERY OF MORTARS differs from a battery of guns; for it is sunk into the ground, and has no embrasures, it being designed to throw its charge up into the air. It consists in a parapet of about twenty feet thick, seven and a half in front, and six in the rear; of a berm about three feet broad, according to the quality of the earth; of a ditch twenty-four feet broad at top, and twenty at the bottom. The beds are not made sloping like the platforms for guns, but exactly horizontal: they should be nine feet long, and six broad, with eight feet betwixt them, and nine from the part.

BATTERY, OPEN, is a number of cannon, generally field-pieces, ranged a-breast of one another, on a small natural elevation of the ground, or an artificial bank of about a yard or two high.

BATTERY, SUNK or BURIED, batterie en terre, is that whose platform is sunk into the ground, so that there must be trenches cut in the earth, before the muzzles of the guns, for them to fire out at.

BATTERY, FLOATING, a sea battery of mortars, generally composed of old ships considered unfit for active service, properly strengthened by balks and other timbers. Several improvements have been attempted on floating batteries in this country. Among others, a mortar battery, for the bombardment of the enemy's ports, has been invented by Sir W. Congreve, which is proof both against shells and red-hot balls. It is so contrived that the masts and sails can be securely disposed of in less than a quarter of an hour; so that it then presents upon the water nothing but a mere hull, with sloping sides, which is rowed by forty men, under cover of the bombardment, and may, by the peculiar construction of the masts and rigging, be brought under sail again as expeditiously as dismantled. The rudder and moorings are wholly under water, and protected by the bomb-proof. The battery is armed with four large mortars, for bombardment, and four forty-two-pounder carronades, for self-defence; though, from being covered with plates and bars of iron, she can neither be set fire to nor be carried by boarding. Four such vessels, though not more than 250 tons burden each, and drawing less than twelve feet water, would throw upwards of 500 shells into any place in one tide, and with the greatest precision; both because from their construction they have nothing to apprehend from approaching the enemy's batteries, and because from the peculiar contrivance of the mortar-beds, the elevation of the mortars is not affected by the rolling or pitching of the vessel.

BATTEURS D'ESTRADE, scouts, or horsemen, sent out before, and on the wings of an army, two or three miles, to make discoveries; of which they are to give an account to the general.

BATTIE (William), M. D., was born in Devonshire, in 1704. He received his education at Eton; and in 1722 was sent to King's College, Cambridge. His own inclination prompted him to the law; but his finances could not support him at one of the inns of court. He therefore turned his attention to physic, and first entered upon the practice of it at Cambridge; where in 1729 he gave a specimen of an edition of *Iso-crates*, which in 1749 he completed in 2 vols. 8vo. He afterwards removed to London; and in 1738 or 1739 fulfilled by marriage a long engagement to a daughter of Barnham Goode, the under master of Eton, who is honored with a place in the *Dunciad*, for having abused Pope, in *The Mock Æsop*. A cousin now left the doctor £30,000. In the dispute which the college of physicians had with Dr. Schomberg, about 1750, Battie took a very active part. In 1751 he published *De Principiis Animalibus Exercitationes*, in *Coll. Reg. Medicorum*, in three parts; which were followed in 1752 by a fourth. In 1757, being physician to St. Luke's, he published *A Treatise on Madness*, in quarto; and in 1762 *Aphorismi de cognoscendis et curandis Morbis nonnullis, ad principia accommodati*. In Feb. 1762 he was examined before a committee of the House of Commons, on the state of the private mad-houses in this kingdom, and received in their printed report a testimony honorable to

his abilities. In 1776 he was seized with a paralytic stroke, of which he died June 13, aged seventy-five.

BATTIFOLIUM, or **BATTIFOLLUM**, a kind of tower or defence, frequently mentioned by Latin historians of the middle age. It seems to have been made of wood, and erected on sudden occasions.

BATTING STAFF, the same with **BATLET**.

BATTISTA (Franco), a celebrated painter, born at Venice, was one of the disciples of Michael Angelo, whose manner he followed so closely, that, in the correctness of his outlines, he surpassed most of the masters of his time. His paintings are pretty numerous, and widely dispersed; but his coloring being very dry, they are not much more esteemed than the prints he etched. He died in 1561.

BATTITURA, the scales that fly off from hot iron, when newly taken out of the fire and beaten on the anvil.

BATTLE, *v. & n.* Derivation, Old Saxon, **BATLEMENT**, } beaten. See **BATAIL**,
BATLEMENTED, } to fight; also to prepare
BATTLING. } for fight. The substantive is used in various senses; it sometimes is applied to an encounter between opposite armies; and to a body of forces, or division of an army; to the main or middle body of an army, says Nares, between the van and rear. Crabbe traces the verb to the Latin *batuo*, and to the Hebrew *abat*, to beat, signifying a beating. The words *battle*, *combat*, and *engagement*, are frequently, but incorrectly, used as synonymses. *Battles* are fought between armies only. *Combats* are entered into between individuals, whether of the brute or human species. *Engagements* are confined to no particular membe only to such as are engaged.

If houses strongly built,
And towers *battled* hie,
By force of blast be overthrown,
When Eol's impes doe flie.

Turberville.

And he is bred out of that bloody strain
That haunted us in our familiar paths :
Witness our too much memorable shame,
When Cressy *battell* fatally was struck,
And all our princes captiv'd by the hand
Of that black name; Edward, black prince of Wales.
Shakspeare.

The English army, that divided was
Into two parts, is now conjoined in one;
And means to give you *battle* presently. *Id.*

The vaward, Zerbin hath in government,
The duke of Lancaster the *battell* guides,
The duke of Clarence with the rereward went.
Harrington's Ariosto.

The king divided his army into three *battles*; where-
of the vanguard only, with wings, came to fight.
Bacon.

Sicinius Dentatus fought in an hundred *battles*;
eight times in single combat he overcame, had forty
wounds before, was rewarded with 140 crowns.
Anat. Mel.

He ended frowning, and his look denounc'd
Desp'rate revenge, and *battel* dangerous
To less than gods. *Milton.*

Go Michael, of celestial armies prince,
And thou in military prowess next,

Gabriel, lead forth to *battle* these my sons
Invincible; lead forth my armed saints;
By thousands, and by millions. *Id*

Just so, by our example, cattle
Learn to give one another *battle*. *Hudibras.*

Through this we pass
Up to the highest *battlement*, from whence
The Trojans threw their darts. *Denham.*

'Tis ours by craft and by surprize to gain :
'Tis yours to meet in arms, and *battle* in the plain.
Prior.

We receive accounts of ladies *battling* it on both
sides. *Addison.*

Should he go farther, numbers would be wanting
To form new *battles* and support his crimes. *Id.*

I cannot find my hero; he is mixed
With the heroic crowd that now pursue
The fugitives, or *battle* with the desperate.
Byron

There is given
Unto the things of earth, which time hath bent,
A spirit's feeling, and where he hath leant
His hand, but broke his scythe, there is a power
And magic in the ruined *battlement*;
For which the palace of the present hour
Must yield its pomp, and wait till ages are its doom
Id

Wave high your torches on each crag and cliff—
Let many lights blaze on your *battlements*—
Shout to them in the pauses of the storm,
And tell them there is hope—
And let our deep-toned bell its loudest peals
Send cheerly o'er the deep—
'Twill be a comfort to the wretched souls
In their extremity. All things are possible;
Fresh hope may give them strength, and strength
deliverance. *Maturin*

BATTLES, ANCIENT. The ancients never joined battle without much ceremony and preparation; as taking auguries, offering sacrifices, haranguing the soldiers, giving the word, or a tesserà, &c. The signals were, sounding the classicum or general charge, and displaying a peculiar flag, called by Plutarch a purple robe. To which may be added, singing peans, raising military shouts, and the like. A Roman legion, ranged in order of battle, consisted of hastati, placed in the front; of principes, who were all experienced soldiers, placed behind the former; and of triarii, heavy armed with large bucklers, behind the principes. The hastati were ranked close: the ranks of the principes were much opener, so that they could receive the hastati; and those of the triarii opener still, insomuch that they could receive both the principes and the hastati within them, without any disorder, and still facing the enemy. When therefore the hastati found themselves unable to stand the enemy's charge, they retired gently within the principes, where joining with them, they renewed the combat. If these found themselves too weak to sustain the enemy, both retired among the triarii, where rallying, they formed a new corps, and charged with more vigor than ever. If these failed, the battle was lost; the Romans had no farther resource. The moderns are unacquainted with this method of inserting or embattling one company into another; without which the former cannot be well succoured or defended, and their places taken by others; which was a thing the

Romans practised with great exactness. For the velites, and in later times the archers and slingers, were not drawn up in this regular manner, but either disposed of before the front of the hastati or scattered up and down upon the void spaces of the hastati, or sometimes placed in two bodies in the wings. These always began the combat, skirmishing in flying parties with the foremost troops of the enemy. If they were repulsed, which was usually the case, they fell back to the flanks of the army, or retired again in the rear. When they retired, the hastati advanced to the charge. As to the cavalry, it was posted at the two corners of the army, like the wings on a body; and fought sometimes on foot, sometimes on horseback. The auxiliary forces composed the two points of the battle, and covered the whole body of the Romans. Other less usual forms of battle among the Romans were the cuneus, or wedge; globus, or round form; forfex, or pair of sheers; turris, or an oblong square figure; serra, or saw. The Greeks were inferior to the Romans in marshalling their armies for the battle, as they drew up their whole army in a front, and trusted the success of the day to a single force. They had three forms of battle for the horse, viz. the square, the wedge, and the rhombus or diamond form. The first held best for the defensive; the latter for the offensive; the wedge being preferred as bringing most hands to fight.

The Romans had their particular days, called *præclares dies*, wherein alone it was lawful to join battle; and others wherein it was unlawful, called *dies atri*. The Athenians, by the ancient laws of their country, were not to draw out their forces for battle till after the seventh day of the month. Lucian relates of the Lacedæmonians, that, by the laws of Lycurgus, they were not to fight before full moon. Among the Germans it was reputed an impiety to fight in the wane of the moon; and Cæsar tells us that Ariovistus was beaten by him, because, contrary to the laws of his country, he had fought when the moon was in her wane. The German soldiers were intimidated with the apprehension, and afforded Cæsar an easy victory; *acie commissa, impeditos religione hostes vicit*. Jerusalem was taken by Pompey in an attack on the sabbath day, when, by the superstitious notions of the Jews, they were not allowed even to defend themselves. The Romans did not carry their superstition so far; their *atri dies* were only observed in respect of attacking; no day was too holy for them to defend themselves in. Among the ancients, we find frequent instances of battles in the night; it was by moon-light that Pompey beat Mithridates, and Scipio, Asdrubal and Syphax.

The Greeks notified the places of their battles and victories by adding the word *Ναχη*: whence Nicomedia, Nicopolis, Thessalonica, &c. The ancient Britons did the like, by adding the word *Maus*; whence Maiseveth, Malmesbury, &c. The English by the word *field*.

BATTLE, or BATTLE, a market town in the hundred of Battle, Hastings rape, Sussex, twenty-six miles south-east from Tunbridge, and fifty-six south from London; contains 2652 inhabitants. The ancient name was *Epton*, but the famous

battle of Hastings gave it its present name, in 1066; the conqueror first landed near Pevensey, a few miles distant. In memory of this important day, William founded a celebrated abbey, at Heathfield, or Headfield plain, called Battle-Abbey; one of those religious houses which had, formerly, the privilege of sanctuary. From its remains it appears to have been very magnificent, they being nearly a mile in circumference: its abbot was mitred. The gate-house is entire, and is converted into a sessions' house. On one part of the site of the abbey stands the family mansion of the Websters. The incumbent of the church is called the dean of Battle. Here is a charity school for forty boys. At no great distance is Beacon-hill, formerly called Standard-hill; where the standard of the conqueror was first planted. The town has long been famous for making the best gunpowder in Europe. The market is on Thursday, till 1600 it was held on Sunday: it has also a very large market on the second Tuesday in every month.

BATTLE-AXES were a principal part of the offensive armour of the Celts. At the siege of the Roman Capitol by the Gauls, under Brennus, we find one of the most distinguished of their warriors armed with a battle-axe. And Ammianus Marcellinus, many centuries afterwards, describing a body of Gauls, furnishes them all with battle-axes and swords. Some of the weapons have been found in the sepulchres of the Britons, on the downs of Wiltshire, and in the north of Scotland. Within these four or five centuries the Irish went constantly armed with an axe. At the battle of Bannockburn, king Robert Bruce clave an English champion down to the chine at one blow with a battle-axe. The axe of Lochaber remained a formidable implement of destruction in the hands of the Highlanders, nearly to the present period; and it is still used by the city-guard of Edinburgh, in quelling mobs, &c.

BATTLE DYKES, a place in the parish of Oathlaw, in Angusshire, where there are the remains of a Roman camp, and a *via militaris* connecting it with another in the parish of Inverarity. They are supposed to have been erected by Agricola.

BATTLE-FAULD, a place in Aberdeenshire, in the parish of Longside, where there are a great number of tumuli and other evidences, as well as the name, confirming the tradition of its having been the scene of a foreign invasion.

BATTLEFIELD, a small place in Shropshire, about five miles east of Shrewsbury, distinguished as the scene of the memorable battle in which Henry IV. overthrew Hotspur's rebellion, in 1402, in memory whereof he founded a collegiate church, part of which is still used. A mound adjoining the church-yard, marks the burial place of the slain; and a plot of ground called King's Croft distinguishes the place in which the royal tent was pitched.

BATTOL'OGIZE, } Fr. *battologie*; from
BATTOL'OGIST, } the Greek *βαττολογία*,
BATTOL'OGY. } which means to do as
Battus did, and which is described by Suidas in these words *βαττολογία η Πολυλογία*, *battolo-*

gy, is the multiplying of words, &c. Hesychius explains it 'empty, idle, unseasonable discourse;' and the translation of our Bible well expresses it by 'vain repetitions.'

After the eastern mode, they wagged their bodies, bowing their heads, and *battologizing* the name Alough Whoddaw and Mahumet very often.

Sir T. Herbert's Travels, p. 191.

BATTON, in merchandise, a name given to certain pieces of wood or deal for flooring or other purposes.

BATTON, **BATTUNE**, or **BASTON**, Fr. bâton, in heraldry, a staff truncheon, used as an abatement in coats of arms to denote illegitimacy, thus :

BATTERY, a name given by the Hans Towns to their magazines or factories abroad. The chief of these batteries are those of Archangel, Novogorod, Bermen, Lisbon, Venice, and Antwerp.

BATRACHUS, in ichthyology, a species of silurus, found in Asia and Africa. The dorsal fin is single, and contains sixty rays; beards of the mouth eight. Lin. Mus. Fr.—The tail is entire.

BATTUS, a general of the Celti, who, according to Camden and Boetius, gave the first check to the Roman conquests, under Augustus; but, being routed in the reign of Tiberius, part of them settled at the mouth of the Rhine, where from him the country was named Batavia.

BATTUS, an order of ci-devant penitents at Avignon, and in Provence, whose piety carried them to exercise severe discipline upon themselves both in public and private.

BATTUS, in the heathen mythology, a herdsman, whom Mercury turned into a touch-stone, for discovering, for a bribe, what he had promised to conceal.

BATTUTA, in the Italian music, the motion of the hand or foot in keeping or beating time. Among Italian musicians, a battuta imports, in measure, or beating each time equally. This usually occurs after what they call recitativo, which is rather declaiming than singing, and in which little or no measure is observed.

BATUA, **BUTUA**, **BUTHOE**, or **BUTHOECE**, in ancient geography, a town of Dalmatia situated on the Adriatic; now called BUDOA; which see.

BATUALIA, from *batuere*, Lat. to fence, the exercise of those who learned to fence.

BATUA TORES, in antiquity, fencers.

BATUDA, a method of fishing mentioned in some middle age writers, wherein the fish are driven by beating the water with poles, till flocking into one place, they are the sooner caught.

BATTUECAS, **LAS**, a territory of Spain, in the province of Leon, almost insulated amid the high mountains of the bishopric of Coria, fifty miles distant from Salamanca. It forms a sort of valley, a league in length, the inhabitants of which are supposed by some writers to have remained for ages unknown to the rest of Spain.

BATURIN, a town of European Russia, in

the Ukraine, on the river Sem, now in the government of Czernigov. The castle was formerly the residence of the hetman, or commander-in-chief of the Cossacks. On the desertion of the hetman Mazeppa to Charles XII. of Sweden, in 1708, the town was taken by the Russians, sacked and burned, and all its inhabitants put to the sword. The empress Elizabeth made a perpetual grant of it, with part of the surrounding country, to the hetman Rasumowski, under whom the houses were rebuilt. It is eighty miles E. S. E. of Czernigov, the capital of the province.

BATURIUS. See **BACURIUS**.

BATUS, בַּט, Heb. an Hebrew liquid measure, containing seventy-three sextaries.

BATTU (**PULO BATU**).—An island off the western coast of Sumatra, situated immediately to the southward of the equinoctial line. In length forty miles, by ten the average width. Their exports are cocoa-nuts, oil, and sivallo or sea slug. It is largely wooded, and the inhabitants are subject to the Rajah of Buluam.

BATTY or **BIATTI**, the country of the Batties, or Bhatties, bounded on the north by the Punjab and the river Sutuleje, east by the district of Hurrianah, west by the desert, and south by Bicanere. From north to south it extends about 150 miles, and from east to west about 100, comprehending part of the provinces of Lahore, Delhi, and Ajmeer.

The productive part of the country is along the banks of the river Cuggur, from the town of Futtehabad to Batneer. The land within the influence of the inundations of this river produces wheat, rice, and barley, but the remainder of the Bhaty country, owing to a scarcity of moisture, is sterile and unproductive. The Cuggur is afterwards lost in the sands to the west of Batneer, though it is said formerly to have joined the Sutuleje in the vicinity of Ferozepoor.

The capital is Batneer; the other towns of note are Arroah, Futtehabad, Sirsah, and Ranyah. There is but little commerce carried on in this country, the inhabitants being more addicted to thieving than industrious pursuits. With the exception of the sale of their surplus grain, ghee, and cattle, the Batties have little intercourse with the neighbouring states. Their imports are coarse white cloth, sugar, and salt, but the trade is inconsiderable. The Bhatties are properly shepherds. Their morals are very indifferent, their neighbours describing them as cruel, savage, and ferocious thieves from their birth. The females are allowed to appear in public unveiled, and without any of that concealment so common over Hindostan.

BATZ, **BATZEN**, **BAT**, or **BATE**, in commerce, a small copper coin, mixed with a slight portion of silver, current in parts of Germany, and in Switzerland, and varying in value according to its alloy.

BAVAR, or **BAUER**, or **BOUWER** (John William), was born at Strasburgh in 1610, and became a disciple of Frederick Brentel. He had great genius, but the liveliness of his imagination hindered him from studying nature, or the antique, in such a manner as to dives himself of his German taste, though he went to

Rome to improve himself. In Italy he applied himself entirely to architecture, as far as it might contribute to the enrichment of his landscapes, which were his favorite subjects; and for his scenes and situations, he studied the rich prospects about Fresecati and Tivoli. He was fond of introducing battles, marchings of armies, skirmishes, and processions; but never arrived at a grandeur of design; nor could he ever express the naked figure. His pencil however was light, his composition good, and his general expression beautiful. He painted in water-colors on vellum; his coloring is glowing, but his drawing is incorrect. He etched from his own ideas numerous designs from Ovid's *Metamorphoses*, very much in the style and spirit of Callot, and died at Vienna in 1640.

BAVARIA, now one of the principal secondary states of Germany, was derived from a circle of the same name, bounded by Franconia and Bohemia on the north, Austria on the east, Tyrol on the south, and Suabia on the west. The original circle included a territory of 16,500 square miles, covered with a population of 1,300,000 inhabitants, and before the dismemberment of the German empire, in 1806, formed one of its great divisions. The numerous states which comprised it were formed into two divisions, governed by the ecclesiastical and secular benches, the former including the archbishop of Salzburg, the bishops of Ratisbon, Passau, and Freysingen, the princely provostship of Berchtesgaden, with the abbey of St. Emerau, Nieder and Ober Munster, in the city of Ratisbon. The latter consisted of the elector of Bavaria, the dukes of Neuburg and Salzburg, the Landgrave of Leuchtenberg, the prince of Steinstein, the counts of Haag and Ortenburgh, with the lords of Ehrenfels, Salzburg, Pyrbaum, Hohen-Waldeck and Breitenack, together with a representative from the imperial town of Ratisbon.

The greater part of this circle belonged to the elector, who was at that time one of the most powerful princes of Germany; and before the French revolution wielded the imperial authority, not only over the countries of the secular bench, already mentioned, but over the lordships of Wiesenstein, Meindilheim, and Schwabach, in Suabia; most of the country of Erbach, in Franconia; the palatinate of the Lower Rhine, in the circle of that name; the principalities of Simmern, Lautern and Veldenz; two-thirds of the country of Spanheim; half the bailliage of Homburg in the circle of the Upper Rhine, together with the duchies of Juliers and Berg, in the circle of Westphalia.

The ancient duchy of Bavaria formed a great part of the circle, bordering on Austria, Passau, and Salzburg on the east, Tyrol on the south, Suabia on the west, Neuburg and the Upper Palatinate on the north. It was formed of Upper and Lower Bavaria, including, in round numbers, a territory of 12,000 square miles, and a population of 900,000 inhabitants.

Bavaria originally made a part of the Rætia, Vindocina, and Noricum, of the ancients; and received its Latin name Boiaria, or Bojoaria, from the Boii, a people of Celtic Gaul, who colonised it at an early period. These people were

governed by native princes, till Charlemagne took possession of the country, and committed the government to some of his counts, and, on the partition of his imperial dominions amongst his grandsons, Bavaria was assigned to Louis the German. It bore the title of margravate till the year 920, when Arnold, the reigning prince, was raised to the quality of duke. In 1623 Maximilian I., having assisted Ferdinand II. against his Bohemian insurgents, was elevated to the electoral dignity, after which few events of importance occurred till the year 1777, when the disputed succession, incident on the extinction of the reigning branch, produced a disposition in Austria to seize the whole electorate, and annex it to her dominions; a measure which was happily prevented by the prompt and energetic conduct of Frederic II. After the adjustment of the Austrian pretensions, the electorate enjoyed the blessings of peace till the French revolution, which involved all Germany in the flames of civil discord. The elector remained on the side of the imperialists till 1796, when the French marched a powerful army into his dominions, and concluded a treaty for the cessation of hostilities. The year following was signed the treaty of Campo-Formio, and in 1801 that of Luneville; by which all the German dominions left of the Rhine, were annexed to France, and the elector lost the palatinate of the Rhine, the duchies of Juliers and Deux Ponts, with all his possessions in the Netherlands and Alsace, receiving as indemnities the bishoprics of Freysingen, Bamberg, Augsburg, and Kempten, with ten abbey, fifteen imperial towns, and two imperial villages, besides the western part of the bishopric and town of Passau. In the conflicts between France and the continental powers, Bavaria remained neuter till 1805, when the elector entered into an alliance with Napoleon, and was shortly afterwards raised to the dignity of king, and had his dominions enlarged by the annexation of several important provinces.

Shortly after the campaign of 1806, when Austria, to purchase peace, sacrificed part of her possessions, the kingdom of Bavaria received still a further enlargement, by the addition of Tyrol, Eichstadt, the eastern part of Passau, and other territories, when she began to assume a more important station amongst the surrounding states. Another alteration occurred at the dissolution of the Germanic constitution, and the formation of the Rhenish confederation, when the duchy of Berg was resigned for the margravate of Anspach, together with the imperial towns and territories of Augsburg and Nuremberg. In 1809, Bavaria took part with France against Austria, and again shared the spoils of conflict; but subsequently ceded some of her territories to Wirtemberg and Wurtzburg; and by another alteration, which shortly followed, exchanged a great part of Tyrol for the acquirement of Bayreuth and Ratisbon.

Before the political proceedings of October 1809 the extent of Bavaria was calculated a 36,770 English square miles, and the population at 3,231,570; and it furnished in time of war a contingent of 30,000 troops. But by the treaty concluded at that time, she acquired an additional

territory of 5550 square miles, and a population of 1,492,000, which augmented the Bavarian territories to 42,320 square miles, and the population to 4,723,570.

When the love of military conquest, and the intoxication of unparalleled success, induced Napoleon to march the French armies to Moscow, the Bavarian troops were amongst those which were destined never to return. The king of Bavaria now began to apprehend the consequences of this expedition upon the future success of the French emperor, and just at the period of that eventful crisis entered into a treaty with the emperor of Austria, and joined the allies in breaking that thraldom under which a great part of Europe labored. These important services were not forgotten, and in the subsequent negotiations, at the congress of Vienna, the title of king was confirmed, part of the contribution money paid by France was assigned him, and the support of a body of Bavarian troops at the expense of France was agreed to. With respect to territory, the remaining part of Tyrol was ceded to Austria. The grand duchy of Wurtzburg, the principality of Aschaffenburg, and the greater part of the ci-devant French department of Mont Tonnere, were acquired; amounting to about 4000 square miles, and more than half a million of inhabitants.

In 1810 Bavaria was divided into the following circles:

Circles.	Chief Towns.
Upper Maine }	Bamberg.
Lower Maine }	
The Rezat	Anspach.
The Upper Danube	Eichstadt.
The Lower Danube	Passau.
The Regen	Ratisbon.
The Iller	Kempten.
The Iser	Munich.

The names of these circles are derived from the principal rivers of the several districts, and a slight alteration in some of them has since occurred. The subsequent acquisitions are as follows:

The principality of Aschaffenburg	Aschaffenburg.
The grand duchy of Wurtzburg	Wurtzburg.
The circle of the Rhine, (late Mont Tonnere)	Landau.

The population of Bavaria is by no means equally distributed over its surface. The sides of the Danube, the lower districts of the grand duchy of Wurtzburg some districts of the margraviate of Anspach, with the recent acquisitions on the left bank of the Rhine, are much more thickly inhabited than the other parts. Indeed, much of the southern portion consists of rugged mountains and other tracts, which are scarcely fit for habitation, except in the valleys formed by the several divisions of the Alps.

Surrounded as it is by other countries, from which it is separated by mere arbitrary divisions, the outlines of Bavaria present nothing remarkable. The surface is greatly diversified, and the southern regions are mountainous and woody. The ground near the Alps lies higher than the general area, forming an ascent, in which numerous lakes are

embosomed, together with wastes and marshes, which have not yet been brought to any considerable pitch of cultivation. Much of the ancient palatinate swells into mountains, which are darkened with forests. The margraviate of Anspach is in part mountainous and sandy. But the extensive and fertile plains that stretch along the northern and central regions, and the wide valleys which lie to the north and north-east of Munich, and are watered by the rivers Inn and Iser, serve to vary the general surface, and relieve the natural features of the landscape.

Mountains and hills are numerous in Bavaria, especially in Anspach, and the neighbouring districts, together with the territories on the left bank of the Rhine. The Alps, branching off in a lofty chain, strike out the line of division between this kingdom and Tyrol; while the broken surface of Bohemia is bounded by an elevated range, the lateral branches of which diversify the surface of the adjacent regions.

Bavaria, from the position of its included area, is intersected by numerous rivers, which, for the most part, become tributary to the Danube. The Inn descends from the lofty regions of eastern Switzerland. Like its sister streams, it soon becomes a rapid river; and, having collected a great body of water, rolls north-east through the kingdom of Bavaria, and having formed the line of boundary between that state and Austria, falls into the Danube. The Iser and the Lech originate in the mountains and cascades of Tyrol, and flow through the southern regions of Bavaria. The former passes Munich, Mosburg, and Landsbut, after which it falls into the Danube, opposite to Deckendorf; and the latter proceeds almost due north to the same receptacle. The Iller flows nearly parallel to the Lech, and joins the same parent river near the city of Ulm. The Nab rises in the range lying between Bohemia and Bavaria, and the Altmuhl in the higher parts of the margraviate of Anspach: the former joins the Danube, west of Ratisbon; and the latter a few miles higher up the stream. The Danube is the grand river of Bavaria, and intersects the whole kingdom, east and west, though not without a considerable sweep towards the north.

These rivers greatly refresh the herbage and terranean productions of the kingdom generally, besides answering, to a considerable extent, the important purposes of an inland navigation.

The largest lake is that of Ammer, lying at the foot of the Alps. Other lakes are found in different parts of the kingdom, but in general are not of sufficient importance to require distinct enumeration.

The climate and temperature of Bavaria are various, owing to its relative situation, and the different degrees of elevation observable upon its surface, by which it is rendered capable of producing all the necessaries of life, together with many of its luxuries. While the vine flourishes in one part, the fir attains maturity in another; but the native indolence of the inhabitants prevents their reaping all the advantages of their climate; and thousands of acres of good land lie completely unoccupied. The valleys are generally well watered, and possess a rich soil, while

the upland territories are overspread with rocks and forests. The plains produce grain, fruit, wine, hops, &c. Flax is cultivated in the district of the Bavarian desert. Vines flourish on the banks of the rivers Danube and Iser; and much excellent fruit is grown in the vicinity of Landshut, although the most fertile parts are frequently spotted with oases and islands of sand, which seem at present to be incorrigible.

The mineral productions of Bavaria comprise copper, iron, marble, coal, gypsum, vitriol, and several kinds of argillaceous earth, the most noted of which is the species of clay of which the Passau crucibles are made. Iron and copper are the most important, and of the latter 3000 quintals are obtained annually. At Traunstein, near the confines of Salzburg, are numerous rich salt-springs, which furnish employment to a great number of the inhabitants. Mineral waters are also common in Bavaria, but are generally considered inferior to those found in many other parts of Germany.

The margravate of Anspach is noted for its superior breed of horses, which have been of late much improved by an intermixture with those of England. The same degree of attention has been bestowed upon their cattle, by an intermixture with the Swiss breed. The coarse wool of their native flocks has also been much improved, by the introduction of Marinos amongst the sheep, especially in Bavaria Proper. The wild animals of Bavaria are bears, wolves, lynxes, foxes, wild boars, &c. The rivers are well stocked with fish, and in some of them beavers are common.

The principal towns are Munich, Augsburg, Bamberg, Anspach, Bayreuth, Amberg, Wurtzburg, Eichstadt, Passau, Ingolstadt, and Nuremberg, together with some others of less note: as, Kempten, Freysingen, Landshut, Mosburg, Neuburg, Nordlingen, Memmingen, Schweinfurt, Straubing, and others.

Munich, the capital, is seated on the river Iser, and in the year 1814, contained as many as 60,000 inhabitants, besides 18,659, who inhabited the suburbs, and 26,000 strangers, who were supposed to visit it annually. It is the centre of the most valuable national manufactures, and was rendered, by the concordat of 1817, the seat of an archbishop.

The general manufactures and commerce of Bavaria, are under a restrictive influence, from the native indolence of the inhabitants, together with the numerous fasts and saints' days of the Roman church. Their manufactures, which include linen, woollen, and cotton cloths, iron, firearms, earthenwares, &c., are chiefly directed to the supply of their domestic wants. Augsburg has manufactures of paper, gold, silver, jewelry, and cotton. It is engaged in the transfer of goods between Germany and Italy, and is the general focus of exchange for the southern countries of Germany. Friedburg is noted for its clocks and watches. Philosophical instruments are made at Munich; and it was here that the art of lithography was discovered. Near Hohen Aschau is an iron mine, the largest in the kingdom, together with foundries and forges, the produce of which, with their grain, wood, wine, salt, and vitriol, form the chief exports.

The government of Bavaria is a constitutional monarchy. The National Assembly consists of two chambers; and no tax can be imposed, or general law enacted, without their consent. The first chamber consists of the nobles, bishops, &c., and the second of deputies chosen once every six years by the landholders, universities, boroughs, cities, and clergy. The crown is hereditary in the male line, and only transferable to the female in the event of total failure of male issue. Louis I., of Bavaria, is a liberal prince, and the kingdom has flourished by his policy. A royal commissioner presides over each of the circles into which the nation is divided; and commissaries of police are distributed in all the principal towns. A court of appeal also, is established in each circle, to which causes may be removed; and there is a supreme court at Munich, whose sentence is final. By the new constitution of Germany, according to the decisions of the late congress, Bavaria is made the first of its secondary kingdoms, possesses one vote in the federative diet and four in the general assembly.

The Bavarian army, during the late war, amounted to 60,000 men; but after the peace it was reduced to 40,000. The annual revenue is estimated at two millions; burdened, however, with a considerable debt.

The inferior kingdoms of Germany are of too little importance to become principals in any European war, but they are frequently found very effective allies. For instance, in case of war between France and Austria, the alliance of Bavaria with the former, would bring the French troops into the very heart of Germany; and with the latter, would conduct the Austrian troops to the very borders of France. It is in this light only that the political importance of this kingdom can be duly estimated: a practical illustration of which took place in 1813, when, during the crisis in which Napoleon was endeavouring to establish himself at Dresden, Bavaria declared in favor of the allies.

The prevailing religion of Bavaria is the Roman Catholic. The inhabitants were formerly considered some of the most intolerant in Europe, and the Bavarian bishops being independent princes, the power of the church knew no control; but by the diffusion of superior light, liberal sentiments began to prevail, the temporal authority of the ecclesiastics was abolished in 1802, as were also many of the monastic institutions, and toleration was regarded as a civil right. There are now two archbishops, and four bishops; the former, according to a concordat agreed to by the Pope in 1817, are those of Munich and Bamberg, and the latter those of Augsburg, Wurtzburg, Ratisbon, and Eichstadt. The influence of the church is still greater in Bavaria than in any other part of Germany.

Bavaria has never risen to any remarkable distinction. Indeed the bigotry, ignorance, and intolerance, which formed the national character of the people, presented almost insurmountable obstacles to all liberal and enterprising views with respect to education, agriculture and commerce. The almost ceaseless train of saints' days, and holy days, seemed to breed nothing but indolence and superstition. Bavaria now begins to emerge

from her long-cherished barbarism. Education is attended to; academies, lyceums, and universities, have been multiplied; productions of foreign literature have been imported, to excite the emulation of native genius, and the effects of these generous efforts have already shone forth, in the improved condition of society, and the gradual advance of moral and physical renovation. Much, however, yet remains to be done, especially in those regions which were most darkened by religious superstition. But, calculating upon the measures of the present government, the eye of anticipation looks through a train of consequences to the distant period when the mists shall disperse, the clouds clear up, and Bavaria aspire to an equality with the other kingdoms of Europe.

The language of the Bavarians is a dialect of the German, which, however, they have neglected to cultivate; travellers agree in describing them as the most sensual and phlegmatic of the German nations.

The Bavarians are in appearance a stout and vigorous race of men, well adapted to bear the fatigues of war. They resemble the Irish peasantry in their propensity to drink and quarrel; and their manners at the close of the last century were coarse in the extreme. Amidst all the dirt, indolence, and laxity of morals, which are here carried to excess, the Bavarian is, in general, faithful to his word; which is almost the only good feature that is at all prominent. Many of the females are lively, handsome, and graceful; but their charms are altogether personal, since intellectual cultivation is scarcely a subject of attention.

The antiquities and curiosities are few in number, but are calculated to awaken no ordinary feelings of interest and astonishment. In the capital, Munich, the objects most worthy of attention are the Cabinet of Natural Curiosities, the Library, the Arsenal, and the Ducal Gardens.

The Museum contains a complete series of busts of the Roman emperors, together with many other remarkable antiquities. Roman stations, roads, and coins, are frequent, and form, with the churches and castles, a charming collision of objects, highly interesting to the architect, the statuary, and the antiquarian. But all the works of art are more than eclipsed by the more magnificent wonders of nature. The scenes in the interior of the mountains have often awakened the astonishment of the traveller, and left him overwhelmed by the terror of the sublime; and no doubt many unexplored caverns yet remain which no human foot has ever trod. We shall select the following instance of these amazing recesses, as described by Mr. Parkinson, for the entertainment of the reader. It is to be found in his curious and valuable work *The Organic Remains of a former World*.

Among the most remarkable of these caverns are those of Gaylenreuth, on the confines of Bayreuth. The opening to these, which is about seven feet and a half high, is at the foot of a rock of lime-stone, of considerable magnitude, and in its eastern side. Immediately beyond the opening is a magnificent grotto, of about 300 feet in circumference, which has been naturally divided by the form of the roof into four caves. The

first is about twenty-five feet long and wide, and varies in height from nine to eighteen feet; the roof being formed into irregular arches. Beyond this is the second cave, about twenty-eight feet long, and of nearly the same width and height with the former. In this cave the stalactitic crust begins to appear, and in considerable quantity; but not in such quantity as in the third cave, which is beautifully hung, as it were, with this sparry tapestry. The roof now begins to slope downwards, so that in the next, the last of these caves, it is not above four or five feet in height. In the caves forming this first grotto fragments of bones are found, and it is said that they were as plentiful here as they now are in the interior grottoes.

The passage into the second grotto is about six feet high, and fourteen feet wide. This grotto, which extends straight forward sixty feet from the opening, and is about forty feet wide, and at its commencement about eighteen feet high, would commodiously hold 200 men. Its appearance is rendered remarkably interesting, from the darkness of its recesses, and from the various brilliant reflections of the light from the stalactites with which its roofs and sides are covered. The constant drip of water from the roof, and the stalagmatic pillars on the floor, assist in perfecting the wonders of the scene. In this grotto no search was made for bones, on account of the thickness of the sparry crust.

A low and very rugged passage, the roof of which is formed of projecting pieces of rock, leads to the third grotto; the opening to which is a hole, three feet high, and four feet wide. This grotto is more regular in its form, and is about thirty feet in diameter, and nearly round. Its height is from five to six feet. This grotto is very richly and fantastically adorned by the varying forms of its stalactitic hangings. The floor is also covered with a wet and slippery glazing, in which several teeth and jaws appear to have been fixed.

From this grotto commences the descent to the interior caverns; within only about five or six feet an opening in the floor is seen, which is partly vaulted over by a projecting piece of rock. The descent is about twenty feet, and occasioned to M. Esper and his companions some little fear, lest they should never return, but remain to augment the zoolithes contained in these terrific mansions. This cavern was found to be about thirty feet in height, about fifteen in width, and nearly circular; the sides, roof, and floor, displaying the remains of animals. The rock itself is thickly beset with teeth and bones; and the floor is covered with a loose earth, formed by animal decomposition, and in which numerous bones are imbedded.

A gradual descent leads to another grotto, which, with its passage, is forty feet in length, and twenty feet in height. Its sides and top are beautifully adorned with stalactites. Nearly twenty feet further is a frightful gulph, the opening of which is about fifteen feet in diameter; and, upon descending about twenty feet, another grotto, about the same diameter with the former, but forty feet in height, is seen. Here the bones are dispersed about, and the floor, which is

formed of animal earth, has great numbers of them imbedded in it. The bones which are here found seem to be of different animals; but in this, as well as in the former caverns, perfect and unbroken bones are very seldom found. Sometimes a tooth is seen projecting from the solid rock, through the stalactitic covering; showing that many of these wonderful remains may here be concealed. A specimen of this kind, which I possess, from Gaylenreuth, is rendered particularly interesting by the first molar tooth of the lower jaw, with its enamel quite perfect, rising through the stalactitic mass which invests the bone. In this cavern the stalactites begin to be of a larger size, and of a more columnar form.

Passing on through a narrow opening in the rock, a small cave, seven feet long and five feet high, is discovered. Another small opening out of this leads to another small cave, from which a sloping descent leads to a cave twenty-five feet in height, and about half as much in its diameter, in which is a truncated columnar stalactite, eight feet in circumference.

A narrow and difficult passage, twenty feet in length, leads from this cavern to another of twenty-five feet, which is everywhere beset with teeth, bones, and stalactitic projections. This cavern is suddenly contracted so as to form a vestibule of six feet wide, ten long, and nine high, terminating in an opening close to the floor, only three feet wide, and two high; through which it is necessary to writhe with the body on the ground. This leads into a small cave, eight feet high and wide, which is the passage into a grotto twenty-eight feet high, and about forty-three feet long and wide. Here the prodigious quantity of animal earth, the vast number of teeth, jaws, and other bones, and the heavy grouping of the stalactites, produced so dismal an appearance as to lead M. Esper to speak of it as a perfect model for a temple for a god of the dead. Here hundreds of cart-loads of bony remains might be removed, pockets might be filled with fossil teeth, and animal earth was found to reach to the utmost depth to which they dug. A piece of stalactite being here broken down, was found to contain pieces of bones within it, the remains of which were left imbedded in the rock.

From this principal cave is a very narrow passage, terminating in the last cave, which is almost six feet in width, fifteen in height, and the same in length. In this cave were no animal remains, and the floor was the naked rock.

Thus far only could these natural sepulchres be traced; but there is reason to suppose that these remains were disposed through a greater part of this rock. By what means such immense quantities of animal materials were accumulated in these subterraneous abodes remains totally inexplicable, and no reasonable conjectures have yet been offered on the subject.

BAVATA TERRA, i. e. a bavoch of land, an ancient division of land, in the highlands of Scotland, mentioned by the Regium Majestatem, as containing thirteen acres, and distinguished from a smaller portion called davata terra, a davoch of land, which contained only four acres, of the eighth part of a bavata i. e. 1½ acres.

BAVAY, a small town of France, in the department of the north (late province of Hainault), to which the French retired after the battle of Malplaquet, in 1709. It was taken by the Austrians in 1792, but recovered the same year. This was anciently the capital of the Nervii; and a variety of Roman medals have been found in the neighbourhood. It has manufactories of woollen stuffs, stockings, and iron plate; and was ceded to France by the peace of Nimeguen, in 1678. It stands on the road from Maubeuge to Valenciennes, about eight miles north-east of Quesnoy, and nearly thirty east of Douay.

BAUBEE. A Scottish word for a halfpenny. This coin, bearing the head of James the Vth king of Scotland, when young, has been supposed by some to have been therefore called *baubee*, as exhibiting the figure of a baby. But Dr. Jamieson says this is a great mistake; the name, as well as the coin, being known before that prince's reign. Mr. Pinkerton derives it from the French *bas-billon*, or the worst kind of billon.

Though in the drawers of my Japan bureau,
To Lady Gripeall I the Cæsars show,
'Tis equal to her Ladyship or me
A copper Otho, or a Scotch *baubee*.

Bramston's Man of Taste.

And as to her false accusation of spoil, we did remit us to the conscience of Mr. Robert Richeson, master of the coining-house, who from our hands received silver, gold, and metal, as well coined as uncoined, so that with us there did not remain the value of a *baubee*, or farthing.

Knox. History of the Reformation of Scotland.

BAUCHERVILLE, a port in lower Canada, on the south bank of the St. Lawrence, opposite Montreal. It is beautifully situated, and remarkable as the retreat of several of the old French nobles, who spend their small incomes in a little society of their own.

BAUCIS, in fabulous history, a woman who lived with Philemon her husband, in a cottage in Phrygia. Jupiter and Mercury, travelling in the country, were well received by them, after having been refused entertainment by every-body else. To punish the people for their inhumanity, these gods laid the country waste with water; but took Baucis and Philemon with them to the top of a mountain, where they saw the deluge, and their own little hut above the waters, turned into a temple. They desired to officiate in this temple as priest and priestess, and that they might die both together, which were granted them.

BAUCONICA, in ancient geography, a town of the Vangiones in Gallia Belgica, supposed to be the present **OPPENHEIM**, which see.

BAUD, a town of France in Brittany, the head of a canton in the department of Morbihan, arrondissement of Pontivy. Population 6200. 18 miles north-west of Vannes.

BAUDEKIN, **BALDICUM**, and **BALDAKINUM**, in our old writers, a cloth of gold, or tissue, upon which figures in silk, &c. were embroidered. Some writers regard it as only a cloth of silk.

BAUDELLOT (Charles Cæsar), a learned advocate of Paris, was distinguished by his skill in ancient monuments; he was received into the Academy of Belles Lettres in 1705. He wrote a Treatise on the Advantages of Travelling; Letters and

Dissertations on Medals, &c; and died in 1722, aged seventy-four.

BAUDIÉ (Michael), of Languedoc, lived in the reign of Louis XII., and wrote 1. An Inventory of the General History of the Turks; 2. The History of the Seraglio; 3. Of the religion of the Turks; 4. Of the Court of the King of China; and 5. The Life of Cardinal Ximenes, &c.

BAUDISSERTÉ, in mineralogy, a compound mineral, found at Baudissero in Piedmont, composed principally of silver and magnesia. It passes into Meerscham, or sea froth, of which bowls of pipes for smoking are frequently made.

BAUDIUS (Dominic), a professor of history in the university of Leyden, born at Lisle, in 1561. He studied at Aix-la-Chapelle, Leyden, and Geneva, and was admitted L. L. D. in 1585. Soon after, he accompanied the ambassadors from the states to England, where he became acquainted with Sir Philip Sidney. He was admitted advocate at the Hague in 1587; but being soon tired of the bar, went to travel in France, where he remained ten years, and was much esteemed. Through the influence of Achilles de Harlai, first president of the parliament of Paris, he was admitted advocate of the parliament of Paris in 1592. In 1602 he went to England with Christopher de Harlai, the president's son, who was sent ambassador to London from Henry IV., but being soon after appointed professor of eloquence at Leyden, he settled in that university. Here he read lectures on history, and on the civil law. In 1611 the states conferred on him, in conjunction with Meursius, the office of historiographer, and in consequence he wrote *The History of the Truce*. He was an elegant prose writer, as appears from his letters, many of which were published after his death, and also an excellent Latin poet. His poems were first printed in 1587, and he published separately a book of Iambics in 1591, dedicated to Cardinal Bourbon. He died at Leyden in 1613.

BAUDOBRIGA, in ancient geography, a town of the Treveri in Germany, now Boppard, in the electorate of Triers. See **BOPPART**.

BAUDRAND (Michael Antony), a celebrated geographer, born at Paris in 1633. He travelled into several countries, and then applied himself to the revision of Ferrarius' Geographical Dictionary, which he enlarged by one half. He wrote, 1. Notes to Papirius Masson's description of the Rivers of France; 2. A Geographical and Historical Dictionary; 3. Christian Geography, or an account of the Archbishoprics and Bishoprics of the whole world; and made several maps. He died at Paris, May 29, 1700.

BAUERA, in botany, a genus of plants, class polyandria, order digynia. Its generic characters are: *cal.* inferior eight-fid: *cor.* eight petals, capsule bilocular, many seeded. The species are, 1. *B. rubrifolia* madder-leaved Bauera *B. rubioides*; *Audr. Repos. t. 198, Curt. Mag. t. 715. Venten. Malmals. t. 96.* Native of New South Wales, first discovered in that country by Sir Joseph Banks. It requires the shelter of a green-house, or conservatory, and flowers during most part of the summer and autumn. Another species is mentioned by the name of *B. humilis*, in *Ait.*

Epit. 364, as introduced at Kew, from New Holland in 1805, and flowering in June and July.

BAUGE, a druggot manufactured in Burgundy, with thread spun thick, and coarse wool.

BAUGE', a small town of France, in the department of the Mayenne and Loire, and late province of Anjou, famous for the victory gained by Charles VII. over the English in 1421. It is seated on the Coesnon, twenty-two miles east by north of Angers, and has about 3000 inhabitants.

BAUHIN (Casper, or Gaspar), an eminent anatomist and botanist, born at Basil in 1550. In 1580, he was chosen first professor of these sciences at Basil, and in 1614 was first professor of physic, and first physician of that city, a distinction which he held till his death, in 1623. He wrote, 1. *Anatomical Institutions*; 2. *Prodromus Theatri Botanici*, and other works.

BAUHIN (John), elder brother to Caspar, a great botanist, was born about the middle of the sixteenth century. He took his doctor's degree in physic in 1562, and afterwards became principal physician to Frederick duke of Wirtemberg. The most considerable of his works is his *Universal History of Plants*.

BAUHINIA, **MOUNTAIN EBONY**, in botany, a genus of the monogynia order, and decandria class of plants, ranking in the natural method under the thirty-third order, lomentaceæ: *cal.* quinquefid, and deciduous; the petals, oblong expanded, and clawed, the superior one more distant, all inserted on the calyx; the capsule, a legumen. There are 10 species, which are propagated by seeds, and must be sown in hot-beds, and are reared in a bark stove. The most remarkable are: 1. *B. aculeata*, with a prickly stalk, common in Jamaica and other American sugar islands, where it rises to sixteen or eighteen feet, with a crooked stem. 2. *B. acuminata*, with oval leaves, a native of both the Indies, rising with several pretty strong, upright, smooth stems, sending out slender branches, garnished with oval leaves divided into two lobes. 3. *B. divaricata*, with oval leaves, whose lobes spread different ways. This grows naturally in great plenty on the north side of the island of Jamaica. 4. *B. tomentosa*, with heart-shaped leaves, a native of Campeachy; and rises to twelve or fourteen feet, with a smooth stem dividing into many branches. 5. *B. variegata*, with heart-shaped leaves, and lobes joining together, is a native of both the Indies. It rises with a strong stem upwards of twenty feet, dividing into many strong branches.

BAVIAN. The same as *babian*. A baboon or monkey; an occasional but not a regular character in the old morris dance. From *Dut. bavian*, Germ. *pavian*, a great monkey. He appears in act iii. scene 5, of *The Two Noble Kinsmen*, where his office is to bark, to tumble, to play antics, and exhibit a long tail with what decency he could. So *babouin* in French, and our *baboon*.

Where's the *bavian*?

My friend, carry your tail without offence
Or scandal to the ladies, and be sure
You tumble with audacity and manhood;
And when you bark, do it with judgment.

Beaumont and Fletcher.

BAVIN. Brushwood, or small faggots, made of such light and combustible matter, used for lighting fires. Still in use in some counties.

The skipping king, he ambled up and down,
With shallow jesters and rash *bavin* wits,
Soon kindled and soon burnt.

Shakspeare. Henry IV.

Bavins will have their flashes, and youth their fancies, the one as soon quench'd as the others are burnt.

Mother Bombie, 1594.

BAVIUS and **MÆVIUS**, two wretched poets of ancient Rome, who have been

'Damn'd to everlasting fame,'

in that severe line of Virgil :

Qui Bavius non odit amet tua carmina Mævi.

BAULEAH, a considerable town of Bengal, in a very fertile country, to the north-east of the Ganges. The East India Company have here a very extensive factory for silk, which supplies a third part of that material exported from Bengal.

BAULOT, or **BEAULIEU**, famous for his operations in lithotomy. He was born in 1651, of parents in low circumstances, and he entered early into the army; but after he had been some time a soldier, he got acquainted with an empirical surgeon, who pretended to cure the stone; and having received some lessons from this man, he assumed the monastic habit, though he belonged to no religious order, calling himself brother James. Thus he travelled through various provinces, and performed various operations; and at last went to Paris. Here his practice was disapproved of at first; but having been successful in curing a boy, his patients soon after became numerous. After extracting the stone he left the wound to heal of itself. The famous Cheselden adopted and improved upon brother James's method. He died in 1720.

BAUM, in botany. See **MELISSA**.

BAUM, **BASTARD**. See **MELITTIS**.

BAUM, **SUREBEY**. See **MOLUCCA**.

BAUMAN ISLES, a cluster of islands in the South Pacific Ocean, discovered in 1722, by the person whose name they bear, in his voyage round the world with M. Roggewein. They lie in 12° of south latitude, and 173° of west longitude. The largest is about twenty miles in circumference; and the inhabitants were found to manifest a gentle and friendly disposition.

BAUMANNIANA, in entomology, a species of *platan* (tortrix) that inhabits Austria. The anterior wings are yellow, with two ferruginous anatomizing bands bordered with silver; posterior one interrupted.

BAUMANSHOEPE, a remarkable cavern in the Brunswick states, principality of Blankenburg, Germany, situated in a steep rock near Rubeland. It consists of six or seven vaults, communicating by narrow apertures, and filled with stalactitic petrifications, arranged in a thousand fantastic forms. No one has ever penetrated to the bottom, on account of the dampness and impurity of the air, which extinguishes all lights.

BAUMÉ (Antony, an eminent French chemist towards the close of the last century, who distinguished himself by his opposition to the theory of Lavoisier, and his colleagues. He practised as a physician at Paris, and was, in 1775,

chosen a member of the Royal Academy of Sciences. On the establishment of the National Institute, he was also one of its members. His principal works are a Treatise on Theoretical and Experimental Chemistry, and a Manual of Pharmacy. He also wrote a Memoir on Argillaceous Earths; a Dissertation on Æther, &c. He died in 1805. He also wrote a great many articles in the Dictionnaire des Arts et Métiers.

BAUME-LES-NONES, a town of France, the head of an arrondissement, in the department of the Doubs, seated on the river of that name, and having 2500 inhabitants. Five miles from this town is a remarkable cavern, containing a small brook, said to be frozen in summer, but not in winter. When the peasants perceive a mist rising out of this cave, they know that it will rain the next day. Before the revolution there were here two famous abbeys, one for males, the other for females. Sixteen miles north-east of Besançon. Long. 6° 25' E., lat. 47° 21' N.

BAUNACH, or **PAUNACH**, a market town of Bavaria, capital of the district of Gleusdorf, circle of the Maine. It is situated at the influx of a small river of the same name into the Maine, and lay formerly in the principality of Bamberg, in Franconia. Here is a bridge across the latter river, and the surrounding country is rich in corn and wine. Seven miles north of Bamberg.

BAVOSA, in ichthyology, a name given by Italians to a species of the ray fish, now called *leviraia*, and *raia oxyrynchus*, and by earlier authors, *raja bos*, *bos marinus*, and *leioraja*. It is distinguished by Artedi as the variegated ray, with ten prickly tubercles on the middle of the back. See **PHOLIS**.

BAUR (Frederick William Von), a Russian general, born in the county of Hessian Hanau. He very early entered on a military life, and, in 1755, was in the British service as an officer of Hessian artillery. In 1757 he was advanced to the rank of general and engineer; and was afterwards ennobled by Frederick II. of Prussia. He entered into the service of Catharine II. empress of Russia, in 1769, and was by her appointed director of the salt works in Novogorod. He also superintended two great works, the supplying of Moscow with water, and deepening the canal near Petersburg, at the end of which he constructed a commodious harbour. He died in 1783. He wrote *Memoires Historiques et Geographiques sur la Valachie*, &c. 8vo.; and constructed the *Carte de Moldavie, pour servir de la Guerre entre les Russes et le Turcs*, in seven sheets.

BAURAC, an ancient name for nitre, and some other salts, confusedly called nitre. The Arabians give the name to tincar or tinal, which, when refined, is called borax, but when rough, in little crystalline masses, like the small crystals of sal gem, mixed with earth or other impurities, it is called tinal.

BAUTRU, a celebrated wit, and one of the first members of the French academy, was born at Paris in 1588, and died there in 1665. He was the delight of the whole court, but while he played the buffoon, took the usual privilege of saying what he pleased. Many of his *bon mots* are preserved. Once, when in Spain, having

been to see the famous library of the Escorial, where he found a very ignorant librarian, the king of Spain asked him what he had remarked? Bautru replied, that 'the library is a very fine one; but your majesty should make your librarian treasurer of your finances.' 'Why so?' 'Because,' said Bautru, 'he never touches what he is entrusted with.'

BAUTZEN, or BUDISSEN, a considerable town of Germany, the capital of Upper Lusatia, in the kingdom of Saxony, with a strong citadel. It is seated on the river Spree, thirty miles east by north of Dresden. Including the suburb of Seidau, it contains a population of 11,000 or 12,000, most of whom are employed in manufactures, of which the principal are paper, cloth, linen, leather, and stockings. The provincial diet assembles at Bautzen, which is also the seat of the central post office. One half of the parish church is given to the Catholics, and the other to the Lutherans, the latter of whom are about three-fourths of the inhabitants. Here is also a collegiate establishment, called the provostship of St. Peter, all the members of which are Catholics, except the head, who is a Lutheran. The funds of this institution are extensive; and it possesses large tracts of land, both in Saxony and Bohemia. The town-hall, academy, orphan-house, ingenious water machines, as well as the public walks, are worthy of attention. Bautzen has suffered much by fire, particularly in the years 1709, 1760, and 1767. It was also the scene of a bloody conflict between the French and allies in 1813, in which the former were victorious. The language of the Wendens, or descendants of the ancient Vandals, is spoken at Bautzen nearly as much as the modern German.

BAW'BLE, } *Bauble*, or *bable*, *s.* Low Lat.
 BAW'BLING. } *baubella*; but that word being found only in Hoveden, it is probable that the English may be the original, and the contrary; perhaps both are from the Fr. *babiole*. *Baciballum* is found in Petronius Arbitr in a similar sense; and *βαβαλία* in Julius Pollux, vol. 16, for bracelets.—*Nares*. Skinner suggests that it may be from *babe*, Ital. *babolo*, an infant; *q. d.* an infant's plaything. Any pretty, showy, trifling toy. It was anciently used to signify the badge of a fool. In its general signification the word is still current, but the office of a fool being obsolete, it requires, in the latter sense, some explanation. A fool's *bauble* was a short stick, with a head ornamented with asses' ears, fantastically carved upon it.

An idiot holds his *bauble* for a god,
 And keeps the oath which by that god he swears.

Shakspeare. Titus Andronicus.

It had been fitter for you have found a fool's coat,
 and a *bauble*.

Lingua, O. Pl. v. 129.

If every fool should wear a *bauble*, few would be dear.

Ray's Prov. p. 108.

It was also the subject of another proverb, which, as well as several allusions made to it, was of a licentious nature. It appears by the French proverb, subjoined by Ray, that the equivalent word in that language was *marotte*, which is now used for a person's particular foible, or hobby-horse. *C'est-là sa marotte*; it is

his hobby-horse. It is in general whether applied to persons or things, a term of contempt.

And hapneth that the kynges foole,
 Sat by the fire upon a stole,
 As he that with his *bauble* plaide,
 And yet he heard all that thei saide,
 And thereof toke thei no hede.

Gower. Conf. Ann.

In the reproof of chance

Lies the true proof of men: the sea being smooth,
 How many shallow *bauble* boats dare sail
 Upon her patient breast, making their way
 With those of nobler bulk?
 But let the ruffian Boreas once enrage
 The gentle Thetis, and anon behold
 The strong-ribb'd bark through liquid mountains cut,
 Bounding between the two moist elements,
 Like Perseus' horse: Where's then the saucy boat,
 Whose weak untimber'd sides but even now
 Co-rival'd greatness? either to harbour fled,
 Or made a toast for Neptune. Even so
 Doth valour's show, and valour's worth divide
 In storms of fortune.

Shakspeare.

A *baubling* vessel was he captain of,
 For shallow draught, and bulk, unprizable;
 With which such scathful grapple did he make,
 With the most noble bottom of our fleet.

Id.

Paper!

Black as the ink that's on thee; senseless *bauble*,
 Art thou a feodary, for this act, and look'st
 So virgin-like without.

Id.

When a man begins truly to fear God, and is in the agonies of mortification, all these new-nothings and curiosities will lye neglected by as *baubles* do by children when they are deadly sick.

Taylor's Sermons.

For who without a cap and *bauble*,
 Having subdued a bear and rabble,
 And might with honour have come off,
 Would put it to a second proof.

Hudibras.

He (Cromwell) commanded a soldier to seize the mace: 'What shall we do with this *bauble*? Here, take it away. It is you,' said he, addressing himself to the house, 'that have forced me to this, I have sought the Lord, night and day, that he would rather slay me than put me upon this work.'

Hume's History of England.

If, in our contest, we do not interchange useful notions, we shall traffick toys and *baubles*.

Government of the Tongue.

This shall be writ to fright the fry away,
 Who draw their little *baubles*, when they play.

Dryden.

A lady's watch needs neither figures nor wheels;
 'Tis enough that 'tis loaded with *baubles* and seals.

Prior.

Our author then, to please you, in your way,
 Presents you now a *bauble* of a play,
 In gingling rhyme.

Granville.

A rhymer, the moment he is crown'd,
 Inherits every virtue round,
 As emblems of the sovereign pow'r,
 Like other *baubles* of the tow'r.

Swift

Whate'er was light, impertinent, and vain,
 Whate'er was loose, indecent, and profane,
 (So ripe was folly, folly to acquit),
 Stood all absolv'd in that poor *bauble*, wit.

Churchill. Gotham, bk. iii.

BAW'COCK. A burlesque word of endearment, supposed to be derived from *beau coq*; but rather perhaps from *boy* and *cock*. It seems to mean young cock, or fine fellow.

Why that's my *baawcock*. What has smutch'd thy nose?

Shakspeare.

Good *baucok*, bate thy rage! use lenity, sweet chuck.

BAWD', *v.*, *n. s.* & *adj.*

BAWD'LY,
BAWD'INESS,
BAWD'RY,
BAWD'SHIP,
BAWD'Y.

Either from *baude*, which signifies joyous, from *baudy*, dirty, or from the Goth. *bauyan*, to scrape together, thus

bawd is a collector of filth, or obscenity. The French have *bauderie*, *baudrie*, that is pimping, keeping a bawdy-house. It refers to obscenity of language, and of intercourse. A bawd is either a male or female pander. It is more frequently applied, however, to the depraved mother in the trade of debauchery, who either facilitate the illicit intercourse of the sexes, as procuresses, or as furnishing them with a place of meeting. Johnson says, somewhat coarsely, that *bawdry* is a wicked practice of procuring and bringing whores and rogues together.

This false thief, this sompnour quod the frere,
Had alway *baudes* redy in his hond,
As any hawke to liue in Engleland.

Chaucer. *The Freres Tale.*

This thing is wonder mervailous to me,
(Sin that thy lord is of so high prudence,
Because of which men shulde him reverence.)
That of his worship rekketh he so lite
His overest sloppe it is not worth a mite,
As in effect to him so mote I go;
It is all *bawdy* and to sore also.

Id.

But here, with al mine herte, I thee besече
That never in me thou deme soche folie,
As I shall saine—Methought by thy speche,
That this whiche thou me doest for companie,
I should wenen it were a *bauderie*:
I am not wode, all if I leud ybe:
It is not so, that wote I well parde.

Id.

H'll hang handsome young men for the soote sinne
of leve,

When so his knavery himselve a *bawdy* Jack doth
prove.

Whetstone. *Old Play.*

Besides, *bawdry* is become an art, or a liberal science, as Lucian calls it; and there be such tricks and subtleties, so many nurses, old women, panders, letter-carriers, beggars, physicians, friars, confessors, employed about it; such occult notes, stenography, polygraphy, mantius animatus, or magnetical telling of their minds, which Cabens, the Jesuit, by the way, counts fabulous and false; cunning conveyances in this kind, that neither Juno's jealousy, nor Danae's custody, nor Argo's vigilancy can keep them safe.

Burton. *Anat. of Mel.*

The eye is a secret orator, the first *baude*, amoris porta, and with private looks, winking, glances, and smiles, as so many dialogues they make up the match many times and understand one another's meanings before they come to speak a word.

Id.

Thy sin's not accidental, but a trade:

Mercy to thee would prove itself a *bawd*:

'Tis best that thou diest quickly.

Shakspeare.

She says enough; yet she's a simple *bawd*,

That cannot say as much.

Id.

Come, sing me a *bawdy* song; make me merry; I was as virtuously given as a gentleman used to be; virtuous enough: swore little; dined not above seven times a week; went to a *bawdy*-house, not above once in a quarter of an hour; paid money that I borrowed, three or four times; lived well, and in good compass; and now I live out of all order, out of all compass.

Id.

HEART. For my part I have once escaped—and when I wed again, may she be—ugly as an old *bawd*.

VAINL. Ill-natured, as an old maid—

BELMOUR. Wanton as a young widow—

SHARP. And jealous as a barren wife—

Congreve. *Old Bachelor.*

Now nothing left, but wither'd, pale, and shrunk,
To *bawd* for others, and go shares in punk.

Pope.

You may generally observe, that the appetites are sooner moved than the passions. A sly expression, which alludes to *bawdry*, puts a whole row into a pleasing smirk; when a good sentence that describes an inward sentiment of the soul, is received with the greatest coldness and indifference.

Spectator.

Has the pope lately shut up the *bawdy*-houses, or does he continue to lay a tax upon sin?

Dennis.

BAWDY-HOUSE. The keeping of a house of ill-fame is cognizable by the temporal law, as a common nuisance, not only because it endangers the public peace by drawing together dissolute and debauched persons, and promoting quarrels, but because it tends to corrupt the manners of the people by an open profession of lewdness (3 Inst. 205. 1 Hawk. P. C. c. 74). Those who keep *bawdy*-houses are punished with fine and imprisonment, and also such infamous punishment as the court shall inflict; and so is a lodger, who keeps only a single room for such purposes. Also persons resorting to a *bawdy*-house are punishable, and may be bound to their good behaviour. If a constable receives information that a man and woman are gone to a lewd house, he may carry them before a justice of peace without any warrant, and the justice may bind them over to the sessions. In London, they may carry them to prison; and by the custom of the city, whores and bawds may be carted. By stat. 25 Geo. II. c. 36, made perpetual by stat. 28 Geo. II. c. 19, if two inhabitants, paying scot and lot, shall give notice to a constable of any person keeping a *bawdy*-house, the constable shall go with them before a justice of peace, and shall, upon the oath of such inhabitants, that they believe the contents of such notice to be true, and their entering into a recognizance of £20 each, to give material evidence of the offence, enter into a recognizance of £30 to prosecute with effect such person for such offence at the next sessions. The constable shall be paid his reasonable expenses by the overseers of the poor, ascertainable by two justices; and upon conviction of the offender, the overseers shall pay the two inhabitants £10 each. A constable, neglecting his duty, forfeits £20. Any person appearing as master or mistress, or as having the care or management of any *bawdy*-house, shall be deemed the keeper of it, and liable to be punished as such. And a wife may be indicted and set in the pillory with her husband for keeping a brothel; for this is an offence respecting the domestic economy and government of the house, in which the wife has a principal share.

BAWD-MONEY, a name given to the aleum athamanticum.

BAWD'DRICKS, *n.* See BALDRICK. *Belts*, *belt*, according to Du Cange, is the ring, belt, or girdle of a bold man, that is of a warrior. The word is used by Sir Thomas More, by Hall, and by Fabian, and is spelt by them variously, *bawdrick*, *bawdryck*, and *bawdryke*.

And in her hand a sharp bone spear she held,
 And at her backe a bow and quiver gay,
 Stuff with steel-headed darts, wherewith she queld
 The salvage beasts in her victorious play,
 Knit with a golden *baudrick*, which forelay
 Athwart her snowy breast. *Spenser. Faerie Queene.*
 Fresh garlands to the virgins' temples crown'd;
 The youths gilt swords wore at their thighs, with silver
baudricks bound. *Chapman's Iliad.*

BAWL, *v. a. & n.* } Vossius and Festus
BAWLING, } concur in thinking that
BAWLER, *n.* } this word is formed, a
 sono vocis, from the sound of the voice; Min-
 shew and Skinner conjecture that it is from the
 noise which dogs make in barking; and Johnson
 derives it from the Latin *balo*, to hoot, to cry
 with great vehemence, whether for joy or pain;
 to cry as in the market place, either wares or
 news; a word always used in contempt.

They *bawl* for freedom in their senseless mood,
 And still revolt when truth would set them free.

Milton.

To cry the cause up heretofore,
 And *bawl* the bishops out of door. *Hudibras.*

Through the thick shades th' eternal scribler *bauls*,
 And shakes the statues on their pedestals. *Dryden.*

From his lov'd home no lucre him can draw;
 The senate's mad decrees he never saw,
 Nor heard at *bawling* bars corrupted law. *Id.*

Loud menaces were heard, and foul disgrace,
 And *bawling* infamy, in language base,
 Till sense was lost in sound, and silence fled the
 place. *Id. Fables.*

So on the tuneful Margarita's tongue
 The list'ning nymphs and ravish'd heroes hung;
 But cits and fops the heav'n-born musick blame,
 And *bawl*, and hiss, and damn her into fame. *Smith.*

I have a race of orderly elderly people, who can
bawl when I am deaf, and tread softly when I am
 only giddy and would sleep. *Swift.*

It grieved me when I saw labours which had cost
 so much, *bawled* about by common hawkers. *Id.*

Fie; fie miss, how you *bawl*!—Besides, I have told you,
 you must not call me mother. *Congreve.*

A little child was *bawling*, and a woman chiding it.
L'Estrange.

If they were never suffered to have what they cried
 for, they would never, with *bawling* and peevishness,
 contend for mastery. *Locke.*

My husband took him in, a dirty boy; it was the
 business of the servants to attend him, the rogue did
bawl and make such a noise.

Arbutnot's History of John Bull.

When rosemary and bays, the poet's crown,
 Are *bawl'd* in frequent cries through all the town,
 Then judge the festival of Christmas near
 Christmas! the joyous period of the year. *Gay.*

BAWLING, among sportsmen, is spoke of
 the dogs when they are too busy before they find
 the scent good.

BAWM. See **BALM**. *Bawmed*, used by R.
 Brunne.

BAWN, *n.* in the Gothic *bauan*, Germ. *bauen*,
 a place to reside in; a dwelling; any edifice,
 whether a fortification or a common habitation,
 and with whatever materials constructed; it is
 used by Spenser for an eminence. In Ireland,
 says Todd, a *bawn* is said to be a place near
 the house, inclosed with mud or stone walls, to
 keep the cattle from being stolen in the night.

But these round hills and square *baunes*, which
 you see so strongly trenched and thrown up, were
 (they say) at first ordained for the same purpose, that
 people might assemble themselves therein, and, there-
 fore, aunciently, they were called folkmotes, that is, a
 place of people, to meete or talke of any thing that
 concerned any difference between parties and town-
 ships, which seemeth yet to me very requisite.

Spenser. View of the State of Ireland.

Thus spoke to my lady the knight full of care,—
 Let me have your advice in a weighty affair;
 This Hamilton's *bawn*, whilst it sticks on my hand,
 I lose by the house what I get by the land;
 But how to dispose of it to the best bidder,
 For a harrack or malt-house, we now must consider.

Swift. The Grand Question Debated.

BAWTREY, or **BAWTRY**, a market town and
 chapelry, in the parish of Blythe, West Riding
 of York. It stands near the river Idle, eight or
 ten miles from its fall into the Trent: is nine
 miles south-east from Doncaster, and 153 from
 London, and contains from 900 to 1000 inhabi-
 tants. This place has much trade from its river
 navigation, having mill and grindstones from
 Derbyshire, and lead, and all kinds of iron manu-
 factures, from Sheffield. It is a great thorough-
 fare to Scotland, and has a good market on
 Thursday, formerly on Wednesday.

BAXTER (Andrew), an ingenious metaphy-
 sical writer, was born in 1686 or 1687, at Old
 Aberdeen, and educated at King's College.
 About 1724 he married the daughter of a clergy-
 man in Berwickshire. A few years after, he
 published in 4to, An Inquiry into the Nature of
 the Human Soul, wherein its immateriality is
 evinced from the principles of reason and philo-
 sophy. In 1741 he went abroad with Mr.
 Hay, and resided some years at Utrecht; having
 there Lord Blantyre also under his care. He
 made excursions from thence into Flanders,
 France, and Germany; his wife and family re-
 siding, in the mean time, chiefly at Berwick. In
 1737 he returned to Scotland, and resided till his
 death at Whittingham, in the shire of East Lo-
 thian. He drew up, for the use of his pupils and
 his son, a piece entitled *Matho*: sive, *Cosmothe-
 oria puerilis*, dialogus. In quo prima elementa
 de mundi ordine et ornatu proponuntur, &c.
 This was afterwards greatly enlarged, and pub-
 lished in English, in two volumes, 8vo. In
 1750, he published an Appendix to his Inquiry.
 He died April 23, 1750, after suffering for some
 months under a complication of disorders.

BAXTER, (Richard), an eminent nonconformist
 divine, was born at Rowton in Shropshire,
 in 1615. He was somewhat unfortunate in his
 tutors, who were either men of little ability, or
 very inattentive to their charge; but his own
 genius and perseverance surmounted this ob-
 stacle; and he was distinguished in early life for
 his learning, as well as his piety. He was or-
 dained in 1638, and upon the opening of the
 long parliament, was chosen vicar of Kidder-
 minster. In the heat of the civil wars he with-
 drew to Coventry, and preached to the garrison
 and inhabitants. When Oliver Cromwell was
 made protector, he would not comply with his
 measures, though he preached once before him.
 He came to London just prior to the deposing
 of Richard Cromwell, and preached before the

parliament the day before they voted the return of King Charles II. Upon the Restoration he was appointed one of the king's chaplains in ordinary. He assisted at the conference in the Savoy, as one of the commissioners for the settlement of religion, and drew up a reformed liturgy. About this time he was offered the bishopric of Hereford, which he refused; and desired only to resume his charge at Kidderminster. He was not, however, permitted to preach there above twice or thrice after the Restoration. On this he returned to London, and preached occasionally about the city, till the act of uniformity took place. In 1662 he married Margaret, daughter of Francis Charleton, Esq. of Salop, a justice of the peace. She was a woman of great piety, and entered fully into her husband's views concerning religion. During the plague in 1665, he retired into Buckinghamshire; but afterward returned to Acton, where he staid till the act against conventicles expired; and then his audience was so large that he wanted room. Soon after we find him imprisoned, but procuring an habeas corpus, he was discharged. After the indulgence in 1672 he returned to London; and in 1682 he was once more incarcerated and put to great expense. In 1684 he was again apprehended, and at the commencement of the reign of James II. was tried before justice Jefferies, for his Paraphrase on the New Testament; which was called a scandalous and seditious book against the government. He continued in prison two years; from whence he was discharged, and had his fine remitted by the king. He died in 1691; and was buried in Christ Church. One of his biographers says, rather boldly, of Richard Baxter, 'he could say what he would, and he could prove what he said.' He was honored, however, with the friendship of the earl of Lauderdale, the earl of Balcarras, L. Chief Justice Hales, Drs. Tillotson, Barrow, &c. and had correspondence with the most eminent foreign divines. He himself wrote above 120 books, and had above sixty written against him. Barrow says, that 'his practical writings were never confuted, and his controversial seldom confuted.' Ganger declares that he was a man famous for weakness of body and strength of mind; for having the strongest sense of religion himself, and exerting a sense of it in the thoughtless and prodigal; for preaching more sermons, engaging in more controversies, and writing more books, than any other nonconformist of his age. He spoke, disputed, and wrote with ease; and discovered the same intrepidity when he reproved Cromwell and expostulated with Charles II. as when he preached to a congregation of mechanics. His portrait, in full proportion, is drawn in his narrative of his own Life and Times; which though a rhapsody, composed in the manner of a diary, contains a great variety of memorable things, and is itself, as far as it goes, a History of Nonconformity. His most famous works were, 1. The Saint's Everlasting Rest. 2. Call to the Ur converted, of which 20,000 have been sold in one year; and which has been translated into all the European Languages. 3. Poor man's Family Book. 4. Dying Thoughts; and the above-mentioned Paraphrase. His prac-

tical works have been printed in four volumes folio. See BAXTERIANS.

BAXTERIANS, in ecclesiastical history, those who adopt the doctrinal sentiments of Richard Baxter. The opinions maintained by this excellent man were conciliatory, and have, since his time been embraced by many moderate and candid men, of different sects and parties. Baxter's system was formed not to inflame the passions and widen the breaches, but to heal those wounds of the church under which she had long languished. Some controversialists, however, were much displeased with Baxter's attempt; and we have heard of a piece in which supposed inconsistencies in his doctrines are set in a kind of battle-array against each other;—it is entitled Richard against Baxter.

The Baxterian strikes into a middle path, between Arminianism and Calvinism, and thus endeavours to unite both schemes. With the Calvinist, he professes to believe that a certain number, determined upon in the divine councils, will be infallibly saved; and with the Arminian, he joins in rejecting the doctrine of reprobation as absurd and impious; admits that Christ, in a certain sense, died for all, and supposes that such a portion of grace is allotted to every man as renders it his own fault if he doth not attain to eternal life.

BAY, } The name of the tree which is
BAYS. } translated laurel, and of which honorary garlands were anciently made. Fr. *baye*, a berry, Lat. *bacca*. To wear the *bays*, is, in poetical language, to be pre-eminent in excellence. The honorary crown or garland, which was bestowed as a prize for literary or military, or indeed any other species of merit, bearing this name.

I have seen the wicked in great power, and spreading himself like a green *bay*-tree. *Bible.*

See where she sits upon the grassie greene,
(O seemly sight!)

Yclad in scarlet, like a mayden queene,
And ermines white:

Upon her head a cremosin coronet,
With damaske roses, and daffadillies set;

Bay-leaves betwene,
And primroses greene,
Embellish the sweete violet.

Spenser. Shepherd's Calendar

So him they led through all their streetes along,
Crowned with garlands of immortal *baies*,

And all the vulgar did about them throng,
To see the man, whose everlasting praise,
They all were bound to all posteritie to raise

Spenser.

I can but laugh at both,

That strive and storne with stirre outrageous,
For her, that each of you alike doth loth,
And loves another, with whom now she go'th,
In lovely wise, and sleepes, and sports, and playes;
Whilst both you here, with many a cursed oth,
Swear she is yours, and stirre up bloodie frayes,
To win a willow bough, whilst other weares the *bays*.

Id.

See how the stubborn damsell doth deprave
My simple meaning with disdaynfull scorn;
And by the *bay* which I unto her gave;
Accepts myself her captive quite forlorne.
The *bay* quoth she, is of the victors born,

Yielded them by the vanquish as they meeds,
 And they, therewith, doe poetes heads adorne,
 To sing the glory of their famous deeds.
 But sith she will the conquest challenge needs,
 Let her accept me as her faithful thrall,
 That her great triumph, which my skill exceeds,
 I may in trump of fame blaze over all.
 Then would I decke her head with glorious *bays*,
 And fill the world with her victorious prayse. *Id.*

To take a boat in a pleasant evening, and with musick to row upon the waters, which Plutarch so much applaudes, Ælian admires, upon the river Peneus, in those Thessalian fields beset with green *bays*, where birds so sweetly sing, that passengers, enchanted as it were with their heavenly musick, forget forthwith all labours, care and grief; or in a gondulo, through the grand canale in Venice, to see those goodly palaces, must needs refresh and give content to a melancholy dull spirit.

Burton. Anat. Mel.

So up they rose, while all the shepherd-throng
 With their loud pipes a country triumph blew,
 And led their Thirsil home with joyful song:
 Mean time the lovely nymph, with garlands new,
 His locks in *bay* and honour'd palm-tree bound,
 With lilies set, and hyacinths around;
 And lord of all the year, and their may-sportings,
 crown'd. *Fletcher's Purple Island.*

Like thunder 'gainst the *bay*,
 Whose lightning may enclose but never stay,
 Upon his charmed branches. *Id. Faith. Shepherdess.*

That name I say in whom the muses meete,
 And with such heate his noble spirits raise,
 That kings admire his verse, whilst 't at his feete,
 Orpheus his harpe, and Phœbus casts his *bays*.

F. Beaumont.

Till critics blame, and judges praise,
 The poet cannot claim his *bays*. *Swift.*

Say, Britain! could you ever boast
 Three poets in an age at most?
 Our chilling climate hardly bears
 A sprig of *bays* in fifty years,
 While ev'ry fool his claim alleges,
 As if it grew in common hedges. *Id.*

Bid the warbling nine retire;
 Venus string thy servant's lyre;
 Love shall be my endless theme,
 Pleasure shall triumph over Fame:
 And when these maxims I decline,
 Apollo! may thy fate be mine;
 May I grasp at empty praise,
 And lose the nymph to gain the *bays*. *Prior.*

The polish'd pillar diff'rent sculptures grace,
 A work outlasting monumental brass.
 Here smiling loves and bacchanals appear,
 The Julian star, and great Augustus here.
 The doves, that round the infant top spread,
 Myrtle and *bays*, hang hovering o'er his head. *Pope.*

Yet suffer me, thou bard of wondrous meed,
 Amid thy *bays* to weave this rural weed. *Gay.*

BAY, *adj.* } Lat. *badius*, old Fr. *baye*, *bai*,
BAY'ARD, } *rouge brun*, Ital. *baio*, Gr. *βαῖς*,
BAY'ARDLY. } or *βαῖον*, the branch of the palm.
 Does it refer to the color of the bark? or the tenacity with which the branch adheres to the trunk; to intimate boldness, determination, or dogged firmness? It is applied both to signify the color and spirit of a horse; and also to men who are bold, blind, and self-willed. A *bay* horse is one whose color inclines to a chestnut; and this color is various, either a light *bay*, or

a dark *bay*, according as it is less or more deep. All *bay* horses are commonly called brown by the common people. *Bayard* is another name for a horse of this complexion. It was likewise the appellation of a noted blind horse in the old romances; whence, perhaps, the proverbial expression 'as bold as blind Bayard.' Rinaldo's horse, in Ariosto, is called *Baiardo*. There is an allusion to the proverb just cited, in the old play entitled *Match at Midnight*, 'Do you hear, Sir Bartholomew *Bayard*? But leap before you look.' Perhaps, says Nares, the whole proverb might be 'as bold as blind *Beyard*, that leaps before he looks,' in allusion to another proverb, 'look before you leap.' *Byard* occurs in R. Brunne, and *bay* in Chaucer.

Upon a stede *bay*, trapped in steele.
 Ye ben as bold as is *Bayar* the blind,
 That blondereth forth, and peril careth non,
 He is as bold to run against a ston.
 As for to go besides in the way. *Chaucer.*

But as *baiarde* the blind stede
 Till he fall in the ditche a midde
 He gothe there no man will hym bidde,
 He stant so fer forthe out of rewle,
 There is no witte that maie hym reule.
Gower. Conf. Ann.

I marvel not so much at blind *Bayards*, which neuer take God's book in hand.

Bernard Gilpin's Sermons.

Who is more bold than the *bayard* blind?
Mirror for Magistrates.

BAY, *v. & n.* From the Fr. *aboi*, which signifies the last extremity. Its primary sense is the barking of a dog at haud, and relates to the condition of a stag, when the hounds are almost upon him. It does not refer to the assailant, but to his selected victim, and in the moment of his utmost peril. It is figuratively employed to describe the state of any thing surrounded by enemies. It is sometimes applied to the simple barking of a dog at any object. In Spenser it is used in the sense of parley, before surrendering.

So well he woo'd her, and so well he wrought her,
 With faire entreatie and sweet blandishment,
 That at the last unto a *bay* he brought her,
 So as she to his speeches was content
 To lend an eare, and softly to relent. *Spenser*

Like dastard cures that, having at a *bay*
 The salvage beast embost in wearie chace,
 Dare not adventure on the stubborn pray,
 Ne byte before, but move from place to place,
 To get a snatch when turned is his face. *Id.*

Here wast thou *bay'd* brave hart,
 Here didst thou fall, and here thy hunters stand,
 Sign'd in thy spoil and crimson'd in thy Lethe;
 O world, thou wast the forest to this hart,
 And this, indeed, O world, the heart of thee
 How like a deer, stricken by many princes,
 Dost thou here lie. *Shakspeare.*

What, shall one of us,
 That struck the foremost man of all this world,
 But for supporting robbers; shall we now
 Contaminate our fingers with base bribes?
 And sell the mighty space of our large honours,
 For so much trash as may be grasped thus?
 I had rather be a dog, and *bay* the moon,
 Than such a Roman.

We are at the stake,
And bay'd about with many enemies.

Id.

I was with Hercules and Cadmus once,
When in the wood of Crete they bay'd the boar
With hounds of Sparta.

Id.

If he should do so,
He leaves his back unarm'd, the French and Welsh
Baying him at the heels.

Id.

This ship, for fifteen hours, sate like a stag among
hounds at the bay, and was sieged and fought with,
in turn, by fifteen great ships.

Bacon's War with Spain.

Fair liberty, pursued and meant a prey
To lawless power, here turn'd, and stood at bay.

Denham.

Nor flight was left, nor hopes to force his way;
Embolden'd by despair, he stood at bay;
Resolv'd on death he dissipates his fears,
And bounds aloft against the pointed spears.

Dryden.

The hounds at nearer distance hoarsely bay'd;
The hunter close pursued the visionary maid;
She rent the heav'n with loud laments, imploring aid.

Id. Fables.

Joyful he know the lamp's domestic flame
That trembled thro' the window; cross the way
Darts forth the barking cur and stands at bay.

Gay.

Sweet was the sound, when oft, at evening's close,
Up yonder hill the village murmur rose;
There as I pass'd with careless steps and slow,
The mingling notes came soften'd from below;
The swain responsive as the milkmaid sung,
The sober herd that low'd to meet their young;
The noisy geese that gabbled o'er the pool,
The playful children just let loose from school;
The watch-dog's voice that bay'd the whisp'ring wind,
And the loud laugh that spoke the vacant mind;
These all in sweet confusion sought the shade,
And fill'd each pause the nightingale had made.

Goldsmith's Deserted Village.

But the hound bayeth loudly,
The boar's in the wood,
And the falcon longs proudly
To spring from her hood.

Byron.

BAY. To bathe.

He feeds upon the cooling shade, and bays
His sweate forehead in the breathing wind.

Spenser. Faerie Queene.

BAY, from the old Saxon *bugan*, *bygan*, to bow or bend; it is applied to the curvings of a shore; to recesses in barns, buildings, or windows, so say Skinner and Minshew; Nares thus defines it: a principal division in a building; probably, as Dr. Johnson conjectured, a great square, in the framework of the roof, whence, barn of three bays, is a barn twice crossed by beams, in large buildings having the Gothic framework to support the roof, like Westminster Hall, the bays are the spaces between the supporters; houses were estimated by the number of bays; as a term among builders, it also signified every space left in the wall, whether for door, window, or chimney. See *Chambers's Dictionary and Korymb.*

Coles, in his Latin Dictionary, makes a bay a space of a definite size: 'a bay of building, mensura viginti quatuor pedum,' i. e. the measure of twenty-four feet.

BAY-WINDOW, from bay, *signa*; not according to Minshew, from its resemblance to a bay on a coast, or round, for it was usually square;

bow-window has now effectually supplanted it, in practice, and implies a semi-circular sweep, like a bow. Mr. Tyrwhitt, in his Glossary to Chaucer, thus explains it:—'a large window, probably so called because it occupied a whole bay, i. e. the space between two cross-beams.' We have the authority of an old dictionary for asserting that a bay-window meant also a balcony.

And there, beside, within a bay-window,
Stood one in green, full large of head and length,
And beard as black as feathers of the crow.

There stands in sight an isle, hight Tenedon,
Rich, and of fame, while Priam's kingdom stood;
Now but a bay, and rode unshure for ship.

Surrey.

Like as a ship that thro' the ocean wyde
Directs her course unto one certaine coast
Is met of many a counter-winde and tyde,
With which her winged speed is let and crost,
And she herself in stormie surges tost;

Yet making many a borde and many a bay,
Still winneth way, nor hath her compasse lost;
Right so it fares with me in this long way,

Whose course is often stay'd, yet never is astray.

Spenser.

I'd have some pleasant lodging i' the high street, sir;
Or if 'twere near the court, sir, that were much better;
'Tis a sweet recreation for a gentlewoman

To stand in a bay-window and see gallants.

Middleton.

We have also some works in the midst of the sea,
and some bays upon the shore for some works, wherein
is required the air and vapour of the sea.

Bacon.

A reverend Syracusan merchant,

Who put unluckily into this bay.

Shakespeare.

If this law hold in Vienna ten years, I'll rent the
fairest house in it after threepence a bay.

Id.

Why it hath bay-windows transparent as barricadoes,
and the clear stones towards the south-north
are as lustrous as ebony.

Id.

Such murmur fill'd

The assembly, as when hollow rocks retain
The sound of blust'ring winds, which all night long
Had rous'd the sea, now with hoarse cadence lull
Seafaring men o'er-watch'd, whose bark by chance
Or pinnace anchors in a craggy bay
After the tempest.

Milton.

The bay of St. Nicholas, where they first put in,
lieth in sixty-four degrees, called so from the abbey
there, built of wood, wherein are twenty monks, un-
learned, as then they found them, and great drunk-
ards: their church is fair, full of images and tapers.
There are besides but six houses, whereof one built
by the English. In the bay, over against the abbey,
is Rose Island, full of damask and red roses, violets,
and wild roses.

Milton's History of Muscovia.

Hail, sacred solitude! from this calm bay,
I view the world's tempestuous sea.

Roscommon.

Here in a royal bed the waters sleep,
When tir'd at sea, within this bay they creep.

Dryden.

Some of you have bay.

Id.

Blake having heard that a Spanish fleet of sixteen
ships, much richer than the former, had taken shelter
in the Canaries, immediately made sail towards them.
He found them in the bay of Santa Cruz, disposed in
a formidable posture. The bay was secured by a
strong castle, well provided with cannon, besides
seven forts in several parts of it, all united by a line
of communication, manned with musqueteers.

Hume's History of England.

They gain by twilight's hour their lonely isle,
 To them the very rocks appear to smile,
 The haven hums with many a cheering sound,
 The beacons blaze their wonted stations round,
 The boats are darting o'er the curly bay,
 And sportive dolphins bend them through the spray.
 Even the hoarse sea-bird's shrill discordant shriek,
 Greeted like the welcome of his tuncless beak!
 Beneath each lamp that through its lattice gleams,
 Their fancy paints the friends that trim the beams.

Byron.

BAY, in botany. See LAURUS.

BAY, in hunting, is when the dogs have heard a vermin, or brought a deer, boar, or the like, to turn head against them. In this case, not only the deer, but the dogs are said to bay. It is dangerous going in to a hart at bay, especially at rutting time; for then they are fiercest.

BAY OF ISLANDS, a bay on the east coast of New Zealand, so called from the number of islands off the shore. Here is good anchorage; high water takes place about eight o'clock at the full and change of the moon, when the perpendicular rise of the tide is from six to eight feet. Abundance of fish frequent the bay, which the natives take with enormous nets made of a kind of grass, five fathoms deep, and 300 or 400 fathoms long. Round their villages nets lie in heaps, like hay-cocks covered with thatch, to resist the weather. All kinds of refreshment may be had here. Long. 135° 38' W., lat. 35° 18' S.

BAY OF ISLES, a bay on the east coast of the island of Georgia, so called from a great number of small islands in and before it. Long. 37° 30' W., lat. 54° 3' S.

BAY COLOR, a sort of red inclining to chestnut, is formed from the Latin *baius*, and that from the Greek *βαίος*, a palm branch; so that *badius* or bay properly denotes color phœniceus. Hence, among the ancients, the horses now called bays, were denominated *equi palmati*.

BAY, PLUM. See GUAIAVA.

BAY, ROSE. See OLEANDER.

BAY SALT, a variety of common salt, (muriate of soda), obtained from sea-water, and which is thought to possess peculiar advantages for curing provisions. In the bay of Biscay, on the shores of the Mediterranean, and in the Bahama islands, the process for procuring it is thus simply carried on:—An artificial pond is formed, of ten inches or a foot deep, and carefully lined with clay, at some convenient distance from the sea, so that one end may have a ready communication by means of a sluice, for the purpose of filling when necessary, while at the opposite end the brine pit communicates with smaller and shallower receptacles. In the large reservoir the sea-water is concentrated by evaporation, from the action of the sun and air; and in the smaller ones the process is completed by removing the crust of salt as fast as it may be formed. Thus the salt obtained is deposited in large flattened octohedral crystals which do not deliquesce, in consequence of being free from the muriate of magnesia, with which the common salt is contaminated. The process may be considered as one of the most ancient applications of chemical principles, for in hot climates, and especially in Egypt, it was taught by nature herself. See Pliny lib.

xxxi. cap. 7. France is thus furnished with a very profitable article for exportation into other countries. The salt made is of different colors, according to the color of the clay employed in making the pits. That of the French is brown, whence it is said comes the denomination of bay salt, and it is usually sold without further preparation; though in some places they make it white by refining it in large flat cauldrons. The great difficulty which attends the making it in Great Britain arises from the heat of our summer not being sufficiently strong to evaporate a great quantity of sea-water in a small portion of time.

BAYA, in ornithology, Indian grosbeak, or *Loxica Indica*, rather larger than a sparrow, with yellow brown plumage, yellowish head and feet, a light-colored breast, and a conic beak, very thick in proportion to his body. This bird is very common in Hindostan; and described as surprisingly sensible, faithful, and docile. In a state of nature, it builds on the highest tree which it can find; generally on the palmyra or Indian fig-tree, preferring that which overhangs a well or rivulet. There it suspends its bottle-shaped nest, so as for it to rock with the wind, and places it with its entrance downwards, to secure it from birds of prey. It is taught with ease to fetch a piece of paper, or any small thing which his master wants. Almost incredible tales are told of its docility; and it is confidently asserted, that if a house or any other place be shown to him once or twice, he will carry a note thither immediately, on observing a proper signal. They are also trained by the youths of Benares to pluck off the pieces of gold called *ticas*, placed by way of ornament between the eye-brows of their mistresses, which they bring in triumph to the lover. The flavor of the eggs is said to be exquisite.

BAYAMO, a town on the east part of Cuba, on the river Estreo, which forms a bay on the coast, twenty miles below the town. It gives name to a channel between the small islands and rocks called *Jardin de la Reyna*, on the north-west, and the shoals and rocks which line the coast on the south-east, situated eighty miles W. S. W. of St. Jago. Long. 76° 50' W., lat. 20° 45' N.

BAYANO, a considerable river of South America, in the kingdom of Terra Firma, and province of Panama, which rises in the province of Darien, and falls into the sea twenty-four miles from the bay of Panama. Its mouth is in long. 78° 55' W., lat. 9° 3' N.

BAYARD (Peter du Terrail de), esteemed by his contemporaries the model of soldiers and men of honor, and denominated 'the knight without fear and without reproach,' was descended from an ancient and noble family in Dauphiné. He was with Charles VIII. at the conquest of the kingdom of Naples; where he gave remarkable proofs of his valor, especially at the battle of Fornova. He was dangerously wounded at the taking of Brescia; and there restored to the daughters of his host 2000 pistoles, which their mother had directed them to give him in order to prevent the house from being plundered. At his return to France he was made lieutenant-general of Dauphiné. He fought by the side of Francis

I at the battle of Marignan; and that prince afterwards insisted on being knighted by his hand, after the manner of the ancient knights. The chevalier Bayard defended Mezieres during six weeks against Charles V.'s army. In 1524, at the retreat of Rebec (the general Bonnavet having been wounded and obliged to quit the field), the conduct of the rear was committed to Bayard, who, though so much a stranger to the arts of a court that he never rose to the chief command, was always called, in time of real danger, to the posts of greatest difficulty and importance. He put himself at the head of the men at arms: and animating them by his presence and example to sustain the whole shock of the enemy, he gained time for his countrymen to make good their retreat. But in this service he received a wound which he immediately perceived to be mortal; and being unable to continue on horseback, ordered an attendant to place him under a tree, with his face towards the enemy; then fixing his eyes on his sword, which he held up instead of a cross, he addressed his prayers to God; and in this posture calmly waited the approach of death. Bourbon, who led the foremost of the enemy's troops, found him in this situation, and expressing his regret and pity at the sight, 'Pity not me,' cried the high spirited chevalier, 'I die as a man of honor ought, in the discharge of my duty; they indeed are objects of pity, who fight against their king, their country, and their oath.' The marquis of Pescara, passing soon after, manifested his admiration of Bayard's virtue, as well as his sorrow for his fate, with the generosity of a gallant enemy; and finding that he could not be removed with safety from that spot, ordered a tent to be pitched, and appointed proper persons to attend him. He died, notwithstanding their care, as his ancestors for several generations had done, in the field of battle. Pescara ordered his body to be embalmed, and sent to his relations; and such was the respect paid to military merit in that age, that the duke of Savoy commanded it to be received with royal honors in all the cities of his dominions.

BAYAS, a town at the foot of Mount Amanus, on the gulf of Issus (now of Scanderin), the key to the celebrated defile (the Pyla Amanica of the ancients), between it and Alexandretta (Scanderin). The neighboring country is fertile, and the mountains, in summer time, a delightful retreat. It is exactly opposite the Ayas, the ancient Ege, where the survey of the southern coast of Asia Minor, by captain Beaufort, in 1812, was unfortunately terminated. The Aghas, in this and the neighbouring places, have long bid defiance to the authority of the Porte. See *Beaufort's Karmania*.

BAYAZID, or **BAJAZID**, a city of Turkish Armenia, in the pachalic of Erzerum, on the declivity of a mountain, the summit of which, as well as the whole of this place, is strongly fortified. It contains two churches, three mosques, and an ancient monastery called Kara Rilicsea, celebrated for its beautiful architecture. The inhabitants, who amount to about 30,000, are esteemed the most handsome and warlike people in Armenia. The majority are Turks. Distant fifty miles S. S. W. of Erivan, and 140 east of Erzerum.

BAYEN (Peter), a celebrated French chemist, was born in 1725, at Chalons sur Marne. Having received a classical education, he studied pharmacy; and, during the seven years' war, was chief apothecary to the French army in Germany. He was afterwards employed in analysing the mineral waters of France, on completing which, he settled at Paris, where he pursued his chemical experiments with great reputation, till his death in 1801. He pursued a tedious but certain mode of analysing minerals, by exposing them, without being reduced to powder, to the action of sulphuric acid at the temperature of the atmosphere; after this action had continued for a length of time, he got by lixiviation the sulphates formed by the combination of the acid with the different component elements of the stone. He did not make use of the trituration of the stone to an impalpable powder, nor its fusion with caustic potash, which facilitate the action of acids, and which are used with so much advantage at present. The account he has published of his analysis will, nevertheless, be instructive to the chemical student. His chemical tracts have been collected in 2 vols. 8vo.

BAYER (John), a German lawyer and astronomer of the latter part of the sixteenth and beginning of the seventeenth century, but in what particular year or place he was born, is not certainly known: however, his name will be ever memorable in the annals of astronomy, on account of his excellent work, published in 1603, under the title of *Uranometria*, being a complete celestial atlas, or large folio charts of all the constellations, with a nomenclature collected from all the tables of astronomy, ancient and modern. By means of the Greek letters, which he used as marks of their relative magnitudes, the stars of the heavens may, with as great facility, be distinguished and referred to, as the several places of the earth are by means of geographical tables; and our celestial globes and atlases have ever since retained this method. Astronomers, in speaking of any star in the constellation, denote it by saying it is marked by Bayer, α , or β , or γ , &c. He greatly improved and augmented this work by subsequent study. At length, in 1627, it was republished under a new title, viz. *Cælum Stellatum Christianum*, i. e. the Christian Stellated Heaven; or the Starry Heavens Christianised; in this edition the Heathen names and characters, or figures of the constellations, were rejected, and others taken from the scriptures, were inserted in their stead, an innovation, however, too great for general reception. In later editions of his work (in those of 1654 and 1661), the ancient figures and names were restored.

BAYER (Theophilus Sigfred), a learned philologist and antiquarian, born at Königsberg in 1694, applied himself successfully to the study of the eastern languages, particularly the Chinese, of which he acquired a great knowledge.—When about twenty-three years of age, he was appointed librarian at Königsberg. In 1726 he accepted of an invitation to Petersburg, and was there made professor of Greek and Roman antiquities. In 1730, he published a very curious and learned work, entitled *Museum Siniicum*, in 2 vols. 8vo. He died at Petersburg in 1738.

BAYEUX, a considerable town of France (the Beducassum and Bajece, of ancient geography), in the department of Calvados, and late province of Normandy. It was formerly the capital of Bessin, and is still a bishop's see, whose jurisdiction extends over all the department. The cathedral church is accounted one of the finest in France, and contains a celebrated piece of tapestry, representing the conquest of England by William I., supposed to have been the work of his queen Matilda. It consists of a web of linen, 442 feet in length, and about two feet in breadth. It is situated on the river Aure, four miles from the English Channel; and carries on a good trade in corn, cattle, hemp, and butter, as well as in its own manufactures of lace, camblets, stockings, and leather. Inhabitants about 10,000.

BAYEUX (George), an advocate at Caen, who obtained the prize from the academy at Rouen for a poem on Filial Piety. He translated the *Fæsti of Ovid*, on which he added valuable notes, printed in 4 vols. 8vo. He wrote also *Reflections on the Reign of Trajan*, 4to. He was, however, unfortunate, and having been imprisoned at Orleans, fell in the massacre which took place there in 1792.

BAYLA, or **BELA**, a town of Persia, capital of the district of Lus, in the province of Mekran. It is situated on the north-east banks of the river Pooralie, and about a third of it is surrounded by a good mud wall. It consists of above 2000 mud and wood houses, of which 250 or 300 are inhabited by Hindoos, who are well treated here. Bayla is, on the whole, a neat town, the residence of the jam, or chief of Lus, who seems dependent on the khan of Kelat. His durbar, or hall of audience, is a very ordinary apartment. The cemetery of the jam and his family contains several curious tombs, ornamented with black and white pebbles, arranged in short quotations from the koran, and encircled with wreaths of the same substance, which produce a pleasing effect. Distant 293 miles north of Kelat.

BAYLE (Peter), author of the *Historical and Critical Dictionary*, was born November 18, 1657, at Carlat, in France, where his father John Bayle was a protestant minister. In 1666 he went to the protestant university at Puylaurens, and in 1669 removed to that of Toulouse, whither protestants at that time frequently sent their children to avail themselves of the learning of the Jesuits; but here, to the great grief of his father, he embraced the Romish religion; being, however, soon sensible of his error, he left that university, and went to study at Geneva. After this he was chosen professor of philosophy at Sedan; but that protestant university being suppressed by Louis XIV. in 1687, he was obliged to leave the city, and was soon after chosen professor of philosophy and history at Rotterdam, with a salary of about £45 a year. In 1682 appeared his *Letter concerning Comets*. And Father Maimbourg having published his *History of Calvinism*, wherein he endeavours to draw upon the protestants the contempt and resentment of the catholics, Mr. Bayle wrote a piece to confute it. The reputation which he had now acquired, induced the States of Friesland, in 1684, to offer him a professorship in their univer-

sity; but he wrote them a letter of thanks, and declined the offer. This same year he began to publish his *Nouvelles de la republique des Lettres*. In 1686 he was drawn into a dispute with the famous Christina queen of Sweden. His *Journal* for April had noticed a printed letter, supposed to have been written by her Swedish majesty to Chevalier de Terlon, wherein she condemns the persecution of the protestants in France; and had observed, that her tolerant spirit was 'a remainder of protestantism.' This produced a letter to the philosopher, from that singular woman, in which she says, 'You express so much respect and affection for me, that I pardon you sincerely; and I would have you know, that nothing gave me offence but that remainder of protestantism, of which you accused me. I am very delicate upon that head, because nobody can suspect me of it, without lessening my glory, and injuring me in the most sensible manner. My fortune, my blood, and even my life, are entirely devoted to the service of the church; but I flatter nobody, and will never speak any thing but the truth.' Mr. Bayle replied in a subsequent number of his work, to that princess's entire satisfaction. The persecution which the protestants at this time suffered in France affected Mr. Bayle extremely. He made occasionally some reflections on their sufferings in his journal; and some time afterwards he published his *Commentaire Philosophique* upon these words, 'Compel them to come in;' and in the year 1690 appeared his famous *Avis aux Refugiez*, &c. which so excited the anger of M. Jurieu, that he charged the author with being a traitor against the state. Bayle retorted with the utmost severity, and Jurieu replied with equal bitterness; till at last the magistracy of Amsterdam enjoined the controversialists not to publish any thing against each other before it had been examined by Mr. Boyer, the pensionary of Rotterdam. In Nov. 1690, Bayle advertised a Scheme for a *Critical Dictionary*. The public not approving his first plan, he threw it into a different form; and the first volume was published in August, 1695, the second in October following. The work at last was extremely well received by the public; but it engaged him in fresh disputes, particularly with M. Jurieu and the Abbé Renaudot. Jurieu endeavoured to engage the ecclesiastical assemblies to condemn the dictionary; and presented it to the senate sitting at Delft, but they took no notice of the affair. The consistory of Rotterdam granted Mr. Bayle a hearing; and after having heard his answers to their remarks, declared themselves satisfied. Jurieu made another attempt with the consistory in 1698; and so far prevailed with them, that they exhorted Mr. Bayle to be more cautious with regard to his principles in the second enlarged edition of his dictionary, which was published in 1702. Bayle was a most indefatigable writer. In one of his letters to Maizeaux, he says, that since his twentieth year, he hardly remembers to have had any leisure. His intense application contributed to impair his constitution, and to increase a pulmonary disorder which had cut off several of his family. Judging it to be mortal he would take no remedies. He died the twenty-eighth of De-

ember, 1706, after he had been writing the greatest part of the day. Voltaire says of the Critical Dictionary 'it is the first work of the kind in which a man may learn to think;' and remarks, that 'the decree of the parliament of Toulouse, when it declared his will valid in France, notwithstanding the rigor of the laws,' added, 'that such a man could not be considered as a foreigner.' Bayle, however, has been more correctly characterised as a sophist rather than a philosopher. With great powers of distinguishing truth from falsehood, he pushed enquiry into universal doubt, and remained in doubt because he thought indifferentism to truth a virtue, and therefore cultivated it. In private life he is said to have been an unassuming and temperate man; but his writings abound with the bigotry of scepticism, and contain not a few uncharitable insinuations against that religious zeal which he never felt: moreover, he is notoriously indelicate, and seems as if laboring to atone for distracting by debauching the tyro's mind. Lord Lyttleton finely expostulates with him under the assumed character of Mr. Locke, in his Dialogues of the Dead, vol. ii. Dialogue 24. p. 315. 'You have endeavoured,' says this excellent writer, 'and with some degree of success, to shake those foundations, on which the whole moral world, and the great fabric of social happiness, entirely rest; how could you, as a philosopher, in the sober hours of reflection, answer for this to your conscience, even supposing you had doubts of the truth of a system, which gives to virtue its sweetest hope, to impenitent vice its greatest fears, and to true penitence its best consolations: which restrains even the least approaches to guilt, and yet makes those allowances for the infirmities of our nature, which the stoic pride denied to it, but which its real imperfection, and the goodness of its infinitely benevolent Creator, so evidently require!'

BAYLY (Lewis), author of the Practice of Piety. He was born at Caermarthen in Wales, educated at Oxford, made minister of Evesham in Worcestershire, about 1611, became chaplain to king James, and was promoted to the see of Bangor in 1616. His celebrated book was dedicated to Charles, prince of Wales; in 1734 it had reached the fifty-ninth edition. He died in 1632.

BAYNES (John), an English lawyer, born at Middleham, in Yorkshire, in 1758. He received the first part of his education at Richmond school, and afterwards went to Trinity College, Cambridge, from whence he removed to Gray's Inn. He became a member of the Constitutional Society, and wrote a number of anonymous pieces, chiefly political, in prose and verse. There has also been attributed to him an Archaeological Letter on the subject of the poems printed by Chatterton under the name of Rowley, addressed to dean Milles. He proposed the republication of lord Coke's tracts, a design prevented by his death in 1767.

BAYNES (Sir Thomas), an English physician, born about 1622, was educated at Christ's College, Cambridge, where he applied to the study of physic. He afterwards became professor of music at Gresham College; and travelled with

Sir John Finch to Italy and Constantinople. He died at Constantinople in 1681, much lamented by his companion, who survived him but a short time. They left between them £4000 to Christ's College.

BAY'ONET, *v. & n.* Fr. *bayonette*. A short sword or dagger fixed at the end of a musket, by which the foot hold off the horse, so called because the first bayonets were made at Bayonne, in France.

One of the black spots is long and slender, and resembles a dagger or *bayonet*. Woodward.

You send troops to sabre and *bayonet* us into submission. Burke.

Not a single head

Was spared—three thousand Moslems perish'd here,
And sixteen *bayonets* pierced the seraskier. Byron.

You, should but give few cartridges to such
Troops as are meant to march with greatest glory on.
When matters must be carried by the touch
Of the bright *bayonet*, and they all should hurry on,
They sometimes, with a hankering for existence,
Keep merely firing at a foolish distance. Id.

The town was entered: first one column made
Its sanguinary way good—then another.
The reeking *bayonet* and the flashing blade
Clashed 'gainst the scimitar.

BAYONETS were formerly made with a round handle fitted to the bore of a firelock, and to be fixed there after the soldier had fired; but they are now made with iron handles and rings, that go over the muzzle, and are screwed fast, so that the soldier fires with his bayonet on the muzzle of his piece, and is ready at once to act. This use of the bayonet fastened on the muzzle was a great improvement, first introduced by the French; to which, according to M. Folard, they owed a great part of their victories for some time afterwards; and to the neglect of this, in succeeding wars, and trusting to their fire, the same author attributes most of the losses they sustained. Of late the bayonet has come into very general use; and some battles have been won by it without firing a shot. It was much encouraged by Frederick the Great, who caused an inch and a half to be added to the length of the Prussian bayonet.

A French writer, in a work entitled *L'Essai général de la Tactique*, has proposed a method of exercising soldiers in a species of fencing or tilting with this weapon. But, as another very sensible author, Mœuvillon, in his *Essai sur l'Influence de la Poudre à Canon dans l'Art de la Guerre Moderne*, justly asks, how can any man tilt or fence with so cumbersome an instrument and so difficult to be handled, as the firelock? It seems probable that great advantage may be obtained by a person who has been taught to use such a weapon scientifically, when contending with an individual; but the niceties of parrying are not applicable to the charge in line; a firm grasp and a quick and steady thrust are what is required.

BAYONNA, a well-built town of the province of Galicia, in Spain, situated on a small bay of the Atlantic. It contains a collegiate church, a Franciscan convent, and a hospital, and is defended by a castle, with a governor and a small garrison. The inhabitants obtain

their livelihood by fishing. The Bay of Bayonna forms part of the Gulf of Vigo, nine miles south-west of Vigo, and twelve north-west of Tuy.

BAYONNA ISLES, or ISLAS DE SEYAS DE BAYONNA ET D'ESTELAS, two small islands, with a number of insular rocks, situated in the Atlantic, at the entrance of the Bay of Bayonna, off the coast of Galicia, in Spain. They were called by the ancients *Insulæ Deorum*, or the Isles of the Gods, and lie six miles N. N. W. of Bayonna.

BAYONNE, a rich, populous, and flourishing commercial town of France, in the department of the Lower Pyrenees. It is seated near the mouth of the Adour, which forms a good harbour, and is divided into three parts: the great town on this side the Nive; the little town between the Nive and the Adour; and the suburbs of St. Esprit, chiefly inhabited by Jews, beyond this last river. A citadel, constructed by Vauban, on the top of an eminence in the suburb, commands both the harbour and the town, which are further defended by small redoubts. A wooden drawbridge, which allows vessels to pass, and where a small toll is levied, connects the suburbs with the town. The ancient cathedral is remarkable for the height of the nave, and the delicacy of the pillars which support it. The quay is an elegant and frequented promenade; but the most beautiful part of the city is the Place de Grammont. The bishop was formerly suffragan of the archbishop of Auch; he is now under the archbishop of Toulouse, and exercises jurisdiction over three departments, those of the Upper and Lower Pyrenees and of the Landes. Bayonne, before the revolution, was the seat of a provincial tax-office, and court of justice. At present it is the largest though not the chief town of the Lower Pyrenees, and the head of the most western *arrondissement*, which consists of seven cantons, and contains 70,000 inhabitants. An extensive commerce is carried on here with Spain, in which French and foreign goods are given in exchange for wood, iron, fruit, and the precious metals. The principal of the maritime trade is the cod and whale fishery; in these branches from thirty to forty ships of 250 tons average, were lately employed. Masts and other wood for ship-building, brought from the Pyrenees, are exported to Brest and other ports of France. Hams, wines, and chocolate, are exported in great quantities to various parts. The military weapon called the bayonet was invented here in the seventeenth century. The language of the people is the ancient Biscayan or Basque. Forty-four miles W. N. W. of Pau, and 518 S. S. W. of Paris. Long. 1° 24' W., lat. 43° 29' N. Inhabitants about 13,000.

BAYONNE BAY, or LA MER DES BASQUES, a part of the Bay of Biscay washing the shores of the district of Labour in the south of France.

BAYREUTH, or BAREITH, a principality of Germany, formerly included in the Circle of Franconia; now forming a part of the kingdom of Bavaria. It is bounded by the Upper Palatinate and Bohemia on the east, and by the territories of Nuremberg and Anspach south. Its extent is estimated at 1760 square miles, and its population at 200,000 souls. Oberland is a hilly region the climate is cold, and much of

the soil barren, but it still affords good pasturage, and black cattle of a superior breed and sheep are reared here. The lower division, Unterland, is flat, and in some parts sandy; but affords much fertile soil, and good crops of grain and tobacco. The last is sent in great quantities to Hamburg and Bremen. Bayreuth is not destitute of minerals; iron and marble are found in Oberland; flax also constitutes a considerable production here, in spinning and working which into linen as well as into lace, a large portion of the population is employed. At the peace of Tilsit, Buonaparte appropriated this principality and annexed it to the kingdom of Bavaria in 1810. The upper division is included in the Circle of the Maine, the lower in that of the Rezat.

BAYREUTH, or BAREITH, the capital, is situated near the Maine, and is a handsome town with broad and regular streets, entered by six gates. Among the public buildings which deserve notice, are the old and new castles, the convents and churches, the barracks, the mint, and the gymnasium. Its chief manufactures are cloth, earthenware, and tobacco-pipes. It is about fifty miles north of Augsburg, in N. lat. 49° 54', and E. long. 11° 17'

BAYS, in antiquity. See **BAY**.

BAYZE, BAYS, or BAIZE, was first introduced into England, with says, serges, &c. by the Flemings; who, being persecuted by the duke of Alva for their religion, fled hither about the fifth of queen Elizabeth's reign; and had afterwards peculiar privileges granted them by act of parliament 12 Charles II. 1660. The exportation of bayze was formerly much more considerable than now, the French having learnt to imitate it. The English bayze, however, is still in request in Spain and Portugal, and even in Italy.

BAY'ZE. See **BAIZE**.

BAZA, or BAÇA, a town of Spain. See **BAÇA**.

BAZA, HOYA DE, See **BAÇA**.

BAZ'AR, n. s. Persian *buzzar*, the market, now written *bazaar*, in the commercial language of the East Indies. A constant market; a kind of covered market.

This noble city (Cashan) is in compass not less than York or Norwich, about four thousand families being accounted in her. The houses are fairly built. The *buzzar* is spacious and uniform, furnished with silks, damasks, and carpets of silk.

Sir T. Herbert's Travels, (edit. 1677 p.) 223.

BAZAR, BAZAAR, or BASAR, a denomination originally given by the Turks and Persians to a kind of exchange, or places where their finest stuffs and miscellaneous wares are sold. These are also called *bezesteins*. The word is of Arabic origin, where it denotes sale, or exchange of goods. Some of the eastern bazars are open, like the market-places in Europe, and serve for the same uses, particularly for the sale of the bulky commodities. Others are covered with lofty ceilings, or domes, pierced to give light; and in these the jewellers and other dealers in rich wares, have their shops. The bazar of Ispahan is one of the finest places in Persia; yet, notwithstanding its magnificence, it is excelled by the bazar of Tauris, which is the largest that is known, having several times held

30,000 men ranged in order of battle. At Constantinople there are an old and new bazar, which are large square buildings, covered with domes, and sustained by arches and pilasters; the former chiefly for arms, harness, and the like; the latter for goldsmiths, jewellers, furriers, and all sorts of manufactures. See ALEPPO.

BAZAS, a town of France, in the department of the Gironde, and late province of Guienne. It is built on a rock, and lies thirty miles south-east of Bourdeaux. Inhabitants about 5000. It was formerly the bishop's see of a very extensive diocese.

BAZAT, or BAZA, in commerce, a long fine-spin cotton, which comes from Jerusalem, whence it is also called Jerusalem cotton.

BAZEEGURS, a tribe of Indians, inhabiting different parts of Hindoostan, and recognised by several appellations, as Bazeegurs, Panchperes, Kunjura, or Nuts; they follow a mode of life distinguishing them from the Hindoos, and abstain from intermixing their families with them. The name Bazeegur is said to signify a juggler, and some etymologists find a derivation of conjuror from kunjura. They are found partly in wandering tribes, and partly adhering to fixed residences.

The Bazeegurs are divided into seven castes, Chueer, Athbhycea, Bynsa, Purbutte, Kalkoor, Dorkinee, and Gurgwar; but all the castes intermarry. Their own historical traditions trace their descent from four brothers, who, finding it difficult to provide for their followers, resolved to separate, and direct their course respectively to each quarter of the world; in consequence of which, one of them, named Sa, arrived in Bengal, from Gazeepour or Allahabad. His first abode was at Hoogly, and having governed his tribe peaceably during many years, he died at Uneour-poor. Sa left three sons who succeeded each other, and the succession regularly passed through several generations, and to Mumbhungee, about fifteen or twenty years ago. At that time, some of the castes considered a woman called Toota as their chief; but the power ascribed to her seems merely nominal. Mumbhungee, however, would not suffer any of Toota's people to remain in the territory occupied by his sect; and the latter were equally jealous of the former.

The features of the Bazeegurs do not decidedly differ from those of other tribes around them. Some of their women are reputed beautiful, and are by no means scrupulous in forming temporary alliances. They are Mahomedans in food and apparel; some traversing the country as Nizamian Pickers; a particular association among them has been accused of sacrificing human victims. Those called Panchperes seem to venerate a female deity, Kali, probably the secondary goddess of the Hindoos. The Bazeegurs, properly so called, are circumcised, and have priests to officiate at their marriages and funerals, but their knowledge of the system of Mahomet is very imperfect. They seem to have a knowledge an omnipotent being, and believe that all nature is animated by one universal spirit, to which the soul, as a portion of it, will after death be united.

The marriage ceremony among them begins

by the bridegroom repairing to the hut of his elect, and calling aloud for her to be delivered to him. A near relation, guarding the door, resists his entrance, and pushes him away, while he is the object of taunts and jocularities; at last the bride is brought forward. Both now receive the exhortation of a priest to practise mutual kindness, and the bridegroom, marking the bride's face with ochre, declares her his wedded wife, and she, on her part, does the same in return. The little fingers of their hands are now joined, and a scene of merriment commences from which the bride alone is spared. This consists chiefly in the progress to intoxication, for these people are addicted to the most immoderate use of spirits; and after copious libations, a cavalcade is formed of the whole party, which moves on to the hut of the bridegroom. Several enigmatical ceremonies are performed before the door; the mother of the bridegroom advances with a sieve containing rice, paint, and grass, with which the foreheads of the couple are touched, after being waved around them; and the bride is led into the house, before which there stands a small fresh branch of the mango tree in an earthen pot of water. In the evening the bride is conducted to her own hut, when the sober friends of the parties retire; but the majority, and generally with the bridegroom among them, pass the night in a state of insensibility on some neighbouring plain.

The chief occupation of both the male and female Bazeegurs consists in feats of address and agility to amuse the public. The former are very athletic, and the women are taught a species of lascivious dancing. The men are also jugglers, tumblers, &c. The people of each set, or dramatic personæ, go out under a sirdar, or manager of a company, for a definite period, generally a year; but no person can establish a set of actors without permission from the Nardar Boutah, or chief of the Bazeegurs, who receives a proportion of the profits. Each of five sets at Calcutta has a subordinate sirdar or ruler. These sirdars and the chief, apparently constitute a court for the trial of infringements of these regulations; and if, on application of the tongue to a piece of red-hot iron, a suspected person be burnt, he is declared guilty of a fraud, which is expiated by a fine, or by the additional punishment of having his nose rubbed on the ground. The fine being paid, it affords a new opportunity for gratifying the strong propensity implanted in these people for ardent liquors. Sometimes differences are the subject of reference to a larger assembly; where, before commencing the business, both plaintiff and defendant must provide a quantity of spirits proportioned to the importance of the case; the party non-suited bears the whole expense, and the assembly is regaled with the beverage produced.

Some of the females practise physic, and cupping, and perform a kind of tattooing on the skin of the Hindoos of their own sex. The men, besides their usual occupations, collect medicinal herbs, and a certain bud, the latter is dried, and the former prepared by their wives as curatives, especially of female complaints: thus they find employment in the towns, in such vocations, or by the sale of trinkets, though both afford but a

precarious subsistence. Some tribes also exhibit wild beasts to the vulgar, or offer mats fabricated by themselves for sale.

A striking coincidence has been remarked in the mode of life, the vocations, manners, and language of the different sects of these people and those of the gipsies scattered over Europe and Asia. Both the Bazeegurs and gipsies have a chief or king; each has a peculiar language, bearing some reciprocal analogy, and different from that of the people among whom they reside. In India, and in Europe, they are equally an itinerant race; their pursuits, in so far as modified by the manners of countries distant from each other, are alike; for the discrepancies they exhibit may reasonably be ascribed to an insensible acquisition of the habits of those near whom the various tribes of mankind dwell. They are equally indifferent as to the quality of the food serving for their subsistence; and equally ignorant of systematic religious principles. All preserve the strictest adherence to their own sect, and sedulously abstain from intermixtures or intermarriages with those of every nation: and where infringements of these rules are seen, they are to be ascribed more to necessity than inclination. Another resemblance, which has probably been lost in the lapse of time, is supposed to consist in the three-stringed viol, introduced into Europe by the jugglers of the 13th century, which is exactly similar to the instrument now used in Hindostan. On uniting and combining the whole features of resemblance, it does not seem unlikely, that if Asia is their original country, or if they have found their way from Egypt to India, they may also have emigrated farther at a period of remote antiquity, and reached the boundaries of Europe.

BAZGENDGES, in natural history, a substance used by the Turks and other eastern nations in dyeing scarlet. They mix it for this purpose with cochineal and tartar, in the proportion of two ounces of bazgendges to one of cochineal. It seems to be no other than the horns of the turpentine tree. They are found also in China. Many things of this kind were sent over to Mr. Geoffroy at Paris from China, as the substances used in the scarlet dyeing of that country, and they all proved to be the same with the Syrian and Turkish bazgendges, and with the common turpentine horns. The lentisk, or mastic tree, also produces horns of a similar kind; all being occasioned by the pucerons, which make their way into the leaves, to breed their young. See *Reaumur's History of Insects*, vol. vi.

BDELLA, in zoology, a genus of the class arachnides, order acera, family Ricinix. Generic character: palpi very slender, filiform bent, having a seta at the extremity; eyes four; hind feet the longest.

BDELLIUM, *n. s.* Gr. *βδελλιον*, Heb. *בדלה*. An aromattick gum brought from the Levant, used as a medicine and a perfume. *Bdellium* is mentioned both by the ancient naturalists, and in Scripture; but it is doubtful whether any of these be the same with the modern kind.

This *bdellium* is a tree of the bigness of an olive, whereof Arabia hath great plenty, which yieldeth a certain gum, sweet to smell to, but bitter in taste, called also *bdellium*. The Hebrews take the loadstone for *bdellium*. *Raleigh.*

BDELLIUM is a gummy resinous juice, produced by a tree in the East Indies, of which we have no satisfactory account. It is brought into Europe, in pieces of different sizes and figures, externally of a dark reddish brown, somewhat like myrrh; internally it is clear, and not unlike glue. If held in the mouth, it soon becomes soft and tenacious, sticking to the teeth. Laid on a red-hot iron, it readily catches flame, and burns with a crackling noise, and in proportion to its goodness it is more or less fragrant. Near half of its substance dissolves either in water or in spirit of wine; but the tincture made with spirit is somewhat stronger and much more agreeable. Vinegar, or verjuice, dissolves it entirely. The simple gum is a better medicine than any preparation from it. Though one of the weakest of the deobstruent gums, it is sometimes used as a pectoral and an emmenagogue with advantage. Some authors suppose the word translated *bdellium* (Gen. ii. 12) signifies a precious stone; others fine crystal or steel; and Bochart insists that it denotes pearls, numbers of which are fished near the mouth of the river Pison, in the gulf of Persia.

BE, *v.* } This verb is so remarkably irre-
BEING, *n.* } gular, that it is necessary to set
down many of its terminations:

Present. *I am, thou art, he is, we are, &c.*
eom, eapt, ip, anon, Sax.

I was, thou wast or wert,

Preter. } *pæſ, pæne,*
he was, we were, &c.

paſ pænon, Sax.

The conjunctive mood,

I be, thou beest, he be, we be, &c.

beo, biſt, beo, beon, Sax.

Its etymology is as uncertain as its forms are irregular. The simple words to which *be* is prefixed, are used also in their simple form as verbs. When employed as an auxiliary, it renders the verb passive. As a prefix, it appears in many instances to give emphasis to the application of the simple term. As to *bedaub*, to *bepraise*, to *besmear*, and particularly, say the compilers of the Encyclopedia Metropolitana, when derision or contempt is intended, as *becurl*, in Search; *bemuffle*, &c. in Sterne; *beprose*, in Mallet; *bescutcheon*, *betagged*, in Churchill; *betailed*, in Goldsmith. To exist, to have existence. It is also used in our old language, for the preposition *by*, and also for the participle *been*.

And who so saith, and weneth it *be*

A jape, or els a nicete,

To wene that dremes after fal,

Let who so liste a fole me call;

For this trowe I and say for me,

That dremes signifaunce *be*

Of gude and harme to many wightes,

That dremen in hir sleep a nightes,

Full many thinges covertly,

That fallen after openly.

Chaucer. Romaunt of the Rose.

Before this world's great frame, in which all things
Are now contain'd found any *being* place,
That high eternal pow'r which now doth move
In all these things, mov'd in itself by love.

Spenser. Hymn on Heavenly Love.

BEL. Aye hopeless
To have the courtesy your cradle promis'd,
But to be still hot summer's tanlings and
The shrinking slaves of winter.

GUL. Than be so,
Better to cease to be. *Shakspeare.*

Awake! arise! or be for ever fall'n. *Milton.*

The mind is its own place, and in itself
Can make a heav'n of hell, a hell of heav'n.
What matter where, if I be still the same,
And what I should be, and all less than he,
Whom thunder had made greater! Here at least
We shall be free. *Id.*

Neither did thy wisdom herein proceed in time
only; but in degrees; at first thou madest nothing
absolute; first thou madest things which should have
being without life; then those which should have life
and *being*; lastly, those which have *being*, life, and
reason: so we ourselves in the ordinary course of
generation, first live the life of vegetation, then of
sense, and reason afterwards. *Hall. Con.*

O Happiness! our *being*'s end and aim!
Good, Pleasure, Ease, Content, whate'er thy name;
That something still which prompts the eternal sigh,
For which we bear to live, or dare to die;
Which still so near us, yet beyond us lies;
O'erlook'd, seen double by the fool and wise.

Pope. Essay on Man.

Men would be angels, angels would be gods;
Aspiring to be gods if angels fell,
Aspiring to be angels, men rebel,
And who but wishes to invert the laws
Of order, sins against th' Eternal cause. *Id.*

For who, to dumb forgetfulness a prey,
This pleasing, anxious, *being* e'er resign'd,
Left the warm precincts of the cheerful day,
Nor cast one longing, ling'ring look behind.

Gray's Elegy in a Country Churchyard.

From courts and thrones return, apostate praise!
Thou' protestant to thy first love return.
Thy first, thy greatest, once unrival'd theme,
Look to thy fountain; to that parent power,
Whose lips the tongue to sound, the thought to soar,
The soul to be. *Young.*

This is the land of *being*, the dim dawn;
Life's theatre as yet is shut, and death,
Strong death, alone can leave the massy bar,
This gross impediment of clay remove,
And make us endryos of existence free. *Id.*

Count o'er the joys thine hours have seen,
Count o'er thy days from an'ish free
And know whatever thou hast been
Thy sorrow can better not to be. *Byron.*

BEACH, *n.* It is not to be found in
any of our early lexicons.
Beacon. Dr. Johnson offers no ety-
mology. Scamander gives the Goth. *backar*, sig-
nifying the same as beach. The Ency. Metro.
ventures to conjecture that it is derived from
long, aren, ligat, vel ligata, to land, to wreathe)
whatever lands or surroundings. The shore, parti-
cularly that part that is dashed by the waves.
The loose stones that lie between the waters' edge
and the main land.

The fishermen, that walk upon the beach,
Appear no more. *Shakspeare. King Lear.*

Timon hath made his everlasting mansion
Upon the *beached* verge of the salt flood;
Which, once a day, with his embossed froh
The turbulent surge shall cover. *Shakspeare.*

The *beachy* girdle of the ocean
Too wide for Neptune's hips. *Id.*

What! are men mad? Hath nature given them eyes
To see this vaulted arch, and the rich crop
Of sea and land, which can distinguish 'twixt
The fiery orbs above, and the twinn'd stones
Upon the number'd beach? And can we not
Partition make with spectacles so precious
'Twixt fair and foul? *Id.*

Deep to the rocks of hell the gather'd beach
They fasten'd, and the mole immense wrought on
Over the foaming deep. *Milton.*

They find the washed amber further out upon the
beaches and shores, where it has been longer exposed.
Woodward.

Nor far remote

A broken torch—an oarless boat—
And tangled on the weeds that heap
The beach where shelving to the deep—
There lies a white capote!
'Tis rent in twain—one dark-red stain
The wave yet ripples o'er in vain.

Byron. Bride of Abydos

BEACH HILL, an ancient artificial mount,
north of Coupar in Angus, on which justice is
said to have been formerly administered in the
open air. From the top of it there is a delight-
ful prospect of the meandering of the Isla, through
a fertile and extensive champaign country, varie-
gated with fruitful fields and thriving villages.
Some Roman urns have been found on this
mount.

BEACHLEY, or OLD PASSAGE, a point of
land at the confluence of the Wye and Severn,
Gloucestershire; which from its insulated position
has always been considered an important military
post. Earth works of ancient British origin are
still remaining; and it is the terminating point of
Offa's dyke. Here the Royalists, whom prince
Rupert had sent forth to fortify the point in the
wars of the commonwealth, were dislodged with
great loss, and afterwards defeated in a pitched
battle. The royalist commander, Sir John Wyn-
tour, is said to have escaped by a hazardous leap
from a cliff, still called Wyntour's Leap.

BEACHY-HEAD, on the coast of Sussex. It
is known to sailors by the name of the Seven
Cliffs. The summit of the highest cliff, which
is also the highest in the south of England, is
575 feet from the base. From this promontory
to Arundel the hills are called South Downs,
and are celebrated as sheep walks. On the
west side of Beachy-Head is an artificial ca-
verne, named Parson Darby's Hole; consisting of
two apartments, just above high water mark,
dug out of the solid chalk. Tradition asserts it
to have been the residence of a recluse, who was
minister of East Dean.

BEACON, *v. & n.* } Sax. beacon, from
BEACONER, } becn, a signal, and bec-
BEACONAGE. } nann, whence beckon, to
make a signal. Skinner thinks it is derived
from the Ang.-Sax *be*, and *cennan*, to ken, to
see. Any thing so placed, says the Ency. Met.,
that it may be kenn'd, seen, or distinguished;
intended as a sign, notice, or warning, is a bea-

con. Its specific description connects with it instantaneous firing, in the moment of alarm from an enemy; or of a constant light in the darkness, to direct navigators in their course, and warn them from rocks, shallows, and sandbanks.

His blazing eyes, like two bright shining shields,
Did burn with wrath, and sparkled living fire;
As two broad beacons set in open fields
Send forth their flames. *Spenser. Faerie Queene.*

Modest doubt is call'd

The beacon of the wise. *Shakspeare.*

The king seemed to account of Perkin as a May-game; yet had given order for the watching of beacons upon the coasts, and erecting more where they stood too thin. *Bacon.*

No flaming beacons cast their blaze afar,

The dreadful signal of invasive war. *Gay.*

On the top of the steeple there remains an iron pitchpot, designed as a beacon, to be fired occasionally, to alarm the country in case of invasion. It takes its name from the Saxon becnian, to call by signs.

Pennant's Tour from Chester. Hoadley Church.

Wherefore, among other reasons, a suit for beaconage of a beacon standing on a rock in the sea, may be brought into the court of Admiralty, the admiral having an original jurisdiction over beacons.

Blackstone. Comment. III.

The haven hums with many a cheering sound,
The beacons blaze their wonted stations round.

Byron.

The bat builds in his haram bower;
And in the fortress of his power
The owl usurps the beacon tower.

Id. Giaour.

BEACONS anciently were intended as signals for the better securing the kingdom from foreign invasions.—See SIGNAL. On certain eminent places of the country were erected long poles, whereon were fastened pitch barrels to be fired by night, and to smoke by day, to give notice in a few hours to the whole kingdom of an approaching invasion. These served to communicate intelligence as rapidly as the modern invention of the telegraph. We find beacons frequently used among the primitive Britons and Western Highlanders. The besieged capital of one of our northern isles in the third century lighted up a fire upon a tower, and Fingal knew 'the green flame edged with smoke' to be a token of attack and distress, (*Ossian*, vol. i. p. 195). There are to this day several cairns or heaps of stones upon the heights along the coasts of the Harries, on which the inhabitants used to burn heath as a signal of an approaching enemy.

BEACONS on the sea coasts, for guiding and preserving vessels at sea, by night as well as by day, are erected by the king's authority, being a branch of the royal prerogative. The king has the exclusive power, by commission under his great seal, to cause beacons, light-houses and sea marks to be erected in fit and convenient places, as well upon the lands of the subject, as upon the demesnes of the crown: which power is usually vested by letters patent in the office of lord high admiral. And by statute 8 Eliz. c. 13. the corporation of the Trinity-house are empowered to set up any beacons or sea-marks wherever they shall think them necessary; and if the owner of the land or any other person

shall destroy them, or shall take down any steeple, tree, or other known sea-mark, he shall forfeit £100, or, in case of inability to pay it, shall be ipso facto outlawed.

BEACONAGE, a tax paid towards the maintenance of a beacon.

BEACON-HILL, a high rock in the parish of Muthil, in Perthshire, from whence a fire in the night might be seen at the distance of fifty miles east. The top of it is flat, and covered with ashes to a considerable depth. It is within two miles of Strageath, and may be seen from Camp's Castle, and from almost every part of a Roman road, which runs from Strageath for several miles eastward, in a straight line, to the parks of Gask, where there are still the remains of a Roman station. From all which it is evident that it has been a place of signals, and hence derived its name. It is also called Eagle's Craig.

BEACON-HILL, 1. a hill in Essex, on the south side of the mouth of the port of Harwich, with a light-house on it: 2. another in Wiltshire, between Marlborough and Sandy-Lane.

BEACONSFIELD, a town of Buckinghamshire, seated on a hill in the road between London and Oxford; eight miles from Marlow and Uxbridge, and twenty-five W.N.W. of London. It has a market on Thursday, and two fairs, February 13th, and Holy Thursday. In its vicinity was the residence of the poet Waller, at Hall Barn, and of Edmund Burke, at Butler's Court. The duke of Portland's seat, Bulstrode, is also within a short distance. Population about 1736.

BEACUL, a town and fortress of Hindostan, in South Canara, on a point of land projecting into the sea. It consists of about 100 houses. Long. 75° 9' E., lat. 12° 22' N.

BEAD, } From *bede*, Ang. Sax.
BEAD'ROLL, } a prayer; the past participle of *biddan*, *orare*, to
BEAD'S'MAN, } bid; to invite; to solicit;
BEAD'S'WOMAN, }
BEAD'S'BIDDING, } to request; to pray: *bead* is likewise a small globe, or ball of glass, or pearl, or other substance; a number of these, strung upon a thread, are used by Papists to count their prayers. *Beadroll* is a catalogue of prayers, or, perhaps, originally a list of those to be prayed for in church, afterwards any list. *Beadsman*, a prayer man, commonly one who prays for another. From this use *beads* obtained their name, which are now any small globular body, and most frequently used to denominate the little balls which are threaded and worn about the neck for ornament.

A paire of *bedes* eke she bere
Upon a lace, all of white threde,
On which that she her *bedes* *bede* :
But she ne bought hem never a dele,
For they were given hire, I wot wele
God wote of a full holie frere,
That said he was her father dere,
To whom she hod oftener went
Than any frere of his covent. *Chaucer.*

Where that old woman day and night did pray
Upon her *beades* devoutly penitent;
Nine hundred Pater-nosters every day,
And thrice nine hundred Aves she was wont to say;

And to augment her painful penance more
 Thrice every day in ashes she did sit,
 And next her wrinkled skin rough sackcloth wore,
 And thrice three times did fast from any bit.

Spenser.

An holy hospital,

In which seven *beadmen*, that had vowed all
 Their life to service of high heaven's king.

Faerie Queene.

It was a friar of orders gray
 Walk'd forth to tell his *beads*,
 And he met with a lady fair,
 Clad in a pilgrim's weeds.

Old Ballad.

With scarfs, and fans, and double charge of brav'ry,
 With amber bracelets, *beads*, and all such knavery.

Shakspeare.

Thy spirit within thee hath been so at war,
 That *beads* of sweat have stood upon thy brow. *Id.*

In thy danger

Commend thy grievance to my holy prayer;
 For I will be thy *beadman*, Valentine. *Id.*

The king, for the better credit of his espials abroad,
 did use to have them cursed by name amongst the
beadroll of the king's enemies. *Bacon's Henry VII.*

'Twas such a bountie

And honour done to your poore *bedes woman*,
 I know not how to owe it, but to thank you.

Ben Jonson. The Sad Shepherd.

Several yellow lumps of amber, almost like *beade*,
 with one side flat, had fastened themselves to the
 bottom. *Boyle.*

Bring the holy water hither,
 Let us wash and pray together:
 When our *beads* are thus united,
 Then the foe will fly affrighted.

Herrick.

For who would rob a hermit of his weeds,
 His few *looks*, or his *beads*, or maple dish,
 Or do his gray hairs any violence. *Milton. Comus.*

Then might ye see

Cowls, hoods, and habits, with their wearers tost
 And flutter'd into rags; then reliques, *beads*,
 Indulgencies, dispenses, pardons, bulls,
 The sport of winds. *Milton's Paradise Lost.*
 While the disjointed abhess threads
 The gingling chain-shot of her *beads*. *Marvell.*
 Tell your *beads*, says the priest, and be fairly
 truss'd up,

For you surely to-night shall in paradise sup.

Prior. Thief and Cordelier.

He taketh candle, *beades*, and holy water,
 And legends eke of saintes, and bookes of prayere;
 He ent'reth the room, and looketh round about,
 And haspen the door to haspen the goblin out.

Guy. Imitation of Chaucer.

Thy voice I seem in every hymn to hear,
 With every *bead* I drop too soft a tear. *Pope.*

Much is the Virgin teas'd, to shrieve them free
 From crimes as numerous as her *beadmen* be.

Byron.

BEAD, in architecture, a round moulding,
 commonly made upon the edge of a piece of
 stuff, in the Corinthian and Roman orders, cut
 or carved in short embossments, like beads, in
 necklaces. A plain bead is sometimes set on the
 edge of each fascia of an architrave, and some-
 times also an astragal is thus cut. It is not
 uncommon to place a bead on the lining board
 of a door-case, or on the upper edges of skirting
 boards.

BEAD, in assaying, the small lump or mass
 of pure metal separated from the scoria, and seen

distinct and pure in the middle of the cupel
 while in the fire. Thus, in separating silver from
 its ore by means of lead, the silver remains in the
 form of a bead, when the lead, that had before
 assisted in the operation, is reduced to scoria.
 In this process, the bead of silver must be taken
 out of the cupel as soon as it is observed to be
 pure, lest, growing cold, it should be congluti-
 nated to the cupel or litharge. This bead, when
 the assay is properly made, is always porous on
 the under side. See **ASSAYING**.

BEADS, in commerce, those glass globules
 vended to the savages on the coast of Africa;
 thus denominated, because they are strung to-
 gether for the convenience of traffic.

BEADS, in devotional exercises, are much used
 by Roman Catholics, as in rehearsing and num-
 bering their Ave-Marias and Pater-nosters; and
 a similar practice prevails among the dervises
 and other religious throughout the East, as well
 Mahommedan as Heathen. The ancient Druids
 appear also to have had their beads, many of
 which are still found; at least, if the conjectures
 of an ingenious author may be admitted, who
 takes those antique glass globules, having a snake
 painted round them, and called adder-beads, or
 snake-buttons, to have been the beads of our
 ancient Druids.

BEADS, BIDDING OF THE, a charge given by
 the Romish priests to their parishioners, at cer-
 tain times, to say so many Pater-nosters upon
 their beads for a soul departed.

BEADS, used in necklaces, are made of various
 materials, such as steel, garnet, coral, diamond,
 amber, crystal, pastes, &c. The common black
 glass of which beads are made for necklaces, &c.
 is colored with manganese only: one part of
 manganese is sufficient to give a black color to
 near twenty of glass.

BEADLE, } Sax. byðell, a messenger;
BEADLESHIP. } Fr. *bedeau*, Span. *bedel*, Dut.
bedelle. Junius derives it from *biddan*, *beadan*,
 to bid, to tell, to order; because he proclaims
 and executes the will of his superiors, *Beadle-
 ship* is the office of a *beadle*, it occurs in Wood's
 Athenæ Oxon. vol. ii. fol. 388.

A dog's obey'd in office.

Thou rascal *beadle*, hold thy bloody hand:
 Why dost thou lash that whore? *Shakspeare.*

And I, forsooth, in love!

I that have been love's whip:
 A very *beadle* to a humourous sigh,
 A critic; nay, a night-watch constable. *Id.*

They ought to be taken care of in this condition,
 either by the *beadle* or the magistrate. *Spectator.*

Their common loves a lewd abandon'd pack,
 The *beadle's* lash still flagrant on their back.

Prior.

BEADLE is also used for an officer in universi-
 ties, whose place is to walk before the masters
 at all public processions, &c. with a mace.
 Spelman, Vossius, and Sumner, derive *beadle*
 from the Saxon; in which sense bishops, in some
 ancient Saxon manuscripts, are called *beadles* of
 God, *Dei bedelli*. The translator of the Saxon
 New Testament renders *exactor* by *bidele*; and
 the word is used in the same sense in the laws of
 Scotland.

BEADLE is chiefly applied in Scotland to those church officers who keep the keys of the churches and seats, and occasionally attend the ministers and kirk sessions, in the exercise of their parochial duties. The office is somewhat similar, though not in every respect, to that of Church Warden in England.

BEAD-MAKERS, called by the French pater-nostriers, are those employed in the making, stringing, and selling of beads, for devotional purposes. At Paris, before the revolution, there were three companies of bead-makers; one who made them of glass or crystal; another of wood and horn; and the third of amber, coral, jet, &c.

BEAD-PROOF, a term used by distillers to express that sort of proof of the standard strength of spirituous liquors, which consists in their having, when shaken in a phial, or poured from on high into a glass, a crown of bubbles, which stand on the surface some time after. This is esteemed a proof that the spirit consists of equal parts of rectified spirits and phlegm. It however is a fallacious rule as to the degree of strength in the goods; because any thing that will increase the tenacity of the spirit, will give it this proof, though it be under the due strength.

BEAD-PROOF. A method of ascertaining the strength of spirituous liquors, invented by Mr. Brown of Glasgow. It consists of a number of small glass globules, or beads, marked so as to correspond with the degrees of a hydrometer. These beads have a small glass cylinder appended to them, which, being ground with emery, they are brought to the degree of lightness required. They are put up in a box, and being thrown into any spirituous liquor, at a medium temperature, say sixty degrees of Fahrenheit, the bead which remains suspended in any part of it denotes the specific gravity or the proportion of spirit it contains. Thus No. 1. remains suspended in any part of distilled water, of the required temperature, which is the standard from which the proportion of spirit is computed. No. 32. remains suspended in any part of pure alcohol; and all the intermediate beads indicate various proportions of water and spirit in the mixture. When these beads are made with accuracy, they seem to afford a more easy method of ascertaining the strength of spirits than any yet invented. See **HYDROMETER**.

BEAGLE. Fr. *bigles*, perhaps from the Ital. *piccolo*, q. d. *cani piccoli*, smaller dogs. A small hound with which hares are hunted.

She's a *beagle* true-bred, and one that adores me.
Shakspeare.

The rest were various huntings.
The graceful goddess was array'd in green;
About her feet were little *beagles* seen,
That watch'd with upward eyes the motions of their queen.
Dryden's Fables.

To plains with well-bred *beagles* we repair,
And trace the mazes of the circling hare.
Pope.

Already see the deep-mouth'd *beagles* catch
The tainted mazes; and, on eager sport
Intent, with emulous impatience try
Each doubtful trace.
Armstrong.

BEAGLE, in zoology, a valuable dog, kept entirely for hunting hares; they are of small size, inferior to the hare in swiftness, but possess a very delicate scent; and when they have found her, seldom fail of running a hare down.

BEAGLES are of various kinds, as the southern beagle, something less and shorter, but thicker, than the deep mouthed hound; the fleet northern or cat beagle, smaller, and of a finer shape than the southern, and a harder runner. From these two, by crossing, is bred a third sort, held preferable to either. To these may be added a still smaller sort of beagles, scarce lighter than lap-dogs, which make pretty diversion in hunting the coney, or even the small hare in dry weather; but are otherwise unserviceable by reason of their size.

BEAK', } Ang.-Sax. *pycan*, Ger. *picken*,
BEAK'ED, } to pick or peck. The *beak*, says
BEAK'ER, } the *Encyclopaedia Metropolitana*,
BEAK-HEAD. } is that which picketh or pecketh. It is applied generally to whatever is pointed or sharp. Thus the bill of a bird is called its beak; the cup called a beaker, derives its name from the shape of its spout. But the Dutch *beker* Vossius derives from the Lat. *bacur*, and thus *bacur* or *baccar*, says the just mentioned authority, is perhaps from *Bacchus*. It means a vessel or cup for wine. This is a little forced. The term *beak* is now used to signify the fore-part of a ship. In the ancient galleys it was a piece of brass like a beak, fixed at their end, with which they pierced their enemies. It is also applied to a shoe peculiarly constructed, and to a prominence of land.

Father, I swear by Ibis' golden *beake*,
More fair and radiant is my bonny Kate,
Then silver Xanthus, when he doth embrace
The ruddy Simois at Ida's feet. *Whetstone.*

A little wren in *beake* with laurell greene that flew,
Foreshew'd my doleful death, as after all men knew.
Mirror for Magistrates.

His royal bird
Prunes the immortal wing, and cloyes his *beak*,
As when his god is pleas'd.

Shakspeare. Cymbeline
I boarded the king's ship, now on the *beak*,
Now in the waist, the deck, in every cabin. *Id.*

The floating vessel swam
Uplifted, and secure with *benked* prow,
Rode tilting o'er the waves.

Milton. Paradise Lost.
He asked the waves, and ask'd the felon winds,
What hard mishap hath doom'd this gentle swain?
And question'd every gust of rugged wings
That blows from off each *beaked* promontory:
They knew not of his story;
And sage Hippotades their answer brings,
That not a blast was from his dungeon stray'd:
The air was calm, and on the level brine
Sleek Panope with all her sisters play'd.

Id. Lycidas
Him thought, he by the brook of Cherith stood;
And saw the ravens with their horny *beakes*,
Food to Elijah bringing ev'n and morn.

Id. Paradise Regained
With boiling pitch, another near at hand,
From friendly Sweden brought, the seams instops;
Which well laid o'er, the salt sea waves withstand,
And shake them from the rising *beak* in drops.
Dryden.

The magpie, lighting on the stock,
Stood chat'ring with incessant din,
And with her *beak* gave many a knock.

Swift.

And into pikes and musqueteers
Stamp *beakers*, cups, and porringers.

Hudibras.

With dulcet bev'rage this the *beaker* crown'd,
Fair in the midst with gilded cups around.

Pope. Odyssey.

The hooked *beak* of the hawk-tribe, separates the
flesh from the bones of the animal which it feeds upon,
almost with the cleanness and precision of a dissect-
or's knife.

Paley's Natural Theology.

It is as if the desert bird,
Whose *beak* unlocks her bosom's stream,
To still her famish'd nestlings' scream,
Nor mourns a life to them transferr'd ;
Should rend her rash devoted breast,
And find them flown her empty nest.

Byron. Giaour.

BEAK, in ancient military affairs, was used for
one of the battalia, or forms of ranging an army
for battle, particularly by the Macedonians.

BEAK, in architecture, a little fillet left on the
edge of a larmier, which forms a canal, and makes
a kind of pendent chin, answering to what
Vitruvius calls the mentum.

BEAK, in farriery, denotes a little horse-shoe,
turned up, and fastened in upon the fore part of
the hoof. It is used to keep the shoes fast, and
to prevent them from being struck off by the
horse, when by reason of any itch, or being much
disturbed by the flies in hot weather, he stamps
his feet violently on the ground.

BEAK, in ornithology : from the form and struc-
ture of the beaks of birds, Linnæus divides this
whole family, or general class of animals, into
six orders. See ORNITHOLGGY.

BEAK, or **BEAK-HEAD**, of a ship, that part
without the ship, before the fore-castle, which is
rastered to the stem, and is supported by the
main keel. It is usually carved and painted,
which adds beauty to utility. The *beak*, called
by the Greeks *επιδόλον*, by the Latins *rostrum*, was
an important part in the ancient ships of war,
which were hence denominated *naves rostrata*.
The *beak* was made of wood, but fortified with
brass and fastened to the prow, serving to annoy
the enemy's vessels. Its invention is attributed
to Piseus, an Italian. The first *beaks* were made
long and high ; but afterwards a Corinthian,
named Aristo, contrived to make them short and
strong, and placed so low as to pierce the hostile
vessels under water. By the help of these, great
havoc was made by the Syracusans in the Athe-
nian fleet.

BEAKS, in heraldry, a term used to express
the *beak* or bill of a bird. When the *beak* and
legs of a fowl are of a different tincture from the
body, we say *beaked* and *membered* of such a
tincture.

BEALE, a river of England, which runs
through part of the counties of Sussex and Kent,
and falls into the Medway.

BEALE (Mary), particularly distinguished by
her skill in painting, was the daughter of Mr.
Craddock, minister of Walton-upon-Thames,

and learned the rudiments of her art from Sir
Peter Lely. She painted in oil, water colors, and
crayons, and had much business ; her portraits
were in the Italian style, which she acquired by
copying pictures from Sir Peter Lely's and the
royal collections. Her master, says, Mr. Walpole,
was supposed to have had a tender attachment to
her ; but as he was reserved in communicating to
her all the resources of his pencil, it probably
was a gallant rather than a successful one. Dr.
Woodfall wrote several pieces to her honour, under
the name of Belisia. Mrs. Beale died in Pall-
mall, in 1697, aged 65. Her paintings have much
nature, but the coloring is stiff and heavy.

BEALSBURG, a town of the United States
of America, in Kentucky, seated on the east bank
of the Rolling-fork. It is fifteen miles W. S. W.
of Bairdstown, fifty south-west of Frankfort, and
890 from Philadelphia.

BEALT, or **BUALTH** or **BULTH**, an ancient
town in the hundred of Builth, and county of
Brecon, agreeably situated on the western bank
of the river Wye, in a romantic and extremely
picturesque vicinity. It is 173 miles from
London, contains a population of 946 souls,
holds markets on Mondays, and fairs five times
in every year. Two of the streets are con-
venient, well disposed, and adorned by the
parish church, four meeting houses of dissenters,
the free school, founded in 1752, by Thomas
Prichard, Esq., several comfortable inns, and
many substantial private dwellings. The
Gwynnes of Llanelwedd Hall, are lords of the
manor of Builth. The contiguity of this place
to the saline springs of Park-Wells has occa-
sioned an increase in the number of wealthy and
respectable inhabitants within the last twenty
years. This was the Bullæum of the Romans,
and many curious reliques of that bold nation
are daily found in the adjacent districts. The
castle, of Norman erection, is beautifully situ-
ated on the summit of a picturesque hill. It
was once possessed by the Mortimers but now
belongs to the Gwynnes. Llewellyn, the last
reigning prince of Wales was slain near this place,
and his remains interred at a spot called "Cefn y
bedd Llewellyn," a little distance from the town.

BEAM, *n.* } *Bagms*, Goth. *beam* Ang.-
BEAMLIKE, *adj.* } Sax. a tree ; the etymology
BEAMY. } uncertain ; the applications
are various. See our scientific articles under
this term.

Poise the cause in justice' equal scales,
Whose *beam* stands sure, whose rightful cause pre-
vails,
Shakspeare.

The building of living creatures is like the building
of a timber house ; the walls and other parts have
columns and *beams*, but the roof is tile, or lead, or
stone.
Bacon.

So much they could with their chariots by use and
exercise, as riding on the speed down a steep hill, to
stop suddenly, and with short rein turn swiftly, now
running on the *beam*, now on the yoke, then in the
seat.
Milton. Hist. Eng.

He heav'd, with more than human force to move
A weighty stone, the labour of a team,
And rais'd from thence he reach'd the neigh'ring
beam.
Dryden.

BEAM, *v. n.* } Ang.-Sax. *beaman*, to shine,
 BEAMLESS, } to emit rays, as from the sun ;
 BEAMY. } any thing radiant.

Is aught on earth so pretious or deare
 As praise and honour? or is ought so bright
 And beautiful as glories *beames* appeare,
 Whose goodly light than Phœbus lampe doth
 shine more clear? *Spenser.*

How shall a worm, on dust that crawls and feeds,
 Climb to th' Æmpeyral court, where these states reign,
 And there take view of what heav'n's self exceeds?
 The sunless stars, these lights the sun disdain:
 Their *beams* divine, and beauties do excel
 What here on earth, in air, or neav'n do dwell:
 Such never eye yet saw, such never tongue can tell.

Fletcher's Purple Island.

Pile ten hills on the Tarpeian rock,
 That the precipitation might down stretch
 Below the *beam* of sight.

Shakspeare. Coriolanus.

Sunk though he be beneath the wat'ry floor;
 So sinks the day-star in the ocean bed,
 And yet anon repairs his drooping head,
 And tricks his *beams*, and with new spangled ore,
 Flames in the forehead of the morning sky;
 So Lycidas sunk low, but mounted high.

Milton. Lycidas.

No sun to cheer us but a bloody globe,
 That rolls above, a bald and *beamless* fire.

Dryden and Lee.

What modes of sight betwixt each wide extreme,
 The mole's dim curtain, and the lynx's *beam*. *Pope.*

Truth bids me look on men, as autumn's leaves,
 And all they bleed for, as the summer's dust,
 Driven by the whirlwind: lighted by her *beams*,
 I widen my horizon, gain new powers,
 See things invisible, feel things remote,
 Am present with futurities; think nought
 To man so foreign as the joys possess,
 Nought so much his as those beyond the grave.

Young.

Attemper'd suns arise,
 Sweet-*beam'd* and shedding off thro' lucid clouds
 A pleasing calm, while broad and brown below,
 Extensive harvests hang the heavy head.

Thomson's Seasons.

The ghastly form,
 The lip pale quiv'ring and the *beamless* eye.

Id. Summer.

But lo! from high Hymettus to the plain,
 The queen of night asserts her silent reign.
 No murky vapour, herald of the storm,
 Hides her fair face, nor gilds her glowing form;
 With cornice glimmering as the moon-*beams* play,
 There the white column greets her grateful ray,
 And bright around with quivering *beams* beset
 Her emblem sparkles o'er the minaret.

Byron. Corsair.

O Peace, thy injured robes upbind!
 O rise, and leave not one behind
 Of all thy *beamy* train.

Collins's Ode to Peace.

One cultivated spot there was, that spread
 Its flowery bosom to the noon-day *beam*,
 Where many a rose-bud rears its blushing head,
 And herbs for food with future plenty team.

Beattie's Minstrel.

BEAM, in architecture. Some of the best authors have considered the force or strength of beams, and brought their resistance to a precise calculation: particularly M. Varignon and M.

Parent. The system of the latter is as follows: When, in a beam breaking parallel to its base which is supposed to be a parallelogram, two planes of fibres, which were before contiguous, are separated, there is nothing to be considered in those fibres, but their number, bigness, tension before they broke, and the lever by which they act: all these together make the strength or resistance of the beam to be broke. Suppose then another beam of the same wood, where the base is likewise a parallelogram, and of any bigness, with regard to the other, the height or thickness of each of these when laid horizontal, being divided into an indefinite number of equal parts, and their breadth into the same number, 'n each of their bases will be found an equal number of little quadrangular cells, proportionate to the base whereof they are parts. These then will represent little bases, or, which is the same thing, the thicknesses of the fibres to be separated by the fracture of each beam: and, since the number of cells is equal in each, the ratio of the bases of both beams will be that of the resistance of their fibres, both with regard to number and thickness. Now the two beams being supposed to be of the same wood, the fibres most remote from the points of support, which are those which break first, must be equally stretched, when they break. Thus the fibres, e. g. of the tenth division, are equally stretched in each case, when the first breaks; and in whatever proportion the tension be supposed, it will still be the same in both cases; so that the doctrine is entirely free and unembarrassed with any physical system.— Lastly, the levers whereby the fibres of the two beams act, are represented by the height or depth of their bases; and of consequence the whole resistance of each beam is the product of its base by its height; or, it is the square of the height multiplied by its breadth: which holds not only in case of parallelogrammatic, but also of elliptic bases. Hence, if the base of two beams be equal, though both their heights and breadths be unequal, their resistance will be as their heights alone; and, by consequence, the same beam laid on the smallest side of its base will resist more than when laid flat, in proportion as the first situation gives it a greater height than the second: and thus an elliptic base will resist more when laid on its greatest axis, than when on its smallest. Since in beams equally long the bases determine the proportion of their weights or solidities, and since their bases being equal, their heights may be different, two beams of the same weight may have resistances differing to infinity: thus, if in one the height of the base be supposed infinitely great, and the breadth infinitely small, while in the other the dimensions of the base are infinite; the resistance of the first will be infinitely greater than that of the second, though their solidity and weight be the same. If, therefore, all that was required in architecture were to have beams capable of supporting vast loads, and at the same time to be of the least weights possible, it is plain they must be cut thin as laths and laid edgeways. If the bases of two beams be supposed unequal, but the sum of the sides of the two bases equal, e. g. if they be either 12 and 12, or 11 and 13, or 10 and 14, &c. so that they always make 24; and further, if they

be supposed to be laid edgeways; pursuing the series, it will appear, that in the beam of 12 and 12, the resistance will be 1728, and the solidity or weight 144: and that in the last, or 1 and 23, the resistance will be 529, and the weight 23: the first, therefore, which is square, will have less than half the strength of the last, with regard to its weight. Hence M. Parent remarks, that the common practice of cutting the beams out of trees as square as possible is reprehensible: he hence takes occasion to determine geometrically, what dimensions the base of a beam to be cut out of any tree proposed shall have, in order to its being of the greatest possible strength; or, which is the same thing, a circular base being given, he determines the rectangle of the greatest resistance that can be inscribed; and finds that the sides must be nearly as 7 to 5, which agrees with observation. Hitherto the length of the beams has been supposed equal; if it be unequal, the bases will resist so much the less, as the beams are longer. To this it may be added, that a beam sustained at each end, breaking by a weight suspended from its middle does not only break at the middle, but also at each extreme; or, if it does not actually break there, at least immediately before the moment of the fracture, which is that of the equilibrium between the resistance and the weight, its fibres are as much stretched at the extremes as in the middle. So that of the weight sustained by the middle there is but one-third part which acts at the middle to make the fracture; the other two only acting to induce a fracture in the two extremes. A beam may either be supposed only laden with its own weight, or with other foreign weights applied at any distance, or else only with those foreign weights. Since, according to M. Parent, the weight of a beam is not ordinarily above one-seventieth part of the load given it to sustain, it is evident that in considering several weights, they must all be reduced by the common rules to one common centre of gravity. M. Parent has calculated tables of the weights that will be sustained by the middle in beams of various bases and lengths, fitted at each end into walls, on a supposition that a piece of oak of an inch square and a foot long, retained horizontally by the two extremes, will sustain 315lb. in its middle before it breaks, which it is found by experience it will.

BEAM, in heraldry, is used to express the main horn of a hart or buck.

BEAM, in hunting, the main stem of a deer's head, or that part which bears the antlers, royals, and tops; the little streaks whereof are called circles.

BEAM, or **ROLLER**, in weaving, is a long and thick wooden cylinder placed lengthways on the back part of the loom of those who use the shuttle. The threads of the warp of linen or woollen cloth, serges, or other woollen stuffs, are rolled upon the beam, and unrolled as the work goes on. That cylinder on which the stuff is rolled, as it is weaved, is also called the beam or roller, and is placed on the fore part of the loom.

BEAM OF A BALANCE, is that piece of iron or wood, somewhat bigger towards the middle than at the ends, where there are holes, through which run the ropes or strings which hold the

scales; the beam is divided into two equal parts by a needle placed over it perpendicularly, and the centre of motion must be placed a little above the centre of gravity, that the beam may rest exactly in an horizontal position. See **BALANCE**.

BEAM OF AN ANCHOR. The straight part or shank of an anchor, to which the hooks are fastened.

BEAM OF A PLOUGH, a name given by our farmers to the great timber of the plough, into which all the other parts of the plough-tail are fixed. This is usually made of ash, and is straight, and eight feet long in the common plough: but in the four-coultered plough it is ten feet long, and its upper part is arched. The head of this beam lies on the pillow of the plough, and is raised higher, or sunk lower, as that pillow is elevated or depressed by being slipped along the crow-staves. Near the middle it has an iron collar, which receives the tow chain from the box, and the bridle chain from the stake or gallowes of the plough is fixed in it a little below the collar. Some inches below this there is a hole, which lets through the coulter; and below that there are two other small ones, through which the heads of the ratches pass. These are the irons which support the sheet, and with it the share. Farther backward still is a larger perforation, through which the body of the sheet passes; and behind that, very near the extremity, is another hole through which the piece called the hinder-sheet passes. See **HUSBANDRY**.

BEAMS OF A SHIP are the large main cross timbers, stretching from side to side, which hold the sides of a ship from falling together, and which also support the decks and orlops of the ship. The main beam is that next the main mast; and from it they are reckoned by first, second, and third beam. The great beam is also called the midship beam. There are usually twenty-four beams on the lower deck of a ship of seventy-four guns, and to the other decks additional ones in proportion as the ship lengthens above. Hence the following phrases in sea language:-

BEAM, BEFORE THE, signifies an arch of the horizon comprehended between the line of the beam, and that point of the compass which she stems.

BEAM, ON THE, in sea language, denotes any distance from the ship on a line with the beams, or at right angles with the keel. Any object that lies east or west when the ship steers northward, is said to be on the starboard or larboard beam.

BEAM, ON THE WEATHER, signifies on the weather side of the ship.

BEAM-ANTLER, the branch of a deer's horn next the head.

BEAM-BIRD. See **MOTACILLA**.

BEAM, CAMBER. See **CAMBER BEAM**.

BEAM FEATHERS, in falconry, the longest feathers of a hawk's wing.

BEAM-FILLING, in architecture, the filling up the vacant space between the aising plate and roof with stones or bricks, laid between the rafters on the aising plate, and plastered on with loam; this is frequent where the garrets are not pargeted or plastered.

BEAMINSTER, a market town of Dorsetshire, in England, seated on the river Birton, six

miles from Bridport, and 141 west of London. A considerable manufactory of sail cloth, and also of iron and copper goods, is carried on here. It was nearly destroyed by fire in 1645 and 1686, and suffered severely from the same cause in 1781. Population 2290.

BEAN, } Saxon bean, bien, a well
BEAN'FED, } known vegetable. Etymology
BEAN'SHAPED. } unknown. Junius derives it
from the Greek *πυανον* vel *πυανος*; but assigns
in our opinion a very unsatisfactory reason—so
called because they produce blood. And what
food does not?

But God wot that May thought in hire heste,
When she him saw up sitting in his hirt,
In his night cap, and with his necke lene:
She praiseth not his playing worth a *bene*.

Chaucer.

And worse than that bare meat there did remain
To comfort her when she her house had dight,
Sometime a barley-corn, sometime a *bean*,
For which she laboured hard both day and night.

Wyatt.

I jest to Oberon and make him smile,
When I a fat and *beane*-fed horse beguile,
Neighing in likeness of a silly foale.

Shakespeare.

Long let us walk,
Where the breeze blows from yon extended field
Of blossom'd *beans* *Thomson. Spring.*

On turnips feast whene'er you please,
And riot in my *beans* and pease. *Gay's Fables.*
Why does the pea put forth tendrils, the *bean* not;
but because the stalk of the pea cannot support itself,
the stalk of the *bean* can! *Paley.*

BEAN. The old method of choosing king and
queen on Twelfth-day, was by having a bean
and a pea mixed up in the composition of a
cake. They who found these in their portion of
cake, were constituted king and queen for the
evening.

Now, now the mirth comes,
With the cake full of plums,
Where *beane's* the king of the sport here,
Besides we must know,
The pea also,
Must revell as queene in the court here.

Herrick's Hesper.

Cut the cake: who hath the *beane* shall be kinge;
and where the pease is she shall be queene.

Nichol's Progresses.

You may imagine it to be twelfth day at night,
and the *bean* found in the corner of your cake, but it
is not worth a vetch, I assure you.

Middl. New Wond. Anc. Dr. 272.

BEANS. 'Three blue *beans* in a blue bladder.'
What is the origin of this whimsical combination
of words, it may not now be easy to discover,
but at least it is of long standing.

F. Hark, doesn't rattle?

S. Yes, like three blue *beans* in a blue bladder,
rattle bladder, rattle.

Old Fortunatus. Anc. Dr. III. p. 128.

Prior has it in his Alma:—

That putting all his words together
'Tis three blue *beans* in one blue bladder.

Cant. I. v. 25.

BEAN, in botany. See VICIA.

BEANS, in antiquity, were applied to various
uses. The ancients made use of beans in gather-

ing the votes of the people, and for the election
of magistrates. A white bean signified absolu-
tion, and a black one condemnation. Beans had
a mysterious use in the lemuralia and parentalia;
where the master of the family, after washing,
was to throw a sort of black beans over his head,
still repeating the words, 'I redeem myself and
family by these beans.' Ovid gives a lively
description of the whole ceremony in verse. Ab-
stinence from beans was enjoined by Pythagoras,
one of whose symbols is, *κναμον απεχουσαι*, ab-
stine a fabis. The Egyptian priests held it a
crime to look at beans, judging the very sight
unclean! The flamen dialis was not permitted
even to mention the name. The precept of Py-
thagoras has been variously interpreted: some
understand it of forbearing to meddle in trials
and verdicts, which were then by throwing beans
into an urn; others build on the equivocal of
the word *κναμος*, and explain it by abstinence
from sexual pleasures. Clemens Alexandrinus
grounds the abstinence from beans on this, that
they render women barren: which is repeated
by Theophrastus, who extends the effect even to
plants. Cicero suggests that beans are great ene-
mies to tranquillity of mind. For a reason of
this kind it is, that Amphiarus is said to have
abstained from beans, even before Pythagoras,
that he might enjoy a clearer divination by
dreams.

BEANS, in dietetics, are said to be nutritive,
but flatulent. The horse-bean has been often
urged as a succedaneum for coffee, which in
principles it much resembles; only that it con-
tains but half the quantity of oil. Mr. Boyle
describes several experiments of beans treated
pneumatically to show the great plenty of air they
afford, on which their flatulency is supposed to
depend. The expansion of beans in growing,
the same author found so considerable, that it
would raise a plug clogged with above an hun-
dred pounds weight.

BEANS, in fariery. See FARRIERY, INDEX.

BEANS, in fishing, with proper management,
make the finest of all baits. The method of pre-
paring them for that purpose is this: take a new
earthen pot glazed on the inside, boil some beans
in it, suppose a quarter of a peck: they must be
boiled in river water, and should be previously
steeped in some warm water for six or seven
hours. When they are about half boiled, put in
three or four ounces of honey, and two or three
grains of musk; let them boil a little on, then
take them off the fire. They are to be used in
this manner: seek out a clean place where there
are no weeds, that the fish may see and take the
beans at the bottom of the water. Throw some
in at five or six in the morning, and in the even-
ing for some days. This will draw them to-
gether, and they may be taken in a casting net in
great numbers.

BEAN, BOG, or BEAN, BUCK. See MENYAN-
THES.

BEAN, CAPER. Fabago. A plant. See ZY-
GOPHYLLUM.

BEAN-COY, a small fishing-vessel or pilot-boat,
common on the sea coasts and in the rivers of
Portugal. It is extremely sharp forward, having
its stem bent inward above into a great curve;

the stem is also plated on the fore side with iron, into which a number of bolts are driven, to fortify it, and resist the stroke of another vessel, which may fall athwart-haue. It is commonly navigated with a large lateen sail, which extends over the whole length of the deck, and is accordingly well fitted to ply to windward.

BEAN-FLOUR, called by the Romans lomentum, was of some repute among the ancient ladies as a cosmetic, wherewith to smooth the skin, and take away wrinkles.

BEAN-FLY, in natural history, the name given by authors to a very beautiful fly, of a pale purple color, frequently found on bean-flowers. It is produced from the worm or maggot called by authors Mida.

BEAN GOOSE, in ornithology. See ANAS.

BEAN, KIDNEY, in botany. See PHASEOLUS.

BEAN KIDNEY, TREE. See GLYCINE.

BEAN, MOLUCCA, or Anacardium, the fruit of a tree growing in Malabar and other parts of the East Indies, supposed by some to be the Avicennia tomentosa; by others, the bontia germinans. The fruit is of a shining black color, of the shape of a heart flattened, about an inch long, terminating at one end in an obtuse point, and adhering by the other to a wrinkled stalk. It contains within two shells a kernel of a sweetish taste; betwixt the shells is lodged a thick and acrid juice or oil. The medicinal virtues of anacardium have been greatly disputed. Many have attributed to them the faculty of strengthening the nerves, fortifying the memory, and quickening the intellect. Hence a confection made from them was once dignified with the title of confectio sapientium; but which others have thought better deserving the name of confectio stultorum, as instances are said to have occurred of its having rendered people maniacal. But the kernel of anacardium is not different in quality from that of almonds. The ill effects attributed to this fruit belong only to the oil contained betwixt the kernels, whose acrimony is so great, that it is said to be employed by the Indians as a caustic. This oil is of service externally for tetters, freckles, and other cutaneous deformities; which it removes only by exulcerating or excoriating the part, so that a new skin comes underneath. See ANACARDIUM.

BEAN TREE. See CORALLODENDRON.

BEAN TREE, BINDING. See MIMOSA.

BEAR, *v.* } *v. a. pret.* *I bore, or bare;*
BEAR'LE, *n.* } *part. pass.* *bore or born;* Sax.
BEARING, } *beapan, bepan, beoran;* Gothic
BEAR'N, } *haran;* Lat. *pario;* and Heb.

bara, to create. Dr. Johnson remarks, that this word is used with such latitude that it is not easily explained. The general divisions of its meaning are to yield, to bring forth; to carry, to convey, and to transport; to endure, to suffer, to support, and to undergo. Yet is it in all these various significations to be distinguished from the words employed to explain it. *Bear* conveys the idea of creating within itself; *yield* that of giving from itself. Animals bear their young; inanimate objects *yield* their produce. an apple tree *bears* apples; the earth *yields* fruits. *Bear* marks properly the natural power of bringing forth something of its own kind; *yield* is said

of the results or quantum brought forth. Shrubs *bear* leaves, flowers, or berries, according to their natural properties; flowers *yield* seeds plentifully, or otherwise, as they are influenced by circumstances. The second class of meanings attaching to this word, the sense of retaining as well as generating, is expressed by the words *carry, convey, and transport*; but these are not synonymous to bear. To *bear* is simply to take the weight of any substance upon one's self; to *carry* is to remove that weight from the spot where it was; we always *bear* in *carrying*, but we do not always *carry* when we *bear*. Both may be applied to things as well as persons; whatever receives the weight of any thing *bears* it; whatever is caused to move with any thing *carries* it. *Convey* and *transport* are employed for such actions as are performed not by immediate personal intervention or exertion: a porter *carries* goods on his knot; goods are *conveyed* in a waggon or a cart; they are *transported* in a vessel. It is customary at funerals for some to *bear* the pall, and others to *carry* wands or staves; the body itself is *conveyed* in a hearse, unless it has to cross the ocean, in which case it is *transported* in a vessel. In the sense of suffering and endurance, which is the third class of meanings in which this word is to be understood, it is likewise to be distinguished from its exegeretical representatives. To *suffer* is a passive and involuntary act; it denotes simply the being a receiver of evil; it is therefore the condition of our being; to *bear* is positive and voluntary, it denotes the manner in which we receive the evil. To *bear* is a single act of the resolution, and relates only to common ills; we *bear* disappointments and crosses; to *endure* is a continued and powerful act of the mind. The first object of education should be to accustom children to *bear* contradictions and crosses, that they may afterwards be enabled to *endure* every trial and misery. To *bear* and *endure* signify to receive becomingly the weight of what befalls ourselves: to *support* signifies to *bear* either our own or another's evils; for we may either support ourselves, or be supported by others; but in this latter case we *bear* from the capacity which is within ourselves; but we *support* ourselves by foreign aid, that is, by the consolations of religion, the participation and condolence of friends, and the like.—*Crabbe*. An almost infinite variety of shades of meaning, approaching to and receding from these general divisions, must be observed by every one at all familiar with our best English writers.

For in trauayl of hys beryng hys moder was first ded.
R. Gloucester.

For shall neuer brere bere berries as a vyne.
Piers Plouhman.

Lo! a virgyn schal haue in wombe and sche schal bere a sone, and they schulen clepe his name Emanuel.
Wiclif. Matt. chap. i.

“ I wol not fro the door wend
 Tyll I have my staff.” Thou bribour then have
 the todir end

Quod hi that was within; and layn'd it on his bak,
 Right in the same plase as chapmen bereth their pak.
Chaucer. Canterbury Tales.

But he was mounted in his seat so high,
 And his wing-footed coursers him did *bear*
 So fast away, that ere his ready speare
 He could advance, he farre was gone and past,
 Yet still he him did follow everywhere. *Spenser.*
 Pan may be proud that ever he begot
 Such a bellibone ;
 And Syrinx rejoice that ever was her lot
 To *bear* such an one. *Id. Shepheard's Calendar.*

But fayrest she, when so she doth display
 The gate with pearles and rubies richly dight ;
 Through which her words so wise do make their way,
 To *bear* the message of her gentle spright.
Id. Sonnets.

Withhold thine iudigation, mighty heaven,
 And tempt us not to *bear* above our power !
Shakspeare.

For my part, I had rather *bear* with you, than *bear*
 you ; yet I should *bear* no cross, if I did *bear* you ;
 for I think you have no money in your purse. *Id.*

The queen, that *bore* thee
 Oftner upon her knees than on her feet,
 Died every day she liv'd. *Id.*
 There be some plants that *bear* no flower, and yet
bear fruit ; there be some that *bear* flowers and no
 fruit ; there be some that *bear* neither flowers nor
 fruit. *Bacon.*

Where with his hands did help his feet to *bear*,
 Else could they ill so huge a burthen steer.
Fletcher's Purple Island.

Majestic though in ruin : sage he stood
 With Atlantean shoulders fit to *bear*
 The weight of mightiest monarchies. *Milton.*

No keel shall cut the waves for foreign ware
 For every soil shall ev'ry product *bear*. *Dryden.*

My message to the ghost of Priam *bear* ;
 Tell him a new Achilles sent thee there.
Id. Æneid.

A guest like him, a Trojan guest before,
 In shew of friendship, sought the Spartan shore,
 And ravish'd Helen from her husband *bore*. *Garth.*

Ye good distrest !
 Ye noble few ! who here unbending stand
 Beneath life's pressure, yet *bear* up a while,
 And what your bounded view, which only saw
 A little part, deem'd evil, is no more ;
 The storms of wintry time will quickly pass,
 And one unbounded spring encircle all. *Thomson.*

You'll see a draggled damsel here and there
 From Billingsgate her fishy traffic *bear*. *Gay.*

I fancy the proper means of increasing the love we
bear our native country, is to reside some time in
 a foreign one. *Shenstone.*

Let a man be brought into some such severe and
 trying situation as fixes the attention of the public on
 his behaviour,—the first question which we put con-
 cerning him is not what does he suffer ? but how does
 he *bear* it ? If we judge him to be composed and firm,
 resigned to providence, and supported by conscious
 integrity, his character rises, and his miseries lessen
 in our view. *Blair.*

Each *bears* a prize of unregarded charms. *Byron.*

To *bear* up ; to stand firm without falling ;
 not to sink ; not to faint or fail.

So long as nature
 Will *bear* up with his exercise, so long
 I daily vow to use it. *Shakspeare.*

Persons in distress may speak of themselves with
 dignity ; it shews a greatness of soul, that they *bear*
 up against the storms of fortune. *Broomer.*

The consciousness of integrity, the sense of a life
 spent in doing good, will enable a man to *bear* up
 under any change of circumstances. *Atterbury.*

When our commanders and soldiers were raw and
 unexperienced we lost battles and towns : yet we *bore*
 up then, as the French do now ; nor was there any
 thing decisive in their successes. *Swift.*

To *bear* with. To endure an displeasing thing.
 They are content to *bear* with my absence and folly.
Sidney.

Though I must be content to *bear* with those that
 say you are reverend grave men ; yet they lie deadly,
 that tell you, you have good faces. *Shakspeare.*

Look you lay home to him,
 Tell him his pranks have been too broad to *bear* with.
Id.

Bear with me, then, if lawful what I ask.
Milton.

To *bear* in hand. To amuse with false pre-
 tentes ; to deceive.

Your daughter, whom she *bore* in hand to love
 With such integrity, she did confess,
 Was as a scorpion to her sight. *Shakspeare.*

His sickness, age, and impotence,
 Was falsely *bore* in hand. *Id.*

He repaired to Bruges, desiring of the states of
 Bruges to enter peaceably into their town, with a re-
 tinue fit for his estate ; and *bearing* them in hand, that
 he was to communicate with them of matters of great
 importance, for their good. *Bacon.*

All which I suffer, playing with their hopes,
 And am content to win them into profit,
 And look upon their kindness, and take more,
 And look on that, still *bearing* them in hand.

Ben Jonson.
 It is no wonder, that some would *bear* the world in
 hand, that the apostle's design and meaning is for
 presbytery, though his words are for episcopacy. *South.*

To *bear* off. To carry away.
 I will respect thee as a father, if
 Thou *bear'st* my life off hence. *Shakspeare.*

The sun views half the earth on either way,
 And here brings on, and there *bears* off the day.
Creech.

Give but the word, we'll snatch this damsel up,
 And *bear* her off. *Addison. Cato.*

My soul grows desperate.

I'll *bear* her off. *A. Philips.*

To *bear* out. To support ; to maintain ; to de-
 fend.

I hope your warrant will *bear* out the deed.
Shakspeare.

I can once or twice a quarter *bear* out a knave
 against an honest man. *Id.*

Changes are never without danger, unless the
 prince be able to *bear* out his actions by power.
Sir J. Heyward.

Quoth Sidrophel, I do not doubt,
 To find friends that will *bear* me out.

Hudibras.

Company only can *bear* a man out in an ill thing.

South.

I doubted whether that occasion could *bear* me out
 in the confidence of giving your ladyship any farther
 trouble. *Temple.*

To *bear* a brain. To exert attention. Inge-
 nuity or memory.

My lord and you were then at Mantua :
 Nay, I do *bear* a brain.

Shakspeare Romeo and Juliet.

But, still, take you heed, have a vigilant eye—
Well, sir, let me alone, I'll bear a brain.

All Fools, Old Play, iv. 177.

To bear six and six. An obscure phrase, occurring in the Spanish Curate of Beaumont and Fletcher.

He's the most arrant beast.

MELL. He may be more beast.

JAM. Let him bear six and six that all may blaze him.

Span. Cur. ii. 3.

That the object is to make him a horned beast is plain from the context, but by what allusion is not so clear. He is to bear six and six, as his arms. After one or two unsatisfactory conjectures, it was suggested to me that the expression most probably alluded to the horns of a ram, which by the aid of a little fancy may be considered as two figures of six, placed back to back 96. That this is the true interpretation there seems no reason to doubt.

Nares. Glossary.

BEARING-CLOTH. The mantle or cloth with which a child is usually covered when carried to church to be baptised, or produced among the gossips by the nurse.

Here's a sight for thee; look there, a bearing-cloth for a squire's child; look thee here, take up, take up boy; open't.

Shakspeare.

BEAR,	} - Sax. beara, Germ. baer, Lat. <i>ursus</i> . Others derive it from the Greek βεαρ, which they interpret <i>pilosum villosum (ursus, quasi harsus, hirsutus, pilis horrens.)</i> A hairy shaggy animal. a she bear, shaggy, and of horrid aspect.
BEAR-BAITING,	
BEAR-GARDEN,	
BEAR-HERD,	
BEAR-FISH,	
BEAR-FLEEK,	
BEAR-LIKE,	
BEAR-SKIN,	
BEAR-WARD,	
BEAR-WHELP.	

Some have falsely reported, that bears bring their young into the world shapeless, and that their dams lick them into form.

Calmet.

A cruel *beare*, the which an infant bore
Betwixt his hoodie jaws besprinkled all with gore.

Spenser.

I would I had bestowed that time on the tongues,
That I have in fencing, dancing, and bear-baiting. O,
had I but followed the arts.

Shakspeare. Twelfth Night.

They have tied me to a stake I cannot fly.

But bear-like I must fight the course. *Id. Macbeth.*

Virtue is of so little regard in these costermonger times, that true valour is turned bear-herd.

Id. Henry IV.

Like to a chaos, or an unlick'd bear-whelp,
That carries no impression like the dam. *Id. Hen. VI.*

Call hither to the stake my two brave bears,

Bid Salisbury and Warwick come to me.—

Are these thy bears; we'll bait thy bears to death.
And manacle the bearward in their chains. *Id.*

Thou'dst slay a bear;

But if thy flight lay toward the raging sea,
Thou'dst meet the bear i' th' mouth. *Id.*

COR. O, by your leave, sir,
I must be bold to raise you; else your physic
Will turn to further sickness.

MEL. — Physic, bear-leech?

COR. Yes; physic! You are mad.

Ford.

The worsted bear came off with store

Of bloody wounds, but all before:

For as Achilles dipt in pond,

Was anabapti'd, free from wound,

Made proof against dead-doing steel

All over but the pagan heel—

So did our champion's arms defend

All of him but the latter end. *Butler's Hudibras.*

His surcoat was a bearskin on his back. *Dryden.*

In our own language we seem to allude to this degeneracy of human nature, when we call men, by way of reproach, sheepish, bearish, &c. *Harris.*

I must propose some methods for the improvement of the bear-garden, by dismissing all the bodily actors to that quarter. *Spectator.*

Our nobility also kept their bear-ward. *Pennant.*

BEAR, the name of two constellations, called the greater and lesser bear; in the tail of the lesser bear is the pole star.

The chiding billow seems to pelt the clouds,
The wind-shak'd surge with high and monstrous main,

Seems to cast waters on the burning bear,
And quench the guards of the ever fixed pole,
I never did like molestation view
On the enchafed flood. *Shakspeare.*

Others derive it from the bear

That's fixed in northern hemisphere,

And round about his pole does make

A circle like a bear at stake,

That at the chain's and wheels about

And overturns the rabble rout. *Butler's Hudibras.*

E'en then when Troy was by the Greeks o'erthrown
The bear oppos'd to bright Orion shone. *Creech.*

BEAR, in astronomy. See URSA.

BEAR, in zoology. See URSA.

BEAR, in heraldry; this animal occurs as a charge in coats of arms, as, 'He beareth, or, a bear passant, sable; by the name of Fitzcourse: and rampant, as in fig. 1.

Fig. 1.

Fig. 2.

Bears' heads are also borne in coat armour mostly erased, as in fig. 2. 'Argent, a chevron between three bears' heads erased, sable, muzzled, or; by the name of Pennarth.'

BEAR, ORDER OF THE, was a military order in Switzerland, erected by the emperor Frederic II. in 1213, by way of acknowledgment for the service the Swiss had done him, and in favor of the abbey of St. Gall. To the collar of the order hung a medal, on which was represented a bear, raised on an eminence of earth.

BEAR, SEA. See ПНОСА.

BEAR ISLAND, an island in Bantry bay, Ireland, six miles in length, and one and a half broad, hilly and rugged, where batteries have been erected for the defence of the bay. Distant twelve miles from Bantry. Long. 9° 45' W., lat. 51° 35' N.

BEAR ISLAND, a small island in the Atlantic, on the coast of Main. Long. 68° 20' W., lat. 44° 6' N.

BEAR LAKE, BLACK, a lake of North America, in long. 107½ W., lat. 53½ N. The navigation is full of impediments from islands and rapids.

BEAR LAKE, GREAT, a considerable lake in the north-west of America, near the arctic circle. The North-west Expedition reached it in the summer of 1820, and lieutenant Franklin and his

party wintereo nere. In the ensuing spring they attempted to reach the ocean by the Coppermine river; but, unable to accomplish their object, they returned to this lake the same year in great distress, and passed a second winter in the neighbourhood.

BEAR TOWN, in Carolina county, Maryland, lies about seven miles north from Greensburgh, and about fifteen miles south-east from Chestertown.

BEAR'S BREECH, in botany. See ACANTHUS.

BEAR'S COLLEGE, a jocular expression for the bear-garden, commonly called Paris garden.

From the diet and the knowledge
Of the students in *bear's college*.

Ben Jonson. Mash of Gips.

BEAR'S EAR, in botany, a name sometimes given to the primula villosa, or auricula; also to the saxifraga sarmentosa, or Chinese saxifrage.

BEAR'S FOOT, a name given to the nelleborus fœtidus.

BEAR'S FLESH was much esteemed by the ancients: even at this day the paw of a bear, salted and smoked, is served up at the table of princes.

BEAR'S GREASE was formerly esteemed a sovereign remedy against cold disorders, especially rheumatism. It is now much used in dressing ladies and gentlemen's hair.

BEAR'S SKIN affords a fur in great esteem, and on which depends a considerable article of commerce, being used in housings, on coach-boxes, &c. In some countries clothes are made of it, more especially bags wherein to keep the feet warm in severe colds. Of the skins of bears' cubs are made gloves, muffs, and the like.

To BEAR A BODY. A color is said to bear a body in painting, when it is capable of being ground so fine, and mixing with the oil so entirely, as to seem only a very thick oil of the same color.

BEARD, *v. & n.* } The applications of this
BEARDED, } word are better under-
BEARD'LESS. } stood than its etymology;
the full obvious meaning of it is the hair that grows on the lips and chin. It is supposed to be derived from the German baren, to show or manifest, because the beard is an indication of manhood: but this is not to my mind satisfactory; its metaphorical application is to the sharp prickles growing on the ears of corn; to the barb of an arrow; it also describes the hairy tuft that grows from the chin of some animals; the beard of a horse is that part which bears the curb of the bridle; the length of the beard marks age; to beard also is to take or pluck by the beard in contempt or anger; to oppose to the face; to set at open defiance; adopted, according to Mr. Stevens, from romance; in the old language of which it signified, to cut off the beard; beardless, without a beard; a boy.

A merchant was there with a forked *berd*.

Chaucer. Prologue to the Canterbury Tales.

A Franklein was in this compaignie
White was his *berd* as is the daisy. *Id.*

His *berd* as any sowe or fox was rede,
And thereto brode as though it were a spade.

VOL. III.

Upon the cop right of his nose he hade
A wert, and thereon stode a tuft of heres,
Rede as the bristles of a sowes eres. *Id.*

Art thou the caytive that defyest me,
And for this mayd, whose party thou dost take?
Wilt give thy *beard*, though it but little be?
Yet shall it not her lockes for raunsome for me
free. *Speneer.*

He that hath a *beard* is more than a youth; and
he that hath no *beard* is less than a man. *Shakspeare.*

shall a *beardless* boy,
A cocker'd silken wanton, brave our fields,
And flesh his spirit in a warlike soil,
Mocking the air with colours idly spread,
And find no check. *Id.*

No man so potent breathes upon the ground,
But I will *beard* him. *Id.*

_____ and began to hem him round
With ported spears, as thick as when a field
Of Ceres ripe for harvest waving bends
Her *bearded* grove of ears, which way the wind
Sways them. *Milton.*

Ere on thy chin the springing beard began,
To spread a doubtful down, and promise man.
Prior.

Some thin remains of chastity appear'd,
Ev'n under Jove, but Jove without a *beard*.
Dryden.

Would it not be insufferable for a professor to have
his authority, of forty years standing, confirmed by
general tradition and a reverend *beard*, overturned by
an upstart novelist? *Locke.*

Paints, d'ye say?
Why she lays it on with a trowel—Then she has a
great *beard*, that bristles through it, and makes her
look as if she were plastered with lime and hair.
Congreve. Double Dealer.

The *beard*, conformable to the notion of my friend
Sir Roger, was for many ages looked upon as the type
of wisdom. Lucian more than once rallies the philo-
sophers of his time, who endeavoured to rival one
another in *beards*; and represents a learned man who
stood for a professorship in philosophy, as unqualified
for it by the shortness of his *beard*. *Spectator.*

Girt with many a baron bold,
Sublime their starry fronts they rear;
And gorgeous dames, and statesmen old
In *bearded* majesty, appear. *Gray.*

The artificial part of a feather is the *beard*, or as
it is sometimes I believe called, the vane, By the
beards are meant, what are fastened on each side of
the stem, and what constitute the breadth of the
feather; what we usually strip off from one side or
both when we make a pen. *Paley's Natural Theology.*

But if thy *beard* had manlier length,
And if thy hand had skill and strength,
I'd joy to see thee break a lance,
Albeit against my own perchance.
Byron. Bride of Abydos.

I should have *bearded* him in halls of pride,
I should have mated him in fields of death;
Not stolen upon his secret bower of peace,
And breathed a serpent's venom on his flower.
Maturin's Bertram.

BEARDS. 'Neither errors nor beards,' as arch-
bishop Tillotson says, 'are inconveniences lately
sprung up in the world.' As the distinguishing
sign of mature manhood, the beard has in all
ages commanded attention, and received particu-
lar veneration from the less civilised part of man-
2 Z

kind. But Moses is the earliest legislator on the subject. The command which God gave by him to the Israelites, 'Thou shalt not mar the corners of thy beard' (Lev. 19, 27.), seems clearly to allude to some previous well-known custom, probably of the Egyptians. Maimonides, as quoted by Whitby, describes the 'five corners' of the beard, 'none of which,' says he, 'much less all, they might shave off, as the manner of the idolatrous priests was.' More Nevoch, c. xxxvii. Herodotus confirms this with regard to the Egyptian priests, who, as he tells us, shaved the head, chin, and whole body. Accordingly, most of the Egyptian figures are without beard. He further informs us, that in time of calamity, they suffered their beard and hair to grow. The Jews also, in time of mourning, neglected to trim their beards, that is, to cut off what grew superfluous on the upper lips and cheeks. But occasionally manifested their grief in great afflictions by plucking off the hair of their beard. The veneration of the Jews for this appendage of manhood, in the brightest period of their history, is strongly exemplified in the indignation which was felt by the ambassadors of David, when they were outraged in this respect by Hanun the Ammonite, 2 Sam. x. 'The men,' it is said, 'were greatly ashamed,' and 'the children of Ammon stank before David.' We were lately much amused with the argument of a learned modern Jew for the obligation of wearing his beard: 'two of the strongest implications,' he said, 'of the laws of his people required it; the above command, Lev. xix. 27, not to mar its corners, which he contended could only apply when the beard was worn; and the general precept, Deut. xxii. 5, forbidding either sex to wear that which 'pertineth' to the other—a beardless face being, according to nature, he insisted, a woman's face.'

The Assyrians, says Strabo, xvi., like the Egyptians, permitted their beards to grow in seasons of grief. The Persians, on the contrary, shaved not only themselves in honor of the dead, but docked the tails, and cropped the manes, of their horses and mules. Compare Her. ix. 24, H. κ. 45.

According to the fables of the Greeks, when Thetis wished to revenge the wrongs of her son, she approached the knees of Jupiter with a kiss, and touched his beard in supplication. In the same manner Dolon would have besought pity from Diomedes; and if he could have touched the warrior's beard, his life, perhaps, would have been secure. H. κ. 45 l.

As Pausanias observes, that the Greeks always wore their beards till the time of Alexander; and that the first who cut it at Athens ever after bore the reputation of being shaven in mediocrity. He relates a story of a young man, who asked a smooth man if voluntary; whether he quarrelled with nature, or with nature, him a man instead of a woman? xiv. 2. Plutarch states that Alexander commanded all the Macedonians to be shaven, lest the length of their beards should give a handle to their enemies. But his father, as well as his grandfather, and his predecessors, are represented as always wearing beards. The custom of shaving, however, had introduced themselves to the Romans, and was followed by the custom,

however, was not invariable; for the scholiast of Aristophanes, Nub. 120, asserts that the ancient philosophers shaved their beards. The Greeks continued to shave till the time of Justinian, under whose empire long beards came again into fashion, and so continued till Constantinople was taken by the Turks. The Roman philosophers affected to preserve the distinctive character of the mantle and long beard. Horace describes them:

————— 'Tempore quo me
Solatus jussit sapientem pascere barbam.'

Sermon, l. ii. sat. iii. v. 34;

and Aulus Gellius and Lucian express themselves in a similar manner. Persius seems to have been so convinced of the beard's being the symbol of wisdom, that he thought he could not bestow a greater encomium on Socrates than calling him 'Magistrum barbatum.'

From the building of the city, till the year of its foundation 454, barbers are said to have been unknown at Rome. They were first imported from Sicily by Publius Licinius. There is some contradiction however on this point among the ancient writers. Pliny, vii. 59, Aulus Gellius, iii. 4., and Varro, de Re Rust. ii. 2., concur in the foregoing statement. Livy, on the contrary, among the other signs of popular mourning, after the execution of Manlius Capitolinus, which took place in the year U. C. 369, enumerates the letting the beard grow, which, unless shaving had been customary, could not have been noticed. Scipio Africanus is said to have been the first daily shaver at Rome. Slaves wore their beards and hair long; but, when manumitted, shaved their heads in the temple of Feronia, and put on a cap, or 'pileus,' as a badge of liberty. Those who escaped from shipwreck, shaved their heads; and persons acquitted of a capital crime, cut their hair and shaved, and went to the capitol to return thanks to Jupiter. The Roman emperors shaved till the time of Adrian, who retained the mode of wearing the beard, as Plutarch tells us, to hide the scars in his face.

According to Suetonius, Calig. 10., the young Romans were first shaved when the *toga virilis* was assumed. Macrobius, Somn. Scip. i. 6., says it was about the age of twenty-one. Augustus did not shave before the age of twenty-five. Young men with a long down, or 'lanugo,' upon the chin, were called 'juvenes barbatuli,' or 'benè barbati.' The day on which they first shaved, among the Greeks and Romans, was a festival; visits of ceremony were paid them; and they received presents from their friends, as Juvenal, Sat. iii. 186,

'Ille metit barbam, crinem hic deponit amati:
Plena domus libis genialibus.'

The first growth of the beard being consecrated to some god, usually to the Lares. Nero consecrated his in a golden box, set with pearls, to Jupiter Capitolinus.

Persons of respectability had their children shaved the first time by others of the same, or greater quality, who by this means became god-fathers, or adoptive fathers, of the children: a custom which was handed down to Rome Chris-

tion, in which a person became godfather of a child by barely touching his beard: thus historians relate, that one of the articles of the treaty between Alaric and Clovis was, that Alaric should touch the beard of Clovis, and become his godfather. This was also an ancient form of tokens on oath, Aumoin, lib. iv.

Ecclesiastical discipline has varied much on the article of beards: sometimes they have been enjoined on the clergy from a notion of too much effeminacy in shaving, and that a long beard was more suitable to the ecclesiastic gravity; at other times they are forbidden, from the supposed danger of pride lurking beneath a venerable beard. The Greek and Romish churches long disputed on this important matter. Since the time of their separation, the Romanists seem to have given more into the practice of shaving, by way of opposition to the Greeks; and have even made some express constitutions 'de radendis barbis.' The Greeks, on the contrary, espouse very zealously the cause of long beards, and are extremely scandalised at the beardless images of saints in the Roman churches: There are still extant prayers used in the latter on the solemnity of consecrating the beard to God, when an ecclesiastic was shaven.

The barbarous nations of Europe appear very generally to have shaved, some of them reserving the mustachios. When the Franks made themselves masters of Gaul, and assumed the authority of the Romans; the bondsmen were expressly ordered to shave their chins; a law which continued in force until the entire abolishment of servitude in France. So likewise, in the time of the first race of their kings, a long beard was a sign of nobility and freedom. Princes were emulous of having the largest beard; Eginhard, secretary to Charlemagne, speaking of the last kings of the first race, says, they came to the assemblies in the Champ de Mars in a carriage drawn by oxen, and sat on the throne with their hair dishevelled, and a very long beard, crine profuso, barba submissa, solio residerent, et speciem dominantis effingerent. To touch any one's beard, or cut off a bit of it, was, among the first French, the most sacred pledge of protection and confidence. For a long time all letters that came from the sovereign had, for greater sanction, three hairs of his beard in the seal. There was long in being a charter of 1211, which concludes with the following words: Quod ut ratum et stabile perseveret in posterum, presentis scripto sigilli mei robur apposui cum tribus pilis barbæ meæ. In the tenth century Robert of France, the famous rival of Charles the Simple, that it might be the more conspicuous to his soldiers when he was in the field, used to let his long white beard hang down on the outside of his cuirass. French historians describe the beard of Henry IV., deservedly styled the Great, as diffusing over the countenance of that prince a high degree of amiable openness, and majestic sweetness. By the premature death of that prince, the beard, hitherto so highly respected, experienced a sudden and fatal revolution. Louis XIII. mounted the throne of his father without one. Every one concluded immediately, that the courtiers, seeing their

young king with a smooth chin, would look upon their own as too rough. The conjecture proved right; for they presently reduced their beards to simple whiskers, and a small tuft of hair under the nether lip. The people at first would not follow this dangerous example, and the duke of Sully never would adopt it. He kept his long beard, and appeared with it at court, and observing himself ridiculed by the young, said to the king, 'Sir, when your father, of glorious memory, did me the honor to consult me on his great and important affairs, the first thing he did was to send away all the buffoons and stage-dancers of his court.' Whiskers now attained their highest degree of favor, at the expense of expiring beards. A fine black whisker, elegantly turned up, was a very powerful mark of dignity with the fair sex, and it was no uncommon thing for a favorite lover to have his whiskers turned up, combed, and pomatumed, by his mistress; for this purpose, a man of fashion took care to be always provided with every little necessary article, especially whisker wax. Whiskers were still in fashion in the beginning of Louis XIV's reign. That prince, and all the great men of his reign, took a pride in wearing them. They were the ornament of Turenne, Condé, Colbert, Corneille, Moliere, &c. But they now underwent several changes both in form and name: there were Spanish, Turkish, guard dagger, royal whiskers, &c., until their smallness proclaimed their approaching departure. In English history we have no such copious details on this mighty subject. Although the ancient Britons are supposed to have shaved all but the upper lip, Edward the confessor is represented, on his great seal, with a large beard and mustachios. When spies, according to William of Malmesbury, were sent by Harold into the camp of William I. they returned with an assurance of victory, since their enemies were priests, they said, and not soldiers, being all shaven. William the conqueror, on his seal, appears with a short beard and mustachios. Among the edicts which he imposed upon the English, few were considered more oppressive than that which enjoined the practice of shaving. Like a similar edict of Peter I. of Russia, it was perpetually disobeyed, and the hatred of it led in many cases to open insurrection. The Romish clergy, it seems, assumed the right to legislate for princes on this topic among others. The beard of Henry I. was loudly condemned by them; Orderic Vitalis and Serlo both denounced it from the pulpit. The king, to avoid these fulminations, shaved the offending part; yet within twenty years we again find it on the effigy of Henry II. on his seal. In the reign of Henry VIII. it is well known, Sir Thomas More exhibited on the block this memorable ornament: and perceiving it was likely to be cut by the axe of the executioner; took it away, saying, my beard has not been guilty of treason: it would be an injustice to punish it. In Shakspeare we read of 'your straw-colored beard, your orange-tawny beard, your purple in-grain beard, and your perfect yellow.' Bottom's *Histrionic Company* are instructed to have 'good strings to their beards;' an advice which has escaped explanation. 'A beard of the General's cut' is

noticed in Henry V. 'A great round beard' is disapproved of in *The Merry Wives of Windsor*, and compared to 'a glover's paring knife.' Charles I. wore mustachios and a short peaked beard: Charles II. mustachios alone: since the Revolution, except among our modern soldiery, the face has been entirely smooth:—The Spaniards have a proverb, which perhaps suggested the new fashion in the Hussar regiment. *Desde que no hay barba, no hay mas alma.* 'Since we have lost our beards, we have lost our souls.' Among the European nations that have been most curious in beards and whiskers, none have been more distinguished than Spain.

We cannot pursue the details of this subject much farther. The Portuguese, whose national character is similar to that of the Spaniards, have imitated them in this respect. We read, that in the reign of Catherine queen of Portugal, when John de Castro had taken the castle of Diu, in India, he was under the necessity of borrowing from the inhabitants of Goa a thousand pistoles for the maintenance of his fleet; and that, as a security for the loan, he sent them one of his whiskers, telling them 'all the gold in the world cannot equal the value of this national ornament of my valor; and I deposit it in your hands as a security for the money.' The inhabitants of Goa, it is said, generously returned both the money and his whisker. Le Conte observes, that the Chinese affect long beards extravagantly; but nature has balked them, and only given them very little ones, which, however, they cultivate with infinite care; the Europeans are strangely envied by them on this account. Among the Turks it is more infamous for any one to have his beard cut off than among us to be publicly whipt or branded with a hot iron. There are many people in that country, who would prefer death to this kind of punishment. The Arabs make the preservation of their beards a capital point of religion, because Mahomet never cut his. Hence the razor is never drawn over the Grand Seignior's face. The Persians, who clip their, and shave above the jaw, are reputed heretics. It is likewise a mark of authority and liberty among them, as well as among the Turks. They who serve in the seraglio, have their beards shaven as a sign of their servitude. They do not allow it to grow till the sultan as a reward bestows them at liberty.

Of that singular variety of our race, bearded women, many more Romish stories are told. Heliodorus speaks of a people above Halicarnassus, the Pelasgians, amongst whom the chin of the priestesses of Minerva regularly budded with a large beard, when any great public calamity impended. Hist. l. 175. Hippocrates tells us of two bearded women of respectability, Phactusa of Aledra, the wife of Pygmalus, and Hamysia of Thessaly, a friend of Gorgippus. Generally, where this peculiarity has occurred, the menses have hardly ceased. Eusebius Nurembergensis mentions a woman, who had a beard reaching to her navel; and Bartholin speaks of a bearded woman well known at Copenhagen. Whether it conveys of his imperial majesty that beards no longer distinguish men, and therefore produced his jealousy against them, we are not told; but a woman

is said to have been taken in 1724, by the Prussian army in the battle of Pultowa, and carried to Petersburg, where she was presented to the Czar. Peter I. whose beard measured a yard and a half. We read in the *Trevoux Dictionary*, that there was a woman seen at Paris, who had not only a bushy beard on her face, but her body likewise covered all over with hair. The great Margaret, the governess of the Netherlands, is said also to have had a very long stiff beard, on which she prided herself; and preserved it with the greatest care. In the nursery of Albert, Duke of Bavaria, in the time of Wolfius, there was reported to be a virgin with a large black beard; but these good ladies, young or old, have been singularly rare in modern times, and in all well-authenticated history.

BEARDS, in entomology, are two small, oblong, fleshy bodies, placed just above the trunk, as in the gnats, and in the moths and butterflies.

BEARDS OF COMETS. See COMET.

BEARDS OF HORSES. The part underneath the lower mandible, on the outside and above the chin, which bears the curb, is called the beard or chuck. It should have but little flesh upon it, without any chops, hardness, or swelling; and be neither too high raised nor too flat, but such as the curb may rest in its right place.

BEARDS OF MUSCLES, OYSTERS, &c. denote assemblages of threads or hairs, by which those animals fasten themselves to stones. The hairs of this beard terminate in a flat spongy substance, which being applied to the surface of a stone, sticks thereto, like the wet leather used by boys in what they call a sucker.

BEARD (John), an English actor and singer, was brought up a sizer in the king's chapel. In 1737 he made his first appearance on the stage, at Drury-lane, in the character of Sir John Love-rule, in the *Devil to Pay*. About two years after he married lady Henrietta Herbert, daughter of the earl of Waldegrave, and widow of lord Edward Herbert; but this connexion brought him little fortune, and though he gave up the stage, for some time, he returned again to it, until 1758, when he joined with Mr. Rich, whose daughter he had married on the death of his former wife. He died in 1763, aged seventy-four.

BEARDED BROTHERS, *fratres barbati*, are particularly used in ecclesiastical writers for those otherwise called *fratres conversi* in the order of Grammont and of the Cistercians. They took this denomination because they were allowed to wear their beards, contrary to the rules of the professed monks.

BEARDED HUSK, among florists, a husk which is hairy on the edges, as that of the rose, &c.

BEARDED VENUS. The Romans paid their devotions to a bearded Venus, *Veneri barbatae*, supposed to have been of both sexes. A statue of her was found in the Isle of Cyprus.

BEARERS, at funerals, is applied to the supporters of the pall. The ancients had peculiar orders or officers of bearers, called by the Greeks *κοραροι*; by the Romans, *lecticarii*. The *vespillones*, or *bajuli*, were a lower sort of bearers, appointed for persons of inferior rank.

BEARERS, *gestantes*, in writers of the middle age, are sometimes used for a child's gossips,

because they hold the infant in their arms, and present him to the priest in the ceremony of baptism.

BEARERS, in heraldry, or supporters, are certain figures, standing on the scroll, and placed by the side of an escutcheon, which they seem to bear up. They are, chiefly, figures of beasts: figures of human creatures, used for the like purpose, are more properly called tenants. Some make another difference between tenant and bearer, or supporter: when the shield is borne by a single animal, it is called tenant; when by two, they are called bearers, or supporters. The figures of things inanimate, sometimes placed aside of escutcheons, but not touching, or seeming to bear them, though sometimes called bearers, are more properly called cotises. Bearers have formerly been taken from such animals as were borne in the shields; and sometimes they have been chosen as bearing some allusion to the names of those whose arms they are made to support. F. Menestrier traces their origin to the ancient tournaments, in which the knights caused their shields to be carried by servants or pages under the disguise of lions, bears, griffins, blackmoors, &c. who also held and guarded the escutcheons, which the knights were obliged to expose to public view some time before the lists were opened: But Sir G. Mackenzie says, that the first origin and use of them are derived from the custom of leading such as are invested with any great honor to the prince who confers it, and of his being supported by two of the quality when he receives the symbols of such honor: and, in remembrance of that solemnity, his arms were afterwards supported by any two creatures which he might choose. See **SUPPORTERS**.

BEARERS, in horticulture, denote the fruit branches, or such as bear fruit. The bearers, or bearing branches of an apple-tree, and the like, are found to be rougher, and fuller of asperities in their bark, than the other branches.

BEARERS OF A BILL OF EXCHANGE, denote the persons in whose hands it is, and in favor of whom the last order or indorsement was made. When a bill, or order for money, is said to be payable to bearer, it is understood to be payable to him who first offers himself after it becomes due. To be paid a bill or order of this kind, there needs neither indorsement nor transfer; yet it is proper to know to whom it is paid.

BEARING, in heraldry, a term used to express a coat of arms, or the figures of armories, by which the nobility and gentry are distinguished from the other ranks of the people, and from one another. These signs of nobility with us are evidently a copy of the statues and images among the ancient Romans, which they used to expose before their houses on public days, and carried before the body at the funeral of a great person. These statues among them bore the resemblances of their noble ancestors. And as our coats of arms evidently were brought in the place of them, we may date the origin of heraldry in England, as now practised, from the time of the subversion of the Roman empire by the Goths and Vandals; who, as they destroyed many liberal arts, so they seem, in return, to have given birth to the science of heraldry; for which their posterity, it must

be confessed, are under few obligations. These warlike nations, having subdued the Roman empire and raised their glory by military service, became fond of the achievements of their ancestors and great men, and derived their ensigns and titles of honor from what concerned a soldier. They first distinguished the whole community into three ranks, which they named according to the different orders of military, miles, eques, and scutifer; and their posterity, willing to commemorate their honors, reserved to themselves their military ensigns, and these became what we call bearings, or arms, the marks of gentility or of families, some one of which had once deserved an elevation above the common rank of men. While the direct descendant of this honorable person carried his ensigns of honor for his distinction, the collateral branches also were ambitious of preserving the memory of their having belonged to such an honorable house; and therefore assumed the same figure, but with some difference, to distinguish the distance from the original claim. In process of time, other families, who had deserved as well of their prince and country, whether in civil or military affairs, became desirous of the same sort of distinction, by way of perpetual memorial of their services; and upon this occasion many other devices were formed into arms, and continued down to posterity in their several families. Armorial bearings, in the tenth and eleventh centuries, were single and plain, consisting only of few figures. Charges, differences, quarterings, &c. are the inventions of later times. See **HERALDRY**.

BEARING, in navigation, an arch of the horizon intercepted between the nearest meridian and any distant object, either discovered by the eye, or resulting from the sinical proposition; as in the first case, at four P. M. Cape Spado, in the isle of Candia, bore south by west by the compass. In the second, the longitudes and latitudes of any two places being given, and consequently the difference of latitude and longitude between them, the bearing from one to the other is discovered by the following analogy:—As the meridional difference of latitude is to the difference of longitude, so is radius to the tangent bearing. Bearing is also the situation of any distant object, estimated from some part of the ship according to her position. In this sense, an object so discovered must be either a-head, a-stern, a-breast, on the bow, or on the quarter. These bearings, therefore, which may be called mechanical, are on the beam, before the beam, abaft the beam, on the bow, on the quarter, a-head, or a-stern. If the ship sails with a side wind it alters the names of such bearings in some measure, since a distant object on the beam is then said to be to leeward or to windward; on the lee-quarter or bow, and on the weather-quarter or bow.

BEARING, in sea language. When a ship sails towards the shore, before the wind, she is said to bear in with the land or harbour. To let the ship sail more before the wind, is to bear up. To put her right before the wind, is to bear round. A ship that keeps off from the land is said to bear off. When a ship that was to windward comes under a ship's stern, and so gives her the wind,

she is said to bear under her lee, &c. There is another sense of this word, in reference to the burden of a ship; for they say a ship bears, when, having too slender or lean a quarter, she will sink too deep into the water with an over-light freight, and thereby can carry but a small quantity of goods.

BEARING AWAY (as well as Bearing up) is improperly used to denote the act of changing the course of a ship, in order to make her sail before the wind, after she had sailed some time with a side-wind, or close-hauled.

BEARING OF AN ARCH, OR VAULT, denotes the effort which the stones make to separate by their gravity the piers or piedroits. This amounts to the same with what the French call *poussée*. See **POUSSEE**.

BEARING OF AN ORGAN PIPE denotes an error or variation from the just sound it ought to yield.

BEARING OF A STAG, in hunting, is used in respect of the state of his head, or the croches which he bears on his horns. If one is asked what a stag bears, he has only to reckon the croches, but never to express an odd number; as, if he had four croches on his near horn, and five on his far, a huntsman will say he bears ten, a false right on his near horn; if but four on the near horn, and six on the far horn, he will say he bears twelve, a double false right on the near horn.

BEARING OFF is used by seaman, generally in business belonging to shipping, for thrusting off. Thus in hoisting any thing into the ship, if it has caught hold of any part of the ship, or become any way entangled, they say, bear it off from the ship's side. So if they would have the breadth or mouth of a piece of ordnance, &c. put from them, they say, bear off, or bear about the broad.

BEARING SAIL WELL is said of a ship, when she lies still-guided ship, and will not couch down on a side with a great deal of sail. When a ship is said to bear out her ordnance, it is meant, that her ordnance lies so high, and she will go so upright, that in no sensible fighting weather, she will be obliged to take point her lower tier, and not be forced to shut in her ports. The ship is said to overbear another, when it is able, in a top gale of wind, to carry out more sails, viz. a top sail more, or the like.

BEAUNE, an elevated province of France bounded on the east by Burgundy, on the south by the mountains of Auvergne, on the west by Soule and part of Navarre, and on the north by Gascony, and Armagnac. It had the title of Vicomté as early as the ninth century. It was afterwards raised to a principality, and belonged, with Navarre, to Henry IV. when he came to the crown. His son, Louis XIII. united it, with that part of Navarre which was possessed by the house of Albret, to France, in 1620. It now forms with Basques, the department of the lower Pyrenees, and is about sixteen leagues in length, and twelve in breadth. In general it is barren, yet the plains yield considerable quantities of flax, and Indian corn. It is also rich in mines of iron, copper, and coal, and has great quantities of diamonds. The capital is Pau, in Gascony.

BEARN, a city and canton of Switzerland. See **BERN**.

BEAST, **BEASTLIKE**, **BEASTLINESS**, **BEASTLY**, **BEASTLIHOOD**, **BEASTINGS**, } *Beste*, Fr. *bestia*, Latin; an animal distinguished from birds, insects, fishes, and man; an irrational creature; or a brutal savage man, who practises any thing contrary to the decencies of life and the dictates of humanity.

If that the good man, that the *bestes* oweth,
Wol every weke, er that the cock him croweth
Fasting ydrinken of this well a draught,
As thilke holy Jew our eldre taught,
His *bestes* and his store shall multiple.

Chaucer. Pardoner's Tale.

A *beastli* man parsefueth not tho thingis that ben
of the spyrít of God, for it is foli to him.

Wickliff. 1 Cor. chap. iii.

They held this land, and with their filthiness
Polluted this same gentle soil long time;
That their own mother loath'd their *beastliness*,
And 'gan abhor her brood's unkindly crime.

Spenser. Faerie Queene.

And all wyld *beasts*, made vassals of his pleasures,
And with their spoyles enlarged his private treasures.

Id. Mother Hubbard's Tale.

Not that I being a *beast*, she would have me;
but that she, being a very *beastly* creature, lays claim
to me.

Shakspeare.

With lewd, profane, and *beastly* phrase,
To catch the world's loose laughter or vain gase.

Ben Jonson.

So may we see a little lionet,
When newly whelp't, a weak and tender thing,
Despis'd by ev'ry *beast*; but waxen great,
When fuller times full strength and courage bring,
The *beasts* all crouchen low, their king adore,
And dare not see what they contemn'd before;
The trembling forest quakes at his affrighted roar.

Fletcher. Purple Island.

The sixth, and of creation last, arose
With evening harps and matin, when God said,
Let th' earth bring forth soul living in her kind,
Cattle and creeping things, and *beasts* of th' earth,
Each in their kind.

Milton.

Here sat she by these musked eglantines;
The happy flowers seem yet the print to bear:
Her voice did sweeten here thy sugar'd lines
To which winds, trees, *beasts*, birds, did lend an ear.

Drummond.

Heaven's king
Keeps register of every thing:
And nothing may we use in vain,
Ev'n *beasts* must be with justice slain

Marvell. Wounded Fawn.

Beast of a bird! supinely when he might
Lie snug and sleep, to rise before the light!
What if his dull forefathers us'd that cry,
Could he not let a bad example die.

Dryden.

Medea's charms were there, Circean feasts
With bows that turn'd enamour'd youths to *beasts*.

Id.

It is charged upon the gentlemen of the army,
that the *beastly* vice of drinking to excess hath been
lately, from their example, restored among us. *Swift*
Man cares for all! to birds he gives his woods.

To *beasts* his pastures, and to fish his floods.

Pope.

O ye woods, spread your branches apace;

To your deepest recesses I fly;

I would hide with the *beasts* of the chase,

I would vanish from every eye.

Shenstone. Pastorals.

Inspiring dumb

And helpless victims with a sense so keen
Of injury, with such knowledge of their strength,
And such sagacity to take revenge,
That oft the *beast* has seem'd to judge the man.

Couper. Task. b. vi.

BEAST, among gamesters, a game at cards, played in this manner: the best cards are the king, queen, &c. whereof they make three heaps, the king, the play, the troilet. Three, four, or five may play, and to every one is dealt five cards. But before the play begins, every one stakes to the three heaps. He that wins most tricks, takes up the heap called the play: he that has the king, takes up the heap so called: and he that has three of any sort, that is three fours, three fives, three sixes, &c. takes up the troilet heap.

BEAST, at ombre, is when the player, or person that undertakes the game, loses it to the other two, the penalty of which is a forfeiture equal to the stake played for.

BEAT, *v. n.* } Sax. *beatun, beotan*, Germ.
BEATER, } *batten*, French, *battre*, to strike,
BEATING. } either with gentleness or violence, with or without an instrumental medium; mechanical or animal motion, rising and falling, or terminating on an object, it is used metaphorically, and applied to almost every kind of regular or repeated motion.

To BEAT DOWN, is to lessen, to depress, to repel, or to conquer.

To BEAT UP, is to attack suddenly; to alarm.

To BEAT IN, is to impress or to inculcate by frequent repetition.

To BEAT-ABOUT. To try different ways; to search; to hunt for any thing.

And oftentimes I finde that thei mette
With bloody strokis, and with wordis grete
Assaying how ther speris weren whette,
And God it wote with many a cruel hete
Gan Troilus upon his helme to bete:
But nathelesse Fortune it naught n would
Of eithers honde that either dyen should.

Chaucer. Troilus and Creseide.

And now the westerne winde bloweth sore,
That now is in his chief soveraigntee
Beating the withered leafe from the tree. *Spenser.*

They've chose a consul that will from them take
Their liberties; make them of no more voice
Than dogs, that are often *beat* for barking.

Shakspeare.

Mistress Ford, good heart, is *beaten* black and blue,
that you cannot see a white spot about her. *Id.*

Bid them come forth and hear
Or at their chamber door I'll *beat* the drum,
Till it cry, sleep to death. *Id.*

A turn or two I'll walk,
To still my *beating* mind. *Id.*

The tempest in my mind
Doth from my senses take all feeling else,
Save what *beats* there. *Id.*

It is strange how long some men will lie in wait to speak, and how many other matters they will *beat* over to come near it. *Bacon.*

We are drawn on into a larger speech, by reason of their so great earnestness, who *beat* more and more upon these last alleged words. *Hooker.*

How frequently and fervently doth the scripture *beat* upon this cause! *Hakewell.*

Beyond this flood a frozen continent

Lies dark and wild, *beat* with perpetual storms
Of whirlwind and dire hail. *Milton.*
They lay in that quiet posture, without making the least impression upon the enemy by *beating* up his quarters, which might easily have been done. *Clarendon.*

Tho' oft bound to peace
Yet he never would cease
To vex his poor neighbours with quarrels,
And when he was *beat*
He still made his retreat
To his Clevelands, his bells, and his Carwells. *Marvell.*

Some have been *beaten* till they know
What wood a cudgel's of by the blow;
Some kick'd until they can feel whether
A shoe be Spanish or neat's leather.

Butler's Hudibras.

He, with a careless *beat*
Struck out the mute creation at a *beat.* *Dryden.*
Surveys rich moveables with curious eye,
Beats down the price, and threatens still to buy. *Id.*
My temperate pulse does regularly *beat*;
Feel and be satisfied. *Id.*
When from the cave thou risest with the day
To *beat* the woods, and rouse the bounding prey. *Prior.*

I am always *beating* about in my thoughts for something that may turn to the benefit of my dear countrymen. *Addison.*

She persuaded him to trust the renegade with the money he had brought over for their ransom; as not questioning but he would *beat* down the terms of it. *Id.*

Our warriors propagating the French language, at the same time they are *beating* down their power. *Id.*

Such an unlook'd-for storm of ills falls on me,
It *beats* down all my strength. *Id.*

Will fancies he should never have been the man he is, had not he knocked down constables, and *beat* up a lewd woman's quarters, when he he was a young fellow. *Id.*

One sees many hollow spaces worn in the bottoms of the rocks, as they are more or less able to resist the impression of the water that *beats* against them. *Id.*

To find an honest man, I *beat* about,
And love him, court him, praise him, in or out. *Pope.*

A man's heart *beats*, and the blood circulates, which it is not in his power, by any thought or volition, to stop. *Locke.*

I would gladly understand the formation of a soul, and see it *beat* the first conscious pulse. *Collier.*

I remember, that once lying a bed, and having been put into a fright, I heard my own heart *beat*, but I took it to be one knocking at the door oftener than one, before I discovered that the sound was in my own heart. *Reid. Enquiry into the Human Mind.*

BEAT, in fencing, denotes a blow or stroke given with the sword. There are two kinds of beats; the first performed by the foible of a man's sword, on the foible of his adversary's, which in the schools is commonly called batterie, from the French *battre*, and is chiefly used in a pursuit, to make an open upon the adversary. The second, and best kind of beat, is performed with the fort of a man's sword upon the foible of his adversary's, not with a spring, as in binding, but with a jerk or dry beat, and is therefore most proper for the parades without or within the sword, because of the rebound a man's sword

has thereby from his adversary's, whereby he procures to himself the better and surer opportunity of riposting.

BEAT OF DRUM, in the military art, is differently performed, according to the different purposes intended. Notice is given by it of any sudden danger; or, that scattered soldiers may repair to their arms and quarters: these are called beating an alarm, or to arms. It is also intended to signify, according to the different manners of sounding the drum, that the soldiers are to fall on the enemy: to retreat before, during, or after an attack; to move or march from one place to another: to come out of their quarters, to repair to their colors, &c.

BEATS of a watch or clock, are the strokes made by the fangs or pallets of the spindle of the balance, or of the pads in a royal pendulum. To find the beats of the balance in any watch, or in one turn of any wheel:—Having found the number of turns, which the crown wheel makes in one turn of the wheel you seek for; those turns of the crown-wheel, multiplied by its notches, give half the number of beats in that one turn of the wheel: for the balance or swing has two strokes to every tooth of the crown wheel, inasmuch as each of the two pallets has its blow against each tooth of the crown wheel; whence it is, that a pendulum which beats seconds, has in its crown-wheel only thirty teeth. To explain this, suppose the numbers of a sixteen hour watch, wherein the pinion of report is 4, the dial-wheel 32, the great wheel 55, the pinion of the second wheel 5, &c. The number of the notches in the crown-wheel 17, being multiplied into 6336, (the product arising from the continual multiplication of the quotients 8, 11, 9, 8,) gives 107,712, for half the number of

4) 32 (8

5) 55 (11

5) 45 (9

5) 40 (8

17

beats in one turn of the dial-wheel; for 8 times 17 is 136, which is half the number of beats in one turn of the contrate-wheel 40; and 9 times 136 is 1224, the half beats in one turn of the second wheel; and 11 times 1224 is 13,464, the half-beats in one turn of the great wheel 55; and 8 times 13,464, makes 107,712. Multiply this by the two pallets, i. e. double it, it gives 215,424, which is the number of beats in one turn of the dial wheel, in 12 hours. To know how many beats this watch has in an hour, divide the beats in 12 hours into 12 parts, and it gives 17,952, which is called the train of the watch, or the beats in an hour. If this be divided into 60 parts, it gives 299 and a little more for the beats in a minute, and so you may proceed to seconds or thirds. By the beats and turns of the fusee, the hours that any watch will go may be found, thus: As the beats of the balance in one hour are to the beats in one turn of the fusee, so is the number of the turns of the fusee, to the continuance of the watch's going. Thus 20196 : 26928 :: 12 : 16. To find the beats of the balance in one turn of the fusee, say, as the number of turns of the fusee, to the continuance of the watch's going in hours, so are the beats in one hour, to the beats of one turn of the fusee: as, 12 : 16 :: 20196 : 26928. To find the beats of the balance in an hour, say, as the hours of the watch's going to the number of turns of the fusee, so are the beats in one turn

of the fusee, to the beats of an hour, thus, 16 : 12 :: 26928 : 20196. *Derham's Artificial Clock Maker*, p. 14, &c. and 22. See also **CLOCK-MAKING**.

To **BEAT AN ALARM**, in military affairs, is to give notice by beat of drum of some sudden danger.

To **BEAT A CHARGE**, is to give the signal to fall upon the enemy.

To **BEAT THE GENERAL**, is to give notice to the forces that they are to march.

To **BEAT THE REVEILLE**, is to give leave, by beat of drum at day-break, to come out of quarters.

To **BEAT THE TATTOO** is to give notice to all to retire to their quarters.

To **BEAT THE TROOP** is to give notice to all to repair to their colors.

To **BEAT UPON THE HAND**, or to **CHACK**, in the menage, is spoken of a horse, when his head is not steady, but he tosses up his nose and shakes it all of a sudden, to avoid the subjection of the bridle. Turkish horses are very subject to this fault. When they beat upon the hand neither the best bits, nor the best hand, can fix their heads. Croatian horses are also very apt to beat upon the hand; their bars being too sharp and ridged, so that they cannot bear the pressure of the most gentle bit. It is from this excess of sensibility of the mouth that a horse is apt to chack; but in order to secure his head it is only necessary to put a small flat band of iron, beat arch-ways, under his noseband, which answers as a martingale. This will hinder him to beat upon the hand, but will not break him of the habit; for, as soon as the martingale is taken off, he will fall into the same vice again.

BEATA, Lat. i. e. the blessed, one of the many titles given to the Virgin Mary by the Roman Catholics.

BEATER, in manufacturing, is applied to divers sorts of workmen, whose business is to hammer or flatten certain matters, particularly metals. Thus, 1. **GOLD-BEATERS** are artisans who, by beating gold and silver with a hammer on a marble, in moulds of vellum and bullocks' guts, reduce them to thin leaves, fit for gilding, or silvering of copper, iron, steel, wood &c. Gold-beaters differ from flatters of gold or silver; as the former bring their metal into leaves by the hammer, whereas the latter only flatten it by pressing it through a mill preparatory to beating. 2. **TIN-BEATERS** are employed in the looking-glass trade, whose business is to beat tin on large blocks of marble, till it be reduced to thin leaves, fit to be applied with quicksilver behind looking-glasses. See **FOLIATING** and **GOLD-BEATING**.

BEATH, Ang.-Sax. bethian, bathian, to steep, dip, or bathe. In Suffolk and Norfolk, *beathing* or *bathing* wood by the fire, means straitening unseasoned wood by heat; and this is much the same as Spenser's meaning in the example. To bathe or warm in fire so as to harden.—*Todd's Johnson*.

And in his hand a tall young oake he bore
Whose knotie snags were sharpen'd all afore,
And *beath'd* in fire for Steele to be insted.

Spenser. Faerie Queene.

BEATIFICALLY, } From *beatus, beatifico*,
BEATIFICATION, } to be happy; to make
BEATIFICK, } happy with the completion
BEATIFY, } of celestial enjoyment. It
BEATITUDE. } is used only of heavenly
 fruition after death. *Beati-*
fication is an acknowledgment made by the
 pope, that the person beatified is in heaven, and
 therefore may be revered as blessed; but is
 not a concession of the honors due to saints,
 which are conferred by canonisation.

Beatifically to behold the face of God, in the
 fullness of wisdom, righteousness, and peace, is blessed-
 ness no way incident unto the creatures beneath man.
Hakevill.

If at the conversion of a sinner there is joy before
 the *beatified* spirits, the angels of God, and that is the
 consummation of our pardon and our consignation to
 felicity; then we may imagine how great an evil it
 is to grieve the spirit of God, who is greater than
 the angels. *Jeremy Taylor.*

In midst of this city celestial,
 Where the eternal temple should have rose,
 Lighten'd the idea *beatifical*
 End, and beginning, of each thing that grows.
Giles Fletcher.

Admiring the riches of heaven's pavement
 Than aught divine or holy else, enjoy'd
 In vision *beatifick*. *Milton.*

About him all the sanctities of heav'n
 Stood thick as stars, and from his sight received
Beatitude past utterance. *Id.*

It is also their felicity to have no faith; for enjoy-
 ing the *beatifical* vision in the fruition of the object of
 faith, they have received the full evacuation of it.
Brown's Vulgar Errors.

He set out the felicity of his heaven, by the delights
 of sense; slightly passing over the accomplishment of
 the soul, and the *beatitude* of that part which earth
 and visibilities too weakly affect. *Id.*

We shall know him to be the fullest good, the
 nearest to us, and the most certain; and consequently
 the most *beatifying* of all others. *Brown.*

We may contemplate upon the greatness and
 strangeness of the *beatifick* vision; how a created eye
 should be so fortified, as to bear all those glories that
 stream from the fountain of uncreated light. *South.*

The obedient, and the men of practice, are those
 sons of light, that shall outgrow all their doubts and
 ignorances, that shall ride upon these clouds, and
 triumph over their present imperfections, till persua-
 sion pass into knowledge, and knowledge advance
 into assurance, and all come at length to be com-
 pleted in the *beatifick* vision, and a full fruition of
 those joys which God has in reserve for them, whom
 by his grace he shall prepare for glory.
South's Sermons.

This is the image and little representation of hea-
 ven; it is *beatitude* in picture. *Taylor.*

The use of spiritual conference is unimaginable and
 unspeakable, especially if free and unrestrained, bearing
 an image of that conversation which is among
 angels and *beatified* saints. *Hammond.*

I wish I had the wings of an angel, to have as-
 cended into Paradise, and to have beheld the forms
 of those *beatified* spirits from which I might have cop-
 ied my archangel. *Dryden.*

Over against this church stands an hospital erected
 by a shoemaker, who has been *beatified*, though never
 sainted. *Addison.*

For you alone his raptures can describe,
 And stem the impetuous joys that rise
 Within your breasts when all unveil'd you view,
 The wonders of the *beatifick* sight. *Mrs. Rowe.*

BEATIFICATION, in ecclesiastical affairs, an act
 by which the pope declares a person *beatified*, or
 blessed, after his death. It is the first step
 towards canonisation, or raising any one to the
 honor and dignity of a saint. No person can be
beatified till fifty years after his or her death.
 All certificates or attestations of virtues and mi-
 racles, the necessary qualifications for saintsship,
 are examined by the congregation of rites. This
 examination often continues for several years;
 after which his holiness decrees the *beatification*.
 The corpse and relics of the future saint are from
 thenceforth exposed to the veneration of all good
 Christians; his image is crowned with rays, and a
 particular office is set apart for him; but his
 body and relics are not carried in procession.
 Indulgences likewise, and remissions of sins, are
 granted on the day of his *beatification*; which,
 though not so pompous as that of canonisation, is
 however very splendid. *Beatification* differs from
 canonisation in this, that the pope does not act as
 a judge in determining the state of the *beatified*,
 but only grants a privilege to certain persons to
 honor him by a particular religious worship,
 without incurring the penalty of superstitious
 worshippers; but in canonisation the pope speaks
 as a judge, and determines, *ex cathedra*, upon the
 state of the canonised. *Beatification* was intro-
 duced when it was thought proper to delay the
 canonisation of saints, for the greater assurance
 of the truth of the steps taken in the procedure,
 Some particular orders of monks have assumed to
 themselves the power of *beatification*. Thus
 Octavia Melchiorica was *beatified* with extraor-
 dinary ceremonies by the Dominicans.

BEATING, in book-binding. See **BOOK-
 BINDING**.

BEATING, in English law. See **BATTERY**.

BEATING, in hunting, a term used of a stag,
 which runs first one way and then another.
 He is then said to beat up and down.—The noise
 made by conies in rutting time is also called *beat-*
ing or tapping.

BEATING, or **PULSATION**, in medicine, is ap-
 plied to the reciprocal agitation or palpitation of
 the heart and pulse, or arteries. Some physici-
 ans distinguish eighty-one different kinds of
 simple beatings, and fifteen compound ones.
 They compute sixty beats in the space of a
 minute as the proper number in a temperate
 man; but, in fact, we generally find a greater
 number.

BEATING, in navigation, the operation of mak-
 ing a progress at sea against the direction of
 the wind in a zig-zag line, or traverse, like that in
 which we ascend a steep hill. See **TACKING**.

BEATING, in paper-making, signifies the *beat-*
ing of paper on a stone with a heavy hammer,
 with a large smooth head and a short handle, in
 order to render it more smooth and uniform, and
 fit for writing. Engines driven by water are now
 used.

BEATING FLAX, or **HEMP**, is an operation in
 the dressing of these substances, to render them
 more soft and pliant. When hemp has been

swinged a second time, and the hurds laid by, they take the strikes, and, dividing them into dozens and half-dozens, make them up into large thick rolls, which, being broached on long strikes, are set to dry; after which they lay them in a round trough made for the purpose, and there beat them well with beetles till they handle both without and within as pliant as possible, without any hardness or roughness to be felt: that done, they take them from the trough, open and divide the strikes as before, and, if any be found not sufficiently beaten, they roll them up and beat them over again. Beating hemp is a punishment that was often inflicted on loose or disorderly persons, in houses of correction, before the happy invention of the tread-mill!

BEATING, or inflicting stripes, on the person, was one of the most ancient, as well as universal, species of punishment. Among the Romans it obtained, under the denomination of *verberatio*, *fustigatio*, *flagellatio*, *pulsatio*, &c. In the East it still prevails, under the name of *BASTONADO*, which see.

BEATING THE WIND was a practice in use in the ancient method of trial by combat. If either of the combatants did not appear in the field, at the time appointed, the other was to beat the wind, or make so many flourishes with his weapon; by which he was entitled to all the advantages of a conqueror. Perhaps St. Paul alludes to this 1 Cor. ix. 26.

BEATING TIME, in music, a method of measuring and marking the time for performers in concert, by a motion of the hand and foot up or down successively, and in equal times. Known as the true time of a crotchet, and supposing the measure actually subdivided into four crotchets, and the half measure into two, the hand or foot being up, if we put it down with the very beginning of the first note or crotchet, and then raise it with the third, and then down with the beginning of the next measure: this is called beating the time; and, by practice, a habit is acquired of making the motion very equal. Each motion down and up is called a time or measure. The general rule is, to contrive the division of the measure so, that every down and up of the beating shall end with a particular note, on which greatly depends the distinctness; and, as it were, the sense of the melody. Hence the beginning of every time or beating in the measure is reckoned the accented part of it. Beating time is denoted, in the Italian music, by the term of a *battuta*, which is usually put after what they call *recitativo*, where little or no time is observed, to denote that here they are to be in again to mark or beat the time exactly. The Romans aimed at somewhat of harmony in the strokes of their oars; and had an officer called *pontifex* in each galley, whose business was to beat time with the rowers, sometimes by a pole or mallet, and sometimes only by his voice. The ancients marked the rhythm in their musical compositions: but, to make it more observable in the practice, they beat the measure of time in different manners. The most usual consisted in a motion of the foot, which was raised from, and struck alternately against, the ground, according to the *moderato* method. Doing this was commonly the province of the

master of the music, who was thence called *μεσοχορος*, and *κορυφαιος*, because placed in the middle of the choir of musicians, and in an elevated situation, to be seen and heard more easily by the whole company. These beaters of measure were also called by the Greeks *ποδοκτυποι*, and *ποδοφιροι*, because of the noise of their feet; and *συντοναριοι*, because of the uniformity or monotony of the rhythm. The Latins denominated them *podarii*, *pedarii* and *pedicularii*. To make the beats or strokes more audible, their feet were generally shod with a sort of sandals, either of wood or iron, called by the Greeks *κρουπιζα*, *κρουπαλα*, *κρουπητα*, and by the Latins *pedicula*, *scabella*, or *scabilla*, because resembling little stools or foot-stools. Sometimes they beat upon sonorous foot-stools, with the foot shod with a wooden or iron sole. They beat the measure not only with the foot, but also with the right hand, all the fingers of which they joined together, to strike into the hollow of the left. He who thus marked the rhythm, was called *manuductor*. The ancients also beat time with shells, as oyster shells and bones of animals, which they struck against one another, much as the moderns now use castanets, and the like instruments. This the Greeks called *κρημβαλιαζων*, as is noted by Hesychius. The scholiast on Aristophanes speaks much to the same purpose. Other noisy instruments, as drums, cymbals, citterns, &c., were also used on the same occasion. They beat the measure generally in two equal or unequal times; at least, this holds of the usual rhythm of a piece of music, marked either by the noise of sandals, or the slapping of the hands. But the other rhythmic instruments last-mentioned, and which were used principally to excite and animate the dancers, marked the cadence after another manner; that is, the number of their percussions equalled, or even sometimes surpassed, that of the different sounds which composed the air or song played.

BEATITUDE, in divinity, denotes the fruition of God in a future life to all eternity. Beatitude is also used in speaking of the theses contained in Christ's sermon on the mount, whereby he pronounces the poor in spirit, those that mourn, the meek, &c., blessed.

BEATITUDE, in ecclesiastical affairs, was a title anciently given to all bishops; but of latter days has been restrained to the pope. It appears to have been sometimes also given to laymen.

BEATON (David), archbishop of St. Andrew's, and a cardinal of Rome, in the early part of the sixteenth century, was born in 1494. Pope Paul III. raised him to the degree of a cardinal in December 1538; and being employed by James V. in negotiating his marriage with the court of France, he was there consecrated bishop of Mirepoix. Soon after his instalment as archbishop of St. Andrew's, he promoted a furious persecution of the reformers in Scotland; but the king's death put a stop, for a time, to his arbitrary proceedings, he being then excluded from affairs of government, and confined. He raised, however, so strong a party, that, upon the coronation of the young queen Mary, he was admitted in the council, made chancellor, and procured a commission as legate à latere from the court of Rome.

He now began to renew his persecution of heretics : and, among the rest, of the famous protestant preacher George Wishart, whose sufferings at the stake he viewed from his window with apparent exultation. It is said, that Wishart, at his death, retold the murder of Beaton, which indeed happened shortly after, he being assassinated in his chamber, May 29th, 1547. Beaton had great talents, and vices that were no less conspicuous.

BEATON (James), a nephew of the archbishop, was born at Balfour, in 1530, and raised to the archbishopric of Glasgow, when about twenty-five years of age. In 1560 he collected the sacred vessels and records belonging to his cathedral, and embarked for France, where he died in 1603. He wrote a history of Scotland, but it was never printed.

BEATORUM INSULA, in ancient geography, was seven days journey west of Thebæ, a district of the Nomos Oasites, and called an island, because surrounded with sand, like an island with water; yet abounding in all the necessaries of life. Some suppose it to have been a third Oasis, in the Regio Ammoniaca; and the site of the temple of Ammon answers to the above description, as appears from the writers on Alexander's expedition thither. Ulpian says, it was a place of banishment for criminals from which there was no escape.

BEATSON (Robert), an ingenious and extensive compiler of books, was born in 1742 at Dysart, in the county of Fife. At the age of fourteen he entered into the army, but rising no higher than to the rank of lieutenant, turned his attention to literature as a profession, and in 1786 published *A Political Index to the Histories of Great Britain and Ireland*, of which there have been three editions. In 1790 appeared his *Naval and Military Memoirs of Great Britain*, in 3 vols. 8vo., to which he subsequently added three more; and in 1807 a *Chronological Register of both Houses of Parliament from the Union*. He obtained the degree of doctor of laws from the university of Edinburgh, and was a member of the Royal Society of Scotland. He died in 1818. He was also the author of an *Essay on vertical and horizontal Windmills*.

BEATTIE (James), LL. D., professor of moral philosophy and logic in the Marischal college, Aberdeen, was born in Kincardineshire, in 1735. His father, who kept a small shop in Laurencekirk, and rented a farm in the neighbourhood, gave him all the education which could be obtained at the parish school, and afterwards sent him to the university of Aberdeen. There he pursued his studies with great diligence, and was soon preferred to a bursary. Having continued four years at the university, studying philosophy and divinity, with a view to the established church, and no prospect opening for him, he accepted in 1753, of the office of schoolmaster and parish clerk in the parish of Fordun. Here he continued four years, little known or noticed. In 1758 he was appointed one of the ushers to the grammar school of Aberdeen, and soon after gained attention among the men of letters in the university. In 1760 he published a small volume of original poems and translations, and the same year was appointed professor of philosophy; the

duties of which situation he continued to discharge till within a short time of his death. Aberdeen could at this period boast of Drs. Campbell, Gerard, Gregory, and Reid, among its professors; and the benefits which their new associate must have derived from such company, were rendered still more invaluable, by the harmony in which they lived with each other, and the familiar manner in which they communicated their sentiments. In a kind of literary club, which met twice a month, they discussed freely all the topics of literature and philosophy which occurred to any of them; and it was in this society that those speculations took their rise, which have since made their names so familiar to all who read for instruction. In 1763 Mr. Beattie visited London, and in 1765 published his *Judgment of Paris*; this year also, he became acquainted with the poet Gray, and continued in close friendship with him while he lived. In 1767 he married a daughter of Dr. Dun, master of the grammar school; and about this time seems to have begun his *Minstrel*, and his *Essay on the Nature and Immutability of Truth*; the latter of which was published in 1770. It was designed particularly to oppose the philosophy of Hume, who is said to have been so sensible of the strength of its arguments and popularity, that he never afterwards could hear the name of Beattie mentioned without displeasure. In 1771 appeared the first canto of that beautiful poem, *The Minstrel*, which was completed in 1774, and in a very short time ran through several editions. In a second journey to London, he was introduced by his friend Dr. Gregory to Mrs. Montagu, and to all the distinguished literary society then in the metropolis. He visited London a third time in 1773, and associated for some months with Drs. Johnson, Porteus, and other eminent men. About this time he received an honorary degree of LL.D. from Oxford; and obtained a pension from the king of £200 per annum. He had also the honor of an interview with their majesties. This year there was a proposal for transferring Dr. Beattie to the university of Edinburgh, but he declined it; and in 1774 two offers were made him in the church of England, one of them a living of £500 a year, with views of further preferment; but these he also declined. Dr. Priestley at this time made an attack upon him, of which, however, he took no notice. In 1776 he published a volume of *Essays*; and in 1783, *Dissertations Moral and Critical*, in one volume 4to. At the recommendation of the bishop of London, in 1786, he published two small volumes on the *Evidences of the Christian Religion*; and in 1790 the *Elements of Moral Science*, being the outlines of his academical lectures. Dr. Beattie was very much tried by domestic affliction: his wife became the victim of hereditary insanity, and his two sons, James Hay and Montagu, died successively, after attaining to manhood. The situation of his wife, and the precarious state of his own health, had sunk him into an habitual depression; but the death of his eldest son James, who had been conjoined with him in the professorship, was so severe a shock to him that he never recovered from it. But the sudden death of his only remaining child

in 1796, completely unbiassed his mind; the first symptom of which was a temporary, but almost total loss of memory, respecting his son. At this time, after searching in every room in the house, he would say to his niece, Mrs. Glennie, 'You may think it strange, but I must ask you if I have a son, and where he is?' She then felt herself,' says Sir William Forbes, 'under the painful necessity of bringing to his recollection his son Montagu's sufferings, which always restored him to reason.' And he would often, with many tears, express his thankfulness that he had no child, saying, 'How could I have borne to see their elegant minds mangled with madness!' When he looked for the last time on the dead body of his son, he said, 'I have now done with the world.' His last publication was *An Account of the Life, Character, and Writings of James Hay Beattie*. His spirits from this period were never restored, and his health continued gradually to decline, till, in 1799, he was struck with palsy; and, after being reduced to a state of permanent insensibility, this excellent man, all of whose labors tended to enlighten and benefit mankind, expired in June, 1803.

BEAU', } From the Fr. *beau*, good, gay,
BEAU'ISH, } fine. The plural *beaux* is now
BEAU'SHIP, } Anglicised. A *beau* is a man of dress, whose great care is to deck his person. Vulgarly employed to designate a lover, who of course must be a smart fellow. A *beau* was the dandy of the last age, as a dandy is the fop of the present.

What will not *beaux* attempt to please the fair.

Dryden.

The water nymphs are too unkind
To Vill'roy; are the land nymphs so?
And fly they all, at once combin'd
To staine a general, and a *beau*?

Prior.

You will become the Delight of nine ladies in ten,
and the envy of ninety-nine *beaux* in a hundred.

Swift.

A youth more glittering than a birth-night *beau*,
That even in slumber caus'd her cheek to glow.

Pope. Rape of the Lock.

With varying vanities from ev'ry part,
They shift the moving toy-shop of their heart,
Where wigs with wigs, with sword-knots sword-knots
strive,

Beaux banish *beaux*, and coaches coaches drive.
The ermine mortals Ev'ity may call,
Oh blind to truth! the sylphs contrive it all.

Id.

Just at that time of life, when a man by rule,
The top laid down, takes up the graver fool,
He started up a fop, and fond of show
Look'd like another He held'st starr'd *beau*.

Churchill.

BEAUCHE (Charles de), a learned French author, born at Paris in 1701. He became professor in the Royal College, and secretary of the Academy of Inscriptions. He wrote a history of the Lower Empire, in 22 vols. which is much esteemed; also *Opera Latina*, published at Paris five years after his death, in 3 vols. 12mo. He died at Paris in 1773.

BEAUCHE (John Lewis de), brother of Charles, was also a man of considerable learning. He was born at Paris in 1721, and became professor of rhetoric in the college of the Sorbonne, and mem-

ber of the academy of inscriptions. In 1746 he published an edition of Homer in Greek and Latin, 2 vols.: and in 1750, the *Orations of Cicero*, 3 vols.: also a Discourse on the Poverty of the Learned. He died in 1766.

BEAUBASSIN, a bay in the straits of Magellan, on the coast of Terra del Fuego, so named by Bougainville. According to his account, there is good anchorage in it from forty to twelve fathoms; the bottom of sand, small gravel, and shells. Long. 71° 13' W., lat. 54° 22' S.

BEAUCAIRE, a town of France, in the department of the Gard and ci-devant province of Languedoc, on the Rhone, opposite to Tarascon, with which it has a communication by a bridge of boats. The fair of the Magdalen, which is held July 22, partly in the town, and partly under tents in an adjacent valley, for seven days, is one of the most famous in Europe, though of late it has declined. Beaucaire is ten miles east of Nismes. The canal of Aigues Mortes now extends to this town, where it communicates with the Rhone. On the Rhone, opposite Tarascon, are the picturesque ruins of an old castle. Its population is stated to be 8500. Long. 4° 39' E., lat. 43° 50' N.

BEAUCE, one of the former provinces of France, famous for its fertility in grain. It was situated between Perche, the Isle of France, the Blaisois, and the Orleansais, Chartres was its capital. Beauce now forms a part of the department of the Eure and Loir.

BEAUCLERK, PORT, a good harbour in an island in the North Pacific, on the west coast of North America. Long. 226° 23' E., lat. 56° 17' N.

BEAUCLERK (Topham), a gentleman of whom Dr. Johnson said, referring to his conversational power and facility of expression, that his talents were those which he had felt himself more disposed to envy than those of any whom he had known. He was the son of lord Sidney Beauclerk, and was born in December 1739. In 1763 he married lady Diana Spencer, daughter of the duke of Marlborough, whose previous marriage with viscount Bolingbroke had two days before been dissolved by act of parliament. Mr. Beauclerk died at his house in Great Russell Street, Bloomsbury, March 11, 1780, leaving by his wife a son and two daughters, and a very valuable library. Lady Diana Beauclerk long survived him, and died in August 1808, at the age of seventy-four. She was a lady distinguished for her taste and skill in the arts.

BEA'VER. Sax. *befer*, Dut. *bever*, Germ. *biber*, Fr. *bicvre*, Lat. *fiba*. An animal, otherwise named the *castor*, amphibious, and remarkable for his art in building his habitation; of which many wonderful accounts are delivered by travellers. His skin is very valuable on account of the fur. Of this fur, hats of the best quality are manufactured, and therefore called *beavers*.

High on hors he sat,
And on his head a Flaundrish *bever* hat.

Chaucer

Then unto him all monstrous beasts resorted,
Bred of two kinds; as griffons, minotaurs,
Crocodiles, dragons *beavers*, and Centaures.

Spenser. Mother Hubberd's Talc.

Ha! you felt the wool of beaver?
 Or swans' down ever?
 Or have smelt o' the bud o' the briar,
 Or the nard in the fire,
 Or have tasted the bag of the bee;
 Oh, so white! Oh, so soft! Oh so sweet is she!

Ben Jonson.

They placed this invention upon the beaver, for the sagacity and wisdom of that animal; indeed from its artifice in building.

Broune's Vulgar Errors.

You see a smart rhetorician turning his hat, moulding it into different cocks, examining the lining and the button during his harangue: a deaf man would think he was cheapening a beaver, when he is talking of the fate of a nation.

Addison.

The broker here his spacious beaver wears,
 Upon his brow sit jealousies and cares.

Gay.

BEAVER, } From *baviere*, French; *baviere*,
 BEAVERED. } says Cotgrave, is the *bib*, mocket,
 or moeketer, to put before the bosom of a slaver-
 ing child; so that *baviere* or beaver, is, accord-
 ing to the Ency. Met., that part of the helmet
 which lets down to enable the wearer to drink,
 and which receives the drops or dribblings; by
 Shakspeare and others, however, as the editor
 admits, it is quite oppositely applied.

His dreadful hideous head,

Close couched on the beaver, seem'd to throw
 From flaming mouth bright sparkles fiery red.

Spenser.

Big Mairn seems bankrupt in their beggar'd host,
 And faintly through a rusty beaver peeps.

Shakspeare.

I saw young Harry,—with his beaver on,
 His cuisses on his thighs, gallantly arm'd,—
 Rise from the ground like feather'd Mercury,
 And vaulted with such ease into his seat,
 As if an angel dropp'd down from the clouds,
 To turn and wind a fiery Pegasus,
 And witch the world with noble horsemanship. *Id.*

He was slain upon a course at tilt, the splinters of
 his staff going in at his beaver.

Bacon.

His beaver'd brow a birchen garland bears,
 Dropping with infant's blood, and mother's tears.

Pope.

BEAVER, in zoology. See CASTOR.

BEAVER SKINS are a prodigious article of trade, being the foundation of the hat manufactory. In 1763 were sold, in a single sale of the Hudson's Bay Company, 54,670 skins. They vary in their colors; the finest are black, but the general color is a chestnut brown, more or less dark: some have been found, but very rarely, white. They are distinguished by the names of coat beaver, which is what has been worn as coverlets by the Indians: parchment beaver, because the lower side resembles it; and stage beaver, which is the worst, and is that which the Indians kill out of season, on their stages or journeys. Besides hats and furs, in which the beaver's hair is commonly used, they attempted in France, in 1699, to make cloths, flannels, stockings, &c. partly of beaver's hair, and partly of Segovia wool. This manufactory, which was set up at Paris, in St Anthony's suburbs, succeeded at first pretty well; and, according to the genius of the French, the novelty of the thing brought into some repute the stuffs, stockings, gloves, and cloth, made of beaver's hair. But they were found of very bad wear, and the

colors quickly faded: when they had been wet, they became dry and hard, like felt. When the hair has been cut off from the skins, to be used in the manufacture of hats, the skins are employed by trunk-makers, to cover trunks and boxes; by shoe-makers; and by turners, to make sieves, &c. Merchants distinguish beaver skins into,

1. BEAVER, DRY, which is sometimes called lean beaver, and which comes from the summer hunting at the time when these animals lose part of their hair. Though this is inferior to the new beaver, yet it may also be employed in furs; but it is chiefly used in the manufacture of hats. The French call it summer castor or beaver.

2. BEAVER, FAT, is that which has contracted a certain gross and oily humor, from the perspiration which exhales from the bodies of the savages, who wear it for some time. Though this is a better kind than the dry beaver, yet it is used only in the making hats.

3. BEAVER, NEW, or WHITE BEAVER, also called Muscovy beaver, because it is commonly kept to be sent into Russia, is that which the savages catch in their winter hunting. It is the best, and the most proper for making fine furs, because it has lost none of its hair by shedding.

BEAVER CREEK, a river of North America, which falls into lake Erie at its east end, about seven miles south-east from Fort Erie. 2. A river of North America, which falls into the Alleghany. Twenty-eight miles north-west from Pittsburgh. 3. A river of Kentucky, which runs into the Cumberland. 4. A river of Georgia, which runs into the Tennessee.

BEAVER ISLANDS, are a remarkable chain of small islands in lake Michigan, extending about thirty miles south-west. They appear beautiful, but the soil is barren.

BEAVER KILL, a river of North America, which falls into the Popachton branch of the Delaware.

BEAVER LAKE, in North America, lies in about 52° 45' N. lat., and 101° 30' W. long.

BEAVER RIVER, so called from the multitude of beavers which frequent its banks, a river of North America, which rises on the eastern side of the rocky mountains, and falls into the Yellowstone from the north.

Also a river of North America, which rises in the ridge of mountains that divides the waters which discharge themselves into Hudson's bay, from those which flow towards the Northern Ocean. It falls into Lake la Crosse, in about 56° N. lat. and 108° W. long.

BEAVER'S TOWN, a town of the United States of America, in the western territory, built in 1764. Eighty-five miles north-west of Pittsburgh.

BEAUFORT a sea-port of the United States, in Carteret, North Carolina county, North America. Fifty-five miles south by east of Newburn. Long. 77° W., lat. 34° 47' N.

BEAUFORT, a town of the United States, in South Carolina, situated on the island of Port Royal, at the mouth of Coosawhatchie river. It has an excellent harbour, and is seventy-three miles from Charlestown. Long. 80° 53' W., lat. 32° 26' N.

BEAUFORT EN VALLEE, a town of France, in

the department of the Maine and Loire, late province of Anjou, with a castle. It contains two parishes, and formerly had a convent of Recolets. Beaufort gives the title of a Duke in England to the noble family of Somerset, who are lineally descended from John of Gaunt, duke of Lancaster, whose duchess resided here. It contains 800 houses, 6000 inhabitants, and carries on an active trade in grain, wine, and hemp, with manufactures of linen and woollen stuffs, and hats. The village of Beaufort en Franchise, or Beaufort hors la Ville, is separated from this town by an arm of the river Coesnon. Fifteen miles east of Angers, and thirty-eight west of Tours.

BEAUFORT DISTRICT, a county of South Carolina, which lies on the sea-coast, between Combahee and Savannah rivers.

BEAUFORT (Henry), brother of Henry IV. king of England, was made bishop of Lincoln, whence he was translated to Winchester. He was also nominated chancellor of the kingdom, and sent ambassador to France. In 1426 he received a cardinal's hat, and was appointed legate in Germany. In 1431 he crowned Henry VI. in the great church of Paris. He died at Winchester in 1447. He was a haughty, turbulent prelate, and Shakspeare is considered as giving a true portrait of him, when he describes his last scene.

BEAUFORT (Margaret), the foundress of Christ's and St. John's colleges in Cambridge; the only daughter and heir of John Beaufort, duke of Somerset, and of Margaret Beauchamp, was born in 1411. She married in 1456 Edmund, earl of Richmond, by whom she had King Henry VII. and died in 1509, after having had two other husbands, namely, Sir Henry Stafford, and Thomas, lord Stanley, earl of Derby. By her marriage, according to bishop Fisher, with the earl of Richmond, and by her birth, she was allied to thirty kings and queens, within the fourth degree of either blood or affinity. Besides the foundation of the two colleges at Cambridge, before-mentioned, she left salaries for two divinity lecturers, one at Oxford, and the other at Cambridge; as also for a grammar-school at Wimborn, and other foundations in support of learning, of which she was not altogether deficient herself, as appears from some of her works, namely, 1. *The Mirroure of Gold for the Sinful Soul*; translated from the French version of a book entitled, *Speculum Aureum Peccatorum*. 2. A translation of the fourth book of Gerson's treatise, entitled, *Of the Imitation and Following the Blessed Life of our Most Merciful Saviour Jesus Christ*; printed at the end of Dr. Atkinson's English translation of the three first books, 1504. 3. *A Letter to her Son*, printed in Howard's Collection of Letters. She was also possessed of extraordinary zeal in religion, and declared that provided she could induce the princes of Christendom to form a league, and march against the infidels, she would willingly attend them as their landlady.

BEAUFORT (Lewis de), a celebrated writer of the eighteenth century. He distinguished himself in the literary world by several valuable works, and was chosen fellow of the Royal Society

of London. He wrote the *History of Germanicus*; *Dissertation upon the Uncertainty of the five first Ages of the Roman Republic*; *History of the Roman Republic, or Plan of the Ancient Government of Rome*. He died at Maestricht in 1795.

BEAUFORTIA, in botany, a genus of plants of the class polyadelphia, and order icosandria. Its generic characters are five groups of stam. opposite to the petals: ANTH. inserted into the base; bifid at the apex, lobes deciduous: CAPS. trilocular one-seeded, connate, included in the thickened tube of the calyx adnate at the base. It contains two species, natives of New Holland.

BEAUFRONT, a small town of Northumberland, on the Tyne.

BEAUGENCY, a town of France, in the department of the Loiret, and arrondissement of Orleans, seated on the Loire. Long. 1° 46' E., lat. 47° 48' N. It had formerly the title of county, has 4900 inhabitants, and is the head of a canton. It has a considerable trade in wine and brandy; a few cloth stuffs are also manufactured, and there are several tanneries. Over the Loire is a stone bridge. Fifteen miles south-west of Orleans, and eighteen north-east of Blois.

BEAUHARNOIS (Alexander de), a French nobleman, who perished during the revolution, and who was the first husband of the late empress Josephine of France. He was born at Martinique, and going early in life to Paris, was elected deputy of Blois in the Constituent Assembly, in which he joined the popular party. He proposed equality of punishments for all classes of citizens, and their eligibility to all offices. After the attempted flight of Louis XVI. Beauharnois was appointed adjutant-general to Luckner, general-in-chief of the army of the Moselle, in which post he gave many proofs both of his courage and humanity. He was offered the place of minister of war, which he refused. Five days previous to the fall of Robespierre, he was condemned by the revolutionary tribunal, and perished on the scaffold, July 23d, 1794.

BEAUHARNOIS (Eugene de), only son of the preceding, and viceroy of Italy under Napoleon, was intimately connected throughout life with his father-in-law. He is said to have governed Italy with great judgment and moderation, so as to conciliate the respect and esteem of the inhabitants in general. In the Russian campaign he commanded the Italian troops of the grand army. Napoleon's downfall in 1814 terminated Beauharnois's prosperity. In January, 1806, he married the princess Augusta Amelia, eldest daughter of the king of Bavaria, to whose court at Munich he retired on the restoration of Louis XVIII. and died there in 1824.

BEAULIEU, a village of Hampshire, four miles south-west of Southampton, in which are the remains of a Cistercian abbey, founded by king John in 1204. Its walls afforded an asylum to Margaret, the queen of Henry VI. after the battle of Barnet. The celebrated Perkin Warbeck was protected here in later times; when their sanctity was so far respected, that though surrounded by an armed force, he was not seized, but voluntarily surrendered himself.

BEAULIEU, a small town of France, on the

right bank of the Indre, in the government of Touraine. It had formerly the title of barony; since the revolution it has been included in the department of Indre and Loire. It has 1500 inhabitants.

BEAULIEU (Sebastian de Pontault de), a celebrated French engineer, and major-general under Louis XIV. He published plans of all the battles and sieges of his master, to which he added historical subjects in perspective. He died in 1674.

BEAUMARCHAIS (Heter Augustin Caron de), an ingenious French artist and dramatic writer, was born at Paris in 1732. His father was a clock-maker, and early in life he applied himself with great diligence to that occupation. He invented a new escapement, the honor of which was contested by another artist, but the Academy of Sciences determined it in favor of young Beaumarchais. At the commencement of the revolution he retired to Holland, from whence he came to England, and was proscribed by the convention, yet he ventured to return to his country, where he died in 1799. See **ANTOINETTE**.

BEAUMARIS, a borough, market, fair, and assizes town, in the hundred of Tyndaethwy, and county of Anglesea, situated on a level tract at the foot of Baron hill, and at the entrance of the Menai straits. It is 243 miles from London, holds markets on Wednesdays and Saturdays, fairs four times in the year, and contains a population amounting to 2205 inhabitants. The high street is handsome, open, and adorned with well built houses, the back streets remarkably neat, and the villas on the green and along the shore graceful in design, and enjoy the prospect of an unrivalled landscape. The church, dedicated to St. Mary, is a spacious and elegant structure: the town hall affords accommodation to the members of the corporation on public occasions, and includes an elegant suite of assembly rooms. The county court, jail, custom house are on a scale proportioned to the necessities of the place. The great facility of bathing afforded by a gently shelving strand, and the attraction of the majestic scenery encompassing the bay, have occasioned a great influx of visitors to this remote and interesting little town. Public baths, reading and billiard rooms have been established here; a noble inn erected by the principal proprietor, and a regular intercourse preserved with Liverpool and Chester by steam-boats. David Hughes, a native of Beaumaris, founded a free school, here A. D. 1600, and an almshouse for six poor men, which number was augmented to ten, by the late and last Lord Bulkeley. The corporation consists of a mayor, recorder, two bailiffs, &c., and the borough is contributing with others in sending one member to parliament. Here the great and quarter sessions are held, and, although there is little trade, yet, owing to the secure asylum adjacent, called "Friar's road," vessels put in here both on the inward and outward passages; many good sloops also belong to the port, and ships are frequently cleaned and refitted here on the beach. The character of the Beaumaris roadstead is not deteriorated by the melancholy loss of the *Rothsay* steamer, with 120 souls on

board, this catastrophe being wholly attributable to the ill-conduct of the unfortunate persons who had charge of her. This place was the ancient Bonovium, a name exchanged for the Norman compound Beau-maris, or the beautiful marsh, by King Edward I., the founder of the noble castle, which still constitutes one of the most interesting features in the beautiful scenery of this vicinity. The ruins are extensive, in good preservation, and the new entrance gate forms the termination of the principal street. This was a regular garrison until the reign of Henry VII. In 1642 it was again garrisoned and held by Thomas, subsequently, Lord Bulkeley, for King Charles, and surrendered at last to General Mytton, having obtained conditions the most honourable. In the immediate neighbourhood are Friars, the seat of Lady Williams, Baron Hill, the noble mansion of Sir R. B. Williams Bulkeley, bart., governor of the castle. In one of the shrubby walks of this elegant demesne is preserved an ancient stone coffin, brought thither from Friars, and supposed to have contained the mortal remains of Joan, daughter of King John, and consort of Llewellyn, Prince of Wales. The last Lord Bulkeley was a munificent benefactor of Beaumaris, and his memory is cherished there with much fondness. To him are due the improvements of the town, augmentation of its charitable institutions, new line of road, four miles in length, from the town to the Menai bridge, and many other works dictated by benevolence, and executed with wisdom. One ferry establishes a communication with Aber, at low water, and Garth Ferry with the city of Bangor, at all times of tide.

BEAUMELLE (Laurence), a French author, born at Vallerangue, in Lower Languedoc, in 1727. He was a man of considerable abilities, and went to Denmark, where he settled for some time as professor of belles lettres. He wrote a Defence of the Spirit of Laws; Letters to Voltaire; Thoughts of Seneca; a Commentary upon the Henriade; a Life of Mad. Maintenon, &c., but was twice confined in the Bastille for libels and satires. The king, however, appointed him his librarian in 1772. He died at Paris in 1773.

BEAUMONT (Francis), a celebrated dramatic writer, who flourished in the reign of James I., was descended from an ancient family of his name at Grace-Dien, in Leicestershire, where he was born about 1585, or 1586, in the reign of queen Elizabeth. Out of fifty-three plays, which are collected together as the joint labours of Beaumont and Fletcher, (for an account of their celebrated joint works, see **FLETCHER**.) Mr. Beaumont was concerned in the greater part, yet he did not live to complete his thirtieth year, death summoning him away in the beginning of March, 1615. He was interred in the entrance of St. Benedict's chapel, Westminster, abbey.

BEAUMONT (Sir John), the elder brother of Francis the poet, was born in 1582, and educated at Oxford, whence he removed to one of the inns of court. In 1626 he had the dignity of a baronet conferred on him by king Charles I. He wrote, *The crown of Thorns*, a

poem, in eight books; Bosworth Field, and other poems; Translations from the Latin Poets; and several poems on religious and political subjects; as, on the Festivals; on the Blessed Trinity; a Dialogue between the World, a Pilgrim, and Virtue; Of the miserable State of Man; Of Sickness, &c. He died in 1628. His poetic genius was celebrated by Ben Jonson and Michael Drayton.

BEAUMONT (Mad. le Prince de), a literary lady, a native of Rouen, in Normandy, who kept a boarding school for young ladies at London, and afterwards at Annecy, in Savoy, where she died in 1780. Her publications are, *Magazin des Enfans*; *Magazin des Adolescens*; *Magazin des Jeunes Dames*; *Nouveau Magazin Anglois*; *Lettres de Madame du Montier*; and *The New Clarissa*.

BEAUMONT (Elic d'), a French advocate, born at Carentan in 1732. He distinguished himself by his interesting memoir in favor of the unfortunate family of Calas, the effect of which upon the nation was very great. Besides this, he wrote several other pieces of considerable merit. He died in 1785. The much admired novel, entitled, *Letters of the Marquis de Roselle*, was written by his wife, who died in 1783.

BEAUMONT DE LOMAGNE, a town of France, in Gascony, with 3700 inhabitants; the head of a canton, situated in the department of the Tarn and Garonne. Here are manufactures of coarse cloths, hats, and leather. It stands on the small river Gimone, twenty-eight miles north-west of Toulouse.

BEAUMONT LE VICOMTE, a town of France, in the province of Maine, and department of the Sarthe. It contains 2400 inhabitants, with manufactures of woollen stuffs, and lies on the river Sarthe, fifteen miles north of Le Mans, and fifteen south of Alençon.

BEAUMONT SUR OISE, a small town of France, with 2150 inhabitants. It is situated in the department of the Seine and Oise, on the river Oise, twenty miles north of Paris.

BEAUMONT SUR VINGEANNE, a town of France, in Burgundy, department of the Cote d'Or, ten miles west of Gray, and thirteen north-east of Dijon.

BEAUNE, or BEAUNE, a town of France, in Burgundy, included since the revolution in the department of the Cote d'Or; the head of an arrondissement of nine cantons. It is tolerably well fortified, and has a castle, with five suburbs. The only public establishment deserving mention is the hospital, founded in 1443, by the chancellor Rollin. In former times it was the third town in Burgundy, the seat of a governor, and other functionaries, and the capital of the district called from it the Beauinois. The town is particularly celebrated for its wines, and lies in an agreeable country, on the right bank of the Bouze, not far from the Saone. Twenty miles S.S.W. of Dijon, and twenty-three north-east of Autun. Inhabitants about 10,200.

BEAUNE (James de, baron of Samblançai, an unfortunate financier under Francis I. While that monarch was contending about the Milanese, Beaune had settled matters for sending 300,000

crowns to Lautrec, the commander, for paying the troops; but the queen mother demanded the money for herself, threatening to ruin the superintendant if he did not satisfy her demand, and thus obtained it. In consequence of the army not receiving the promised supply, they failed in their design, and laid the blame upon Samblançai, against whom they complained to the king. The baron endeavoured to justify himself, by laying before the king the real cause; but the queen mother bribed his secretary to deliver to her the receipts she had granted to him, by which means he was deprived of the only evidence for substantiating his innocence; he was accordingly accused of having made use of the money himself, and was executed in 1527. He met his fate with the utmost intrepidity; and his courage is commemorated in a beautiful epigram by the poet Marot.

BEAU-PLEADER, or BEW-PLEADER, a writ on the statute of Marlbridge, whereby it is provided that no fine shall be taken of any man in any court for fair pleading, i. e. for not pleading aptly, and to the purpose.

BEURAIN (John de), geographer to Lewis XV. was born at Aix in 1697. Besides constructing a number of charts, he published a topographical and military description of the campaigns of Luxemburg, from 1690 to 1694. three volumes, folio. He died in 1771.

BEAUREGARD L'ÉVEQUE, a town of France, in the department of the Puy-de-Dome, has an elegant castle, which, before the revolution, belonged to the bishop of Clermont. The memory of the celebrated Masillon is still cherished here by the inhabitants. Beauregard is not far from the Allier. Nine miles east of Clermont-Ferrand.

BEAURIEU (Gaspard-Guillard de), an ingenious French philosopher, born in the county of Artois in 1727. His most celebrated work was the *Pupil of Nature*, two volumes. He fell a sacrifice to the revolutionary storms, being left to perish in an hospital in 1795.

BEAUSOBRE (Isaac de), a very learned French Protestant writer, was born at Niort in 1659. He was forced into Holland to avoid the execution of a sentence, which condemned him to make the amende honorable, for having broken the royal signet, which was put upon the door of a church of the reformed, to prevent the public profession of their religion. He went to Berlin in 1694; was made chaplain to the king of Prussia, and counsellor of the royal consistory. He died in 1738, aged seventy-nine, after having published, 1. *Defense de la Doctrine des Reformés*. 2. *A Translation of the New Testament and Notes*, jointly with M. Lenfant. 3. *Dissertation sur les Adamites de Boheme*. 4. *Histoire Critique de Manichees, et du Manicheisme*, two vols. quarto. 5. *Several dissertations in the Bibliotheque Britannique, &c.* M. Beausobre had strong sense, with profound erudition; he preached as he wrote, with warmth and spirit.

BEAUSOBRE (Lewis), counsellor to the king of Prussia, was born at Berlin in 1730. He wrote *Philosophical Dissertations on the Nature of Fire*. *Le Pyrrhonisme du Sage*; and *Les Songes d'Épiqueure*. He died in 1783.

BEAUTY, v. & n.
 BEAUTE'OUS,
 BEAUTE'OUSLY,
 BEAUTE'OUSNESS,
 BEAUTIFIER,
 BEAUTIFUL,
 BEAUTIFULLY,
 BEAUTIFULNESS,
 BEAUTIFY,
 BEAUTIFYING,
 BEAUTIFLESS,
 BEAUTYWARNING,

Beauté, French; from the ancient Latin, *bonus*, i. e. *bonus*; fair; good; lovely. It is applied to external objects; to whatever imparts pleasure and comes under the cognizance of the senses; there is also an ideal world of beauty; the various qualities of the human mind and character,

and the productions of the intellect which have a relation to taste; beauty of scenery; beauty of person; beauty of description, of thoughts, of words, of actions.

But, for to spekin of her eyin clere!
 Lo! truly thei writtin that hire sciē,
 That Paradis stode formed in hire eien;
 And with hire richē *beaute* evirmore
 Strove love in hire aie which of hem was more.

Chaucer. Troilus and Creseide.

Faire Marian, the muses onely darling:
 Whose *beautie* shyneth as the morning cleare,
 With silver dew upon the roses pearling. *Spenser.*
 'Tis beauty truly blent, whose red and white
 Nature's own sweet and cunning hand laid on.

Shakspeare.

Beauty and grace are like those beams and shinings that come from the glorious and divine sun, which are diverse, as they proceed from the diverse objects, to please and affect our several scēses; 'as the species of *beauty* are taken at our eyes, ears, or conceived in our inner soul,' as Plato disputes at large in his Dialogue de Pulchro, Phaedos, Hippias; and, after many sophistical errors are confuted, concludes that *beauty* is a grace in all things, delighting the eyes, ears, and soul itself; so that, as Valesius infers, hence whatsoever pleaseth our ears, eyes, and soul, must needs be *beautifull*, fair, and delightful to us.

Burton. Anat. Mel.

His hair (which the young men of Greece used to wear very long) was stirred up and down with the wind, which seemed to have a sport to play with it as the sea had to kiss his feet; himself full of admirable *beauty*, set forth by the strangeness both of his seat and gesture; for holding his head up full of unmoved majesty, he held a sword aloft with his fair arm, which often he waved about his crown, as though he would threaten the world in that extremity.

Sir Philip Sydney. Arcadia.

A bed of lilies flow' t' upon her cheek,
 And in the midst was set a circling rose;
 Whose sweet aspect would force Narcissus seek
 New liveries, and fresher colours choose,
 To deck his *beauteous* head in snowy tire;
 But all in vain; for who can hope t' aspire
 To such a fair, which none attain, but all admire?

Fletcher's Purple Island.

Ask me no more where Jove bestows,
 When June is past, the fading rose;
 For in your *beauties* orient deep,
 These flowers, as in their causes, sleep.

T. Carew.

But likeness soon together drew,
 What she did separate lay,
 Of which one perfect *beauty* grew,
 And that was Celia.

Marvell.

O! she has *beauty* might ensnare
 A conqueror's soul, and make him leave his crown
 At random, to be scuffled for by slaves.

Otway. Orphan.

Like blossom'd trees o'erturn'd by vernal storms,
 Lovely in death, the *beauteous* ruin lay.

Young. Night Thoughts.

The lengthened night elaps'd, the morning shines
 Serene, in all her dewy *beauty* bright,
 Unfolding fair the last autumnal day.

Thomson. Seasons.

As lamps burn silent, with unconscious light,
 So modest ease in *beauty* shines most bright.

A. Hill.

Perhaps the most complete assemblage of *beautiful* objects that can anywhere be found, is presented by a rich natural landscape, where there is sufficient variety of objects; fields in verdure, scattered trees and flowers, running water, and animals grazing.

Blair's Lectures.

A lady seldom listens with attention to any praise but that of her *beauty*.

Johnson. Rambler.

The silver light, which hallowing tree and tower,
 Sheds *beauty* and deep softness o'er the whole,
 Breathes also to the heart, and o'er it throws
 A loving languor, which is not repose.

Byron.

Her cheek of youth was *beautiful*,

Till withering sorrow blanched the bright rose there.

Maturin. Bertram.

BEAUTY. Locke defines beauty, as, 'a certain composition of color and figure, causing delight to the beholder.' Mr. Burke, confining his definition to the merely sensible qualities of things, states beauty to be 'that quality, or those qualities, in bodies by which they cause love, or some, passion similar to it.' Others define it, more generally, as a term whereby we express a certain relation of some object, either to an agreeable sensation, or to an idea of approbation. When, therefore, we say a thing is beautiful, we either mean that we perceive something that we approve, or something that gives us pleasure: whence it appears, that the idea annexed to the word beauty is double; which renders the word equivocal, and this is the source of most of the disputes on the subject of beauty.

Mr. Hazlett, in an ingenious dissertation on the subject, in the Supplement to the Encyclopædia Britannica, speaks of it as that property in objects by which they are recommended to the power or faculty of taste—the reverse of ugliness—the primary or most general object of love or admiration.

We do not regard works of science as altogether suited for dissertations on matters of taste. We find our space and our attention occupied with the more tangible and better defined objects of human knowledge. But we shall endeavour to collect the most respectable opinions on this disputed subject.

Beauty, says Dr. Reid, (*Essay on the Intellectual Powers of Man*, ch. iv.) is found in things so various and so very different in nature, that it is difficult to say wherein it consists, or what can be common to all the objects in which it is found. Of the objects of sense, we find beauty in color, in sound, in form, in motion. There are beauties of speech, and beauties of thought; beauties in the arts, and in the sciences; beauties in actions, in affections, and in characters. In things so different, and so unlike, is there any quality, the same in all, which we may call by the name *o. beauty*? Why then should things so different be called by the same name? They please, and are

denominated beautiful, not in virtue of any one quality common to them all, but by means of several different principles in human nature. The agreeable emotion excited by them, and called beauty, is produced by different causes. However, though there be nothing common in the things themselves, yet the kinds of beauty, which seem to be as various as the objects to which it is ascribed, must have some common relation to us, or to something else, which leads us to give them the same name. All the objects we call beautiful, agree in two things, which seem to concur in our sense of beauty. First, when they are perceived, or even imagined, they produce a certain agreeable emotion or feeling in the mind; and, secondly, this agreeable emotion is accompanied with an opinion or belief of their having some perfection or excellence belonging to them. Whether the pleasure we feel in contemplating beautiful objects may have any necessary connexion with the belief of their excellence, or whether that pleasure be conjoined with this belief, merely by the good pleasure of our Maker, Dr. Reid does not determine. Beautiful objects excite an emotion of a soothing and enlivening kind, that sweetens the temper, allays angry passions, and promotes every benevolent affection, and disposes to other agreeable emotions, such as those of love, hope, and joy.

'There is nothing,' says Addison, 'that makes its way more directly to the soul than beauty, which immediately diffuses a secret satisfaction and complacence through the imagination, and gives a finishing to anything that is great and uncommon. The very first discovery of it strikes the mind with an inward joy, and spreads a cheerfulness and delight through all its faculties.' This agreeable emotion, produced by beautiful objects, is accompanied with an opinion or judgment of some perfection or excellence of those objects, adapted by its nature for producing that emotion; and this, according to Dr. Reid, is a second ingredient in our sense of beauty. To assert, says this writer, that there is in reality no beauty in those objects, in which all men perceive beauty, is to attribute to man fallacious senses; and thus to think disrespectfully of the Author of our being; who has diffused over all the works of nature a profusion of beauties, which are real, and not fanciful, and thousands of which our faculties are too dull to perceive. This author distinguishes our determinations with regard to the beauty of objects into two kinds, viz. instinctive and rational. In the former case, objects strike us at once, and appear beautiful at first sight, without any reflection, and without our being able to say why we call them beautiful, or being able to specify any perfection which justifies our judgment. Whereas our rational judgment of beauty is grounded on some agreeable quality of the object, which is distinctly conceived, and may be specified. Beauty itself may be distinguished into original, and derived. It is natural and agreeable to the strain of human sentiments and of human language, says Dr. Reid, that in many cases the beauty which originally and properly exists in the things signified, should be transferred to the sign; that which is in the cause to the effect; that which is in the

end to the means; and that which is in the agent to the instrument. E. G. The beauty of good breeding is not originally in the external behaviour in which it consists; it is derived from the qualities of mind which it expresses; and though there may be good breeding without the amiable qualities of mind, its beauty is still derived from what it naturally expresses. Good breeding is the picture; these agreeable qualities are the original; and it is the beauty of the original that is reflected to our senses by the picture.

Dr. Reid is of opinion, that beauty originally dwells in the moral and intellectual perfections of mind, and in its active powers, and that from this, as the fountain, all the beauty which we perceive in the visible world is derived. This was the opinion of the ancient philosophers; and it has been adopted by lord Shaftesbury and Dr. Akenside among the moderns.

Mind, mind alone! bear witness earth and heav'n,
The living fountains in itself contains
Of beauteous and sublime. Here, hand in hand,
Sit paramount the graces. Here, enthron'd,
Celestial Venus, with divinest airs,
Invites the soul to never-failing joy.

AKENSIDE.

But neither mind, nor any one of its qualities or powers, is an immediate object of perception to man. These are perceived through the medium of material objects, on which their signatures are impressed. The signs of these qualities are immediately perceived by the senses, and by them reflected to the understanding: and we are apt to attribute to the sign the beauty which is properly and originally in the thing signified. Thus, the invisible Creator hath stamped on his works signatures of his divine wisdom, power, and benignity, which are visible to all men. The works of men in science, in the arts of taste, and in the mechanical arts, bear the signatures of those qualities of mind, which were employed in their production. Their external behaviour or conduct in life expresses the good or bad qualities of their minds. In every species of animals we perceive by visible signs their instincts, appetites, affections, or sagacity; and even in the inanimate world, there are many things analogous to the qualities of mind; so that there is hardly any thing belonging to mind, which may not be represented by images taken from the objects of sense; and, on the other hand, every object of sense is beautiful, by borrowing attire from attributes of the mind. Thus, the beauties of mind, though invisible in themselves, are perceived in the objects of sense, on which their beauty is impressed. Thus also, in those qualities of sensible objects to which we ascribe beauty, we discover in them some relation to mind, and the greatest in those that are most beautiful. The qualities of inanimate matter, in which we perceive beauty, are sound, color, form, and motion: the first being an object of hearing; and the other three of sight. These several qualities are particularly illustrated by Dr. Reid, with a view of evincing the beauty that respectively belongs to them. Of all the objects of sense, the most striking and attractive beauty is perceived in the human species, and particularly

in the fair sex. In the following well-known passage of Milton, this great poet derives the beauty of the first pair in paradise from those expressions of moral and intellectual qualities, which appeared in their outward form and demeanor.

Two of far nobler shape, erect and tall,
 Godlike erect! with native honor clad,
 In naked majesty, seem'd lords of all,
 And worthy seem'd, for in their looks divine,
 The image of their glorious Maker, shone
 Truth, wis'dom, sanctitude severe, and pure:
 Severe, but in true filial freedom plac'd,
 Whence true authority in man; though both
 Not equal, as their sex not equal seem'd;
 For contemplation he, and valour form'd,
 For softness she, and sweet attractive grace.

And here we cannot forbear subjoining the excellent reflections of Mr. Thomson, a late writer on the subject of beauty: 'If we should see a person employ himself with a sledge hammer to dash the enchanting form of the Venus de Medicis to pieces, break her lovely limbs, and deface her beauteous features, we should not hesitate a moment to pronounce him a savage barbarian, without taste, feeling, or sentiment; though his frenzy was employed only on a senseless piece of stone: what then must we think of the diabolical savage, who exercises the worst of all cruelties (because the most lasting and affecting both to body and mind) on the most beautiful and amiable of all creatures on this side heaven?—made expressly for his happiness, solace, and delight;—by first corrupting and betraying her, and then basely abandoning her to perish with want, wretchedness, and misery.'

Dr. Blair (Lectures, vol. i. p. 101, &c.), in his enumeration of the separate principles of beauty, in each of those classes of objects, which most remarkably exhibit it, begins with *color*, as affording the simplest instance of beauty. With respect to this, he observes, that neither variety, nor uniformity, nor any other principle which he knows, can be assigned as the foundation of beauty; and that it can be referred to no other cause but the structure of the eye, which determines us to receive certain modifications of the rays of light with more pleasure than others. As his organ varies in different persons, they have their different respective favorite colors. In some cases, he thinks it probable, that association of ideas has influence on the pleasure which we receive from color. Green, for instance, may appear more beautiful, by being connected in our ideas with rural prospects and scenes; white with innocence; blue, with the serenity of the sky. Independently of such associations, those colors chosen for beauty are, generally, delicate, rather than glaring. *Figure* opens to us forms of beauty more complex and diversified. Under this head, regularity is first noticed as a source of beauty. Thus a circle, a square, a triangle, or a hexagon, please the eye by their regularity, as beautiful figures. But regularity is not the sole, or the chief foundation of beauty in figure. On the contrary, a certain graceful variety is found to be a much more powerful principle of beauty. Regularity, according to this author,

expresses beauty chiefly, if not solely, on account of its suggesting the idea of fitness, propriety, and use, which have always a greater connexion with orderly and proportioned forms, than with those which appear not constructed according to any certain rule. Nature, the most graceful artist, hath, in all her ornamental works, pursued variety with an apparent neglect of regularity. Mr. Hogarth, in his *Analysis of Beauty*, published about the year 1753, enumerates, as elements of beauty, fitness, variety, uniformity, simplicity, intricacy, and quantity; and he observes, that figures bounded by curve lines are, in general, more beautiful than those bounded by straight lines and angles. The beauty of figure principally depends, in his opinion, upon two lines which he has selected. One of them is the 'waving line,' somewhat in the form of the letter S: and this he calls the 'line of beauty,' which is found in shells, flowers, and such other ornamental works of nature, and is also common in the figures designed by painters and sculptors for the purpose of decoration. The other line, which he calls the 'line of grace,' is the former waving curve, twisted round some solid body, and exhibited in twisted pillars and twisted horns, and in the curling worm of a common jack. Variety plainly appears, in the instances which he mentions, to be so material a principle of beauty, that he defines the art of drawing pleasing forms to be the art of varying well; and, according to him, the curve line, which is so much the favorite of painters, derives its chief advantage from its perpetual bending and variation from the stiff regularity of the straight line. *Motion*, says Dr. Blair, furnishes another source of beauty, distinct from figure; being of itself pleasing, so that bodies in motion are, *cæteris paribus*, preferred to those at rest. But the quality of beautiful belongs to gentle motion, such as that of a bird gliding through the air, and that of a smooth running stream. In general, motion in a straight line is less beautiful than that in an undulating direction; and motion upwards is also commonly more agreeable than motion downwards. The easy curling motion of flame and smoke is an object singularly pleasing, and exhibits an instance of Mr. Hogarth's waving line of beauty. This artist observes, that, as all the common and necessary motions for the business of life, are performed in straight or plain lines, all the graceful and ornamental movements are made in waving lines.

Dr. Beattie, in his *Dissertations, Moral and Critical*, has introduced, in his digression on beauty, some ingenious remarks on this subject. After observing that custom has a perpetual influence in determining our notions of beauty, he proceeds to prove, that from associations founded on habit, many, or perhaps most of those pleasing emotions are derived, which accompany the perception of what in things visible is called beauty. With regard to the beauty or awkwardness of motion, he observes, that the one will be found to please, and the other to displease, chiefly on account of certain disagreeable ideas suggested by the former, and of certain disagreeable ones associated with the latter. Motions, that imply ease, with such an arrangement and proportion

of parts in the moving object, as may give reason to expect its continuance without injury, are generally pleasing, at least in animals, especially when they betoken a sort of perfection suited to the nature of the animal. But motions that betray infirmity, unwieldiness, unperfection, or the appearance of danger, cannot be called beautiful, because they convey unpleasing ideas. These observations are illustrated by a variety of apposite instances. Cicero (*de Off. l. i. sect. 36*) blames every motion that alters the countenance, quickens the breath, or betrays any discomposure. Rousseau observes, that in running, a woman is destitute of that grace which attends her on other occasions. Perhaps, says Beattie, the jutting out of her elbows, the natural effect of her endeavouring, with lifted hands, to secure the most delicate part of the human frame, may give to her motion the appearance of timidity and constraint. Or, perhaps, she may fail in this exercise, merely because, according to our manners, she cannot be much accustomed to it.

It is not easy to convey, in so few words, so many charming ideas of beauty, in its several varieties of color, shape, attitude, and motion, as Gray has combined in the following image:—

Slow melting strains their queen's approach declare;
Where'er she turns the graces homage pay:
With arms sublime that float upon the air,
In gliding state she wins her easy way:
O'er her warm cheek and rising bosom move
The bloom of young desire, and purple light of love.

Burke, in his *Philosophical Inquiry into the Origin of our Ideas of the Sublime and Beautiful*, excludes from the number of real causes of beauty, the proportion of parts, fitness, or that idea of utility which consists in a part's being well adapted to answer its end, and also perfection; and he observes, p. 210, that beauty is, for the greater part, some quality in bodies, acting mechanically upon the human mind by the intervention of the senses. The qualities of beauty, as they are merely sensible qualities, which he enumerates, are the following: they should be comparatively small, smooth, various in the direction of their constituent parts; these parts should not be angular, but melted, as it were, into each other; they should be of a delicate frame, without any remarkable appearance of strength; the colors should be clear and bright, but not very strong and glaring; and any glaring color that is introduced should be diversified with others. These are the seven properties upon which, according to this author, beauty depends; properties that operate by nature, and are less liable to be altered by caprice, or confounded by a diversity of tastes, than any others. The physiognomy also, says Mr. Burke, has a considerable share in beauty, especially in that of our own species. The manners give a certain determination to the countenance, which, being observed to correspond pretty regularly with them, is capable of joining the effects of certain agreeable qualities of the mind to those of the body. So that to form a finished human beauty, and to give it its full influence, the face must be expressive of such gentle and amiable qualities as correspond with the softness, smooth-

ness, and delicacy of the outward form. For Mr. Burke's mode of illustrating and confirming his theory of beauty, the reader is referred to his work above cited.

Dr. Sayers, in his *Disquisitions, Metaphysical and Literary*, 8vo. in 1793, has given a new analysis of beauty, conducted on the principles which were applied by Dr. Priestley, in his *Lectures on Oratory and Criticism*, and by Mr. Alison, in his *Essays on Taste*, to the explanation of the intellectual pleasures, namely, the doctrines of the Hartleyan school. His argument, summed up in a few words, is as follows: that individual of a class of objects is justly to be esteemed more beautiful than the rest, with the whole of which, or with its component parts, when properly understood, the greater number of the excellencies of its class are universally associated. The same may be asserted of any species of objects, when compared with any other species of its kind; and that object may be justly esteemed a 'standard of beauty,' with the whole appearance, or with the component parts of which, when properly understood, all the excellencies of its kind are 'universally' associated.

Mr. Alison's *Essays*, Mr. Knight's *Analytical Enquiry*, and Mr. D. Stewart's *Dissertations on the Beautiful*, and on *Taste*, in his *Philosophical Essays*, are each of them modern works of sterling merit, and may be said to contain all the known truths of this subject.

Mr. Alison contends, that all beauty, or at least all the beauty of material objects, depends on the associations that may have connected them with the ordinary affections or emotions of our nature; and in this, which is the fundamental point of his theory, we conceive him to be no less clearly right, than he is convincing and judicious in the copious and beautiful illustration by which he has sought to establish its truth. When he proceeds, however, to assert, that our sense of beauty consists not merely in the suggestion of ideas of emotion, but in the contemplation of a connected series of such ideas, and indicates a state of mind in which the faculties, half active and half passive, are given up to a sort of reverie or musing, in which they may wander, though among kindred impressions, far enough from the immediate object of perception, we confess that he not only seems to us to advance a very questionable proposition, but very essentially to endanger the evidence, as well as the consistency, of his general doctrine. In the long train of interesting meditations to which Mr. Alison refers,—in the delightful reveries in which he would make the sense of beauty consist,—it is obvious that we must soon lose sight of the external object which gave the first impulse to our thoughts; and though we may afterwards reflect upon it, with increased interest and gratitude, as the parent of so many charming images, it is impossible that the perception of its beauty can depend upon a long series of various and shifting emotions.

The work of Mr. Knight is more lively, various, and discursive, than Mr. Alison's, but not so systematic or conclusive. It is the cleverer book of the two, but not the most philosophical

discussion of the subject. He agrees with Mr. Alison in holding the most important, and, indeed, the only considerable part of beauty, to depend upon association, and has illustrated this opinion with a great variety of just and original observations. But he maintains that there is a beauty independent of association, prior to it, and more original and fundamental, the primitive and natural beauty of colors and sounds. Now this we look upon to be a heresy, and a heresy inconsistent with the very first principles of catholic philosophy. Language, it is believed, affords no other example of so whimsical a combination of different objects under one appellation, or of the confounding of a direct physical sensation with the suggestion of a social and sympathetic moral feeling.

Mr. Stewart makes fewer positive assertions, and enters less into the matter of controversy. His *Essay on the Beautiful* is rather philological than metaphysical. The object of it is to show by what gradual and successive extensions of meaning, the word, though at first appropriated to denote the pleasing effect of colors alone, might naturally come to signify all the other pleasing things to which it is now applied. In this investigation he makes many admirable remarks, and touches with the hand of a master upon many of the disputable parts of the question; but he evades the particular point at issue between us and Mr. Knight, by stating, that it is quite immaterial to his purpose, whether the beauty of colors be supposed to depend on their organic effect on the eye, or on some association between them and other agreeable emotions, it being enough for his purpose that this was probably the first sort of beauty that was observed, and that to which the name was at first exclusively applied. It is evident to us, however, that he leans to the opinion of Mr. Knight, as to this beauty being truly sensual or organic. In observing, too, that beauty is not now the name of any one thing or quality, but of very many different qualities,—and that it is applied to them all, merely because they are often united in the same objects, or perceived at the same time and by the same organs,—it appears to us that he carries his philology a little too far, and disregards other principles of reasoning of far higher authority. To give the name of beauty, for example, to every thing that interests or pleases us through the channel of sight, including in this category the mere impulse of light that is pleasant to the organ, and the presentment of objects, whose whole charm consists in awakening the memory of social emotions, seems to us to be confounding things together that must always be separate in our feelings, and giving a far greater importance to the mere identity of the organ of perception, than is warranted either by the ordinary language or ordinary experience of men. Upon the same principle, we should give this name of beautiful, and no other, to all acts of kindness or magnanimity, and, indeed, to every interesting occurrence which took place in our sight, or came to our knowledge by means of the eye: nay, as the ear is also allowed to be a channel for impressions of beauty, the same name should be given

to any interesting or pleasant thing that we hear, and good news read to us from the gazette should be denominated beautiful, just as much as a fine composition of music. These things, however, are never called beautiful, and are felt, indeed, to afford a gratification of quite a different nature.

BEAUTY IN THE FINE ARTS. Nothing here has been decided as to the nature and properties of abstract beauty itself, even if such a quality be acknowledged. If an Asiatic artist was to treat this subject, his principle, it is evident, would differ from that of a European. This must not, however, prevent us from studying some principles of beauty, as they are the foundation of the ornamental part of sculpture, painting, and architecture; and govern the proportion of the human figure. Modern artists seem to have implicitly adopted Grecian ideas; which circumstance may account for the prevalence of the antique profile in modern pictures, which is certainly a great inconsistency, when the subjects are chosen from any other than Grecian history; there being one principle of beauty in the form of the Greeks, another in that of the Romans, and another in that of the modern Europeans, and yet they are all beautiful. Professor Camper, in his book upon the different forms of the human cranium, has endeavoured to trace this style of the straight or Grecian profile from a probable source. The projection of the mouth and depression of the forehead, with a flat nose, marks that kind of face which is the nearest allied to the brute creation; there being but one degree between a dog, monkey, ape, orang-outang, Calmuc, and negro. From the negro to the European countenance are many degrees, which may be traced by an attentive study of the human species; and again, between the best modern faces and those of the antique, there are also many gradations of form and outline. Perhaps from the Greeks observing the resemblance between the lowest class of human countenances and those of monkeys, may be the reason why they conceived beauty to be as far as possible removed from all resemblance to them. As the lower part of the brutal face projected, in such proportion they thought the same position of the human face should recede; and as in the former there was a descent from the forehead to the nose, in the latter it should be perpendicular. As a small space between the eyes gives the appearance of an ape, they made the distance of man wide. As a great breadth of cranium at the eyes, ending above in a narrow forehead, and below in a pointed chin, marked the face of a savage; they gave a squareness of forehead and a breadth of face below, to express dignity of character. Hence, may be the origin of that ideal beauty, which has created so many schisms and feuds in art, and which nothing but a recurrence to nature can rectify. See **IDEAL BEAUTY.**

BEAUVAIS (Charles and William), two antiquaries. William, born in 1698, was a member of the Literary Societies of Orleans, Combray, &c.; he published a work on the Medals of the Roman Empire in 3 vols. 12mo. 1767, and died in 1773.

Charles Nicholas was a native of Orleans, where he was born in 1745. He practised physic at Montpellier, and is the author of some Essays on the History and Antiquities of his native city, a Topographical Description of Mount Olivet, and other tracts. His death took place in 1794.

BEAUVAIS (Vincent de), a friar of the Dominican order, was a native of the diocese of Beauvais, in France. Louis IX. supplied him with the means of prosecuting his great work. It is a kind of Encyclopædia, divided into four parts: the first entitled, *Speculum Doctrinale*, treats of the sciences in general, from grammar to theology; the second *Speculum Historiale*, contains a summary of general history from the beginning of the world to the year 1254, of which there is a continuation by an anonymous author to 1494; the third part, or *Speculum Naturale*, relates to physics, or natural philosophy; the fourth, *Speculum Morale*, is a treatise on vice and virtue. This last part was completed by another hand, Beauvais dying in 1224.

BEAUVAIS, a city of France, the ancient Bellocvacum, in the department of the Oise, and late province of the Isle of France, on the Therin. The cathedral is dedicated to St. Peter, and is much admired for its fine architecture, and the extraordinary elevation of the choir. It had formerly a great number of relics, and a curious library. There are twelve other churches. The town was industrially besieged by the English in 1443; and by the duke of Burgundy in 1472, with an army of 80,000 men. In this last siege the women signalled themselves by sallying forth against the besiegers, headed by Jeanne Laine, and under a standard which was long after preserved in the church of the Jacobins. There was, before the revolution, a procession on the 10th of July in memory of this exploit. Beauvais was long the capital of Beauvoisis, and the see of a bishop, who was the first of the three ecclesiastical counts and peers of France. At the coronation of the king, he carried the royal mantle. This bishopric was suppressed at the revolution. It is still a fortified town, though commanded by several heights, and contains about 12,000 inhabitants. It has several flourishing manufactures of linen and woollen cloth, cadices, serges, and fine tapestry. From its supposed impregnability, it has obtained the appellation of *La Pucelle*. Many eminent men have been born here. It is about six leagues from Paris, in lat. 49° 25' N., and long. 2° 19' E.

BEAUVILLIERS (Francis de, duke de St. Aignan), was born in 1607, and entered into the army. He distinguished himself in several engagements; on which account Louis XIV. raised him to a dukedom. He was great in the direction of the court festivals, and many of his verses are to be found in the works of Madame Deshoulières, of Scarron, &c. He died in 1687.

BEAUVILLIERS (Paul, duke de), eldest son of the above, was first gentleman of the bed-chamber, minister of state, chief of the royal council of finance, and governor of the duke of Burgundy, father of Louis XV. He died in 1741, at the age of sixty-six. This nobleman was distinguished for his cultivated talents and

probity of character; as well as for his success in the education of the duke of Burgundy which he shared with the celebrated Fenelon.

BEAUVILLIERS (Paul Hippolitus, duke de St. Aignan), son of the preceding, had the rank of lieutenant-general in the army, the collar of the royal orders, and was a member of the French Academy. He was the author of *Amusemens Littéraires*, and a Memoir of the Transactions of the Academy of Inscriptions, on the cession made by Andrew Paleologus, of the empire of Constantinople and Trebizond, to Charles VIII. of France.

BEAUVOIR SUR MER, a maritime town of France in the department of La Vendee, and late province of Poitou; twenty-three miles south-west of Nantes. It lies near the sea-coast, opposite the Isle of Noirmoutier, and had formerly the title of marquisate. It contains about 1900 inhabitants, and trades in wood, wool, salt, cattle, and butter.

BEAUVOISIS, a ci-devant territory of France, formerly part of Picardy, and afterwards of the Isle of France. Beauvais was the capital.

BEAUZEE (Nicholas), a French author, born at Verdun in 1717. He became professor of grammar in the military school; and wrote an Universal Grammar, or Exposition of the Elements of Languages, in two vols. 8vo.; an Exposition of the Historical Proofs of Religion, and several other works. Having been elected member of the academy, he wrote the articles relating to grammar for the Encyclopædia; but though he was thus connected with infidels, he was himself a faithful churchman. He once asked Diderot how they came to elect him a member of the academy, being a Christian? Diderot replied, 'Because we had not a grammarian among us, and we considered you an honest man.'

BE'BATHE. Bathe, with the prefix be. See **BATHE**.

BEBELINGUEN, or **BOBLINGEN**, a town of Germany, in the duchy of Wirtemberg, seated on a lake from which proceeds the river Wurm, ten miles north-west of Stutgard.

BE'BLAST. Blast, with the prefix be. See **BLAST**.

BE'BLEMED, } Bled and blood, with the pre-
BE'BLOOD. } fix. See both.

BE'BLIND. See **BLIND**.

BE'BLISTER. Blister, with the prefix. See **BLISTER**.

BE'BLLOT. Blot, and the prefix. See **BLOT**.
BE'BLUBBER. Blubber, with the prefix. See **BLUBBER**.

BE'BRYCIA, in ancient geography, the name of Bithynia, so called from the Beryces its inhabitants; who were afterwards driven out by two Thracian nations, the Bithyni and Thyni; from whom, in process of time, the country took the name of Bithynia.

BEC, a town of France, in the department of the Lower Seine, and late province of Normandy, seated on a tongue of land, at the confluence of two rivers.

BECAN, or **BEKAN**, a Jewish coin, being half a shekel. In Dr. Arbuthnot's table of reductions, the bekan amounts to 13 $\frac{1}{2}$ d. In Dr.

Prideaux's computation to 1s. 7d. Every Israelite paid 100 bekahs a-head annually for the support of the temple.

BE'CALM, γ Calm, and the prefix be.

BE'CALMING. \S See CALM. The prefix thus joined to give emphasis; to add a syllable in the verse; to give a ludicrous or endearing force to the term employed.

BECANCOUR, a river of Lower Canada, which rises to the south of St. Lawrence, and is afterwards increased by several tributary streams. After an easterly course of about forty-six miles, it diverges to the north-west for about twenty-one miles, and discharges itself into the St. Lawrence, seven miles below the town of Three Rivers.

BECASSINE, in zoology, a name given to the tringa minor, or sand-piper.

BECASSE, in zoology, a species of woodcock.

BE'CAUSE. Be and cause. Cause being; there being cause; *because* of his sickness; i. e. his sickness is the cause. It formerly, also expressed the motive or end; but is not now so used. It has in some sort the force of a preposition. But because it is compounded of a noun, has *of* after it.

His squiers, which that stoden ther beside,

Excused him *because* of his sikenesse,

Which letted him to done his besinesse. *Chaucer.*

God persecuteth us *bycause* we abase his holy Testament, and *bycause*, when we knowe the truth, we followe it not. *Tyndall's Works.*

Because thou hast, though thron'd in highest bliss,
Equal to God, and equally enjoying
Godlike fruition, quitted all to save
A world from utter loss, and most been found,
By merit, more than birthright, Son of God;
Found worthiest to be so, by being good,
Far more than great or high; *because* in thee
Love hath abounded more than glory abounds,
Therefore thy humiliation shall exalt
With thee thy manhood also to this throne;
Here shalt thou sit incarnate, here shall reign
Both God and Man, for both of God and Man,
Anointed universal king; all power
I give thee; reign for ever, and assume
Thy merits: under thee as head supreme
Thrones, principdoms, pow'rs, dominions I reduce;
All knees to thee shall bow, of them that bide
In heaven, or earth, or under earth, in hell. *Milton.*

Why is our food so very sweet?

Because we carn before we eat.

Why are our wants so very few?

Because we nature's calls pursue.

Whence our complacency of mind?

Because we act our parts assign'd. *Cotton.*

BECCABUNGA, brooklime; the trivial name of a species of veronica. See VERONICA.

BECCAFICO, in zoology, a small bird, scarcely so large as the common linnet, and with a remarkably short body. Its head, neck, back, wings and tail, are of a greenish gray, and in some of greenish brown. It feeds on vegetables, berries, &c. and is common in the north of England, where, according to Ray, it is called the petty-chaps.

BECCARI (James Bartholomew), a physician of Bologna, was born in 1682. He was professor of chemistry at his native city many years, and published, in 1729, a Dissertation on the Impurity

of its Air, and in 1730 a Treatise on the Internal Motion of Fluids; &c. He died 1796.

BECCARIA (John Baptist), an ingenious philosopher of the eighteenth century. He was a native of Mondovi in Piedmont, and became professor of philosophy at Palermo, and afterwards at Rome, from whence he removed to Turin. The king of Sardinia had a very great regard for him, and made him tutor to his sons. He made several important discoveries in electricity, and wrote, 1. *Experimenta quibus Electricitas Vindex late constituitur*, &c. 4to. Turin, 1771. 2. *Electricismo Artificiale*, 4to, 1772, translated into English, 4to. London, 1776; besides an Essay on the Cause of Storms and Tempests, and several pieces on the Meridian of Turin, &c. He died in 1781.

BECCARIA (Bonesana Cesar, marquis), was born at Milan in 1735, and showed a very early propensity to philosophical subjects. He first studied under the Jesuits at Parma, but left college at seventeen, and became henceforth the director of his own useful researches. His devotedness to the study of Jurisprudence and Political Philosophy, was first determined by the *Lettres Persannes* of Montesquieu; a production capable, indeed, of alluring a less enthusiastic mind. But his industry appears to have been chiefly stimulated by the patriotic and honorable desire of diffusing instruction among his countrymen, whom he represents as abandoned to ignorance; and who were little prepared for liberal opinions or political science. Fortunately, however, he gained the confidence of Count Firmiani, then governor of that part of the Austrian dominions; a nobleman, who, with comprehensive views of policy, concurred in every plan which was calculated for improving the state of the provinces.

Beccaria's first work appeared in the year 1762, and consisted of Observations on the Derangement of the Currency in the Milanese States. Soon after he established a select literary society at Milan, which, among other distinguished men, included the brothers, Alessandro and Pietro Verri. Assisted by these friends, and patronised by Firmiani, he commenced a periodical published under the name of the *Caffe*, a plan suggested to them by the celebrity of our English Spectator. But, the most remarkable production to which this association gave rise, and that upon which the reputation of Beccaria was destined chiefly to rest, was the treatise on Crimes and Punishments (*Dei Delitti e Delle Pene*). This is said to have been undertaken at the earnest solicitation of Count Alexander Verri, who then discharged the functions of Protector of Prisoners (*Protettore de' Carcerati*) at Milan. It was written at the house of Peter Verri, where the meetings of the society were held; and in concert with him the author, every evening, corrected what he had written during the day. In this manner this celebrated work was completed in two months, and was printed in the course of the year 1764.

The author here breaks up most of the important ground that Sir Samuel Romilly, Bentham, and others, have so well cultivated since: he is everywhere the advocate of reason, sound po-

licy, and humanity; and, by examining the foundation, objects, and consequent boundaries of penal law, he exposes the inefficacy as well as injustice of many provisions in the judicial code of his own country, and in those of other European nations;—provisions only the more pernicious in many cases, as derived from remote times, and perverting our respect for established maxims into the most debasing and servile barbarism. Six Italian editions were immediately called for; and it is computed that it has run through more than fifty editions and translations. As a most important conclusion resulting from this examination, or rather as concentrating a number of his conclusions, he closes his book with the following proposition:—‘In order that punishment may not be an act of violence, of one, or of many, against an individual member of society, it is essential that it should be public, prompt, and necessary, the least possible in the given case, and determined by the law.’

The prospects which Beccaria entertained as to the probable influence of his works, appears from the sentence of Lord Bacon, which he prefixed to some of the editions. ‘It is not to be expected in any difficult undertaking, of whatever kind, that the same person who sows the seed should also reap the harvest; but there must of necessity, be a preparation and gradual progress to maturity.’ ‘Never,’ says a writer in the *Biographie Universelle*, ‘did so small a book produce so great an effect.’ The medal given by the academy of Berne was instantly bestowed upon Beccaria; and the Empress Catharine II, invited him to St. Petersburg, with the offer of an honorable station at her court; a proposal which was the means of procuring him a similar distinction at home. In 1767 was issued an imperial order for establishing, in the Palatine College at Milan, a Professorship of Public Law and Economics, under the title of *Scienze Camerali*. To this chair, endowed expressly for him, the marquis was appointed on the 1st of November, 1768, and commenced the duties of it in the month of January following. From the preliminary discourse (*prolusione*) which he pronounced on this occasion, and in which he sets forth the object, of the institution, it appears that the only instructions which he received on his appointment, consisted in an order to deliver his discourses in the vulgar tongue; an injunction as highly honorable to the government as all the other circumstances of the transaction. His lectures, which he received a special permission to deliver in his own house, attracted much notice. They were not published during his life; but have since appeared, under the title of *Elementi di Economia Pubblica*, in the compilation of the *Sereno Classico Italiano de Economia Politica*, printed at Milan. One of his inferences on this subject is, that ‘every restriction on freedom, whether in the case of commerce, or any other, ought to be a result from the necessity of preventing an actual disorder, not the effect of a purpose or aim at amelioration.’ And he has propagated the same doctrine under different views, in various passages.

In 1770 he published an Enquiry into the nature of Taxation, which he never completed. In

the following year he was appointed a member of the Supreme Economic Council; on the suppression of which he was transferred to the Magistracy of State; and, lastly, by a despatch of the 17th of January, 1791, was named one of the Board for Reform of the Judicial Code, civil and criminal. His activity in the discharge of these important trusts is proved by the circumstance, that all the chief matters in those different departments were committed to his direction, or guided by his counsels. The most remarkable of his state papers were, various Ordinances relative to the grain; a very important Despatch transmitted to the Court in 1771, which gave rise to the reform of the public money in 1778; a Plan, proposed in 1780; for effecting a uniformity in the weights and measures; and certain Proposals, in 1786, founded on the tables of the population.

In 1776 the marquis made a journey to Paris, in company with Alessandro Verri, and there passed about three weeks in the society of D’Alembert, and other eminent men of letters: on his return he visited Voltaire. This seems to have been the only incident which, for a period of twenty-five years, diversified his manner of life, or interrupted his public duties. He died of apoplexy in the year 1793, having been twice married. He has the character of having been steadfast in his friendships; modest, but tenacious of his opinions; and much above jealousy or envy in regard to other literary men. It is related of him that the king of Naples, while at Milan, twice attempted to find him at his house; but that the marquis found means on both occasions to escape from his distinguished guest.

BECCLES, a town of Suffolk, seated on the Waveney. It has an elegant church, with a lofty spire; and two free schools, one of them with ten scholarships for Emanuel college, Cambridge. There is a market on Saturday. It lies twelve miles south-west of Yarmouth, and 109 north-east of London.

BE'CHANCE, *v.* & *adv.* Be and chance. See CHANCE.

BE'CHARM. Be and Charm. See CHARM.

BECHER (John Joachim), a celebrated chemist, born at Spire in 1645, and connected with the most learned men in Europe. The emperor, the electors of Mentz and Bavaria, and other persons of high rank, furnished him with the means of making experiments in mathematics, natural philosophy, medicine, and chemistry. He was invited to Vienna, where he contributed greatly to the establishment of several manufactures, a chamber of commerce, and an India company; but the jealousy of the ministers occasioned his disgrace and ruin. He was not less unfortunate at Mentz, Munich, and Wurtzburg; which determined him to go to Haerlem, where he invented a machine for working a great quantity of silk in a little time, and with few hands; but new misfortunes made him come to England, and he died at London in 1685. He wrote, 1. *Physica Subterranea*, which was reprinted at Leipsic in 1703, and in 1739, in 8vo, with a small treatise, by E. Stahl, entitled *Specimen Becherianum*. 2. *Experimentum Chymicum Novum*, 8vo. 3. *Character pro Notitia Linguarum Universali*. 4.

Institutiones Chymica, seu Manufactio ad Philosophiam Hermeticam, 4to. 5. *Institutiones Chymicae Prodromi*, 12mo. 6. *Experimentum Novum ac Curiosum de Minera Arenaria Perpetua*, &c.

BECHERA, in botany, a genus of plants, class, pentandria; order, digynia: CAL. five-cleft, with a globular tube: COR. five-petalled: CAP. two-celled and bi-valved. The name is derived from the reverend John Becher of Southwell Nottinghamshire, an accurate botanist, to whom the science is indebted for the discovery of the crocus nudiflorus. This plant is a native of Tranquebar.

БЕЧНИС, **ВЕСНИСНА**, among the old physicians, amount to much the same with pneumonics, thoracics, expectorants, and pectorals.

BECHIN, a town and circle of Bohemia, which abounds in salt mines and mineral waters, and particularly the singular mineral called Bechin stone. Bechin, the capital, has an ancient castle. It was taken and burnt by general Bucquoy in 1619, and was often the scene of conflict in the thirty years' war. It is seated on the river Luschintz, fifty miles south by west of Prague.

BECK, *v. & n.* } Sax. *becken*, Fr. *bec*, head.
BECK'ING. } To make a sign with the head; a nod of command, or of intimation.

Bell, book, and candle, shall not drive me back,
When gold and silver *beck* me to come on.

Shakespeare.

Oh this false soul of Egypt, this gay charm,
Whose eye *beck'd* forth my wars, and call'd them home.

Id. Antony and Cleopatra.

Neither the lusty kind showed any roughness, nor the easier any idleness; but still, like a well-obeyed master, whose *beck* is enough for discipline.

Sidney.

Haste, thee, nymph, and bring with thee

Quips, and cranks, and wanton wiles,

Nods, and *becks*, and wreathed smiles.

Milton.

Then forthwith to him takes a chosen band

Of spirits, likest to himself in guile,

To be at hand, and at his *beck* appear.

Id.

The menial fair, that round her wait,

At Helen's *beck* prepare the room of state.

Pope.

BECK, or **BEKE**, a word which imports a small stream of water issuing from some bourn or spring. The word is chiefly used among us in the composition of names of places originally situated on rivulets; such as Welbeck, Bournbeck, &c. The Germans use *beck* in the same sense.

BECKET (Thomas), lord chancellor of England, and archbishop of Canterbury in the 12th century. The story of his birth is as extraordinary as that of his life. His father, Gilbert Becket, some time sheriff of London, went on a pilgrimage to Jerusalem, where being surprised and enslaved by a party of Saracens, his master's daughter fell in love with him; and when he made his escape, followed him to London. So singular an instance of heroic affection struck him; and after consulting with some bishops, he baptised her by the name of Matilda, from which marriage proceeded the haughty Thomas Becket. Being raised to the archbishopric, he began the great dispute between the crown and

the mitre, and sided with the pope: at which King Henry II. was greatly offended; and calling an assembly of the bishops at Westminster, offered six articles against papal encroachments, which he urged Becket to assent to. Becket, at the importunities of several lords, signed them; but relapsing he was ordered to be tried as a traitor; upon which he fled into Flanders. The king banished all his relations, and Becket excommunicated all his opposers. At last, after seven years, by the intercession of the French king and the pope, he returned; but refused to absolve the bishops and others, whom he had excommunicated: upon this the king grew enraged; and is reported to have said, in the presence of his court, then in Normandy, that he was an unhappy prince, who maintained a great number of insignificant persons about him, none of whom had gratitude, or spirit enough, to revenge him on a single insolent prelate. Hearing these exclamations, four gentlemen of the court started for Canterbury, determined upon assassinating the archbishop. They endeavoured to drag him out of the cathedral, but finding they could not do this without difficulty, they beat out his brains there, on the pavement: 29th of December, 1171. The assassins being now afraid they had gone too far, durst not return to the king's court, but retired to Knaresborough in Yorkshire, and at length took a voyage to Rome; where, being admitted to penance by Alexander III., they went to Jerusalem; and, according to the pope's order, spent their lives in penitential austerities. In the mean time, king Henry was, or affected to be, much disturbed at the news of Becket's death, and despatched an embassy to Rome to clear himself from the imputation of being connected with it. Immediately all divine offices ceased in the church of Canterbury, for a year, excepting nine days; at the end of which, by order of the pope, it was reconsecrated. Two years after, Becket was canonised; and the two following years, Henry returned to England, went to Canterbury, where he did penance, as a testimony of his regret for the murder of Becket. When he came within sight of the church where the archbishop was buried, he alighted off his horse, and walked barefoot, in the habit of a pilgrim, till he came to the tomb. Here, after he had prostrated himself, and prayed for a considerable time, he submitted to be scourged by the monks, and passed all that day and night without refreshment, kneeling upon the bare stone. In 1221 Becket's body was taken up, fifty years after his murder, in the presence of Henry III. and a great concourse of the nobility, and deposited in a rich shrine, erected at the expense of Stephen Langton, archbishop of Canterbury. This was soon visited from all parts, and enriched with the most costly gifts and offerings: the miracles said to be wrought at his tomb were so numerous, that Gervase of Canterbury tells us, two large volumes, recounting them, were kept in the church. The monks used to raise his body every year; and the day on which this ceremony was performed, which was called the day of his translation, was a general holiday: every fiftieth year a jubilee was celebrated to his honor, which lasted fifteen days: plenary indulgences were then

granted to all that visited his tomb; and 100,000 pilgrims have been registered at a time in Canterbury. The devotion towards him had almost effaced in this town the adoration of the Deity; nay, even that of the Virgin. At God's altar, for instance, there were offered in one year £3 2s. 6d.; at the Virgin's, £63 5s. 6d.; and at St. Thomas's £832 12s. 3d. But next year the disproportion was still greater: there was not a penny offered at God's altar; the Virgin's gained only £4 1s. 8d.; but St. Thomas's had for its share £954 6s. 3d. Louis VII. of France made a pilgrimage to this miraculous tomb, and bestowed on the shrine a jewel, which was esteemed the richest in Christendom. Henry VIII., to whom it may easily be imagined how obnoxious a saint of this character would appear, not only pillaged St. Thomas's rich shrine, but made the saint himself be cited to appear in court, and be tried and condemned as a traitor. He ordered his name to be struck out of the calendar; the office for his festival to be expunged from all breviaries; and his bones to be burnt, and the ashes thrown in the air. From Thomas Warton we learn, that Becket was the subject of poetical legends. The Lives of the Saints in verse, in Bennet's library, No. CLXV. contain his martyrdom and translation. This MS. is supposed to have been written in the fourteenth century. The same writer informs us, from Peter de Blois, that the palace of Becket was perpetually filled with bishops highly accomplished in literature, who passed their time there in reading, disputing, and deciding important questions of the state. These prelates, though men of the world, were a society of scholars; yet very different from those who frequented the universities, in which nothing was taught but words and syllables, unprofitable subtleties, elementary speculations, and trifling distinctions. De Blois was himself eminently learned, and one of the most distinguished ornaments of Becket's attendants. We know that John of Salisbury, his intimate friend, the companion of his exile, and the writer of his life, was scarcely exceeded by any man of his time for his knowledge in philological and polite literature.

BECKETS, in the marine, large hooks, or circular wreaths of rope, or wooden brackets, used to confine ropes, tackles, oars, or spars, in a convenient place till they are wanted. And to put the tacks and sheets in the becket, is to hang up the weather-main and fore-sheet, and the lee-main and fore-tack, to a little knot and eye-becket on the fore-mast, main, and fore-shrouds, when the ship is close hauled, to prevent them from hanging in the water.

BECKINGHAM (Charles), an English dramatic writer, the son of a linen draper in London, was born in 1669; and educated under the learned Dr. Smith. He early discovered an uncommon genius in poetry, two dramatic pieces of his writing being represented on the stage before he was twenty years old. The titles of these plays are, 1. Henry IV. of France; 2. Scipio Africanus. He wrote, also, several other poems, and died 18th Feb. 1730, aged thirty-two.

BECKMANN (John), forty-four years professor at Gottingen, a native of Hoya, in the elec-

torate of Hanover, and born in 1739. His father was a post-master and receiver of taxes. His mother became a widow when Beckmann was hardly seven years old, and, though left in narrow circumstances, sent him, in his fifteenth year to the school of Stade, then under the care of Gehlen. In 1759 he repaired to Gottingen, to study for the church, but quitted it, and this design together, at his mother's death, in 1762, to fill the situation of professor of natural philosophy in the Lutheran academy at St. Petersburg. Beckmann soon gave up this place, and made a journey through Sweden to acquire a detailed knowledge of its mines. Linnaeus receiving him hospitably at Upsal, he prolonged his stay there. In 1766 the governors of the university of Gottingen appointed him, on the recommendation of Busching, professor to this celebrated establishment, of which he became one of the chief ornaments. His mind, now entirely directed to the practical uses of human knowledge, conceived the idea of an academical classification of the arts, both political and domestic. He therefore composed, as a guide, to serve him in this course of instruction, Treatises on Rural Economy—On Policy—On Finance—On Commerce, and other departments of practical knowledge; and his lectures, which had at the time the recommendation of novelty, were attended by the flower of the youth of the most civilised nations of Europe. He was in the habit of accompanying them to the workshops, to give them a knowledge of the different processes and handicrafts. His notices on these subjects make five volumes in octavo, published at Leipsic from 1783 to 1805; and will furnish the most invaluable materials to the individual, or to any society who may hereafter venture to undertake the general history of the origin and progress of the mechanic arts. Great merit, also, belongs to his History of the earliest Voyages made in modern times; of which he lived only to publish eight numbers. Another result of the literary application of the industry of Beckmann was a return to the studies of humanity, to which we are indebted to him, likewise, for editions of the work De Mirabilibus Auscultationibus, attributed to Aristotle, 1786; of the Wonderful Histories of Antigonus Carystius, 1711; and of Marbodius's Treatise on Stones, 1799; publications which required the rare union of physical knowledge and sagacity with philological learning. The Royal Society of Gottingen had, in the year 1772, admitted him one of its members, and, from that period to 1783, Beckmann supplied their proceedings with several interesting memoirs, among which are: On the Reduction of Fossils to their Original Substances—On the History of Alum—On the Sap of Madder—On the froth of the Sea, from which the Heads are formed for the Nicotian Fistula—On the History of Sugar. Beckmann died, 3rd of February, 1811, a member of almost all the learned societies of Germany and the north of Europe.

BECK'ON, *v. & n.* See to BECK.

Thou blinded god, quoth I, forgive me this offence,
Unwittingly I went about to malice thy pretence,
Wherewith he gave a *beck*, and thus methought he
swore,

Thy sorrow ought suffice to purge thy fault, if it were more;
The virtue of which sound mine heart did so revive,
That I methought was made as whole as any man alive.

Earl of Surrey.

For he that will be called with a *beck*,
Makes hasty suit on light desire,
Is ever ready to the check,
And burneth in no wasting fire. *Wyatt.*
Proceeding to the midst he still did stand,
As if in mind he something had to say;
And to the vulgare *beckning* with his hand,
In sign of silence, as to hear a play,
By lively actions he gan bewray,
Some argument of matter passioned;
Which doem, he backe retired soft away,
And, passing by, his name discovered,
Ease, on his robe in golden letters cyphered. *Spenser.*

It *beckons* you to go away with it,
As if it some impartment did desire
To you alone. *Shakspeare.*

The queen, fair Fancy, past;
And thro' her rainbow-tinged veil
A glance benignant cast!
Then, *beck'ning* to a secret glade,
'Come see,' she cried, 'the train,
Who own beneath this mystic shade
My visionary reign.' *Bishop.*

Anon all this rout was brought in silence,
And I by an usher brought to presence
Of Lucifer; then low, as well as I could,
I kneeled, which he so well allow'd
That thus he *beck'd*, and, by St. Anthony,
He smiled on me well-favour'dly. *Heywood. The Pardoner.*

So throng into the memory,
Of calling shapes, and *beckoning* shadows dire,
And aery tongues, that syllable men's names,
On sands and shores and desert wildernesses. *Milton.*

With this his distant friends he *beckons* near,
Provokes their duty, and prevents their fear. *Dryden.*
What *beck'ning* ghost along the moonlight shade,
Invites my steps and points to yonder glade. *Pope.*
When he had raised my thoughts by those transporting airs, he *beckoned* to me, and, by the waving of his hand, directed me to approach. *Addison.*

All ether softening, sober evening takes
Her wonted station on the middle air,
A thousand shadows at her *beck*. First, this
She sends on earth, then that of deeper dye
Steals soft behind; and then a deeper still,
In circle following circle, gathers round,
To close the face of things. *Thomson. Summer.*
They had not spoken; but they felt allured
As if their souls and lips each other *beckon'd*,
Which being join'd like swarming bees they clung,
Their hearts the flowers from whence the honey sprung. *Byron.*

BE/CLAP. Be and clap. See CLAP.
BE/CLAW. Be and claw. See CLAW.
BE/CLIP. Be and clip. See CLIP.

BE/COME, } Be and come, Ang.-
BECOM'ING, n. adj. } Sax. *cuman*; Dutch *ko-*
BECOMING'LY. } *men*; Germ. *kommen*;
Swed. *komma*. *Becuman, ingredi, occurrere, pervenire, supervenire*; to go; to enter in; to meet with; to come or attain to; to come upon suddenly; it likewise signifies to convene; to concur; and consequently to be convenient or con-

current; hence arises to befit; decent; appropriate; suitable; and further, graceful; ornamental. See ENCY. MET.

The Lord God breathed into his nostrils the breath of life, and man *became* a living soul. *Genesis*, ii. 7.
And unto the Jews I *became* a Jew, that I might gain the Jews. *1 Corinth.* ix. 24.

Upon that other side Damian
Becomin is the sorrowfullest man
That ever was. *Chaucer.*
So soone as she was entred, round about
Shee cast her eies, to see what was *become*
Of all those persons which she saw without:
But lo! they streight were vanisht all and some;
Save that same woeful lady; both whose hands
Were bounden fast, that did her ill *become*,
And her small waste girt rowd with yron bands
Unto a brasen pillour, by the which she stands. *Spenser.*

She to her sire made humble reverence,
And bowed low, that her right well *became*,
And added grace unto her excellence. *Id. Faerie Queene.*

I cannot joy, until I be resolv'd
Where our right valiant father is *become*. *Shakspeare*
If I *become* not a cart as well as another man, a
plague on my bringing up. *Id.*

I would I had some flowers o' th' spring that might
Become your time of day; and your's and your's,
That wear upon your virgin branches yet
Your maidenheads growing. *Id.*

Yet be sad, good brothers;
For, to speak truth, it very well *becomes* you. *Id.*
Your dishonour
Mangles true judgment and bereaves the state
Of that integrity which should *become* it. *Id.*

What is then *become* of so huge a multitude, as
would have overspread a great part of the continent. *Raleigh.*

But I should ill *become* this throne, O peers!
And this imperial sovereignty adorn'd
With splendour, arm'd with power, if aught propos'd
And judg'd of public moment, in the shape
Of difficulty or danger, could deter
Me from attempting. *Milton.*

Perplex'd with thoughts, what would *become*
Of me, and all mankind? *Id.*
The first hints of the circulation of the blood were
taken from a common person's wondering what *became*
of all the blood that issued out of the heart. *Graunt.*

What will *become* of me then? for, when he is free,
he will infallibly accuse me. *Dryden.*
Why would I be a queen? because my face
Would wear the title with a better grace;
If I *became* it not, yet it would be
Part of your duty then to flatter me. *Id.*
Wicherly was of my opinion, or rather I of his-
for it *becomes* me so to speak of so excellent a poet. *Id.*

Their discourses are such as belong to their age
their calling, and their breeding; such as are *becom-*
ing of them, and of them only. *Id.*

What *became* of this thoughtful busy creature, when
removed from this world, has amazed the vulgar, and
puzzled the wise. *Rogers.*

He utterly rejected their fables concerning their
gods, as not *becoming* good men, much less those
which were worshipped for gods. *Stillingfleet.*

Of thee, kind boy, I ask no red and white
To make up my delight,
No odd *becoming* graces,
Black eyes, or little know-not-whats, in faces. *Suckling.*

BECSANGIL, the ancient Bithynia, a province of Natolia in Asia; bounded on the north by the Black Sea, on the west by the sea of Marmora, on the south by Natolia Proper, and on the east by the province of Boli. The principal town is Bursa.

BECSKERECK, NAGY, i. e. GREAT, a market town of Hungary, in the county of Torontal, the capital of the circle of that name. It stands on the Bega, and has a salt office, and the right of choosing its own magistrate.

BECSKERECK, KIS, i. e. LITTLE, a small town of Hungary, in the county of Temeswar, circle of St. Andrew.

BECTASHI, preacher to Amurath I. sultan of the Turks, and founder of the sect of Bectasse. He is also said to have given rise to the order of Janissaries.

BECTASSE, a sect of religious among the Turks. All the janissaries belonging to the Porte are of this sect. The habit of the bectasse is white; on their heads they wear caps of several pieces; with turbans of wood twisted like ropes. They observe constantly the hour of prayer, which they perform in their own assemblies, and make frequent declarations of the unity of God.

BEDPRESSER,
BEDSTEAD,
BEDSTRAW,
BEDSWIVER,
BEDWIVEL,
BEDWELL,
BEDTIME,
BEDWARD,
BEDWORK.

A large family, from one etymon; Ang. Sax. *beddian*; Germ. *bedden* or *betten*, *sternere*, bed; that is, says the etymologist, in the Ency. Met., *stratum*, is the past participle of this verb; therefore we speak of a garden-bed, a bed of gravel, &c. In the ANG-SAX. *bedde* is sometimes used for a table. See Mark iv. 21. From the strata of earth where things are deposited, &c., and in which, till disturbed, they repose; the word has been to whatever bears applied

and supports; to whatever is spread, or laid out, or prepared for the purpose of bearing and supporting. Thus it is more generally applied to a lodging; to something made to sleep on; hence, figuratively, it is used for marriage. To *bed* is to go to bed with; to place in bed; to make partaker of the bed; to sow or plant in earth; to lay in a place of rest or security; to lay in order; to stratify; to cohabit. The various derivatives explain, by their application, their own meaning.

To *bed* he goth, and with him gill his wife,

As any jay she lyht was and jolif. *Chaucer.*

Flora now culbeth forth eche flower,

And bids make readie Maia's bower,

That newe is upryst from *bedd*. *Spenser.*

There be no lins where meet *bedding* may be had,
so that his mantle's reveth him then for a *bed*. *Id.*

On my knees I beg,

That you'll vouchsafe me raiment, *bed*, and food.

Shakspeare.

ENO. Mine, and most of our fortunes, to night,
shall be—drunk to *bed*. *Dryden, Ant. and Cleop.*

ROS. There's a palm, presages chastity, if nothing else.

CHAR. Even as the overflowing Nilus presageth famine.

ROS. Go, you wild *bedfellow*, you cannot soothsay. *Id.*

And as the sleeping soldiers in th' alarm,
Your *bedded* hairs, like life in excrements,
Start up and stand on end. *Id.*

She's a *bedswerver*, even as bad as those
That vulgars give the boldest titles to. *Id.*

They have married me :

I'll to the Tusean wars, and never *bed* her. *Id.*

For he will be swine drunk, and in his sleep he
does little harm, save to his *bedclothes* about him. *Id.*

He loves your people,

But tie him not to be their *bedfellow*. *Id.*

Misery acquaints a man with strange *bedfellows*. *Id.*

This sanguine roward, this *bedpresser*, this horse-
back breaker, this huge hill of flesh. *Id.*

Lying not erect, but hollow, which is in the making
of the *bed*; or with the legs gathered up, which is in
the posture of the body, is the more wholesome. *Bacon.*

There was a doubt ripped up, whether Arthur was
bedded with his lady. *Id.*

Herbs will be tenderer and fairer if you take them
out of *beds* when they are newly come up, and re-
move them into pots with better earth. *Id.*

She was publicly contracted, stated as a bride, and
solemnly *bedded*; and, after she was laid, Maximilian's
ambassador put his leg, stript naked to the
knee, between the espousal sheets. *Id.*

Let coarse bold hands, from slimy nest,
The *bedded* fish in banks outwrest. *Donne.*

So high as heav'd the tumid hills, so low,
Down sunk a hollow bottom, broad, and deep,
Capacious *bed* of waters. *Milton.*

Rigour now is gone to *bed*,
And advice with scrupulous head. *Id.*

George, the eldest son of this second *bed*, was, after
the death of his father, by the singular care and affec-
tion of his mother, well brought up. *Clarendon.*

He was now one of the *bedchamber* to the prince. *Id.*

They were brought to the king, abiding them in his
bedchamber. *Hayward.*

First, with assiduous care from winter keep,
Well father'd in the stalls thy tender sheep;
Then spread with straw the *bedding* of thy fold,
With fern beneath, to fend the bitter cold. *Dryden.*
Arcite return'd, and, as in honour tied,
His foe with *bedding* and with food supply'd. *Id.*

Those houses then were caves, or homely sheds,
With twining oziars fence'd, and moss their *beds*. *Id.*

See hoary Albula's infected tide
O'er the warm *bed* of smokoing sulphur glide. *Addison.*

What charming *bedfellows*, and companions for life,
men choose out of such women. *Id.*

I was deep'y in love with my *bedmaker*, upon which
I was rusticated for ever. *Id. Spectator.*

I came the next day prepared, and placed her
in a clear light, her head leaning to a *bedpost*, an-
other standing behind, holding it steady. *Wiseman's Surgery.*

Chimnies with scorn rejecting smoke;
Stools, tables, chairs, and *bedsteads* broke. *Swift.*

BED may be more accurately defined a convenience for stretching and composing the body on, for ease, rest, or sleep; consisting, generally, of feathers enclosed in a ticken case, and supported by a frame work, called the *bedstead*, standing on pedestals. Mr. Whittaker in his history of Manchester observes, that it was universally the practice, in the first ages, for mankind to sleep upon the skins of beasts. It was originally the custom of the Greeks and Romans, as well as of the ancient Britons, before the Roman Invasion. These skins were spread on the floor of their apartments. Afterwards they were changed for loose rushes and heather: the Welsh a few years ago lay on the former, and many of the Highlanders of Scotland sleep on the latter to this day. In process of time, the Romans suggested to the interior Britons the use, and the introduction of agriculture supplied them with the means, of the neater convenience of straw beds. The beds of the Roman gentry at this period were generally filled with feathers, and those of the inns with the soft down of reeds. But for many ages the beds of the Italians had been constantly composed of straw; it still formed those of the soldiers and officers at the conquest of Lancashire; and from both, our countrymen learnt their use. But it appears to have been taken up only by the gentlemen, as the common Welsh had their beds thinly stuffed with rushes as late as the conclusion of the twelfth century; and with the gentlemen it continued many ages afterwards. Straw was used even in the royal chambers of England as late as the close of the fifteenth century.

In the Highlands heath is generally used as bedding even by the gentry; and a heath bed has been celebrated by travellers as a peculiar luxury, superior to that of down. In France and Italy straw beds are frequent to this day. But after the above period, beds were no longer suffered to rest upon the ground. The better mode, that had anciently prevailed in the east, and long before been introduced into Italy, was adopted in Britain; and they were now mounted on pedestals. This, however, was equally confined to the higher ranks. Beds still continued on the floor among the common people, and were laid along the walls of their houses, as one common dormitory for all the members of the family.

BED, in masonry, a course or range of stones; and the joint of the bed is the mortar between two stones, placed over each other.

BED, in sea language, a flat, thick piece of timber laid under the quarters of casks containing any liquid, and stowed in the ship's hold.

BED, **DINING**, **lectus triclinaris**, or **discubitorium**, that whereon the ancients lay at meals. The dining or discubitory beds were four or five feet high. Three of these were ordinarily ranged by a square table (whence both the table and the room where they eat, were called *triclinium*), in such a manner that one of the sides of the table remained open and accessible to the waiters. Each bed would hold three or four, rarely five persons. They were unknown in Rome before the second Punic war: the Romans, till then, sat down to eat on plain wooden benches, in imitation of the heroes of Homer, or, as Varro

expresses it, after the manner of the Lacedaemonians and Cretans. See **ACCUBATION**.

BED OF A GREAT GUN; that thick plank which lies immediately under the piece, being, as it were, the body of the carriage.

BED OF A MORTAR, with gunners, a sord piece of oak hollowed in the middle, to receive the breech and half the trunnions.

BED OF CORN, is a heap, flat at top, three or four feet high, otherwise called a couch. Corn, in granaries, keeps best in beds.

BED OF JUSTICE, in the *ci-devant* French customs, a throne upon which the king was seated when he went to the parliament. The king never held a bed of justice but for affairs that concerned the state, and then all the officers of parliament were clothed in scarlet robes.

BEDA, commonly called Venerable Bede, one of our most ancient historians, was born A. D. 672, near Weremouth, in the bishopric of Durham. He was educated by the abbot Benedict, in the monastery of St. Peter, near the mouth of the river Wyre. At the age of nineteen he was ordained deacon, and priest at thirty. About this time he was invited to Rome by Pope Sergius; but it is not certain that he accepted the invitation. In 731 he published his *Ecclesiastical History*; a work of so much merit, notwithstanding the legendary tales it contains, that it were alone sufficient to immortalise the author. He died A. D. 735, of a lingering consumption, probably occasioned by a sedentary life, and long uninterrupted application to study and literary compositions, of which he left an incredible number. He was buried in the church of his convent at Jarrow; but his bones were afterwards removed to Durham, and deposited in the same coffin with those of St. Cuthbert. Bede was undoubtedly a singular phenomenon in an ignorant and illiterate age. His learning, for the times, was extensive, his application incredible, his piety exemplary, and his modesty excessive. He was universally admired, consulted, and esteemed, during his life; and his writings are deservedly considered as the foundation of our ecclesiastical history. His language is neither elegant nor pure, but perspicuous and easy. All his works are in Latin. The first general collection of them appeared at Paris in 1544, in three volumes, folio. They were printed again at the same place in 1554, in eight volumes. They were also published in the same size and number of volumes at Basil, in 1567, reprinted at Cologne in 1613, and at the same place in 1688. Besides this general collection, there are several of his compositions, which have been printed separately, or amongst the collections of the writings of ancient authors; and there are several MSS. ascribed to him, which are preserved in the libraries of Oxford and Cambridge.

BE'DABBLE. Dabble, with the prefix *be*. See **DABBLE**.

BE'DAFF. Daff, and the prefix *be*. See **DAFF**.

BE'DAGGLE. Daggel, and the prefix *be*. See **DAGGLE**.

BEDAH, or **VEDAH**, also called *Battas* or *Waddas*, a wild people inhabiting the mountains and forests in the interior of Ceylon. See **CEYLON** and **BATTA**.

BEDAL, a market town in the north riding of Yorkshire, through which passes a Roman causeway to Richmond, Barnard Castle, &c. The parts adjacent are noted for hunting and road horses. It has a market on Tuesday: and is six miles from North Allerton, eight from Richmond, and 220 from London.

BEDALACH, in the materia medica, a name given by some writers to the gum bdellium; but particularly to that kind of it which was brought from Arabia, and was of a yellowish color, like wax.

BEDALGENSE, a name given by the Arab astronomers to a fixed star of the first magnitude, in the right shoulder of Orion. It is of a ruddy color, by which it is easily distinguished.

BEDAMUNGALUM, a town of the Mysore, Hindostan, near the river Palar, which is here about forty feet wide. It was formerly a considerable place, but is now reduced. Salt abounds throughout the neighbouring country, which consists of poor black soil, and low wet grounds. Long. $78^{\circ} 24' E.$, lat. $12^{\circ} 58' N.$

BEDAN, a deliverer, and, probably, a judge of the Israelites, mentioned by the prophet Samuel (1 Sam. xii. 11.), in his expostulation with the people; but not mentioned particularly elsewhere, in Scripture. Some suppose him to be the same with Barak; others with Samson, who was Ben Dan, the son of Dan; others, that he was Jair, and named Bedan after his ancestor.

BEDARIDES, a town of France, near the Rhone, formerly in the papal county of Venaissin; but, since the revolution, included in the department of Vaucluse. The population is about 1700, and the environs are fertile and beautiful. Five miles north of Avignon.

BEDARK. Be and dark. See **DARK**.

BEDARRIEUX, or **BEC DU RIEUX**, a town of France, on the river Orbe, in the department of the Herault. It has 3340 inhabitants, with manufactures of druggot and woollen stuffs, which are exported as far as into Germany. Thirty-three miles west of Montpellier. Long. $3^{\circ} 15' E.$, lat. $43^{\circ} 57' N.$

BEDASH. Be and dash. See **DASH**.

BEDAW. Of uncertain etymology. Awake on the watch. See **ADAW**, to watch over, to keep under.

BEDAUB. Be and daub. See **DABBLE** and **DAUB**.

BEDCHAMBER, **LORDS OF THE**, in the British court, are twelve noblemen who attend in their turns, each a month; during which time they anciently lay in the king's bedchamber, and waited on him when he dined in private.

BEDDAPOLLAM, a town of Hindostan, in the Mysore, fourteen miles west of Gurramconda.

BEDDER, **BEDER**, or **BEDR**, a valley of Arabia, where the tribe of Koreish was defeated by Mahomet in the first year of the Hejira, A. D. 622. Distant forty miles from Mecca, and twenty from Medina.

BEDDEJAM, a town of Ceylon, eighty miles south of Candy.

BEDDINGTON, a village of Surry, between Carshalton and Croydon, adjoining which is Beddington Park, where queen Elizabeth is said to

have resided. The parish church is an ancient Gothic building, with stalls in the aisle like a cathedral.

BEDDOES (Thomas), M. D. a physician of considerable celebrity, was born at Shiffnal, Salop, in the year 1760. He was educated at Bridgenorth, Oxford, and Edinburgh. In 1786 he took his doctor's degree, and was appointed professor of chemistry at Oxford; an appointment which his political opinions, on the breaking out of the French Revolution, did not permit him to retain. In 1793 he removed to Bristol, where he began a series of medical and physiological researches, experiments, lectures, &c.; which might have established for him a lasting reputation. He was capable of great things but aimed at too much. Publications upon a variety of subjects political, scientific, and medical, came from his pen in rapid succession, until 1808, when he was seized with a liver complaint, which proved fatal in the course of that year. Of his numerous works, the principal are; 1. A Translation of Spallanzani's Dissertations on Natural History, 1784; reprinted in 1790. 2. A Translation of Bergman's Essay on Elective Attractions, 1785. 3. Translations of Scheele's Chemical Essays, 1786. 4. Chemical Experiments and Opinions, extracted from a work published in the last century, &c.

BEDE. See **BEDA**.

BE'DEAD. Be and dead. See **DEAD**.

BE'DECK. Be and deck. See **DECK**.

BEDELL (Dr. William), a learned prelate, born at Black Notley, in Essex, in 1750, and educated at Emanuel College, Cambridge, where he obtained a fellowship in 1593. After being some time minister of St. Edmund's Bury, he went to Venice, as chaplain to Sir Henry Wotton, the English ambassador, and continuing eight years in that city, contracted an intimate acquaintance with the famous Father Paul; during this time he translated the English Common Prayer Book into that language; and drew up an English grammar for Father Paul, who declared he had learned more from him in divinity than from any one. At his departure Paul presented him with his picture, the MSS. of his History of the Council of Trent, his History of the Interdict and Inquisition, with other literary donations. In 1629 Dr. Bedell obtained the bishopric of Kilmore and Ardagh in Ireland, and applied himself vigorously to reforming abuses. He procured an Irish translation of the common Prayer-Book, which he caused to be read in his cathedral every Sunday. The New Testament having been translated by archbishop Daniel, he patronised a corresponding version of the Old Testament; which was afterwards printed at the expense of the great Mr. Boyle. In 1624 he published a controversial book against the Roman Catholics, which he dedicated to Charles, prince of Wales; and assisted the archbishop of Spalatro in finishing his famous work *De Republica Ecclesiastica*. When the rebellion broke out in Ireland, in October 1641, the bishop at first did not feel the violence of its effects; for the very rebels had conceived a great veneration for him, and they declared he should be the last Englishman they would drive

out of Ireland. About the middle of December, however, the rebels required him to dismiss the people who had taken refuge with him; and, upon his refusing to do this, they seized him and his family, and carried them prisoners to the castle of Cloughboughter, putting them all except the bishop in irons. After being confined for about three weeks, the bishop and his sons were exchanged for some of the principal rebels; but the worthy prelate died soon after, on the 7th February, 1642, his death being chiefly occasioned, it is said, by this imprisonment. The Irish rebel chiefs, and a large part of their force, accompanied his body to the church-yard.

BE'DELVE, } Be and delve. See **DELVE**.
BE'DELVEN. }

BEDENGIAN, in botany, a name given by Avicenna and Serapion to the pomum amoris, or love-apple, a sort of fruit used in food by the Italians, and some other nations, and seeming to be the third species of the strychnos, or solanum, mentioned by Theophrastus. The author first describes two kinds of this plant, the one of which occasioned sleepy disorders, and the other threw people who eat of it into madness. After these, which he properly accounts poisonous, he mentions a third, which was cultivated in gardens, for the sake of the fruit, which, he says, is large and esculent. This is certainly the same with *bedengian*.

BE'DEVIL. Be and devil. See **DEVIL**.

BE'DEW, } Ang.-Sax. *deavian*, to wet, to
BE'DEW. } moisten.

Both nations shall, in Britaine's royal crowne,
Their differing names, the signes of faction, drown;
The silver streames which from this spring increase,
Bedew all Christian hearts with drops of peace.

Beaumont. Bosworth Field.

For never, gentle knight, as he of late,
So tossed was in fortune's cruell freakes,
And all the while salt tears *bedew'd* the hearers'
cheaks. *Spenser.*

What slender youth *bedew'd* with liquid odours,
Courts thee on roses, in some pleasant cave? *Milton.*

Thrice happy he! who, on the sunless side
Of a romantic mountain, forest-crown'd,
Beneath the whole collected shade reclines;
Or in the gelid caverns, woodbine wrought,
And fresh *bedew'd* with ever-spouting streams,
Sits coolly calm. *Thomson.*

May all the youths, like me, by love deceiv'd,
Not quench the ruin, but applaud the doom!
And when thou dy'st, may not one heart be griev'd,
May not one tear *bedew* the lonely tomb! *Hammond.*

Go, my boy, and if you fall, though distant, ex-
posed, and unwept by those that love you, the most
precious tears are those with which heaven *bedews*
the unburied head of a soldier.

Goldsmith. Vicar of Wakefield.

BEDFORD (John, duke of), a younger son of Henry IV., was Shakspeare's 'prince John of Lancaster.' During the reign of Henry V. he took a leading part in the conquest of France; and was, after the death of the king, appointed regent of that country. He displayed great military skill in the battle of Verneuil in 1424. The only blemish in his character is his cruel and unjustifiable treatment of the maid of Orleans.

He survived this event about four years, and dying at Rouen, in 1435, was buried in the cathedral of that city. Bedford deserves notice as a patron of the arts. A curious proof of his taste in them is still existing in the Bedford Missal, a small thick folio volume, highly illuminated, described by Mr. Dibdin in his *Bibliomania*, page 253.

The dukedom of Bedford, now enjoyed by the Russel family, is perfectly distinct from that of this prince. The title has been twice revived since his time.

BEDFORD (Francis Russel, duke of), an illustrious English nobleman, and distinguished agriculturist; was born July 23d, 1765. Upon the death of his grandfather in 1771, he succeeded to the title and fortunes of his family. He received the first rudiments of education, we believe, at Loughborough house, a fashionable preparatory school: from this place he was removed at an early age to Westminster-school, but he did not remain long at this celebrated seminary. Here it was that, in consequence of a blow from a cricket ball, he became subject to an inveterate hernia, which proved the ultimate cause of his premature death. His grace, at the university, applied to his studies with more diligence than most young noblemen, and soon acquired the esteem of his fellow-students, and of those who superintended his conduct. Early in life he manifested a strong predilection for the amusements of the turf, but this was soon weakened (though not destroyed) in consequence of a superior attachment to the more rational pursuits of agriculture. On his first outset in public life he was connected with Mr. Fox, and became a firm and disinterested supporter of the whig principles. It was long before he could so far overcome his natural diffidence as to speak in public; although, in private company, the clearness of his judgment, the solidity of his remarks, and the strength and accuracy of his expression, had decidedly proved that his grace possessed the chief requisites of a distinguished orator. What the persuasions of his friends could not effect, was at length unexpectedly produced by a momentary glow of indignation. In a debate in the house of lords, the duke imagined himself personally alluded to by one of the speakers. He rose and defended himself and his party by a most able and animated reply. From that period he occasionally spoke upon the most important questions that divided the house, and was constantly heard, even by his political adversaries, with the most respectful attention. His eloquence was rather solid and masculine than brilliant and showy; he did not trim up his language with the gaudy flowers of the rhetorician, but always spoke with such accuracy, and dignity of style and manner, as naturally resulted from the profound meditation of an enlarged and cultivated mind.

But the duke of Bedford was not merely eminent as an orator and politician; he deserved much regard as an anxious promoter of agriculture, and every art subservient to that highly important pursuit. The late Mr. Bakewell was one of his first instructors in the knowledge of cattle; but he soon equalled, if not excelled, his

master, at least in a knowledge of the subject, though not perhaps in success as an improver of the different breeds. His improvements in farming, as well as grazing, were very considerable. His experimental farm consisted of about 3000 acres, and it was in a state of cultivation, before his time, unexampled in this country. In the practice of irrigation his grace was remarkably successful, and he evinced its wonderful effects upon several hundred acres of land. The farmers and graziers for miles round his family seat at Woburn will long remember his grand annual sheep-shearings held there; from which every one returned pleased with the hospitality and affability of the noble duke, and with the prospect of advantage to the agricultural interests of the nation at large, which the premiums here offered were likely to produce. His grace was never married. His death was occasioned by the strangulation of the hernia already spoken of; which was brought on by playing at tennis. He died March 2d, 1802, in his thirty-seventh year.

BEDFORD, the chief town of Bedfordshire, is a place of great antiquity, supposed to be an ancient Roman station, and by some the Lactidorum of Antoninus; although Camden is of a different opinion, from the fact of its not standing on any of the Roman roads, as also from no Roman coins having been found in the immediate vicinity. It is situated on the river Ouse, ten miles from Olney, and fifty miles north of London; and, according to the census of 1821, contains upwards of 1070 houses, and 5466 inhabitants.

Bedford is supposed to be the Bedicanford of the ancient Saxons, called Bedician Forda, fortress of the Ford, from its fortifications, which commanded the river, and rendered the place almost impregnable. Several ancient battles were fought here, between the Britons and the Saxons, particularly one in 572, the obstinacy of which has been justly celebrated. It has also been the scene of many severe and bloody conflicts with the Danes, and of many other changes and remarkable events, since the extinction of the Danish power. Offa, king of the Mercians, chose this town as his burial place, and his remains were accordingly interred in a small chapel, on the brink of the river; but both the royal deposit and the chapel containing them have been long swept away by a violent inundation. Shortly after the Norman conquest, William Rufus gave the barony of Bedford to Pain de Beauchamp, who built a strong castle, adjoining the town. This place, in 1137, stood a siege against king Stephen and his army, and was afterwards committed to Eaux de Brent, a royal favorite. But this gentleman, having fortified it strongly, set the royal power at defiance, and having otherwise rendered himself obnoxious to Henry III. the king, in 1224, marched with an army to reduce him to obedience; and after a siege of two months, which forms one of the most curious details in English history, the place was stormed by four assaults, and taken, the castle was dismantled, the trenches filled up, and of the site on which it stood only a few traces are now visible. Before the conquest, here was a collegiate church,

dedicated to St. Paul, which was afterwards removed to the parish of Goldington, about a mile distant. Numerous other religious houses, in the town and suburbs, were founded at an early period, of which scarcely any vestiges remain. A bridge of great antiquity stood over the river, which is hence navigable to the German Ocean; but that edifice being in a state of great decay, was removed in 1813, and a new and handsome one was erected on its site, preserving the communication between the northern and southern divisions of the town. Bedford is generally considered a compact, handsome place, containing the parishes of St. John, St. Mary, St. Cuthbert, St. Peter, and St. Paul. It is governed by a mayor, recorder, aldermen, two chamberlains, and thirteen common council men. It gives the title of duke to the family of Russel, and, as early as 1295, sent two members to parliament, the election of whom is vested in about 1400 voters, consisting of burgesses, freemen, and householders not receiving alms. The town is a borough and corporation by prescription, and the earliest charter is dated in 1166, 100 years after the conquest. Of the five churches three are on the north side of the river, and two on the south. St. Paul's is a very handsome Gothic edifice with a spire. It has a fine organ, a very ancient stone pulpit, and contains an altar tomb with brass figures of Sir William Harpur and his lady, the former of whom, a great benefactor of the town, died in 1574. The dissenters in Bedford are numerous and respectable. There are three Independent chapels, one of which was built as early as 1707, and a second in 1772. The celebrated John Bunyan was one of the pastors of the original meeting-house, which preceded both, from 1671 to 1688, and during the thirty-two years exercise of his ministry in that place and the neighbourhood, suffered twelve years imprisonment, in the course of which he finished his celebrated work entitled *The Pilgrim's Progress*. A free grammar school was founded here in 1556, by Sir William Harpur, a native of Bedford, who, in the sixteenth century, was elevated to the dignity of lord mayor of London. It was endowed with thirteen acres of land, which, being now let for building, produces an improved rent of £6000 per annum, the surplus of which is applied to other purposes of a charitable nature; £700 is given in small premiums for the apprenticing of children, and £800 is given in marriage portions, of £20 each, to forty poor maidens of the town, with restrictions that the young women must be of good reputation, between the ages of sixteen and fifty, and married within two months after receiving the gratuity. An infirmary, capable of receiving thirty-eight patients, was erected in 1803; towards the building and endowment of which Mr. Whitbread, one of the members of parliament for the borough, gave £8000. A new gaol was erected in 1801, towards which the same gentleman contributed £500. In 1812 was erected an asylum for lunatics. The assizes and sessions of the county are held in the Shire hall, erected in 1753.

The principal manufacture is lace, but in the house of industry an extensive manufactory of

flannel has been established, which has considerably reduced the poor's rates.

The soil in the neighbourhood is singularly productive of good wheat and barley, which are chiefly sent to the markets of Hitchin and Hertford. There are six annual fairs, besides a wool fair, which has been established by the Agricultural Society of the county. There are also two weekly markets; one on Saturday, for corn, and another on Tuesday for cattle. A considerable trade is carried on in coals, timber, and iron, which are brought by the river from Lynn and Yarmouth.

The bailiff of Bedford is a name which the inhabitants of Ely have from time immemorial given to the inundations of the Ouse, the waters of which, after violent rains, frequently overspread the island, so as to suspend all pursuits, and confine the people prisoners till they are abated.

BEDFORD, a county of the United States, in Virginia, bounded on the north by James river, east by Campbell, west by Botetourt, and south by Franklin county. It is thirty-four miles in length, and twenty-five in breadth. Chalk and gypsum are met with in this county. It is agreeably variegated with hills. The chief town is New London.

BEDFORD, a large mountainous county of Pennsylvania, bounded on the north by Huntingdon, east by the North mountain, west by the Alleghany mountain, and south by part of Washington and Alleghany counties, in the state of Maryland. It is fifty miles in breadth from north to south, and fifty-four in length from east to west; and is divided into nine townships, viz. Bedford, Woodbury, Hopewell, Dublin, Providence, Belfast, Bethel, Colrain, Cumberland valley, and Londonderry. The chief waters are the Rays-town branch of the Juniatta, Wills, and Licking creek. The chief mountains are Wills, Evits, Warriors, Sidelings-hill, Dunnings, &c. and a few others of inferior magnitude. The valleys between some of these are extensive, rich, and in many parts well cultivated. Limestone and iron ore are found in many places. This county was purchased from the Indians in 1768 by William Penn, and established in 1771.

BEDFORD, a post town of Pennsylvania, and capital of the above county, situated on the south side of the Raystown branch of Juniatta river, between two small creeks. The town stands on an eminence, and is embosomed by still loftier hills on all sides; that on the west rising to the altitude of 1300 feet, and that on the east 1100. It is regularly laid out, and contains a brick market-house, a stone jail, a court-house, a brick building for keeping the records of the county, and a bank. The inhabitants are supplied with water from a spring at the distance of half a mile, which is conveyed by wooden pipes to a reservoir in the centre of the town. It was incorporated by an act of the assembly, passed in the winter session of 1795, and is governed similar to Chester. It is ten miles west of Philadelphia. Long. $3^{\circ} 16' W.$, lat. $40^{\circ} 0' N.$

BEDFORD NEW, a sea-port and post town in the county of Bristol, Massachusetts, United States of America, is about fifty-two miles south

of Boston, the capital of that province. Seated pleasantly on an arm of the sea, which stretches from Buzzard's Bay, and forms the estuary of the Accushnet river, it commands an extensive prospect, with a spacious and commodious harbour. As late as 1810 Bedford included Fairhaven, on the opposite side of the estuary, which has since been incorporated into a distinct town. Its population, after the above division, was computed at something more than 5000, many of whom are engaged in commerce. The chief buildings are a bank, five places of worship, and a library, besides which there is a considerable academy, for the use of the Society of Friends. The amount of shipping belonging to the port in 1818 was 24,000 tons. The vessels are employed in the whale, cod, and other fisheries, with the exception of a few which trade to Europe and the West Indies. The average value of exports from this port of America has been calculated at 130,000 dollars; the imports are not accurately known. Ship-building is carried on to a considerable extent, and a weekly newspaper is published. The town lies in lat. $41^{\circ} 38' N.$, long $70^{\circ} 54' W.$

BEDFORD, a town of the United States in West Chester, county of New York, thirty-five miles N. N. E. of New York. Long. $70^{\circ} 51' W.$

BEDFORD, a town of Virginia, 100 miles south-west of Richmond.

BEDFORD, a town of the United States in the west-end of Long Island, New York. Four miles north-west of Jamaica bay, and six east from the city of New York.

BEDFORD, a township of New Hampshire, in Hillsborough county. It lies on the west bank of the Merrimack, fifty-six miles west of Portsmouth.

BEDFORD, CAPE, a cape on the coast of Labrador, in Davis' straits. Long. $67^{\circ} 50' W.$, lat. $67^{\circ} N.$; also a cape at the north-east extremity of New Holland. Long. $214^{\circ} 45' W.$, lat. $15^{\circ} 16' S.$

BEDFORD, NEW, a town of Massachusetts, in Bristol county. Fifty-eight miles south of Boston. Long. $70^{\circ} 52' W.$, lat. $40^{\circ} 41' N.$

BEDFORD LEVEL, an extensive tract of low land, stretching over part of the counties of Suffolk, Norfolk, Huntingdon, Lincoln, Northampton, Cambridge, and the Isle of Ely, including a superficial area of nearly 400,000 acres, or 625 square miles. It appears from various phenomena, noticed by different authorities, that the greater part of this space anciently consisted of dry and cultivated land, although from mismanagement, neglect, or some convulsion of nature, it lost its fertility, and assumed its present appearance. Numerous trees of considerable dimensions, remains of buildings, with other natural and artificial productions, found at various depths below the surface, sufficiently evince, that it could not always have been a morass; although they furnish no means of ascertaining the original causes and steps of its deterioration. Dugdale states, that in draining the isle of Axholme, many oaks, firs, and other trees were found at the depths of three, four, and five feet; the roots were firm in the earth, and the trunks had been evidently burnt down, as the ends were reduced to a kind of charcoal. 'The oaks were lying in multitudes,

and of an extraordinary size, being five yards in compass, and sixteen yards long, and some smaller, of a great length, with a great quantity of acorns, and small nuts near them.' Coincident with the above statement, is the following of Mr. Elstob, in his Historical Account of the Bedford Level, which relates, that 'in 1764, many roots of trees were found near Boston in Lincolnshire, in the position in which they had grown, at the depth of eighteen feet below the thin pasturage of the surface.' But the most remarkable circumstance is, that not only trees, but the foundations of buildings, a smith's forge, with many of his tools, several iron articles, horse-shoes &c. have been found near Boston, at sixteen feet depth in the soil. Tacitus, in his Life of Agricola, states that 'the Britons complained of their hands and bodies being worn out and consumed by the Romans, in clearing the woods, and embanking the fens,' in which he is thought to allude more particularly to the destruction of the forests, which anciently covered a considerable part of the Bedford Level. Henry of Huntingdon, a writer of the time of king Stephen, who reigned from 1136 to 1154, describes this part of the kingdom 'as very pleasant and agreeable to the eye, watered with many rivers which run through it, diversified with many large and small lakes, and adorned with many woods and islands.' William of Malmesbury, who flourished in the reign of Henry II., Stephen's successor, describes this tract of country in the most favorable terms, and mentions with astonishment the size of the trees, by which many parts of it were adorned. This statement forms a singular coincidence with those already given, and is corroborated by facts and evidences yet remaining, which furnish, perhaps, the best illustration of this singular and interesting subject.

It is evident, from the above testimonies, that the inundation, by which this beautiful country was converted into the present morass, must have happened after the period of the latter historian, although the precise circumstances which led to it are not determined. This is certain, that the country was completely overflowed, and that it was rendered almost impassable, even for boats, by the sedge, reeds, and mud, with which it was covered, while the putrid effluvia, arising from the stagnant waters, destroyed the health of the inhabitants.

The reign of Edward I. was distinguished by an unsuccessful effort to drain these fens, and several succeeding attempts, in the reigns of Henry VI. and Charles I., after involving considerable expenses, were alike unfortunate. At length, in the year 1634, Francis, earl of Bedford, in conjunction with thirteen gentlemen, undertook the Herculean task, and to a considerable length succeeded; whence the whole of this farming district was called after his name. As a considerable part of the estate of this nobleman consisted of possessions in the vicinity of this marsh, which had been granted to his ancestor on the dissolution of the monasteries, by Henry VIII; he prosecuted the work with the greater assiduity, on the promise of having 95,000 acres assigned him in case of a successful accomplishment of his enterprise. The king granted an

immediate charter of incorporation, and within three years and a-half from the before mentioned period, the public surveyor, at the instance of the commissioners, set out the land. The right of this corporation was afterwards opposed, and the earl dispossessed of the reward of his services; but the civil wars giving a new direction to the schemes of political enterprise, William Duke of Bedford was, in 1649, restored to the possession of his rightful patrimony, and under the patronage of a new act, operations were continued upon an extensive scale; and in 1653, after an expense of £400,000, the level was thought to be fully drained, and the original grant was finally confirmed. The new territory was afterwards (for the better regulation of property), divided into three districts, viz. the northern, middle, and southern. A surveyor was appointed for each of the former, and two for the latter; numerous contentions, litigations, charters, and laws, have nevertheless issued; for further information upon which we refer the reader to the Beauties of England and Wales, vol. ii. and Elstob's Historical Account of the Bedford Level. Notwithstanding all that has been done, much fine land remains undrained in this part of England; and, in the winter season, is subject to frequent inundations. It is the haunt of vast flocks of water fowl, which are taken in considerable numbers. As many as 3000 couple are often sent to the London markets in one week, from a single decoy, in the neighbourhood of Ely.

BEDFORDSHIRE, a small inland county of England, bounded on the north and north-west by Northamptonshire, on the east by the counties of Huntingdon, Cambridge, and Hertford, and on the west by those of Buckingham and Northampton. Its limits are winding and irregular, and the only natural ones are the Ouse, for a short space on the east and west, and a small rivulet on the south-west border. Its form is nearly oval; it is thirty-six miles in extreme length, from eighteen to twenty-two in breadth, and 145 in circumference.

The total of land in this county has been variously calculated. The report of the Board of Agriculture states the superficial area at 307,200 acres. The returns to parliament, relative to the poor's rates, make it 275,200 acres; but Dr. Becke, in his Observations on the Income Tax, gives the content at 293,059 acres; whilst the Population Returns of 1821 state the area at 463 square miles, which is rather more than the mean of the three preceding numbers, and is founded upon the Trigonometrical Survey of England and Wales. According to one, we believe, of the most correct authorities, the superficial content of land in Bedfordshire is computed at 296,320 square acres, of which 80,000 are in a course of tillage, and 168,000 employed in pasturage. This populated area includes 124 parishes, with ten market towns, in which are 13,640 houses, and upwards of 71,000 inhabitants, of whom 4155 families are employed in commerce and manufactures, and 9431 in agriculture. It is in the Norfolk circuit, province of Canterbury, and bishopric of Lincoln, and is divided into nine hundreds, viz. Barford, Biggleswade, Clifton,

Flitt, Manshead, Redborne, Stodden, Willey, and Wixamtree. Its rivers are the Ouse, the Ivel, the Lea, and the Ouzel, together with a few others of inferior note, which come more properly under the denomination of streams. The Ouse is made navigable to Bedford, and divides the county into two parts. Nearly the whole of Bedfordshire lies upon the eastern side of the grand ridge, which separates the waters which flow into the German Ocean from those which pour themselves into the Irish Sea: its general inclination is therefore towards the east, and in that direction its principal rivers flow.

The face of the county is generally varied with small hills and valleys, few of which aspire to the height of mountains. There are, nevertheless, some of a bolder description. The Chiltern hills, composed of a vast mass of chalk and flint stones, lie along the southern border, and form a lofty range, which, rising to an unusual altitude, and irregularly projecting over the valleys, gives the whole landscape a remarkable appearance. The clay hills are stretched over the northern part, and a ridge of sand hills enters the county from the west, in a direction towards the north-east. From the south-east corner to the middle of the county runs a line of good dairy land; the western side is, for the most part, flat and sandy. The north and east portions have a deep soil, which produces large crops of corn, and is generally well wooded. The alluvial soils, which prevail in Bedfordshire, generally consist of yellow and dark colored clays, which are diversified with tracts of chalk and sand. On the south of Luton and Dunstable particularly, the upper stratum is chalk, blended with numerous layers of flints and silicious earth, which is succeeded by hard chalk alone. The mineral productions of the county are limestone, coarse marble, and some coal. The fuller's earth, which is found so plentifully, is a kind of mixed clay, chiefly obtained in the neighbourhood of Woburn, and is of great use in cleansing woollen goods. Mineral springs are also found in different parts of the county, although they have not acquired much celebrity. The chief are those of Barton, Bedford, Bletsoe, Blunham, Bromham, Bushmead, Clapham, Cranfield, Holcot, Milton Ernest, Odell, Pertenhall, Riseley, Silsoe, Turvey, and Wrest Garden. Some of these are saline, and others chalybeate, whilst several have not been yet analysed.

The climate of Bedfordshire, from its situation as an inland county, is of a medium temperature and moisture. From meteorological observations, made at Leighton-Buzzard, for four years, ending with 1804, it appeared that the mean monthly height of the barometer was 29°52 inches; that of the thermometer, with a northern aspect, and in the open air, observed at eight o'clock in the morning, was 47° 2. The average quantity of rain per month was 1.93 inches, and the evaporation 1'05. Thus, by multiplying these numbers by 12, we have 23'16 and 12'6, the former of which is little more than the average of London. The most prevalent wind observed during this period was the south-west. Upon the whole, this county does not appear to be remarkably salubrious, since, from the late returns of the population, fewer instances of longevity were found,

in proportion to the number of inhabitants, than in many others of the united kingdom.

This county has never been remarkable for the extent of either its commerce or manufactures. The most general employment is the making of lace, and preparing straw-plat for the manufacture of hats, bonnets, baskets, toys, mats, &c. The market-towns, for the promotion of internal commerce, are, Bedford, Amptill, Dunstable, Biggleswade, Leighton-Buzzard, Luton, Potton, Shefford-Tuddington, and Woburn. Four members are sent from this county to parliament, in which the Russel, Osborne, and Whitbread families have a preponderating influence.

When the Romans landed in Britain, A. A. C. 55., this county was included in the district inhabited by the Catiuchlani, whose chief, Cassibelinus, headed the force of the whole island against Caesar, and the year following was totally defeated. In 310 the emperor Constantine divided Britain into five Roman provinces, when this county was included in the third division, called Flavia Casariensis; in which state it continued 426 years, when the Romans quitted Britain. A severe battle was fought at Bedford in 571 or 580, between the Saxons and the Britons. At the establishment of the kingdom of Mercia (one of the divisions of the Saxon heptarchy), it was considered as part of that kingdom; and so continued from 582 to 827, when, with the other petty kingdoms of the island, it became subject to the West Saxons, under Egbert, and the whole was named England. In 889 Alfred held the sovereignty, when England was divided into counties, hundreds, and tythings, and Bedfordshire first received its present name.

In the tenth and eleventh centuries, this county was the seat of various conflicts with the Danes, which terminated in the final expulsion of the invaders. Many castles had been erected during these periods, most of which were demolished by king John, during his progress to the north, except that of Bedford, which was dismantled by Henry III.; after which the county is noted for few remarkable occurrences till the year 1642, when it entered into an association against Charles I.

The remains of both Saxon and Gothic architecture are to be seen in several of the churches, as also a few specimens of stained glass in their windows. Roman antiquities, also, are frequently discovered in the county. It is intersected by three Roman roads, and interspersed with military stations. A fortification, called Totternhoe Castle, is seen on the brow of a hill, about two miles from Dunstable, and consists of a lofty circular mound, with a slight vallum around its base; at a distance from which is a much larger one, of irregular form. The other remarkable remains are, a Roman station at Sandy near Potton, (the Magiovinum of Antoninus,) by others supposed to be the ancient Salenæ, containing thirty acres, where many urns, coins, &c. have been dug up. Another at Madining-bowre, or Maiden-bower, one mile from Dunstable, containing about nine acres, which Camden supposes to have been a Roman station, from the coins of the emperors having been frequently dug up there, and calls it Magintum. Leighton-Buzzard is

supposed to have been a Roman camp, and another is at Arlesey near Shefford, and a Roman amphitheatre may be traced near Bradford Magna. The Roman road, Ickniel-street, crosses this country; entering at Leighton-Buzzard, from whence it passes Dunstable, where it inclines northward over Warden hills to Baldock in Hertfordshire. The Watling-street enters this county near Luton from St. Albans, passes a little north of Dunstable, where it crosses the Ickniel-street, and from thence to Stoney Stratford in Buckinghamshire. A Roman road also enters near Potton, passes on to Sandy, and from thence to Bedford, where it crosses the Ouse, and proceeds to Newport Pagnell in Buckinghamshire. The following antiquities in this county are well worthy of attention: Bedford Bridge and Priory; Chick-sand Abbey, near Shefford; Dunstable Priory, near Luton; Eaton Park House, or Eaton Bray; Five Knolls, near Dunstable; Newnham Priory, near Bedford; Northhill church, three miles from Biggleswade; Summeris Tower, near Luton; Warden Abbey, near Shefford; Woburn Abbey; and Woodhill Castle, or Oddhill Castle, near Harwood.—John duke of Bedford, third son of Henry IV. king of England, commanded the English army in France in 1422; and, after making himself master of that kingdom, died at Rouen in 1435, where a handsome monument was erected to his memory. One of the courtiers of Charles VIII. having advised him to destroy it, the king answered, 'Let him rest in peace, who, when living, made all the French tremble.'

BEDIM, be and dim. See DIM.

BEDIZEN, be and dizen. See DIZEN.

BEDLAM, *n.* & *adj.* } Corrupted from
BED LAMIE. } *bethlehem*, the name
of a religious house in London, converted afterwards into an hospital for the mad and lunatic. The adjective, in the sense of mad, is applied to things as well as persons.

Let's follow the old earl, and get the *bedlam*
To lead him where he would; his roguish madness
Allows itself to any thing. *Shakespeare.*

One morning very early, one morning in the spring,
I heard a maid in *Bedlam*, who mournfully did sing,
Her chains she rattled on her hands, while sweetly
thus sung she,
I love my love, because I know my love loves me.

Prior.

If wild ambition in thy bosom reign,
Alas! thou boast'st thy sober sense in vain;
In these poor *bedlamites* thyself survey,
Thyself less innocently mad than they.

Fitzgerald.

At this rate we are wonderfully mistaken when we speak of Don Quixote as a madman, and of Leonidas, Brutus, Wallace, Hampden, Paoli, as wise, and good, and great! The case it seems is just the reverse; these deserve no other names than that of raving *bedlamites*. *Beattie. Don Quixote.*

BEDLIS, or BETLIS, a strong town of Asiatic Turkey in the Pæhalic of Van, lat. 38° 34' N., and long. 42° 35' E. It is placed in a narrow defile, defended by a triangular castle, between two lofty mountains, and traversed by the river Kuzur, which joins the Jûi Rubat below. Here are many public buildings deserving notice, and

among them several medresehs, or colleges, which, together with the list of eminent writers who have been natives of this place, show that learning was much encouraged by its former rulers. The castle contains 300, and the town about 5000, houses within its precincts. This fortress submitted to the Mussulman arms under the caliphate of Omar (A. D. 647), and was conquered by the Turks under Sultân Murâd IV. (A. D. 1634). Its inhabitants are Ruzegis, a tribe of Kurds and Armenians, in nearly equal proportions, who amounted in the middle of the seventeenth century to about 80,000. The strength of its position has often enabled them to maintain a virtual independence of the Porte.

BEDLOE (William), who assumed the title of captain, was an infamous adventurer of low birth, in the reign of Charles II. He had travelled over great part of Europe under different names and disguises, as a man of rank and fortune. Encouraged by the success of Oates, he gave an account of Godfrey's murder, and added many circumstances to the narrative of the former. These villains had the boldness to accuse the queen of entering into a conspiracy against King Charles I's life. A reward of £500 was voted to Bedloe by the Commons. He is said to have asserted the reality of the plot on his death-bed: but it abounds with absurdity, contradiction, and perjury. He died at Bristol, August 20th, 1680. Giles Jacob informs us, that he was author of a play, called *The Excommunicated Prince, or the False Relic*, 1679. The printer of it having, without the author's knowledge, added a second title, and called it *The Popish Plot in a Play*, greatly excited the curiosity of the public, who were, however, much disappointed, when they found the plan of the piece to be founded on a quite different story. Anth. Wood, however, asserts that this play was written partly, if not entirely, by Thos. Walter, M. A. of Jesus College, Oxford.

BED-MOULDING, in architecture, usually consists of an ogee, a list, a large boutine, and another list under the coronet.

BEDNORE, or BIDDANORE, a district in the north-west extremity of the Mysore, Hindostan, on the summit of the western Ghauts. From the elevation of the country, the season is a month later here than on the sea coast. The exports consist of cattle of small size, pepper, betel-nut, cardamoms, sandal-wood; the imports are salt, rice, cocoa-nuts, oil, turmeric, and cotton cloths. When overrun by Hyder, in 1762, the Bednore dominions extended over the maritime province now named Canara, and to the east over a tract of open country, extending to Sunta, Bednore, and Hoolukera, within twenty miles of Chittledroog.

BEDNORE, or BIDDANORE, a town of Hindostan, capital of the district of that name, 452 miles south-east of Bombay, and 187 north-west of Seringapatam. It was taken by the British in 1783, and retaken soon after by Tippoo Sultan; but on his defeat and death, in 1799, the town and its suburbs became subject to the British. It is said to have been once a well-fortified and magnificent city, containing 20,000 houses: at the time of the sultan Tippoo's death, it con-

sisted of about 1500 houses, besides huts. When taken by Hyder, in 1763, it was eight miles in circumference, and it is said the plunder actually realised amounted to twelve millions sterling. He afterwards changed its name to Hydernagur.

BEDOTE, To doat upon, to pet, to befool; obsolete.

To bedote this I ween was their interest.

BEDOWINS, or **BEDWINS**, the nomade inhabitants of the Arabian and African deserts, whose name, derived from the Arabic *bedwî*, 'a native of the desert,' answering to the Arabes *scenitæ* of the ancients, or Arabs dwelling in tents, agrees with their mode of living in encampments, pitching their movable habitations wherever they can find pasturage, and changing their site as often as plunder, famine, and other circumstances may require.

They are the purest and best preserved of all the Arab tribes, tracing their origin to the twelve tribes of Ishmael, mentioned in Gen. xvi. 11, xxv. 12; and are the lineal descendants of those ancient Arabs mentioned by the Greek historians, whose site they occupy, and whose customs, manners, prejudices, and superstitions, they rigorously preserve. These people have been frequently confounded by ecclesiastical writers with the Edomites, Amalekites, and other neighbouring nations to the Hebrews; but it is evident that the latter nations, although branches derived from the same stock, differ in many important points from the genuine Bedowins.

Dwelling in the interior of those vast deserts which extend from the confines of Persia to Morocco, the true Arabians have had little foreign intercourse, and have never mixed with surrounding nations, either by conquest or capture; few emigrations occurred even at the epoch of the revolution effected by Mahomet: on which account, the prophet, in his Koran, is continually styling the Arabs of the desert infidels and rebels; nor has the lapse of time since that period effected any remarkable change in their national character. They still answer the description given by the angel in prophecy, 'wild men, whose hand is against every man, and every man's hand against them;' and their mode of living, at the present day, is precisely the same as that mentioned by Diodorus Siculus, nearly 2000 years ago. It has, indeed, been thought remarkable, that Diodorus should observe silence with respect to their predatory habits; but it is highly probable that, at that time, they were so much restrained by the vigilance of the Roman government, as rarely to have an opportunity of exhibiting that distinguishing feature of their character.

The wandering life of these people arises in a great measure from the site they occupy. To paint to himself these deserts (says Mr. Volney,) the reader must imagine a sky almost perpetually inflamed, and without clouds, immense and boundless plains, without houses, trees, rivulets, or hills, where the eye frequently meets nothing but an extensive and uniform horizon, like the sea, though in some places the ground is uneven and stony. Naked as it is almost invariably on all sides, the earth presents nothing but a few wild plants thinly scattered, and thickets, whose

solitude is rarely disturbed but by antelopes, hares, locusts, and rats. Such is the nature of nearly the whole country, which extends 600 leagues in length and 300 in breadth, stretching from Aleppo to the Arabian Sea, and from Egypt to the Persian Gulf. It must not, however, be imagined that the soil in so great an extent is everywhere the same; it varies considerably in different places. On the frontiers of Syria, for example, the earth is in general fat and cultivable, nay even fruitful. It is the same also on the banks of the Euphrates: but in the internal parts of the country, and towards the south, it becomes white and chalky, as in the parallel of Damascus; rocky, as in the Tih and the Hedjaz; and a pure sand, as to the eastward of Yemen. This variety in the qualities of the soil is productive of some minute differences in the condition of the Bedowins. For instance, in the more sterile countries, that is, those which produce but few plants, the tribes are feeble and very distant; which is the case in the desert of Suez, that of the Red Sea, and the interior of the great desert called Najd. Where the soil is more fruitful, as between Damascus and the Euphrates, the tribes are more numerous, and less remote from each other; and, lastly, in the cultivable districts, such as the pachalics of Aleppo, the Hauran, and the neighbourhood of Gaza, the camps are frequent and contiguous. In the former instances, the Bedowins are purely pastors, and subsist only on the produce of their herds, and on a few dates and fresh meat, which they eat either fresh or dried in the sun and reduced to a powder. In the latter, they sow some land, and add cheese, barley, and even rice, to their flesh and milk diet. In those districts where the soil is stony and sandy, as in the Tih, the Hedjaz, and the Najd, the rains make the seeds of the wild plants shoot, and revive the thickets, ranunculi, wormwood, and kali. They cause marshes in the lower grounds, which produce reeds and grass, and the plain assumes a tolerable degree of verdure. While the rains continue, the soil produces great abundance both for the herds and their masters; but on the return of the heats every thing is parched up, and the earth, converted into a gray and fine dust, presents nothing but dry stems as hard as wood, on which neither horses, oxen, nor even goats can feed. Such is the situation in which nature has placed the Bedowins, to make of them a race of men equally singular in their physical and moral disposition.

The peculiarities of the Bedowin Arabs are so striking, that their neighbours the Syrians regard them as extraordinary beings, especially those tribes which dwell in the depths of the deserts, such as the Anasa, Kaibar, Tai, and others, which never approach the towns. When, in the time of Sheik Daher, some of their horsemen came as far as Acre, they excited the same curiosity there as a visit from the savages of America would among us. Everybody viewed with surprise these men, who were more diminutive, meagre, and swarthy, than any of the known Bedowins. Their withered legs were only composed of tendons, and had no calves. Their bellies seemed to cling to their backs, and their hair was

frizzled almost as much as that of the negroes. They, on the other hand, were no less astonished at every thing they saw; they could neither conceive how the houses and minarets could stand erect, nor how men ventured to dwell beneath them, and always in the same spot; but above all, they were in ecstasy on beholding the sea, nor could they comprehend what that desert of water could be. The Arabs of the frontiers are not such novices; there are even several small tribes of them, who, living in the midst of the country, as in the valley of Bekaa, that of the Jordan, and in Palestine, approach nearer to the condition of the peasants; but these are despised by the others, who look upon them as bastard Arabs and Rayas, or slaves of the Turks. The Bedowins in general are small, meagre, and tawny, owing to the heat of the climate, their continual exercise, and extraordinary abstinence; but well formed, active, and alert in a high degree, having expressive countenances, and bright sparkling eyes. Their beards are remarkably thin, their hair is black and wavy. The two ends of the shawl which forms their turban, hang down upon their shoulders, and constitute almost the only distinction between the dress of the Bedowins and other Arabs. Their sheiks wear very wide sleeves to their robes, and girdles richly embroidered. They also preserve a single lock from the crown of the head, by which, in common with other superstitious Mussulmans, they believe the prophet will carry them up to Paradise. They are continually stroking and anointing their beards; to spit upon which is the greatest possible offence, and the loss or diminution of it will cause an Arab to wander far from his tribe, and even from his country, to avoid the derision consequent upon such a catastrophe.

The abstinence of the Bedowins has long been celebrated; indeed the inferior classes live in a state of almost habitual wretchedness and famine, especially among the tribes of the Najd and the Hedjaz. It will appear almost incredible to us, but is an undoubted fact, that the quantity of food usually consumed by the greatest part of them does not exceed six ounces a day. Six or seven dates soaked in melted butter, a little sweet milk or curds, is the Bedowin's common allowance, and he deems himself happy when he can add a small quantity of coarse flour, or a little ball of rice. Meat is reserved for the greatest festivals; and they never kill a kid but for a marriage or funeral. A few wealthy sheiks alone kill young camels occasionally, and eat baked rice with their victuals. In times of dearth, the vulgar, always half famished, do not disdain the most wretched kinds of food; and eat locusts, rats, lizards, and serpents, broiled on briars. Hence are they such plunderers of the cultivated lands, and robbers on the high roads. Habit undoubtedly has its influence in enabling them to support this extraordinary abstemiousness, by preventing the dilatation of the stomach, otherwise common to the human constitution; whilst the extreme heat of the climate destroys in a great measure the activity and tone of the digestive organs. When we consider the influence of climate, custom, and discipline, the real wants of the Bedowin appear few, and easily satisfied;

and it has been questioned whether even the above abstinence arises from choice or necessity. But, depending for provisions entirely on the oases, or small islands of verdure, which lie scattered upon the desert, the produce of which is often destroyed by the hot pestilential winds, his means appear still more contracted than his exigencies, and leave no doubt that necessity is the parent motive.

M. Volney remarked that the sheiks, that is the rich, and their attendants, were always taller and more corpulent than the common class. He has seen some of them above five feet five and six inches high; though in general they do not (says he) exceed five feet two inches. This difference can only be attributed to their food, with which the former are supplied more abundantly than the latter: the effects of this are equally evident in the Arabian and Turkish camels, for the latter, dwelling in countries rich in forage, are far more robust and fleshy than the former.

With respect to their internal constitution and government, the Bedowins are divided into separate tribes, each composed of one or more principal families, the members of which bear the title of sheiks, i. e. chiefs or lords. These families have a great resemblance to the patricians of Rome, and the nobles of modern Europe. One of the sheiks has the supreme command over the others. Mr. Neibuhr styles him the grand sheik. He is the general of their little army; and sometimes assumes the title of emir, which signifies commander and prince. The more relations, children, and allies he has, the greater is his strength and power. To these he adds particular adherents, whom he studiously attaches to him, by supplying all their wants. A number of small families also, who, not being strong enough to live independent, stand in need of protection and alliances, range themselves under the banners of this chief; forming by their union the elementary parts of what is called a kabila, or tribe. The tribes are distinguished from each other by the name of their respective chiefs, or by that of the ruling family; and when they speak of the individuals who compose them, they call them the children of such a chief, though they may not be all really of his blood, and he himself may have been long since dead. Thus they say, Beni Temin Oulad Tai, the children of Temin and of Tai. This mode of expression is even applied, by metaphor, to the names of countries: the usual phrase for denoting its inhabitants being to call them the children of such a place. Thus the Arabs say, Oulad Masr, the Egyptians; Oulad Sham, the Syrians; they would also say, Oulad Fransa, the French; Oulad Moskou, the Russians; a remark which is not unimportant to ancient history.

The principal sheik has an indefinite and almost absolute authority. He nevertheless leads a simple life, and commonly studies the welfare of his subjects. Persons of this description, according to M. Volney, who in 1784 resided with one of the most powerful in the country of Gaza, may be compared to our substantial farmers. A sheik who has the command of 500 horsemen, does not disdain to saddle and bridle his own horse, and give him barley and

chopped straw. In the tent, his wife makes the coffee, kneads the dough, and superintends the dressing of the victuals. His daughters and kinswomen wash the linen, and go with pitchers on their head, and veils over their faces, to draw water from the fountain. These manners are highly antique, and agree precisely with the descriptions of Homer, and the history of Abraham in the book of Genesis.

Every grand sheik considers himself, in a political point of view, absolute lord of his whole territories; he exacts duties upon all goods carried through his dominions, to which impositions those who send caravans through the desert to Mecca, are obliged to submit. The Bedowins, on the other hand, keep open the wells for them; permit the free passage of merchandise, escort the caravans, and if they sometimes pillage them, the haughty perfidious conduct of the Turkish officers is the invariable cause. The latter affect to consider the former as rebels, and violate their engagements. The Arabs take their revenge by pillaging the caravans. When the famous Ali Bey conducted the Egyptian caravan to Mecca, he refused to defray all the duties on the road, but promised to pay the rest on his return. This promise was broken, and the year following, the Arabs assembled in greater numbers, and obliged the captain of the caravan to pay for himself and Ali Bey both. The Turks exclaimed against this as an act of robbery; yet the Arabs had only done themselves justice. The conduct of Abdallah, pacha of Damascus, who commanded the Syrian caravan in 1756, was still more odious. When the sheiks of the tribe of Harb came to meet him, to receive the stipulated toll, he gave them a friendly invitation to visit him, but instead of paying the toll, cut off their heads, and sent them to Constantinople, as a proof of his victory over the rebel Arabs. The stroke which the latter suffered by the death of their chiefs, prevented their attempting any thing in revenge either that or the following year; the caravans travelled in triumph to Mecca; and the Turks boasted of the valor and prudence of Abdallah Pacha. But, in the third year, the dark storm of vengeance burst over the heads of the aggressors, when the Arabs, with an army of 80,000 men, under the command of the sheik of the Anasé tribe, routed the Turks with great slaughter, and confiscated the treasures of a large caravan. These violent measures, however, may be considered as only the effects of perfidy and provocation. Mr. Niebuhr observes, that the Bedowins are not cruel, and do not murder those whom they rob, except where the travellers stand upon the defensive, and in the contest kill one of their number; in which case the Arabs proceed according to the law of retaliation. A mufti of Bagdad, returning from Mecca, says the same author, was robbed in Nedsjed. He entered into a written agreement with the robbers, who engaged to conduct him safe and sound to Bagdad for a certain sum, payable at his own house. They delivered him to the next tribe; those to a third, and he was thus conveyed from tribe to tribe, till he arrived safe at home.

An European, belonging to a caravan which was plundered, had been infected with the plague

upon his journey. The Arabs, seeing him too weak to follow his companions, took him with themselves, lodged him without their camp, attended him till he was cured, and then sent him to Basra. An Englishman, who was travelling express to India, and could not wait for the departure of a caravan, hired two Arabs at Bagdad, who were to accompany him to Basra. By the way he was attacked by some sheiks, against whom he at first defended himself with his pistols; but, being hard pressed by their lances, was forced to surrender. The Arabs, upon whom he had fired, beat him till he could not walk. They then carried him to their camp, entertained him for some time, and at last conducted him safe to Basra. When Mr. Forskal was robbed by the Arabs in Egypt, a peasant, who accompanied him, was beaten by the robbers because he had pistols, although he had made no attempt to defend himself with them. Pillaging expeditions amongst the Arabs are considered as lawful hostilities against enemies, who would defraud the nation of their dues, or against rival tribes, who have undertaken to protect illegal traders.

The tribes of the Bedowins are extremely numerous, and to attempt an enumeration of them would be a hopeless task. Soyúti, in the fifteenth century, collected many interesting accounts respecting them; but all investigations must, from the very nature of the subject, be exceedingly imperfect. The principal noticed by modern travellers lie in the following order:—

I. Those on the southern and eastern side of the Great Arabian and Syrian Desert, extending from the province of Nejed and El Ahsà to the banks of the Euphrates.

1. Beni Kháled (the children of Kháled), in El Ahsa.

2. Beni Kiyàb, on the northern side of the Persian Gulf, and in Persia.

3. Beni Lám, on the Tigris.

4. Montefic, or Montefij, on the Euphrates, between Basra and Baghdád.

II. Those on the borders of Mesopotamia (Al Jezírah), nominally subject to the pachà of Baghdád.

1. Táí, one of the most ancient and powerful tribes, occupying the fertile plains between Mosul and Nisibis, and rendered illustrious by one of its princes named Hátim, the subject of many well-known romances.

2. Some other tribes which are small and unimportant.

III. Those on the borders of Syria, who provide escorts for the caravans of pilgrims to Mecca.

1. The Mawali.

2. The Beni Sáker

3. The Fáhili, and

4. A numerous and powerful tribe, master of the whole caravan route between Aleppo and Medinah; and, during the reign of the Wahhábis, one of their most effective adherents. It is divided into five inferior clans, and extends from Syria to the Nejed.

IV. More than one hundred other tribes have been mentioned by the writers whose names are

at the close of this article; besides which there are several in Omàn, Hadramaut, Mahrab, and other provinces of the Arabian peninsula, who have never been visited by Europeans. Bedowins also occupy a large portion of Egypt, stretch along the banks of the Nile, almost to the confines of Abyssinia, and are found even in the Súdán itself, as far as the fifteenth degree of east longitude. The latter call themselves branches of the Anezehs, Johainahs, and other well-known tribes in the Arabian and Syrian deserts. The Bedowins in Súdán retain the Arab cast, both in complexion and features, bearing no similitude to the negroes, and one of the Bení Hassan, established in Dár Katakù, near Bornù, whom Burckhardt met at Mecca, was of a dark brown color, 'approaching to a copper tinge;' yet 'his features were decidedly Arab,' having nothing of the Negro in them.—*Burckhardt's Nubia*, p. 477.

Each of the Bedowin tribes appropriates to itself a tract of land, forming its territorial domain; and collected in camps, which are dispersed through the country, make a successive progress over the whole, in proportion as it is exhausted by the cattle. Hence it is, that within a great extent few spots are inhabited, and these vary from one day to another; but as the entire space is necessary for the annual subsistence of the tribe, whoever encroaches on it is deemed a violator of property; this is with them the law of nations. If, therefore, a tribe, or any of its subjects, enter upon a foreign territory, they are treated as enemies and robbers, and a war breaks out. Now, as all the tribes have affinities with each other by alliances of blood or conventions, leagues are formed which render these wars more or less general. The manner of proceeding on such occasions is very simple. The offence made known, they mount their horses and seek the enemy; when they meet they enter into a parley, and the matter is frequently made up; if not, they attack either in small bodies or man to man. They encounter each other at full speed with fixed lances, which they sometimes dart, notwithstanding their length, at the flying enemy; the victory is usually decided by the first shock; the vanquished take to flight full gallop over the naked plain of the desert, and the night generally favors their escape from the conqueror. The tribe which has lost the battle immediately strikes its tents, removes to a distance by forced marches, and seeks an asylum among its allies. The enemy, satisfied with their success, drive their herds farther on, and the fugitives soon after return to their former situation; although the slaughter made in these engagements frequently sows the seeds of hatreds which originate future dissensions.

An eye for an eye, and a tooth for a tooth, was, we know, enacted by the law of Moses; and the universality of this *Lex Talionis* is one of the distinctive marks of the Bedowin race, prevailing through the whole extent of the Arabian deserts. By this law the blood of every man must be avenged by shedding that of his neighbor. This vengeance is called *tar*, or retribution; and the right of exacting it devolves on the nearest of kin to the deceased. So nice

are the Arabs on this point of honor, that if any one neglects to seek his retaliation he is disgraced for ever. He therefore watches every opportunity of revenge: if his enemy perishes from any other cause, still he is not satisfied, and his vengeance is directed against the nearest relation. These animosities are transmitted as an inheritance from father to children, and never cease but by the extinction of one of the families, unless they agree to sacrifice the criminal, or purchase the blood for a stated price, in money or in flocks. Without this satisfaction there is neither peace, nor truce, nor alliances, between them, nor sometimes even between whole tribes: there is blood between us, say they on every occasion; and this expression is an insurmountable barrier. Such accidents being necessarily numerous in a long course of time, the greater part of the tribes have ancient quarrels, and live in an habitual state of war; which, added to their way of life, renders the Bedowins a military people, though they have made no great progress in war as an art. Their camps are formed in a kind of irregular circle, composed of a single row of tents, with greater or less intervals. These tents, made of goat or camel's hair, are black or brown, in which they differ from those of the Turkmen, which are white. They are stretched on three or four pickets, only five or six feet high, which gives them a very flat appearance; at a distance, one of these camps seems only like a number of black spots; but the piercing eye of the Bedowin is not to be deceived. Each tent inhabited by a family is divided by a curtain into two apartments, one of which is appropriated to the women. The empty space within the large circle serves to fold their cattle every evening. They never have any intrenchments; their only advanced guards and patrols are dogs; their horses remain saddled and ready to mount on the first alarm; but as there is neither order nor regularity, these camps, always easy to surprise, afford no defence in case of an attack: accidents, therefore, very frequently happen, and cattle are carried off every day; a species of marauding war in which the Arabs are very experienced. The tribes which live in the vicinity of the Turks are still more accustomed to attacks and alarms. The latter never cease to wage secret or open war against them. The pachas study on every occasion to harass them. Sometimes they contest with them a territory which they had let them, and at others demand a tribute which they never agreed to pay. Should a family of sheiks be divided by interest or ambition, they alternately succour each party, and conclude by the destruction of both. Frequently too they poison or assassinate those chiefs whose courage or abilities they dread, though they should even be their allies. The Arabs, on their side, regarding the Turks as dangerous enemies, watch every opportunity to do them an injury, cut their harvests, carry off their flocks, and intercept their communication and commerce, making it their study to put them to every inconvenience, and deprive them of every thing but life.

Notwithstanding the depredations which render them a terror to those around them, among

themselves they are remarkable for a good faith, a disinterestedness, and a generosity, which would do honor to the most civilised people. The rights of hospitality are scrupulously regarded. The tent of a Bedowin is an asylum amongst all the tribes, and the moment a stranger, or even an enemy, flying for refuge arrives there, his person becomes instantly inviolable; from that moment it would be reckoned an indelible shame to satisfy even a just vengeance at his expense, and all the power of the sultan would be insufficient to force a refugee from the protection of a tribe, but by its total extermination. Ali Bey (Don Pedro de la Badia), informs us, that when one of the Bedowins heard that his wife had given some food to his enemy, who by mistake solicited charity at his tent, he replied, 'I should probably have killed my enemy had I found him here, but I should not have spared my wife if she had forgotten the law of hospitality.' What little the Bedowin possesses he is ever generous to divide, he sits at the door of his tent, and invites passengers to partake of his repast; and to observe the conduct of the Bedowin Arabs towards each other, one would be tempted to suppose they had all things in common.

With respect to their domestic laws, Mr. Niebuhr tells us, 'that, although the Mahomedans are permitted to have four wives, the Bedowins, who are poor, and cannot easily find the means of subsistence, content themselves with one, for the most part. Those who are in the easiest circumstances, and who have two wives, seem to have married so many, chiefly that they might superintend their concerns in two different places. The conduct of our sheik of Beni Saïd, as well as his conversation, led us to make this reflection. The disagreement that subsisted between his two wives afforded an instance of some of the inconveniences that attend polygamy. The dress of the females in the desert, although simpler, is in reality the same as that worn by the ordinary women of Egypt, although the wife of one of our sheiks wore an uncommon piece of dress: brass rings of an enormous size in her ears. These women living remote from the world, and being wholly occupied in the management of their domestic affairs, appear to be, from these circumstances, less shy and scrupulous than the other women of the east. They make less difficulty of conversing with a stranger, or exposing their faces unveiled before him.'

The property of the Bedowin, like his wants, lies within a small compass, and consists of movables, of which the following is a pretty exact inventory:—A few male and female camels; some goats and poultry; a mare and her bridle and saddle; a tent; a lance sixteen feet long; a crooked sabre; a rusty musket with a flint or matchlock; a pipe; a portable mill; a pot for cooking; a leathern bucket; a small coffee roaster; a mat; some clothes; a mantle of black wool; a few glass or silver rings, which the women wear upon their legs and arms. If none of these are wanting their furniture is complete. But what the Arab takes most pleasure in is his mare, which is his chief support, and assists him in his excursions. They prefer the mare on ac-

count of her superior docility, and her milk, together with the improbability of her neighing, to the betrayal of the rider. The Arabs trace the genealogies of their favorite horses to the mares of Mahomet's stud, or even to those of Solomon's. The power of enduring hunger and fatigue in these animals is astonishing. The Emir visited by the Chevalier d'Arvieux was saved by a mare, who carried him three days and nights, without rest or food, and conveyed him out of the reach of his enemies. The attachment of the Bedowin to his horse is almost as proverbial as the fleetness of the animal itself. He inhabits the same tent, is treated with the same care, and is almost as much caressed as the children of the family; which gives the Arabian steeds a docility and tractability which no other breed possesses. Niebuhr, indeed, speaks of the Kohlaniet, or thorough bred Arabian horses, as not possessing any beauty, or other excellence than swiftness; but it is highly probable that he was deceived by the wretched condition in which they are commonly kept, from the great difficulty of procuring fodder. He appears also to have been equally misinformed, as to the little value set upon them by the Turks; since the fact is certain, that the Turks esteem them highly, and give immense prices for them, when they can meet with the genuine Arab breed.

The simplicity of the Bedowins has long been celebrated, and numerous illustrations of it have been given. Their love of poetry is well known, and the most ancient Arabian poems, containing the lively descriptions of their customs and opinions, are the productions of Bedowins. The book of Job affords a more ancient picture of the same nation; and both its phraseology and imagery are susceptible of much illustration from the poems and romances of the early Arabs. Tales in prose form another part of their favorite amusements, after the manner of the *Adventures of Antares* and *Ablat*, and the *Arabian Nights*. They have a peculiar passion for such stories, and employ in them almost all their leisure, of which they have a great deal. In the evening they seat themselves on the ground, at the threshold of their tents, or under cover, if it be cold; and there, ranged in a circle round a little fire of dung, their pipes in their mouths, and their legs crossed, they sit a while in silent meditation, till on a sudden one of them breaks forth with, once upon a time, and continues to recite the adventures of some young sheik and female Bedowin: he relates in what manner the youth first got a secret glimpse of his mistress; and how he became desperately enamored of her: he minutely describes the lovely fair; boasts her black eyes, as large and soft as those of the gazelle; her languid and impassioned looks, her arched eye-brows, resembling two bows of ebony; her waist straight and supple as a lance; he forgets not her steps, light as those of the young filley; nor her eye-lashes, blackened with kool; nor her lips painted blue; nor her nails, tinged with the golden colored henna; nor her breasts, resembling two pomegranates; nor her words, sweet as honey. He recounts the sufferings of the young lover, so wasted with desire and passion that his body no longer yields any shadow.

At length, after detailing his various attempts to see his mistress, the obstacles of the parents, the invasions of the enemy, the captivity of the two lovers, &c. he terminates, to the satisfaction of the audience, by restoring them, united and happy to their paternal tent; and receives the tribute paid to his eloquence, in the Ma cha allah (an exclamation of praise, equivalent to admirably well!) he has merited. The Bedowins have likewise their love songs, which have more sentiment and nature in them than those of the Turks and inhabitants of the towns; doubtless, because the former, whose manners are chaste, know what love is; while the latter, abandoned to debauchery, are acquainted only with enjoyment. These tales, together with a few traditional receipts in medicine, and a practical knowledge of a few of the constellations, constitute the whole of their literature; and their ignorance in other respects is very remarkable. The following anecdote by Mr. Niebuhr, has been thought worthy of insertion. 'In one of those expeditions, a few years since, undertaken against the pacha of Damascus, who was conductor of the Syrian caravan to Mecca, the tribe of Anæse, which gained the victory, showed instances of their ignorance, and of the simplicity of their manners. Those who happened to take goods of value knew not their worth, but exchanged them for trifes. One of those Arabs having obtained for his share a bag of pearls, thought them rice, which he had heard to be good food, and gave them to his wife to boil, who, when she found that no boiling could soften them, threw them away as useless.'

With respect to religion, the freedom of the Bedowins is remarkable. There is, however, a striking difference between the Arabs of the towns and those of the desert. While the former crouch under the double yoke of political and religious despotism, the latter live in a state of perfect freedom from both. On the frontiers of the Turks, indeed, the Bedowins, from policy, preserve the appearance of Mahomedanism; but so relaxed is their observance of its ceremonies, and so little fervor has their devotion, that they are generally considered as infidels, who have neither law nor prophet. They even make no difficulty in saying that the religion of Mahomet was not made for them: 'For (add they) how shall we make ablutions who have no water! How can we bestow alms who are not rich? Why should we fast in the Ramadan, since the whole year with us is one continued fast? And what necessity is there for us to make the pilgrimage to Mecca, if God be present everywhere?' In short, every man acts and thinks as he pleases, and the most perfect liberty exists among them.

Their superstitious dread of charms appears from the following passage of Burckhardt's Account of his Journey in the Peninsula of Mount Sinai. He had made it a rule never to let the Arabs, among whom he was travelling, see him write; but on one occasion his long absence from his companions roused their curiosity. One of them came to look after him, and seeing him immovably fixed, squatted down on the ground, and closely muffled up, he approached on the

tiptoe, and suddenly lifting up the cloak which screened him, detected a book in his hand. 'What is this?' exclaimed the Arab, 'What are you doing? I shall not make you answerable for it at present, because I am your companion; but I shall talk further to you about it when we are at the convent.' When they had returned to their halting place, Burckhardt, 'requested him to tell what he had further to say.' To this the Bedowin replied, in a passionate tone, 'You write down our country, our mountains, our pasturing places, and the rain which falls from heaven; other people have done this before you, but I at least will never assist in the ruin of my country.' Burckhardt assured him that he liked the Arabs too well to wish to injure them. 'On the contrary,' he added, 'had not I occasionally written down some prayers ever since we left Taba, we should most certainly have been all killed, and it is very wrong in you to accuse me on account of that, the omission of which would have cost us our lives.' He was startled at this reply, and seemed nearly satisfied. 'Perhaps you say the truth,' he observed; 'but we know that some years since, several men, God knows who they were, came to this country, visited the mountains, wrote down every thing, stones, plants, animals, even serpents and spiders, and since then little rain has fallen, and the game has greatly decreased.' The same opinions prevail in the mountains as are current among the Bedowins of Nubia, and they believe that a sorcerer, by writing down certain charms, can stop the rains and transfer them to his own country.' *Travels in Syria and the Holy Land*, p. 519.

Notwithstanding this general ignorance and credulity, the Bedowins possess considerable strength of genius; their poems abound with native similitudes, which embellish by their force and variety, and are distinguished by unexpected epigrammatic turns. The skill, also, with which they draw an unforeseen inference, or bring out an unexpected result, shows the acuteness of their understandings, habituated to a rapidity of plan and execution. Their talent for repartee is well known. When one who could repeat all the Hadith or sayings of Mahomet by heart, was asked how his memory could retain so many different sentences at once, he instantly replied, 'just as the sand in the desert retains all the pearly drops that fall from the heavens without losing a single one of them.' Amusing sketches of these people may be found in Volney, Sonnini, Bruce, and other Asiatic travellers; but the most accurate are those of the Chevalier d'Arvieux, *Memoires*; six tomes, in 12mo. Paris 1735, edited by Father Labat, Niebuhr, *Beschreibung von Arabien*, p. 379. Seetzen, *Von Zachi, Monatliche Correspondenz*, 1819, February and March. Description de l'Égypte, *Mémoires par Dubuis et Larrey*; also in Burckhardt's *Travels*, who, as he took great delight in studying the manners and characters of the Bedowins, has left a separate and detailed account of them.

Living constantly, as the Arabs do, under their camel's hair tents, occupied as they are solely with the care of their flocks and herds, speaking nearly the same language, and placed many of

them in the same regions as the Israelites under Moses, their customs and habits bear in many respects a strong resemblance to those of the Jewish patriarchs. The Memoires of the Chevalier d'Arvieux, already quoted, have supplied much curious and useful information on this subject, the perusal of which will interest the reader, and by comparing the articles, as he proceeds, with the Jewish narrative, he will find his views of the patriarchal period, with respect both to the geography and political incidents of it, greatly enlarged.

Those who are fond of tracing the effect produced by local circumstances upon the genius and national character of a people, will find much interesting matter for their consideration in the detailed particulars of the history of this remarkable people. For further historical authorities, we refer to the *Mezhar of Soyúti*; the great historical works of *Abú l'Fedá, Shahrístání, and Makrizi*; *Pococke's Specimen Historiæ Arabum*; *Salé's Preliminary discourse to his translations of the Korán*; *Burckhardt's Translations from Makrizi (Nubia, Appendix, No. iii.)* *Quatremères Mémoires sur l'Égypte*, ii. 190; *Jackson's Account of Morocco*; *Sonnini, Voyages en Égypte, and Volney's Travels*, ii. 25.

BED'RAGGLE, be and draggle. See **DRAGGLE**.

DE'DRAWE, be and draw. See **DRAW**.

BED'REINTE, } See **DRENCH** and **DRINK**.
BETREINTE, }

BEDRI, a town and district in the pachalic of Bagdad, the former surrounded by fine gardens. It is the frontier of the Turkish empire.

BEDRIACUM, in ancient geography, a village of Italy, situated, according to Tacitus, between Verona and Cremona, but nearer the latter than the former. From an account given by that historian, Cluverius conjectures that the ancient Bedriacum stood in the place where the town of Caneto now stands. This village was remarkable for the defeat of the emperor Galba by Otho, and afterwards of Otho by Vitellius.

BED'RIBBLE, be and dribble. See **DRIBBLE**.

BEDRIP, **BEDREPE**, or **BEDERAPE**, the customary service which inferior tenants anciently paid their lord, by cutting down his corn, or doing other work in the field.

BEDROPT, be and drop. See **DROP**.

BEDWIN, **GREAT**, a town of Wiltshire, six miles south of Hungerford, and seventy west from London. It was anciently a borough by prescription, and sent two members to parliament. It is said to have been a considerable city in the time of the Saxons, and that the traces of its fortifications are extant. It is situated by the side of the Kennet and Avon canal. The church is spacious, with a lofty tower, and is constructed entirely of flints.

BEE, } Ang.-Sax. beo. Wachter
BEE-GARDEN, } derives the name from the
BEE-HIVE, } Old Saxon byan, which sig-
BEE-MASTER, } nifies to build, and to inhabit,
because the animals designated by the term dwell together under one government, and construct their habitations with great skill and industry.

Monsieur Cobweb; good Monsieur, get your weapons in your hand, and kill me a red-hip'd humble bee on the top of a thistle; and good Monsieur bring me the honey bag. *Shakspeare.*

So work the honey bees,
Creatures that by a ruling nature teach
The art of order to a peopled kingdom. *Id.*

For that doth wrong must look to be wronged again; Habet et mosca splenem, et formica vas bilis inest. The least fly hath a spleen, and a little bee a sting. An asse overwhelmed a thisselwarps's nest, the little bird pecked his gaul'd back in revenge, and the humble-bee in the fable sung down the eagle's eggs out of Jupiter's lap. *Burton. Anat. Mel.*

As bees
In spring time, when the sun with Taurus rides,
Pour forth their populous youth about the hive
In clusters; they among fresh dews and flowers
Fly to and fro; or on the smoothed plank,
The suburb of their straw built citadel,
New rubb'd with balm, expatiate and confer
Their state affairs. *Milton.*

They that are bee-masters, and have not care enough of them, must not expect to reap any considerable advantage by them. *Mortimer.*

A convenient and necessary place ought to be made choice of for your apiary or bee-garden. *Id.*

To have BEES IN THE HEAD. A phrase meaning to be choleric; to have that in the head which is easily provoked, and gives pain when it is. Also to be restless. To have 'a bee in the bonnet,' is a similar phrase.

But, Wyll, my maister hath bees in his head,
If he find me here pratinge, I am but deade.
Damon and Pith. O. Pl.

He has a head full of bees.
Ben Jonson. Barth Faer.

BEE, in natural history, a genus of insects, the characters and habits of which are fully given under the general name, apis. The principal species are there also described. See **APIS**.

BEE, in astronomy. See **APIS**.

BEE, in metaphorical language, denotes sweetness, industry, &c. Thus Xenophon is called the Attic bee, on account of the great sweetness of his style. Antonius got the denomination of Melissa, or the bee, on account of his collection of common places. Leo Allatius gave the appellation of apes urbanæ, i. e. city bees, to the illustrious men at Rome from 1630 to 1632.

BEE, or **BIE**, in the Saxon language, signifies a station; and in this sense makes part of the names of several places in Scotland; such as Cairnbe, Middlebie, Overbie, &c. Perhaps also the different Beestons, &c, in England may have had their names from the same origin.

BEE-BIRD. See **COLIBRI**.

BEE-BREAD, **BEE'S-BREAD**, or **BEE-GLUE**, the farina of flowers collected by the working bees: called by the ancients propolis. See **APIS**. We feel, however, the following remarks of Mr. Bonner's too sensible and important to be omitted here:—The substance, commonly called bee-bread, he says, 'is to be found at the bottom of many of the cells, and is frequently covered over with honey. The bees carry it home in loads upon their legs, or rather their thighs. It is generally of a yellow color, but often takes its color from the flowers from which it is collected. Various conjectures have been made by different authors re-

specting its use. Some allege that the bees eat it; hence the name bee-bread. Others suppose, that after being taken into their stomachs, it is converted by some peculiar action of their internal juices into wax, of which everybody knows their combs are made. But an objection to this hypothesis arises from the consideration, that the bees, when first put into an empty hive, carry little or none of this stuff on their legs for some time, till a great number of combs are made; and that after the combs are completed (which they generally are within two or three weeks after the swarm have taken possession of the hive), the bees still continue to carry in this stuff during the whole working season. To this, however, it may be replied, that, perhaps, as they have no cells to put it into at that time, they carry it home in their bellies, where it probably undergoes a speedy change in passing through their bodies, and may thereby be converted into perfect wax, with which they manufacture their combs. There is another class of authors, who suppose that the bee-bread is used by the old bees to feed the young ones in the cells, by the mouth, as pigeons feed their young ones. To this it may be objected, that the young bees surely cannot make use of all the bee-bread, which the old bees are almost constantly carrying into the hive, when they are at work. Perhaps both these last hypotheses may be true; as it may not only serve to feed the young bees, but also, by passing through the bodies of the old ones, may be converted into wax; with which bees not only build their combs, when a swarm is newly put into a hive, but also seal up both their young in the cells, and their honey in the combs. If this supposition be true, then the consumption of bee-bread, through the course of the year, but especially during the honey and breeding seasons, must be very great; and therefore we need not be surprised at the quantities imported by the working-bees. But, whatever truth may be in either or both of these theories, I am certain of one thing, that the bees do not live on bee-bread alone; for they will die of hunger, although there be plenty of it in the hive, if there be no honey in it; whereas, when they have abundance of honey, they will live without bee-bread, at least for many weeks. Reaumur, however, says, that it is absolutely necessary for food to bees. For my part, I have always observed the bees most busily employed in carrying in this stuff while the young bees are breeding; but when they want a queen, and have no eggs to rear another, they immediately give over carrying it into the hive; thinking (as it would seem), that as they have no young bees to feed or seal up in the cells, it would be an idle business to bring any more of it home; especially as they do not make much use of it themselves, and have more already in the hive, than they will stand in need of, for their own use.

BEE-EATER. See MITROPIS.

BEE-HIVES. See APIS.

BEE-HUMBLE. See BOMBYLIUS.

BEEBAN, a pass in the high road between Algiers and Constantina. The rocks which cross it are in many cases hewn down like so many doors, which has led the Arabs to give it

the appellation of beeban, or gates. Six miles north of Accaba.

BEECH, } Bece and boc, Old Saxon; φηγος,
BEE'CHEN, } and Latin *fagus*. The *φ.* and *f.*
BEE'CHY. } being changed into *b*. The mast bearing tree in the earliest ages furnished food for man.

The smooth-leaved *beeches* in the field receive him,
With coolest shades till noontide rage is spent.

Fletcher's Purple Island

Black was the forest, thick with *beech* it stood.

Dryden.

With diligence he'll serve us when we dine,
And in plain *beecheen* vessels fill our wine. *Id.*

I know not why the *beech* delights the glade,

With boughs extended, and a rounder shade;

Whilst towering firs in conic forms arise,

And with a pointed spear divide the skies. *Prior.*

Dull are the pretty slaves, their plumage dull,

Ragged, and all its brightening lustre lost;

Nor is that sprightly wildness in their notes

Which, clear and vigorous, warbles from the *beech*.

Thomson's Seasons.

Not a pine in my grove is there seen,

But with tendrils of woodbine is bound;

Not a *beech*'s more beautiful green,

But a sweet-briar twines it around.

Shenstone. Pastorals.

BEECH, in botany. See FAGUS.

BEECH-FORK, a river of the United States in Kentucky, and one of the three principal sources of the river Salt, which rise in three different parts of Mercer county; and, winding westward, unite and form that large navigable river, about fifteen miles from the Ohio.

BEECH GALL, in natural history, a hard knot on the leaf of the beech, containing the maggot of a species of fly. There are sometimes only one of these upon a leaf, sometimes more; they always grow from the same point, owing to the fly's having laid so many eggs in the same spot. They are of an oblong figure somewhat flattened, and shaped like the stone of a plum. They are so hard as not to be broken between the fingers; their substance seems of the same nature with that of a nut-shell. In each gall there is only one cavity inhabited by a white worm, which in time passes through the nymph state into that of the fly, to which it owed its origin.

BEECH MAST, the fruit of the beech-tree; a triangular seed, like an acorn, containing a whitish oleaginous pith, of a very agreeable taste. It is used for fattening hogs, deer, &c. It has sometimes, even to men, proved an useful substitute for bread. Chios is said to have endured a memorable siege by means of it.

BEECH OIL, an oil drawn by expression from beech mast. This oil is very common in Picardy, and used there, and in other parts of France, instead of butter; but most of those who take a great deal of it complain of pains and a heaviness in the stomach. An attempt was made some years ago to introduce the manufacture of beech-oil into England, and a patent was granted to the proprietor, but without success; the country people turning their mast to better account in feeding hogs with it, than by selling it to the patentee for oil.

BEEDEER, a province in the Deccan, Hindostan, now possessed by the Nizam, situated

principally between the sixteenth and eighteenth degrees of north latitude. To the north it is bounded by Aurungabad and Nandere; on the south by the river Krishna; to the east it has the province of Hyderabad; and to the west the province of Bejapoor. In length it may be estimated at 140 miles, by sixty-five the average breadth. The surface of this province is uneven and hilly, but not mountainous, and it is intersected by many small rivers which fertilise the soil, and flow into the Beemah, Krishna, and Godavery. The country is very productive, and under the ancient Hindoo government contained a redundant population, but is now thinly peopled.

BEEDER, a town in the province of Beeder, of which it is the capital. Lat. 17° 47' N., long. 77° 48' E. It is fortified with a stonewall, a dry ditch, and many round towers. The wall is six miles in circumference, and the town which it encloses stands in an open plain, except the east side, which is a rising ground about 100 yards high. The remains of many good buildings are to be seen in this decayed city. It was formerly noted for works of tutenague inlaid with silver, and before the Mahomedan invasion, was the capital of a Hindoo sovereignty. Travelling distance from Hyderabad, seventy-eight miles, from Delhi 857, from Madras 430, and from Calcutta 980 miles.

BEEF', *n.* & *adj.* } Fr. *boeuf*, from the Lat.
BEEF'-EATER, } *bos*, *bovis*, Gr. *βovς*, from
BEEF'-WITTED. } *βωω* (*βοσκω*). To feed. The
 flesh of the ox, bull, or cow, prepared for food. The plural is *beeves*. Johnson says, the flesh of black cattle. *Beef-eater*, because the commons is *beef*, when in waiting. Mr. Stevens derives it thus: *beef-eater* may come from *beaufetier*, one who attends at the sideboard, which was anciently placed in a *beaufet*. The business of the *beef-eaters* was to attend the king at meals. A yeoman of the guard.

Have by the night, accursed thieves,
 Slaine his lambes, or stolne his *beeves*.

Browne. The Shepherd's Pipe.

A pound of man's flesh

Is not so estimable or profitable,

As flesh of muttoms, *beeves*, or goats.

Shakspeare.

The plague of Greece upon thee, thou mongrel *beef-witted* lord. *Id.*

One way a band select from forage drives

A herd of *beeves*, fair oxen, and fair kine,
 From a fat meadow ground. *Milton.*

The fat of roasted *beef* falling on birds, will baste them. *Swift.*

On hides of *beeves*, before the palace-gate,

Sad spoils of luxury! the suitors sate. *Pope.*

BEEF-EATERS, (*Beaufetiers*), yeomen of the guard to the king of Great Britain, so called from being stationed by the sideboard at great royal dinners. They are kept up rather from state than for any military service. Their arms are a sword and lance. They were first raised by Henry VII. in the year 1485, and anciently consisted of 250 men of the first rank under gentry, and of a larger stature than ordinary, each being required to be six feet high. At present there are but 100 on constant duty and seventy more

not on duty; and when any one of the 100 dies, his place is supplied out of the seventy. They go dressed after the manner of king Henry VIIIth's time. Their first commander, or captain, was the earl of Oxford.

BEEF-EATER, in zoology, the English name of the Buphaga Africana. See *BUPHAGA*.

BEEF ISLAND, one of the smaller Virgin islands in the West Indies, between Dog Island on the west and Tortola on the east, about five miles long and one broad. Long. 63° 2' W., lat. 18° 23' N.

BEEF TEA, in medicine, the substance of beef, extracted by boiling it in water, which is now very generally prescribed, and with great success, in all diseases of debility, when the stomach is not able to digest solid food.

BECK (David), an eminent portrait-painter, was born at Arnheim, in Guelderland, in 1621, and became a disciple of Vandyck; from whom he acquired a fine manner of penciling and coloring. He possessed, besides, that freedom of hand, and rapidity of execution, for which Vandyck was so remarkable. King Charles I. when he observed his expeditious manner of painting, was so surprised, that he told him, he supposed he could paint if he was riding post. He was appointed portrait-painter to queen Christina of Sweden; and by her recommendation, most of the illustrious persons in Europe sat to him for their pictures. Having an earnest desire to visit his friends in Holland, he left the court of Sweden much against the queen's inclination, and died soon after at the Hague, where, it is suspected that he was poisoned. This happened in 1656, when he was only thirty-five. A singular adventure happened to him, as he passed through Germany. He was suddenly and violently taken ill at the inn where he lodged, and seeming to all appearance dead, was laid out as a corpse. His servants expressed the strongest marks of grief for the loss of their master; but consoled themselves, while they sat beside his bed, by drinking very freely. At last one of them said to his companions, 'our master was fond of his glass while alive, let us give him one glass now:' and raised up his master's head to pour the liquor into his mouth. Beck, on this opened his eyes; and by proper management and care recovered perfectly.

BEELE, a kind of pick-axe, used by the miners for separating the ores from the rocks in which they lie; and called a tubber by the miners of Cornwall. The iron part of it weighs about eight or ten pounds. Though it is steeled at each end, it wears out so fast, that it requires new points once a fortnight.

BEELIKE, or **BEELICH**, a town of Prussia, in the duchy of Westphalia, with a Benedictine provostship. Twelve miles E. N. E. of Arensberg, and thirteen north-west of Brilon. Long. 8° 27' E., lat. 51° 30' N.

BEELEZEBUB, **BEELZEBUL**. See **BAAL-ZEBUB**.

BEEMAH, or **BEWRAH RIVER** (*Bhima*, terrific), rises in the mountains to the north of Poonah, not far from the source of the Godavery, and passes within thirty miles to the east of Poonah, where it is esteemed sacred. It is one of the principal rivers that join the Krishna,

which it does near the town of Firozegur, in the province of Beeder. The length of its course, including the windings, may be estimated at 400 miles. The horses most esteemed by the Mah-rattas, are those bred on the banks of the Beemah.

BEEMEN, or **SHEEMEN**, in astronomy, seven stars of the fourth magnitude, following each other, in the fourth flexure of the constellation Eridanus.

BEER', } Ger. and Dut. *bier*. Gold-
BEER'-HOUSE, } ast thinks from *pyris*, beer
BEER'-BREWER. } being first made of pears.
Vossius derives it from the Lat. *bibere*, to drink; **Noel** from *beor*, describing a kind of beverage made from honey. **Johnson** traces it to *bir*, Welsh, and adds, liquor made of malt and hops. It is distinguished from ale either by being older or smaller.

Oh, let them come, and taste this beer,
 And water henceforth they'll forswear.

Thomas Nabbes, in Ellis.

Among those that were without the fort, and which were of the foresaid company of **Captaine Ribault**, there was a carpenter of threescore years olde, once a *bere-brewer*.

Hakluyt's Voyages.

Here's a pot of good double beer, neighbour; drink-
Shakspeare.

Flow, Welsted! flow, like thin inspirer, beer;
 Tho' stale, not ripe; tho' thin, yet never clear;
 So sweetly mawkish, and so smoothly dull;
 Heady, not strong; and foaming, tho' not full.

Pope.

BEER is perhaps any fermented liquor made from a farinaceous grain, but generally from barley. It is, properly speaking, the wine of barley. Under the article **ALE**, we have entered upon the subject of brewing that article pretty generally. The only other species of beer is porter. See therefore, **ALE**, **PORTER**, and **BREWING**. Small or Table Beer, we may here add, is usually made, particularly in quantity and for sale, by mashing with a fresh quantity of water what is left after the beer or ale wort is drawn off; and sometimes from a small quantity of malt brewed on purpose. Two parts of London table beer may be considered equivalent in strength to one of ale; but, according to the legal distinction, (59. Geo. III. c. 53. sect. 25.), all beer sold above the price of 18s. per barrel is deemed ale, or strong beer, and pays ale duty, viz. 10s. per barrel; and beer, of the price of 18s. per barrel, or under, exclusive of the duty, namely, 2s. per barrel, is considered as table beer within the meaning of the act.

The final gravity of table beer wort is usually from 11 to 12,50lbs. per barrel. Every brewer, however, fixes that final standard strength, which he finds most suitable to his trade.

BEER, in weaving, nineteen threads running through the whole length of the piece.

BEER, in ancient geography, a city twelve miles north of Jerusalem, on the road to Shechem; where **Jothan** the son of **Gideon** concealed himself from his bloody brother **Abimelech**.

BEER, or **BILR ELEM**, a place in the country of the **Moubites**, where the **Israelites** dug wells. Numbers, xxi. 18.

BEER, **BELEBICK**, **BER**, or **BRABSDICK**, a town of **ASIANIC Turkey**, in the government of **Orfa**,

the ancient **Thiar** or **Barsampse**. It stands upon a lofty eminence on the west bank of the **Euphrates**, which is here deep and rapid, about 130 yards broad. A bridge of boats conveys caravans from **Aleppo** to **Orfa** at this point, for which privilege a portage is paid here. **Niebuhr** says, it consists of 500 houses, protected by a citadel and a wall; but the whole place is in a dilapidated condition. It was long deemed impregnable, and is still considered a place of strength. **Pococke** notices a collection of ancient arms and armour, which he saw here. Among these were various sorts of foil arrows: many of them pointed with iron, and to the extremities of some, combustible matter, made up in a triangular form, was attached, which being ignited was carried into the town which it was intended to set on fire. There was another sort to which iron bottles, or cases filled with similar combustibles, were fixed, which were inflamed previous to their discharge. The cross-bows were straight, and were about five feet long. There were also a variety of slings. Some writers are of opinion that these arms were Roman, as they correspond with the description given of them by **Ammianus Marcellinus**. Considerable trade was carried on to **Bagdad** by means of vessels descending the river. Beer is sixty-seven miles from **Orfa**; 115 south-west of **Diarbekir**; and 114 north-east of **Aleppo**. It is the great thoroughfare from **Aleppo** to **Diarbekir** and **Persia**.

BEERALSTON, an ancient borough in the county of **DEVON**, England, disfranchised by the reform bill in 1832.

BEER, **EAGER**, is used by calico-printers, chemists, lapidaries, scarlet-dyers, vinegar merchants, white-lead men, &c.

BEER LA-HA-ROI, in ancient geography, a place between **Kadesh** and **Shur**, south of **Canaan**, where the angel appeared to **Hagar**. Gen. xvi. 14.

BEER MACHINES, are contrivances by means of which that liquor is drawn from three or four casks at once, and delivered from cocks placed close together in the bar of a tavern or other convenient place above the cellar. These machines are nothing else than an assemblage of small lift pumps, whose suction pipes communicate with the casks containing the beer: they are now very common in London and other large towns. The internal part of the machine consists of four lift pumps, firmly fixed between two blocks of wood, and in each of which semicylindric excavations are made to contain the barrels: these are held together and fastened in the case enclosing the pumps by two screws between each barrel, seen plainly in the figure. The upper part of the case of the pumps is a half cylinder, and has four narrow openings in it, corresponding to the axis of each pump; in these openings the levers which give motion to the pump buckets move: they are bent, the angular point being the centre on which they move: a short arm has the pump rod joined to it, and to a long one is affixed the handle. The centre pins of the levers are supported on a piece of wood fixed in the case nearly in the axis of its cylindric head; the pump rod is divided into two branches; at their lower ends which receive a pin, joining them to the bucket rod, through which the pin passes. The rod is continued above

as well as below the joint : the lower part goes into the pump, and the upper slides through a brass collar fixed to the back of the case; this collar is included between the two branches of the pump rod : its use is to confine the bucket rod to move truly vertical, while the pump rod being attached to it at only one point can obey the irregular motion occasioned by the lever describing a circular arc. The bucket rod passes through a stuffing box in the top of the pump, through which it moves easily, and yet without permitting the escape of any liquor by it : below this it is screwed into the branches of the bucket, which has a valve in it, and is surrounded by soft leather, which makes it fit the barrel of the pump without leaking. In the bottom of the barrel another valve, similar to that in the bucket, is placed, and a close tube leads from it to a leaden pipe, bringing the liquor from the casks in the cellar. At the upper part of each barrel a small leaden pipe is soldered : these pipes are bent upwards, and come through the side of the case. Sometimes the pipes leading from the two first pumps are brought into one, and both deliver through the same spout ; for the convenience of mixing two kinds of beer. The operation of the pumps is exactly the same as the common sucking pump. Some beer-pumps (as those invented by Mr. Rowntree of Blackfriar's-road) are of a more complex construction.

BEERING'S or **BEHRING'S BAY**, is situated in the sixtieth degree of latitude, on the west coast of North America, and received this name from captain Vancouver, in honor of Vitus Behring, who visited these shores in 1740, and anchored in a large bay, the position of which was not correctly ascertained. Captain Cook assigned this appellation to a different part of this shore ; but as he only saw it at a distance, he could not perceive the tract of low ground that stretches from the base of the mountains which he supposed to bound the bay. Vancouver found that this low land precluded all appearance of a bay, in the place which Captain Cook had assigned to it ; and therefore, as the name was intended to be applied to the bay in which Behring anchored, he transferred it to that which Mr. Dixon had previously called Admiralty Bay. There is no other Bay, he tells us, between Cape Suckling and Cape Fairweather, in which Behring could have found shelter.

BEERING'S ISLAND, an island in the North Pacific ocean, which is sometimes classed with the Aleutian chain, of which it may be considered the most western link. It extends 104 miles in length, by fifteen in breadth ; is mountainous and sterile. The west coast is elevated, the northern point low land ; the principal mountains, called the Hanavoy ridge, consisting of granite and sandstone, contain many caverns. There are two bays on the coast, wherein vessels in the fur trade winter, but they are shallow, of dangerous access, and exposed to the north winds ; the climate is rigorous. No wood grows here, but various kinds of plants are common. Several small streams issue from the lakes and pools near the shore. Minerals of value are said to have been found, and pieces of native copper are cast ashore after storms. The surrounding seas abound in whales ;

phocæ are numerous on the shores, and multitudes of sea otters ; black and blue foxes formerly inhabited the island. The sea cow was an object of pursuit, but so incessantly sought after, that the species is either extinct or deterred by danger from approaching the island, as none have been seen on it since the year 1708. When the sea otter, whose numbers have also been greatly diminished, disappears in March, it is replaced by the sea lion, because in the northern regions animals frequent particular places in the most regular succession. This island was discovered in 1740, or 1741, by Vitus Beering, a Dane, a commodore in the Russian service. The latitude of this island is about 55° N., and the long. 167° E.

BEEROO, a country of central Africa, to the south of Bambara, and having Ludamar on the west. The government is in the hands of the Moors. It is probably very populous, since Walet, the capital was reported to be larger than Tombuctoo ; but the interior is little known.

BEERSHEBA ; from **באר**, a well, and **שכע**, he sware, or **שביעה**, an oath ; a city to the south of the tribe of Judea, adjoining to Idumea, where, anciently, Abraham and Isaac swore friendship to Abimelech. It stood twenty miles south of Hebron, and forty-two in the same direction from Jerusalem. When Eusebius wrote, A. D. 315, it was still a considerable town, *κομη μεγιστη*, garrisoned by Roman soldiers. The boundaries of the Holy Land are often described in Scripture as extending from Dan to Beersheba (2 Sam. xvii. 11) ; and after the separation of the kingdoms of Judah and Israel, the boundaries of the former are mentioned as from Beersheba to Mount Ephraim. The Beersheba which is described by the historian of the Crusades (Jacobus de Vitriaco, Hist. Hieros. 36 ; Gulielmus Tyrius, xiv. 22), as situated ten or twelve miles from Ascalon, is a different place.

BEES HEAD (St.), a lofty promontory, with a light-house on the top of it, about five miles from Whitehaven, to which it is connected by one continued range of rocks rising perpendicularly from the beech.

BEES, SAINT, a town in the county of Cumberland, between Whitehaven and Egremont, noted for its public school. It had once a nunnery, the church of which is still used, and the free grammar-school has a good library. The schoolmaster is appointed by the provost and fellows of Queen's College, Oxford. The parish is of great extent, and appears, from its ruins, to have been fortified by the Romans at all the convenient landing places.

BEESTINGS, **BREASTINGS**, or perhaps more properly **BEASTINGS**, a term used by country people for the first milk taken from a cow after calving. The beestings are of a thick consistence, and yellow color, seemingly impregnated with sulphur. Dr. Morgan imagines them peculiarly fitted and intended by nature to cleanse the young animal from the recrements gathered in its stomach and intestines, during its long habitation in utero. The like quality and virtue he supposes in women's first milk after delivery ; and hence infers the necessity of the mother's suckling her own child, rather than committing it to a nurse whose first milk is gone.

BE'ET, *n. s.* Lat. *beta*, the name of a plant. See BETA.

BEET, in botany. See BETA.

BEETLE, *v. & n.* } *Beetle*, an insect, the name probably derived from the word *beat*, because it heavily beats the air with its wings. *Beetle*, BEET'LING, } a mallet; a three-man-

beetle, was one so heavy that it required three men to manage it, two at the long handles, and one at the head. *Beetleheaded*, probably in allusion to this it means a thick and heavy skull. *Beetlebrow* is an overhanging heavy brow. To *beetle* is to hang over like the top of a cliff.

BEETHOVEN (Louis Von), born in Bonn, 1772, was the son of a tenor singer in that place, (according to Fayolle's Dictionary of Musicians, a natural son of Frederick William II., king of Prussia). His great talent for music was early cultivated. He astonished, in his eighth year, all who heard him, by his execution on the violin. In his eleventh year he played Bach's Wohl Temperirtes clavier, and, in his thirteenth, composed some sonatas. These promising appearances of great talent induced the then reigning elector of Cologne to send him, in 1792, in the character of his organist, to Vienna, that he might accomplish himself there in composition, under the instruction of Haydn. Under Haydn and Albrechtsberger he made rapid progress, and became, likewise, a great player on the piano forte, astonishing every one by his extempore performances. In 1809 he was invited to the new court of the king of Westphalia, at which several men of distinction, and among them his pupil the archduke Rodolph, bishop of Olmütz, who persuaded him to remain. He composed his principal works after 1801. A few years before his death, a cold, caught by composing in the open air, produced a deafness, which became troublesome. Instrumental music has received from his compositions a new character. Beethoven united the humor of Haydn with the melancholy of Mozart, and the character of his music most resembles Cherubini's. Besides his great symphonies and overtures, his quintetts, quartetts, and trios for stringed instruments, his numerous sonatas, variations, and other pieces for the piano forte, in which he shows the great richness of his imagination, he also composed vocal music, but with less success. He died March 26, 1827, near Vienna, in the greatest poverty.

BEETLE, in entomology. See ATTELABUS, and SCARABÆUS.

BEETLE, in mechanics, is likewise called a stamper, and by paviours a rammer.

BE'FALL. Be and fall. See FALL.

BE'FIGHT. Be and fight. See FIGHT.

BETIT. Be and fit. See FIT.

BE'FOAM. Be and foam. See FOAM.

BE'FOOL. Be and fool. See FOOL.

BETORE. } Compounded of be and BEFOREHAND, } fore, written differently in BEFORETIME. } different eras of our literature, as *before*, *before*, *before*, and *before*. When referring to time, it signifies anterior or prior; to place in front, or in presence of; and to the state of the mind it expresses preference.

His profession is to deliver precepts necessary to eloquent speech; yet so, that they which receive them, may be taught, *beforehand*, the skill of speaking. *Hooker.*

In this realm of England, *before* Normans, yea, *before* Saxons, there being Christians, the chief pastors of their souls were bishops. *Id. Eccles. Pol.*

Heavenly born,
Before the hills appear'd, or fountain flow'd,
Thou with eternal wisdom didst converse. *Milton.*

You tell me, mother, what I knew *before*,
The Phrygian fleet is landed on the shore. *Dryden.*

Your soul has been *beforehand* with your body,
And drunk so deep a draught of promis'd bliss,
She slumbers o'er the cup. *Id.*

I have not room for many reflections, the last cited author has been *beforehand* with me, in its proper moral. *Addison.*

BEFORT, a ci-devant district of France, on the frontiers of Switzerland, now comprehended in the department of the Upper Rhine. Though comparatively sterile, it has excellent iron mines; these, and the forges connected with them, employ a large portion of its population.

BEFORT, or BELFORT, once the capital of the county, and now of an arrondissement, is a small but strong town, seated on the Savoureuse. It was ceded to France by the treaty of Westphalia, in 1648. It is important as being a pass from Alsace to Franche Comté; and it is, by its central position, enabled to carry on a good trade in the wines of Burgundy and Champagne. It is situated at the point of meeting of several great roads, viz. of two from Paris, two from Switzerland, one from Strasburg, and one from Lorraine. The county and town of Bafort were ceded by Austria to France in 1648. In 1659, Louis XIV. granted them to cardinal Mazarin; and in 1781 they were obtained by the duke of Valentinois, who lost them at the Revolution. The fisheries and forests, as well as the mines, are considered very productive. Bafort is about thirty-five miles south-west of Colmar, and seventy in the same direction from Strasburg Lat. 47° 38' N., long. 6° 57' E.

BE'FRIEND. Be and friend. See FRIEND.

BE'FRINGE. Be and fringe. See FRINGE.

BEG', *v.*

BEG'GAR, *v., n. s., & adj.*

BEG'GABLE, *v.*

BEG'GARY,

BEG'GING, *n.*

BEGGAR'ING,

BEGGAR'LINESS,

BEGGAR'LY, *adj. & adv.*

BEGGAR'FEAR,

BEGGAR'MAID,

BEGGAR'MAN,

BEGGAR'WOMAN.

Ger. *beggeren*. It is probably a corruption of *baggar*, because, says the Encyclopædia Metropolitana, beggars carry with them *bags*, into which they put the alms that may be bestowed upon them.

To *beg*, is to ask, to entreat, with a view to obtain any object. It is the gentle force of persuasion opposed to violence and demand. To *beggar*, is to reduce to a state of dependence on the gratuitous aid of others. To bring into the condition of imploring favor.

And she was clad full poorly,
All in an old torne courtpy,

As she were all with dogges torne,
And both behind and eke before
Clouted was she *beggerly*.

Chaucer.

He raiseth up the poor out of the dust, and lifteth up the *beggar* from the dunghill, to set them among princes.

Samuel.

Touching God himself, hath he revealed that it is his delight to dwell *beggarly*? And that he taketh no pleasure to be worshipped, saving only in poor cottages?

Hooker.

So as their *begging* now them failed quite;
For none would give, but all men would them wyte;
Yet would they take no pains to get their living,
But seeke some other way to gaine by giuing,
Much like to *begging*, but much better nam'd;
For many *beg*, which are thereof asham'd.

Spenser. Mother Hubbard's Tale.

On he brought me into so bare a house, that it was the picture of miserable happiness and rich *beggary*.

Sidney.

Well, whiles I am a *beggar*, I will rail,
And say,—there is no sin, but to be rich;
And being rich, my virtue then shall be,
To say,—there is no vice but *beggary*! *Shakspeare.*

For her person

It *beggar'd* all description; she did lie
In her pavilion, cloth of gold, of tissue,
O'er-picturing Venus.

Id.

I will ever, though he do shake me off

To *beggarly* divorcement, love him dearly.

Id.

He finds it his best way to be always craving, because he lights many times upon things that are disposed of or not *beggable*.

Butler.

— thy suppliant

I *beg* and clasp thy knees; bereave me not,
Whereon I live, thy gentle look, thy aid,
Thy counsel in this uttermost distress.

Milton.

What subjects will precarious kings regard?

A *beggar* speaks too softly to be heard.

Dryden.

These shameful *beggars* of principles, who give this precarious account of the original of things, assume to themselves to be men of reason.

Tillotson.

BEG, a place in Ayrshire, in the parish of Galston; celebrated for being one of the retreats of the patriotic Sir William Wallace, where, in a rude fortification, attended by only fifty of his friends, he obtained a complete victory over 200 Englishmen.

BEG, or BEY, in the Turkish government. See BEY. Beg is more particularly applied to the lord of a banner, called in the Turkish language *sangiak beg*. A *beg* has the command of a certain number of the *sipahis*, or horse, maintained by the province; under the denomination of *timariots*. All the *begs* of a province obey one governor-general, called *begler-beg*, or *beyler-beg*, q. d. lord of lords, or of the *begs* of the province.

BEGS, or BEGS, of Egypt, generals who have the command of the militia or standing forces of the kingdom; and are appointed to secure the country from the Arabs, as well as to protect the pilgrims in their annual expeditions to Mecca. The *begs*, several of whom are descended from the ancient race of the *Mamaluks*, are very rich and powerful, maintaining 500 fighting men each for their own guard, and the service of their court. On discontents, they have frequently risen in rebellion. They are often at variance with the *bashaw*, whom they have more than once imprisoned and plundered.

VOL III

BEGA (Cornelius), painter of landscapes, cattle, and conversations, was born at Haerlem in 1620, and was the disciple of Adrian Ostade. Falling into a dissipated way of life, he was disinherited by his father: for which reason he cast off his father's name, *Begeyn*, and assumed that of *Bega*; his early pictures being marked with the former, and his later works with the other. He had a fine pencil, and a delicate manner of handling his colors, so as to give them a look of neatness and transparence; his performances are so much esteemed in the Low Countries as to be placed among the works of the best artists. He caught the plague from a woman with whom he was deeply enamoured, and died a few days after her, aged forty-four.

BEGA, ST. an Irish virgin, who is said to have lived a solitary life of devotion at the spot in the county of Cumberland, where the town of St. Beas was afterwards built, and thus named after her.

BEGALLED, be and galled. See GALLED.

BEGAWED, be and gawed. See GAWED.

BEGAY, be and gay. See GAY.

BEGEMDER, a fertile province of Abyssinia, bounded by Dembea on the west, Samen on the north, Angot on the east, and Amhara on the south. It includes the dependency of Lasta, and its length has been stated at 180 miles, and its breadth at sixty. There is a much greater proportion of what may be called level ground here, than in almost any of the other provinces in this alpine region. The mountains abound with iron, and afford good pasturage for the noble herds of cattle, with which *Begemder* is stocked. Mr. Bruce was informed that it was capable of raising 45,000 effective cavalry. The southern boundary is full of deep and rugged ravines.

BE'GET, Be and get. Ang-Sax. be-BEGET'TER, } gettan, gettan. To obtain, to
BEGET'TING, } produce as effects; to produce
BEG'OT, } as accidents; to generate, to
BEGOT'TEN. } procreate; to become the father of, as of children.

A yonge man called Melibeus, mighty and riche, *begate* upon his wif, that was called Prudence, a daughter which that called was Sophie. *Chaucer.*

— next he did *begot*

An infinite increase of angels bright,

All glist'ning glorious in their Maker's light.

Spenser

But first come the hours, which we *begot*

In Jove's sweet paradise, of day and night,

Which do the seasons of the year allot.

Id

— see here be all the pleasures

That Fancy can *beget* on youthful thoughts,

When the fresh blood grows lively, and returns

Brisk as the April buds in primrose season.

Milton.

Love is *begot* by fancy, bred

By ignorance, by expectation fed. *Granville.*

Men continue the race of mankind, commonly without the intention, and often against the consent and will, of the *begetter*.

Locke.

My whole intention was to *beget*, in the minds of men, magnificent sentiments of God and his works.

Cheyne.

Son of the Father, first *begotten* Son!

Ere the short measuring line of time begun,

The world has seen thy works, and joy'd to see

The bright effulgence manifest in thee. *Parnell.*

3 C

BEGGHE, (ST.), the founder of the order of the Beguards, and probably of that of the Beguines. She flourished about A. D. 680.

BEGHERME, an extensive country in the eastern part of central Africa, little known. It is said to lie between Bornou on the north, Bergoo on the east, and Cassina on the west, and to be governed by a sultan of its own, dependent on that of Bornou; according to Dr. Seetzen it has lately been annexed to Bergoo, which is also dependent upon Bornou.

BEGILT, be and gilt. See GILT.

BEGIN, *v.* & *n.* } I began or begun; I have
 BEGIN'NER, } begun. Sax. *beginnan*,
 BEGIN'NING, } from *be*, or *by*, to, and *gan*,
 BEGIN'NINGLESS. } *gan*, *gaan*, or *gan*, to go;
 applied to the first motion towards any act, purpose, or design; to enter upon existence, to have its original.

Mindes he our tears; or ever moued his eyes?

Wept he for ruth? or pitied he our loue?

What shall I set before, or where begin? *Surrey*

Thus heaping crime on crime, and grief on grief,
 To loss of love adjoining loss of friend,

I meant to purge both with a third mischief,
 And, in my woe's *beginner*, it to end. *Spenser*

They *began* at the ancient men which were before
 the house. *Ezekiel*

By peace we will *begin*. *Shakspeare*

I'll sing of heroes and of kings.
Begin my muse! *Cowley*

They are, to *beginners*, an easy and familiar introduction; a mighty augmentation of all virtue and knowledge in such as are entered before. *Hooker*

————— if ye know,

Why ask ye, and superfluous *begin*
 Your message, like to end as much in vain?

Milton

Begin every day to repent; not that thou shouldst at all defer it; but all that is past ought to seem little to thee, seeing it is so in itself. *Begin* the next day with the same zeal, fear, and humility, as if thou hadst never *begin* before. *Taylor*

The air was soon after the fight *began*
 Far more inflam'd by it than by the sun.

Marrell

Youth, what man's age is like to be, doth show;
 We may our end by our *beginning* know. *Denham*

By viewing nature, nature's handmaid, art,
 Makes mighty things from small *beginnings* grow:

Thus fishes first to shipping did impart,
 Their tail the rudder, and their head the prow.

Dryden

The understanding is passive; and whether or not it will have these *beginnings*, and materials of knowledge, is not in its own power. *Locke*

These systems are so many enchanted castles; they appear to be something—they are nothing but appearances: like them, too, dissolve the charm, and they vanish from the sight. To dissolve the charm, we must *begin* at the *beginning* of them: the expression may be odd, but it is significant.

Bolingbroke. Study of History.

Rapt into future times, the bard *began*,
 A virgin shall conceive.

Pope

I have taken a list of several hundred words in a sermon of a new *beginner*, which not one hearer could possibly understand. *Swift*

BEGGIRT, } Saxon *begierdan*, *begyrdan*.
 BEGIRTED. } *gyrdan*; to close in round about;
 be and gird, to bind with a girdle; to shut in
 with a siege; to beleaguer; to block up.

Begird th' Almighty throne,
 Beseeching, or besieging. *Milton*

Or should she, confident

As sitting queen adorn'd on beauty's throne,
 Descend, with all her winning charms *begirt*,
 T' enamour. *Id.*

At home surrounded by a servile crowd,
 Prompt to abuse, and in detraction loud:
 Abroad *begirt* with men, and swords, and spears;
 His very state acknowledging his fears. *Prior*

BEGLERBEG, a governor of one of the principal governments in the Turkish empire, and next in dignity to the grand vizier. To every beglerbeg the grand seignior gives three ensigns or staves, trimmed with a horse-tail, to distinguish them from the bashaws, who have but two; and from simple begs, or sangiac begs, who have but one. Five of the beglerbegs have the title of viziers, viz. those of Anatolia, Babylon, Cairo, Romania, and Buda. The beglerbegs appear with great state, and a large retinue, especially in the camp, being obliged to bring a soldier for every 5000 aspers of rent which they enjoy. Those of Romania brought 10,000 effective men into the field. The beglerbegs are become almost independent, and have under their jurisdiction several sangiacs or particular governments, and begs, agas, and other officers, who obey them.

BEGLERBEGLIK, or BEGLIERBEGLIK, the province or government of a beglerbeg. These are of two sorts, viz. 1. Beglerbeglik, basilo, which have a certain rent assigned out of the cities, countries, and signiories allotted to the principality: and are in number twenty-two, viz. those of Anatolia, Caramania, Diarbekir, Damascus, Aleppo, Tripoli, Trebizond, Buda, Temeswar, &c. 2. Beglerbeglik, salianæ, for maintenance of which is annexed a salary or rent, collected by the grand seignior's officers with the treasure of the empire. These are in number six, viz. those of Cairo, Babylon, &c.

BEGNAW. Be and gnaw. See GNAW.

BEGONE. Be and gone. Decayed or worn. Far advanced, or sunk deep, either in weal or woe. Also, the imperative *be*, and the past participle *gone*; as go, depart; generally expressing impetuosity or displeasure. As, Get out of my sight.

I was a lusty one
 And faire, and riche, and yonge, and well *begone*.
Chaucer

And witteth well, that one of the
 Is with treasure so full *begone*,
 That if ye happe thereupon,
 Ye shall be riche men for ever. *Gower*

Begone, I will not hear this vain excuse;
 But, as thou lov'st thy life, make speed from hence.
Shakspeare

Begone. the goddess cries with stern disdain,
Begone! nor dare the hallow'd stream to stain.
 She fled, for ever banish'd from the train.
Addison

Ungrateful wretch! *begone*, and no longer pollute my dwelling with thy baseness; *begone*, and never let me see thee again. Go from my doors; and the only punishment I wish thee, is an alarmed conscience, which will be a sufficient tormentor. *Goldsmith.*

BEGONIA, in botany, a genus of plants of the polygamia monœcia class; the characters of which are these: the flowers are of two kinds; the one is the male flower, composed of four leaves, some broader, and others narrower; the other, which produces the embryo fruit, is of the rosaceous sort, and is composed of several petals, arranged in a circular form, and placed on a foliated cup, which finally becomes a trigonal alated fruit, divided into three cells, and containing small seeds. Willdenow describes twenty-five species of this genus, which belong principally to the West India Islands. See *Transactions of the Linnæan Society*, vol. i.

BEGORED. Be and gored. See **GORE.**

BEGRAVE. Be and grave. See **GRAVE.**

BEGRIME. Be and grime. See **GRIME.**

BEGRIPE. Be and gripe. See **GRIBE.**

BEGROW. Be and grow. See **GROW.**

BEGGRUDGE. Be and grudge. See **GRUDGE.**

BEGSHEHRI (Beissheri) a town and captaincy in the Pachalic of Karaman-ili, Anatolia. The town is protected by a castle built by Alâud-dîn, the Seljûk sultan in the twelfth century. This district contains 122 smaller, and 12 larger fiefs, called by the Turks Zimârets and Ziyâ-mets.

BEGUARDS, or **BEGHARDS**, the third order of the religious of St. Francis in Flanders. They were established at Antwerp in the year 1223, and took St. Begghe for their patroness, whence they had their name. From their first institution they employed themselves in making linen cloth, each supporting himself by his own labor, and united only by the bonds of charity, without having any particular rule. But pope Nicholas IV. having confirmed that of the third order of St. Francis in 1289, they embraced it in 1390. They were greatly favored by the dukes of Brabant, particularly John II. and John III. who exempted them from all contributions and taxes. See **FRANCISCANS.**

BEGUE, an old term for the natural mark in the mouth of a horse, which distinguishes his age. It is probably derived from the French, in which the same word signifies a stutterer.

BEGUE (Lambert le), the founder or restorer of the order of the Beguines, flourished about the end of the twelfth century.

BEGUILE, } Be and guile. *Guile*, from
BEGUILERS, } *gewighian*, and wile, from *wig-*
BEGUILING, } *lian*, to deceive, to allure into a
BEGUILTY. } snare; the worst kind of wickedness; hence the general term *guilt*. The *beguilers* and the *beguiled* divide our species, with the exception of those who are abused and hated by both, because they have wisdom without knavery, and goodness without folly, qualities equally detestable to the deceivers and the deceived.

This miller smiled at hir nicetee,
And thought, all this n' is don but for a wile,
They wenen that no man may hem *begile*.

Chaucer.

For often he that will *begile*,

Is *guiled* with the same *guile*.

And thus the *guiler* is *beguiled*.

Cower.

When we escape from a little wile, and know the *beguiler*, we think that we are *beguiled* already with other great wiles.

Golden Book.

Her lips, most happy each in other's kisses,
From their so wisht imbracements seldome parted,
Yet seem'd to blush at such their wanton blisses;
But, when sweet words their ioyning sweet disparted,
To th' eare a dainty musique they imparted,
Upon them fitly sate delightful smiling,
A thousand smiles with pleasing stealth *beguiling* :
Ah, that such shows of ioyes should be all ioyes ex-
iling.

Spenser.

And often did *beguile* her of her tears,
When I did speak of some distressful stroke
That my youth suffered.

Shakspeare.

Sweet, leave me here awhile;

My spirits grow dull, and fain I would *beguile*

The tedious day with sleep.

Id.

By easy commutations of publick penance, for a private pecuniary mulct, thou dost at once *beguilty* thine own science with sordid bribery, and embolden the adulterer to commit that sin again without fear.

Bishop Sanderson.

Some cursed fraud

Of enemy hath *beguiled* thee, yet unknown,
And me with thee hath ruin'd, for with thee
Certain my resolution is to die.

Milton.

Whosoever sees a man, who would have *beguiled* and imposed upon him by making him believe a lye, he may truly say, that is the man who would have ruined me.

South.

While o'er his lips her lovely forehead bow'd,

Won by his grateful eloquence, which sooth'd

With sweet variety the tedious march,

Beguiling time.

Glover. Leonidrs.

BEGUINAGE, the place of residence of a society of Beguines. See next article. The finest beguinage in Flanders was that of Malines. That of Antwerp was very spacious, and had two separate churches.

BEGUINES, a congregation of nuns, which must not be confounded with the Beghards, founded either by St. Begghe, or by Lambert le Begue. They were established first at Liege, and afterwards at Nivelles in 1207; and from this last settlement sprang the great number of Beguinages, which are spread over all Flanders, and which have passed from Flanders into Germany. In the latter country, some of these religious fell into extravagant errors, persuading themselves that it was possible, in the present life, to arrive to the highest perfection, even to impeccability, and a clear view of God; in short, to so eminent a degree of contemplation, that there was no necessity, after this, to submit to the laws of mortal men, civil or ecclesiastical. The council of Vienne, in 1113, condemned these errors, and abolished the order of Beguines; permitting, nevertheless, those among them, who continued in the true faith, to live in chastity and penitence, either with or without vows. It is by favor of this latter clause, that there still subsist (or at least subsisted till lately) so many communities of Beguines in Flanders; who, subsequently to the council of Vienne, conducted themselves with so much wisdom and piety, that pope John XXII. by his decretal, which explains that of his predecessor made in the council of Vienne, took them under

his protection; and Boniface VIII. in another, exempted them from the secular tribunal, and put them under the jurisdiction of the bishops. There was scarce a town in the Low Countries in which there was not a society of Beguines; and even at Amsterdam there was a very flourishing one. These societies consisted of several houses placed together in one enclosure, with one or more churches, according to the number of Beguines. There was in every house a prioress, or mistress, without whose leave they durst not stir out. They made a sort of vow, in the following terms: 'I—— promise to be obedient and chaste as long as I continue in this Beguineage.' They observed a three years noviciate before they took the habit. They were formerly habited in different manners; some in gray, others in blue; but of late they all wore black. When they went abroad, in Amsterdam, they put on a black veil. Formerly they had as many different statutes as there were societies. In the visitations of the year 1600 and 1601, by the archbishop Matthias Hovius, they were forbidden, under the penalty of a fine, to have lap-dogs.

BEHABAN, a town of Persia, in the province of Fars. It is the capital of the district of Kho-gilaa, and is pleasantly situated in an extensive and highly cultivated valley, which is intersected by the rivers Zab and Jerahi. The walls are three miles in circumference, and the population is 10,000. It is 153 miles from Shiraz.

BEHALF. This word Skinner derives from *half*, and interprets it, for my half; as, for my part. It seems, to be rather corrupted from *behof*, profit; the pronunciation degenerating easily to *behalf*; which, in imitation of other words so sounded, was written, by those who knew not the etymology, *behalf*. For my or your part, or share, or sake. Whatever is done in favour, for the sake of, either in support or vindication.

Yet this I say in *hir behalf*
If Helen were *hir* becke,
Sir Paris need not to disdaine
Bir thro' h the seas to seeke. *Turberville.*

He might, in his presence, defy all Arcadian knights, in the *behalf* of his mistress's beauty. *Sidney.*

Michael this my behest have thou in charge,
Take to thee from among the Cherulim,
Thy choice of fancing warriors, lest the fend,
Or in *behalf* of man, or to invade
Vacant possession, some new trouble raise;
Haste thee, and from the paradise of God
Without remorse drive out the sinful pair. *Milton.*
Were but my heart as naked to the view,
Marcus would see it bleed in his *behalf*. *Addison.*

Never was any nation blessed with more frequent interpositions of divine providence in its *behalf*. *Atterbury.*

BEHANG. Be and hang. See **HANG**.
BEHAPPEN. Be and happen. See **HAPPEN**.
BEHATED. Be and hate. See **HATE**.
BEHAVE. } Be and have: be and haviour.
BEHAVING. } *Geil. had. n. au g. sax. habban.*
BEHAVIOUR. } See **HAVE** and **HAVIOUR**.
to have, to subdue, to discipline, its ancient and now obsolete sense. To carry, to act, to direct ones' self. Manners, carriage, gesture,

appearance. It is taken in either a good or bad sense, as he *behaved* well or ill.

The beautiful prove accomplished, but not of great spirit; and study, for the most part, rather *behaviour* than virtue. *Bacon.*

He who adviseth the philosopher, altogether devoted to the Muses, sometimes to offer sacrifice to the altars of the Graces, thought knowledge imperfect without *behaviour*. *Wotton.*

But who his limbs with labours, and his mind *Behaves* with cares, cannot so easy miss. *Faerie Queene.*

With such sober and unnoted passion
He did *behave* his anger ere 'twas spent,
As if he had but prov'd an argument. *Shakespeare.*

One man sees how much another man is a fool, when he dedicates his *behaviour* to love. *Shakespeare.*

Get ye all three into this box-tree; Malvolio's coming down this walk; he has been yonder 'till the sun, practising *behaviour* to his own shadow, this half hour: observe him for the love of mockery. *Shakespeare.*

To their wills wedded, to their errors slaves,
No man like them, they think, himself *behave*s. *Denham.*

We so live, and so act, as if we were secure of the final issue and event of things, however, we may *behave* ourselves. *Atterbury.*

We are not, perhaps, at liberty to take for granted that the lives of the preachers of Christianity were as perfect as these lessons; but we are entitled to contend, that the observable part of their *behaviour* must have agreed in a greater measure with the duties which they taught. *Paley.*

BEHEAD, } Be and head. See **HEAD**.
BEHEADING, } To head, or behead, is to take off, cut off, strike off, the head: a Gallican accomplishment, greatly in vogue during the Revolution.

His *beheading* he underwent with all Christian magnanimity. *Clarendon.*

Mary, queen of Scots, was *beheaded* in the reign of queen Elizabeth. *Addison.*

I think it was Caligula who wished the whole city of Rome had but one neck, that he might *behead* them at a blow. *Spectator.*

She (Anne Boleyn) was *beheaded* by the executioner of Calais, who was sent for, as more expert than any in England. *Hume.*

On each side they fly,
By chains connext, and, with destructive sweep,
Behead whole troops at once. *Philips.*

Lord Clarendon relates that he (marquis of Argyll) was condemned to be hanged, which was performed on the same day; on the contrary, Burnet, Woodrow, Heath, Echard, concur in stating that he was *beheaded*; and that he was condemned upon the Saturday, and executed on the Monday. *Paley.*

BEHEADING, a capital punishment, wherein the head is severed from the body by the stroke of an axe, sword, or other cutting instrument. Decollatio, or beheading, was a military punishment among the Romans. Among them the head was laid on a cippus, or block, placed in a pit dug for the purpose; in the army, without the vallum; in the city, without the walls, at a place near the porta decumana. Preparatory to the stroke, the criminal was tied to a stake, and whipped with rods. In the early ages the blow was given with an axe, and was but clumsily performed; but in after-times with a sword, which was thought the more reputable manner of dying: when the executioners grew more expert,

and took off the head with one circular stroke. St. Paul thus says that the magistrate 'beareth not the sword in vain.' In England, beheading is the punishment of nobles, being reputed not so disgraceful as hanging. In France, during the revolutionary government, the practice of beheading by an instrument called a guillotine (so denominated from its inventor, Dr. Guillot,) was very general. It resembles an instrument long ago used for the same purpose in Scotland, called the maiden, and which is still preserved in Edinburgh. See *GUILLotine* and *MAIDEN*. It is doubtless the most speedy, and least painful, of capital punishments.

BE'HEARD, *be* and *heard*, past participle of the verb to hear. See *HEAR*.

BEHEM (Martin), an eminent geographer of the fifteenth century, was born at Nuremberg. Assuming the existence of a western continent, he is said to have applied, in 1459, to Isabella, regent of the duchy of Burgundy and Flanders, to supply him with a vessel, with which he discovered the island of Fayal, one of the Azores, or at least established a colony of Flemings there, for the discovery is claimed for Gonsalvo Velho, a Portuguese. After residing at Fayal for twenty years, in 1484 (eight years before the expedition of Columbus), according to letters of his still preserved, it is said, in the archives of Nuremberg, he induced John II. of Portugal, to intrust him with the command of an expedition to the south-west. He is said, at this time, to have discovered Brasil, and even to have sailed to the Straits of Magellan, which he mathematically delineated on a map. These letters bear date 1486; and the event is related in the Latin Chronicle of Hartman Schedl, and by Peter Mateus, who wrote on the canon law two years before the expedition of Columbus. His discoveries are likewise referred to by Cellarius and Riccioli, the first of whom mentions the service which his charts afforded Magellan; and the latter asserts that Columbus obtained direct information from Behem in Madeira. He was knighted by the king of Portugal, and otherwise honored as a person of great merit; although these rewards some writers attribute to his discovery of Congo. He died at Lisbon in July 1506, leaving no works behing him, except the chart before mentioned, and a terrestrial globe, still in the library of Nuremberg, &c. Dr. Robertson treats the story of his discovery of America as a legend; it is certainly strange that he should leave the world without more formally claiming it; but the memoir of M. Otto, in vol. ii. of the American Philosophical Transactions, may be profitably consulted on this curious question.

BEHEMOTII, *n. s.* *Behemoth*, in Hebrew, signifies beasts in general, particularly the larger kind, fit for service. But Job speaks of an animal behemoth, and describes its properties. Bochart has taken much care to make it the hippopotamus, or river-horse. Sanctius thinks it is an ox. The fathers suppose the devil to be meant by it. *Calmet*.

Behold now *behemoth*, which I made with thee; he eateth grass as an ox. *Job*.

Scarce from his mould
Behemoth, biggest born of earth, upheav'd

His vastness: fleec'd the flocks and bleating rose
As plants: ambiguous between sea and land,
The river-hors^z and scaly crocodile. *Milton*.

Behold' in plaited mail
Behemoth rears his head. *Thomson*.

BEHEMOTH is generally supposed by commentators, as well as natural historians, to mean either the elephant or the river-horse. The late Mr. Bruce endeavours to prove that the rhinoceros is the animal meant by this word. Others think that this word denotes the same animal with mammoth, a huge creature, generally supposed to be extinct; but whose bones are frequently found in marshy grounds in Asia and America. See *MAMMOTH*. According to the Jewish rabbin, God, in the beginning, created two behemoths, male and female; the female was killed and salted to be reserved as an entertainment for the faithful whenever the Messiah shall come; the male is still living, and when the last day arrives, God will kill it, and give it to the Israelites, who shall then rise from the dead. *Calmet* relates that the Jews are still so convinced of these extravagant traditions, that it is a common custom to swear by the share that they are to have of Behemoth hereafter. Job xl. 15. See *Calmet's Dictionary*, and *Harmer's Observations on Scripture*, vol. ii.

BE'HELD, participle passive from **BEHOLD**, which see.

All hail! ye virgin daughters of the main!
Ye streams, beyond my hopes, *beheld* again! *Pope*.

BE'HEN, } Valerian roots; a name of the
BEN. } silene inflata or bladder campion

BE'HEST, *Be* and *hest*; Goth. *haitan*; A *Shatan*, *hatun*; Dutch, *heten*; Germ. *heissen*. command; precept; mandate; the declared will of any personage, power, or sovereignty.

To breken forward is not min entente
Behest is dette, and I would hold it fayn
All my *behest* I can no better sayn. *Chaucer*.

Her tender youth had obediently lived under her
parents' *behests*, without framing, out of her own will,
the forechoosing of any thing. *Sidney*.

To visit oft those happy tribes,
On high *behests* his angels to and fro
Pass'd frequent. *Milton*.

In heav'n God ever blest, and his divine
Behests obey, worthiest to be obey'd. *Id*.

The plain, by slow degrees, shall rise
Higher than erst had stood the summit hill;
For time must nature's great *behest* fulfil. *Prior*.

BEHET, } See **BEHEST**. From *hatan*,
BEH'GHT, } to promise, is the primary
BEHO'TE, } sense. It also signifies to en-
BEHO'TEN, } trust; to commit; and some-
BEHE'TEER, } times to name, or call. See
HIGHT. Likewise to command; to adjudge; to address; to intend; to reckon; to esteem.

—In right ill array
She was with storm and heat, I you *behight* (inform).
Chaucer.

False faitour, Scudamour, that hast by fight
And foule advantage this good knight dismay'd,
A knight much better than thyself *behight* (esteemed).
Spenser.

The author's meaning should of right be heard,
He knoweth best to what end he enditeth;
Words sometimes bear more than the heart *behighteth*
(means). *Mirror for Magistrates.*

And him restoring unto living light,
So, brought unto his lord, where he did sit
Beholding all that womanish weake fight;
Whom soome as he beheld he knew, and thus *behight*
(addressed). *Spenser.*

There it was judged, by those worthy wights,
That Satyrane the first day best had donne;—
The second was to Triamond *behight* (adjudged). *Id.*
So taking courteous conge, he *behight* (commanded)
Those gates to be unbarr'd; and forth he went. *Id.*

But now aread, old father, why of late
Didst thou *behight* (name) me born of English blood,
Whom all a faeries son do nominate? *Id.*

That most glorious house that glis'treth bright,
Whereof the keys are to thy hands *behight* (en-
trusted)
By wise Fidelia. *Id.*

Sir Guyon, mindful of his vow yplight,
Uprose from drowsy couch, and him address
Unto the journey which he had *behight* (proposed or
premissed). *Id.*

BEHE'W, *v.* be and hew. See HEW.

BEHIND, *prep.* } The imper. be, and the
BEHIND, *adv.* } noun hind. Goth. *hinder*;
BEHINDAND. } Sax. *behindan*, *hindan*,

after. Posterior in time or space, dilatory, too late. There is a distinction, however, to be observed between the meaning of after and behind: after respects order; behind respects position: one runs after a person, or stands behind his chair. After is used either figuratively or literally; behind is used only literally. See CRABBE.

When that thou wendest homeward by the mell,
Right at the entree of the dore *behind*,

Thou shalt a cake of half a bushel find,
That was ymaked of thin owen mele
Which that I halpe my fader for to stele.

Chaucer's Canterbury Tales.

After the overthrow of this first house of God, a second was erected; but with so great odds, that they wept, which beheld how much this latter came behind it. *Hooker.*

Therefore the prince, whom great affaires in mynd
Would not permit to make there longer stay,
Was forced there to leave them both *behind*
In that good hermit's charge, whom he did pray
To tend them well, so forth he went his way. *Spenser.*

All hurt *behind*, backs red, and faces pale
With sight and agned fear! Mend and charge home,
Or, by the fires of heaven, I'll leave the foe,
And make my wars on you. *Shakspeare.*

And these thy offices,
So rarely kind, are as interpreters
Of my *behindhand* slackness. *Id.*

———— his ponderous shield,
Ethereal temper, massy, large, and round,
Behind him cast. *Milton.*

Such is the swiftness of your mind,
That like the earth's, it leaves our sense *behind*.
Dryden.

What he gave me to publish, was but a small part
of what he left *behind* him. *Pope.*

Consider, whether it is not better to be half a
year *behindhand* with the fashionable part of the
world, than to strain beyond his circumstances.

Spectator.

We cannot be sure that we have all the particulars
before us; and that there is no evidence *behind*, and
yet unseen, that may cast the probability on the other
side. *Locke.*

In the journey of life some are left *behind*, because
they are naturally feeble and slow; some because
they miss the way, and many because they leave it
by choice, and, instead of pressing onward with a
steady pace, delight themselves with momentary de-
viations, turn aside to pluck every flower and repose
in every shade. *Johnson. Rambler.*

BEHIRAT EL MERDJ, or KHOTAIBE, a lake
of Syria, about seven or eight leagues in circum-
ference. It has no visible outlet, and the waters
not exhibiting any sensible increase by the rivers
and the melting of snow which it receives, it is
supposed to discharge them by some subterra-
neous channel. Distant twenty-one miles east of
Damascus.

BEHIMEN (Jacob). See BOEHMEN.

BEHN (Aphra), an authoress, descended from
a good family in Canterbury, was born in the reign
of Charles I. Her father's name was Johnson,
whothrough the interest of lord Willoughby, to
whom he was related, was appointed lieutenant-
general of Surinam. Mr. Johnson died on the
voyage thither; but his family reaching Suri-
nam, settled there for some years. Here Aphra
formed an intimacy with the American prince
Oroonoko, and his beloved Imoinda, whose ad-
ventures she relates in her celebrated novel of
that name, and which Mr. Southerne afterwards
made the ground-work of one of the best trage-
dies in the English language. On her return to
London, she became the wife of Mr. Behn, a mer-
chant, of Dutch extraction; but her wit, abilities,
and some less creditable qualifications, having
brought her into estimation at the court of Charles
II. she was sent over to Antwerp, where, by means
of her influence over Vander Albert, a Dutch-
man of eminence, she, in 1666, sent home in-
telligence of the design formed by De Ruyter,
to burn the English ships in their harbours. In
her return to England she was nearly lost in a
storm. From this period she devoted her life
entirely to pleasure and the Muses; and her wit
gained her the acquaintance of Dryden, South-
erne, and other men of genius. She published
Miscellaneous Poems; Histories and Novels;
translated Fontenelle's Plurality of Worlds, and
annexed a criticism on it; her Plays make four
volumes. The character her plays should main-
tain in dramatic history, it is difficult to de-
termine, as their faults and perfections are equally
striking. In all, even the most indifferent of
her pieces, there are strong marks of genius and
understanding. Her plots are full of business
and ingenuity, and her dialogue everywhere
sparkles with the dazzling lustre of genuine wit.
But then she has been accused of interlarding
her comedies with the most indecent scenes, and
giving an indulgence in her wit to the most in-
delicate expressions. Pope, in his characters of
women, alludes to Mrs. Behn under her poetical
name of Astrea:

The stage how loosely does Astrea tread,
Who fairly puts her characters to bed.

After a life intermingled with numerous disap-

pointments, she died April 16, 1689, and lies interred in Westminster Abbey.

BEHO'LD, BEHO'LDEN, BEHO'LDING, BEHO'LDER, BEHO'LDINGNESS, } Compounded of the intensive be and hold, it signifies to hold or fix the eye on an object; it is derived from the Saxon *beliealdan*. It is sometimes employed as an interjection, in order to excite attention or admiration. *Beholden*, participle adjective. Dut. *Gehouden*. To be held, and as applied to the mind, to be held in obligation. *Beholdingness* expresses the state of being obliged. *Hold* in the sense of being under bond or obligation, is used by Gower, *Conf. Am.* book vii. and also in book viii. *Behold* is used by Wiclif, and some of the elder writers, in the sense of preference, to look on with favor.

Maistere we witen that thou art soth fast and thou techist in treuth the wey of God, and thou chargist not of any man, for thou *beholdist* not the persone of men, therefore seye to us, what it seemeth to thee. *Wiclif. Matt. chap. xxii.*

They should consider howe deeply they wer bounden and *beholden* to hym, therefore, and with devout thankes inwardlye remember his inestimable boüty therin. *Sir Thomas More's Workes.*

His pleasure was, that for our saluacion we should to him be *beholdingyng*, and not to the keypyng of the lawe. *Udall. Galathies. cap. ii.*

This olde Soudannesse Ordeined hath the feste of which I tolde; And to the feste, Cristen folk hem dresse. In general ya, both yonge and olde Ther may men fest and realtee *beholden* And deintees, mo than I can you devise; But all to dere they bought it or they rise. *Chaucer. Cant. Tales.*

Dan Troilus, as he was wont to gide, His yongè knights, ledde hem up and downe In thike large temple on every side; *Beholding* aie the ladeis of the tounne, Now here, now there; for no devocioune Had he to none, to revin him his rest, But gan to praise and lackin whom he lest. *Id. Troilus and Creseide.*

All sodainely she saw transfigured Her linnen stole to robe of scarlet red, And moone-like mitre to a crowne of gold; That even she herself much wondered At such a change, and ioyed to *behold* Herself adorn'd with gems and iewells manifold. *Spenser.*

With him went Hope in rancke, a handsome mayd, Of cheareful looke, and lovely to *behold*; In silken samite she was light array'd, And her fayre locks were woven up in gold. *Id.*

The king invited us to his court, so as I must acknowledge a *beholdingness* unto him. *Sidney.*

In this, my debt, I seem'd loth to confess, In that I shunn'd *beholdingness*. *Donne.*

When Thessalians on horseback were *beheld* afar off, while their horses watered, while their heads were depressed, they were conceived by the spectators to be one animal. *Brown's Vulgar Errors.*

I found you next, in respect of bond, both of near alliance, and particularly of communication in studies: wherein I must acknowledge myself *beholden* to you. *Bacon.*

Horns, which such as you are fain to be *beholden* to your wives for. *Shakspeare.*

Little are we *beholden* to your love, And little look'd for at your helping hands. *Id.*
For Brutus' sake, I am *beholden* to you. *Id.*
But I will haste, and from each bough and brake Each plant and juiciest gourd will pluck such cheer To entertain our angel guest, as he *Beholding* shall confess, that here on earth God hath dispens'd his bounties as in heaven. *Milton.*

When out of hope *behold* her! not far off, Such as I saw her in my dream, adorn'd With what all earth or heaven could bestow. To make her amiable. *Id.*
The philosophy you have condescended to reveal to us is most extraordinary. We are *beholden* to you for your instruction. *Shaftesbury.*

Man looks aloft, and, with erected eyes, *Beholds* his own hereditary skies. *Dryden.*
At this the former tale again he told, With thund'ring tone, and dreadful to *behold*. *Id.*

The Saviour comes, by ancient bards foretold! Hear him, ye deaf; and all ye blind *behold*! *Pope.*
I think myself mighty *beholden* to you for the reprehension you then gave us. *Addison.*

We, who see men under the awe of justice, cannot conceive what savage creatures they would be without it; and how much *beholden* we are to that wise contrivance. *Atterbury.*

BEHO'OVE, or BEHO'VE, v. & n. } Sax. *behoþan*, it is a duty. To be fit; to be meet: either with respect to duty, necessity, or convenience. It is used only impersonally with *it*.
BEHOOF, BEHOVE'FUL, BEHOVE'FULLY, BEHOV'ABLE, BEHOV'EDLY, BEHOVE'LY.

Her majesty may alter any thing of those laws, for her own *behoof*, and for the good of the people. *Spenser.*

It is very *behooveful* in this country of Ireland, where there are waste deserts full of grass, that the same should be eaten down. *Id.*

Tell us of more weighty dislikes than these, and that may more *behoovefully* import the reformation. *Id.*

Laws are many times full of imperfections; and that which is supposed *behooveful* unto men, proveth oftentimes most pernicious. *Hooker.*

For better examination of their quality, it *behooveth* the very foundation and root, the highest well-spring and fountain of them, to be discovered. *Id.*

Madam, we have cull'd such necessities As are *behooveful* for our state to-morrow. *Shakspeare.*

No mean recompence it brings To your *behoof*: if I that region lost, All usurpation thence expell'd, reduce To her original darkness, and your sway. *Milton.*

Wert thou some star, which from the ruin'd roof Of shak'd Olympus by mischance didst fall; Which careful Jove, in nature's true *behoof*, Took up, and in fit place did reinstall. *Id.*

Because it was for the *behoof* of the animal, that, upon any sudden accident, it might be awakened, there were no shuts or stopples made for the ears. *Ray.*

It may be most *behooveful* fo. princes, in matters of grace, to transact the same publicly; so it is as

requisite in matters of judgment, punishment, and censure, that the same be transacted privately,

Clarendon.

It would be of no *behoof*, for the settling of government, unless there were a way taught, how to know the person to whom belonged this power and dominion.

Locke.

He did so prudently temper his passions, as that none of them made him wanting in the offices of life, which it *behoored* or became him to perform.

Atterbury.

But should you lure the monarch of the brook, *Behooves* you then to ply your finest art.

Thomson.

BEIHOWL, be and howl. See HOWL.

BEJA, or BENA, an appanage of the queens of Portugal, in the province of Alentejo, comprehending a city, three towns, and twenty-one parishes. The chief place is the city of Beja, which was raised to the rank of duchy by King John II., and has a population of 6000 inhabitants. It was anciently the Roman Pax Julia. It is the see of a bishop, who is suffragan of Compostella, and lies on the side of a hill, in a delightful tract of country, seventy-two miles S. S. E. of Lisbon. Long. 7° 50' W., lat. 37° 55' N.

BEJADE, be and jade. See JADE.

BEJAGUR (Vijayaghar), a district in the province of Malwah, situated about the twenty-second degree of north latitude. It is possessed by different Mahratta chiefs. The chief towns are Awass, Sindwah, and Gherowd.

BEJAPE, be and jape; perhaps as jabber, and gibe, from Germ. *gabaren*; Fr. *gaber*; Ital. *gabbare*. To joke, mock, deride, deuide, jeer.

Thou hast *bejaped* here dark Theusis

And falsely changed hast thy name thus.

Chaucer.

BEJAPOUR, a city of Hindostan. See VISAPOUR.

BEJAR, a town of Estremadura in Spain, in the district of Placentia, famous for its baths. It is seated in a very a agreeable valley, surrounded with high mountains, whose tops are always covered with snow. Here the duke of Bejar had a handsome palace: it was raised to a dukedom in the house of Zamora in 1449. In this neighbourhood are forests filled with game, and watered with fine springs; also a lake abounding with excellent fish. It is pretended that this lake is so much agitated before a storm as to be heard fifteen miles off.

BEJANI, or BEJANIS, a liberal sect of Mahomedan Arabs.

BEJENELSTERRA, a name given by some astronomers to the principal fixed stars in each constellation; otherwise called *corda*, though some distinguish between *corda* and *bejenia stella*, reserving the former to stars only of the first magnitude, and extending the latter to several of the second or third. Bernis has a treatise, press. De Stellis Bejenis, published by Jortinus, in his Speculum Astrologicum, and also in his commentaries upon Jo. de Sacroboscus's book De Sphaera.

BEICHINGEN, a county of Saxony, in Thuringia, on the Elbe, and belonging, since 1648, to the King of Prussia. The castle of Beichingen is situate not far from Weileda,

eighteen miles north of Weimar, and twenty north-east of Erfurt.

BEIDELGAR, in botany, a name by which some authors call the apocynum Syriacum, or Syrian dog's-bane, a poisonous plant.

BEJETZK, or BESHEZH, a town of Russia, in the government of Twer, the capital of a circle of the same name. Here are 3100 inhabitants; and an annual fair is held here, which lasts five days. The principal articles for sale are grain, iron, silk, and cotton stuffs. It is forty-eight miles N. N. E. of Twer, 260 south-east of St. Petersburg.

BEJIGHUR, a town in the Mahratta territories, in the province of Agra, Hindostan, about seventy miles south-west from Agra. It stands at the extremity of a low hill, and has an upper and lower fort. The surrounding country consists of ranges of low hills much covered with jungle, and separated from each other by intermediate plains, intersected by deep ravines; but upon the whole, well supplied with water.

BEILD, beeld, shelter. Old Sax. be-hlidan, to cover, to protect, to shelter.

BELLSTEIN, in mineralogy, axe-stone, a green stone, remarkable for its toughness, and used by the South Sea islanders, the New Zealanders, for making hatchets, &c. Images of idols and personal ornaments have also been made from it; numbers of which have been brought to this country, and may be seen in both public and private cabinets.

BEIN, BEINN, or BHEIN, in the Gaelic language, signifies a mountain, and accordingly makes part of the names of a considerable number of hills and mountains in Scotland; particularly,

BEIN-AN-INI, in Argyllshire, which has a seam of coals in it, that has been twice attempted to be wrought, but from various causes given up.

BEIN-AN-LOCHAN, i. e. the hill of the lake, in Argyllshire, so named from a lake which washes its base.

BEIN-ARDLANICH, in Ranoch, in the parish of Fortingal, Perthshire, about 3500 feet above the level of the sea, &c.

BEINASCHI (Giovanni Battista), historical painter, was a Piedmontese, and born in 1634. He studied at Rome, under Pietro del Po; and some say afterwards under Lanfranc. It is certain he was particularly fond of Lanfranc's works, and became so thoroughly acquainted with his style and manner, that many of his pictures are, at this day, accounted the works of Lanfranc. He was an admirable designer; his invention was lively, and he was not only expeditious but correct. His merits procured him the honor of knighthood, whence he is styled cavalier.

BEINHEIM, a fort of France, in the department of the Lower Rhine, and ci-devant province of Alsace; seated on the Sur, near its confluence with the Rhine.

BEIRA, a province of Portugal, bounded on the west by the Atlantic ocean, on the south by the Portuguese Estremadura; on the south-east by the Spanish Estremadura; on the east by the province of Tralos Montes, and Entre-Duero-e-Minho; and on the north by the river Douro.

It extends in length about thirty-four leagues, and in breadth about thirty leagues, and is divided into six commarcas. The chief episcopal city is Coimbra, which is likewise an university; and Viseu, also a bishopric, and formerly the capital of a dukedom. It contains, altogether, seven episcopal cities, 230 towns, and 900,000 inhabitants. The country is equally agreeable and fruitful, producing corn, wines, &c. in abundance, and the hills affording excellent pasture to cattle and sheep. Of late, however, the grain has been said not to be sufficient for home consumption; and that the chestnut-trees, which cover many of the mountains, supply the place of it to many of the lower orders of the people. Olive plantations are numerous, and their produce, with that of the vineyards, forms the chief exports. Mines, both of silver and lead, were formerly wrought in the mountainous districts, and rich specimens of ore have been found near Lamego; but since Portugal obtained her American possessions, the inhabitants have been prohibited from extracting the precious metals.

BEIRAM, or BAIRAM. See BAIRAM.

BEISCH (Joachim Francis), a painter of landscapes and battles, born at Ravensburgh in Suabia in 1665. He was taught the rudiments of the art by his father; and first employed at the court of Munich in painting the battles of the emperor Maximilian Emanuel in Hungary. While that prince was absent on some of his expeditions, Beisch took the opportunity of visiting Italy, and it is a sufficient testimony of the perfection to which he arrived to say, that even Solimene copied several of his landscapes. The scenes of his landscapes are agreeably chosen, and picturesque: his touch is light, tender, and full of spirit; and his style of composition resembles that of Gaspar Poussin, or Salvator Rosa. He etched several pleasing views in a good taste, but these prints are scarce. He died in 1748.

BEISSKER, in ichthyology, a name given by Gesner and others to the fish commonly called *mustela fossilis*. It is a species of the cobitis, distinguished by Artedi by the name of the bluish cobitis, with fine longitudinal lines on each side. Schonefeldt calls this the *pæcilia*, and Johnson the *piscis fossilis*.

BEISTON, a township in the parish of Bunbury and county of Chester, distinguished for the ruins of a fortress built in the year 1220, by Randle Blundeville, earl of Chester. It enclosed an area of about five or six acres, and was guarded on the accessible side by a vast moat cut in the solid rock. The other side rose on a mass of insulated rocks, almost perpendicularly, to the height of 366 feet. In the time of Henry VIII. his stately pile was almost dilapidated: yet in the civil wars of Charles I.'s reign, we find it in a state of defence, which rendered it a most important post. It was garrisoned for the parliament, when a Captain Sandford, a celebrated cavalier, undertook to scale its perpendicular side; and having thus gained entrance with eight men, he intimidated the commander, Captain Steel, and compelled him to surrender. Steel was soon afterwards shot for cowardice. The

royalists were then besieged for upwards of four months. Prince Rupert relieved them; but the castle was a second time invested, and a blockade of eighteen weeks reduced the garrison to the most piteous extremity of famine. Nevertheless, after a gallant defence, they obtained honorable terms, and the castle was immediately dismantled by order of the parliament.

BEIT-EL-FAKIH (the Doctor's-house), a town and district of Arabia, in lat. 14° 31' N., long 43° 2' E. It was founded by a Mussulman saint, named Ahmid ibn Musa, in the seventeenth century, and is the great emporium of the coffee trade, the best samples of that article being produced in the neighbouring mountains. The quantity carried to Mocha, twenty-five leagues distant, is about 4000 bales of 313 pounds each, of which thirteen pounds are allowed for package, unless the English or French happen to be there, when it is greater. A bale generally costs forty-two Spanish piastres, which, with all duties and expenses, makes the coffee amount to 14½*d.* per pound. Several European powers have had residents at Beit-el-Fakih, and merchants resort thither from many parts of the east. It is subject to the imám of Yemen, and has risen considerably since the ruin of Ghalefkah, a town on the Red Sea, formerly the port of this part of Arabia.

BEIZA, or BEIZATH, in Hebrew antiquity, 1, a word signifying an egg; 2, a certain measure among the Jews; 3, a gold coin, weighing forty drachms, among the Persians, who gave out that Philip of Macedon owed their king Darius 1000 beizaths, or golden eggs, for tribute money, but Alexander the Great refused to pay them, saying, that the bird which laid these eggs was flown to another world.

BEKES, or BEKESCH, a populous and thriving market town of Hungary, in the above county. It is situated on the river Black Karosch, and was formerly a place of strength. It is inhabited by aboriginal Hungarians, who profess the reformed faith, and have a parish church.

BEKESCH, a county of Hungary, bounded on the north by great Cumania and Bihar, on the east by Zarand, on the south by Arad, and on the west by Zolnok and Czongrad. It forms a square of nearly forty miles, and contains four towns, sixteen villages, and about 55,000 inhabitants, who are composed of Hungarians, Bohemians, Sclavonians, and Walachians, professing the Greek, the Lutheran, and the Catholic religions.

BEKIA, BECOUYA, or BEQUA, a small island among the Grenadilloes, in about lat. 13° N., belonging to Britain, and chiefly valuable for turtle. It produces also wild cotton and water-melons. It lies sixty miles north-east of Grenada. The French have called it Little.

BEKISS, be and kiss. See KISS.

BEKKER (Balthazar), a famous Dutch divine, born in 1634 at Warthuisen, in the province of Groningen. In 1679 he was chosen minister at Amsterdam, where he published *The World Bewitched*, an ingenious piece against the vulgar notion of spirits. It raised such a clamor against him, that he was deposed from the ministry, but the magistrates of Amsterdam

continued his pension. His opinions were, that the essence of spirits consists in thinking; that therefore spirits cannot act on bodies or other spirits: and that those texts, which speak of their actions are metaphorical. The possessions in the gospels he ascribes to mental disorders. He died in 1698.

BEKNOWE, be and know. See **KNOW**.

BEL, בעל, i. e. the Lord, Heb. Chald. or Belus, the supreme god of the ancient Chaldeans, or Babylonians. He was considered as the founder of the Babylonian empire; and supposed to be the Nimrod of Scripture; and the same with the Phœnician Baal. See **BAAL** and **BABYLON**.

BEL, in botany, the name of a plant called by some the cucumis capparisi, or caper cucumber. This plant is very imperfectly described to us; and we find among the Arabian writers, that the fruit was called by that name, as well as the whole plant. Avicenna, who gives the fullest account of it, says that it was an Indian plant, resembling in growth the common cucumber, but bearing a fruit like the caper: he tells us that this fruit was the only part of the plant used in medicine, and that it was very hot and bitter, being somewhat like ginger in the fiery taste.

BEL (Matthias), an eminent Hungarian divine, born at Orsova in 1684. He at first studied physic at Halle, but gave it up for theology, and became rector of the school at Presburg, and minister to a Lutheran congregation there. He wrote, among other works, a History of Hungary, which was so much admired, that the emperor Charles VI. appointed him his historiographer, and ennobled him; and notwithstanding his being a Lutheran, the pope in 1736 sent him his picture, and many large gold medals. He was a member of the Royal Society of London, and of the academies at Berlin and Petersburg. He died in 1749, aged sixty-five.

BEL (Charles-Andrew, son of Matthias), was born at Presburg in 1717. In 1741 he was appointed professor extraordinary at Leipsic, and in 1756 professor of poetry, and librarian to the university, with the title of counsellor of state. He wrote *De Vera Origine et Epochâ Hænorum*, &c. 4to.; besides which he conducted the *Acta Eruditorum* from 1754 to 1781. He died in 1782.

BEL AND THE DRAGON, THE HISTORY OF, an apocryphal and uncanonical book. It was always rejected by the Jewish church, and is extant neither in the Hebrew nor the Chaldee language, nor is there any proof that it ever was so. St. Jerome gives it the title of the Fable of Bel and the Dragon.

BELA, a large town of Hungary, in the county of Zips. It was one of the sixteen towns which were mortgaged to Poland in 1412, and is inhabited by German Lutherans, who gain a livelihood by the tillage of the ground, and a trade in wine, iron, and tobacco.

BELABOUR, be and labor. See **LABOR**.

BELAC, or **BELLAC**, a city of France, in the department of the Upper Vienne, and ci-devant province of Lyonnais; seated on the Vinçon, twenty miles north of Limoges, and 160 south of Paris. It contains 3291 inhabitants.

BELACED, be and laced. See **LACE**.

BEL'AMIE, } Fr. *bel amie*, *bel amour*; a
BEL'AMOUR. } friend, a paramour, a gallant,
a consort.

Wise Socrates

Pour'd out his life, and last philosophy,
To the fair Critias, his dearest *belamie*.

Færicæ Quænc.

Lo, lo, how brave she decks her bounteous bow'r
With silken curtains and gold coverlets,
Therein to shroud her sumptuous *belamour*. *Id.*

BEL'ATE, } be and late. See **LATE**.
BEL'ATEDNESS. }

Fairy elves,

Whose midnight revels, by a forest side,
Or fountain, some *belated* peasant sees,
Or dreams he sees. *Milton's Paradise Lost.*

Or near Fleetditch's oozy brinks,
Belated, seems on watch to lie. *Swift.*

BELATUCADRUS, the name of an ancient British idol, recorded in old inscriptions; and supposed by Selden and Vossius to be the same with Belenus.

BEL'LAY, } Be and lay. To waylay, to lie
BEL'AYED. } in wait, to place in ambush, to
overlay, to cover.

'Gainst such strong castles needeth greater might,
Than those small forces ye were wont *belay*.
Spenser.

All in a woodman's jacket he was clad,
Of Lincoln greene, *belayd* with silver lace. *Id.*

The speedy horse all passages *belay*,
And spur their smoking steeds to cross their way.
Dryden.

To **BELAY**, on board a ship, signifies the same as fasten. Thus they say, *belay* the sheet, or tack, that is, fasten it to the kevel, by winding it several times round a last, &c.

To **BELAY A ROPE**, a sea term; to splice: to mend a rope, by laying one end over another.

BELBEIS, a town of Egypt, near the Syrian frontier, four miles north-west of Suez. It was formerly well fortified, and the only bulwark of the kingdom on this side. Buonaparte, in 1798, availed himself of it, and strengthened the fortifications against the Turks. Its population is now scarcely a third of what it formerly was, and does not exceed 5000. It has been supposed to be the ancient Bubastum, but D'Anville rather thinks that it was Pharbothus. A junction here takes place of the canals derived from different parts of the Nile.

BELCH', *v. & n.* } Sax. *bealcan*. To eject
BELCH'ING. } wind from the stomach; to
eruct. To issue out, as by eructation. To throw out from the stomach; to eject from any hollow place. It is a word implying coarseness, hatefulness, or horror.

The bitterness of it I now *belch* from my heart.
Shakspeare.

They are all but stomachs, and we all but food;
They eat us hungerly, and, when they're full,
They *belch* us. *Id.*

This thing, nor man, nor beast, turns all his wealth
In drink; his days, his years, in liquor drenching:
So quaffs he sickness down, by quaffing health;
Firing his cheeks with quenching; strangely quench-
ing

His eyes with firing; dull and faint they roll'd;
 But, nimble lips, known things and hid unfold;
Belchings, oft sips, large spits point out the tale he
 told. *Fletcher's Purple Island.*

Immediate in a flame,
 But soon obscur'd with smoke, all heav'n appear'd,
 From those deep-throated engines *belch'd*, whose roar
 Imbowell'd with outrageous noise the air,
 And all her entrails tore, disgorging foul
 Their devilish glut, chain'd thunderbolts, and hail
 Of iron globes. *Milton.*

The waters boil, and *belching* from below,
 Black sands as from a forceful engine throw.
Dryden.

A triple pile of plumes his crest adorn'd,
 On which with *belching* flames *Chimæra* burn'd.
Id.

The symptoms are, a sour smell in their faces,
belchings, and distensions of the bowels.

Arbutnot on Aliment.

BELEAGUE, } Be and league. Germ.
 BE'LEAGUER, } *lagen*, Dut. *laeghen*, *be-lae-*
 BE'LEAGUERER. } *ghen*, Swed. *beleagra*, Ang-
 Sax. licjan, to lay, to place before, to attach, to
 besiege; to lie before a town, in order to force
 it to capitulate.

Their business, which they carry on, is the general
 concertment of the Trojan camp, then *beleaguered* by
 Turnus and the Latins. *Dryden's Dufresnoy.*

Against *beleaguer'd* heav'n the giants move;
 Hills pil'd on hills, on mountains mountains lie,
 To make their mad approaches to the sky. *Dryden.*

BELEE, *v. a.* A term used in navigation.
 To place in a direction unsuitable to the wind.

But he (sir) had th' election;
 And I (of whom his eyes had seen the proof
 At Rhodes, at Cyprus, and on other grounds
 Christian and heathen) must be *be-leed*, and calm'd,
 By debtor and creditor. *Shakespeare. Othello.*

BELÉM, a town and fortress of Portugal, in
 Estremadura, about a mile from Lisbon, on the
 north side of the Tagus, and designed to defend
 the entrance of the river. Here all ships that
 sail up to Lisbon must bring to. The fortress is
 on an island in the middle of the Tagus, and on
 the opposite side is the station for quarantine.
 After the earthquake of 1755 the royal family of
 Portugal removed their residence to this town,
 where they occupied a wooden house. On 3d
 September, 1758, king Joseph narrowly escaped
 assassination in this neighbourhood. The town
 was founded by king Emanuel, and contains,
 besides the royal palace, an hospital for decayed
 noblemen, and a rich monastery of Hieronymites,
 the church of which encloses the tombs of many
 kings and princes of the royal family.

BELMNTITE, in mineral conchology, a
 species of fossil organic remains, occurring in
 chalk formations, but very sparingly in the
 upper beds of that substance. It is, however,
 abundant in the beds immediately below the
 chalk: its form is cylindrical, pointed at one end,
 and having a conical hollow at the other. The
 animal is considered to have belonged to the tes-
 taceous molluscæ, and to have been contained in
 a multilocular univalve shell; but the fossil does
 not present itself in a sufficiently perfect state to
 furnish an accurate knowledge of its form. Its
 substance is fibrous carbonate of lime, radiating
 perpendicularly from the axis of the cylindrical

body. In the districts in which they are found
 they have been vulgarly called thunderbolts.

BELMNTITES, *n. s.* From *βελος*, a dart or
 arrow, because of its resemblance to the point
 of an arrow. Arrowhead, or finger-stone, of a
 whitish, and sometimes a gold color. See BE-
 LMNTITE.

BELMNOIDES, or BELENNOIDES, in
 anatomy; from *βελος* a dart, and *ειδος* form;
 the shooting forth of the bone called aliformis, which
 is the sixth in the basis of the skull.

BELENNUS, in ichthyology, the name of a
 small anguiform fish, called by some blennis.
 It is a sea fish, and very scarce. It approaches
 much in figure to the English bull-head, or mil-
 ler's thumb, the cottus of authors.

BELONUS, in mythology, a name which the
 Gauls gave to the sun, which they also called
 Mithra; and, as some suppose, the same with the
 Baal of Scripture, and the Belus of the As-
 syrians.

BELERIUM, in ancient geography, a pro-
 montory of the Dumnonii or Damnonii, the west-
 most Britons. It is now called the Land's End,
 in Cornwall.

BELESIS, or NANYBRUS, said by some ancient
 historians to have been the founder of the Baby-
 lonish empire, and, in conjunction with Arbaces
 the Mede, to have put an end to the kingdom of
 the Assyrians, by the defeat and death of Sarda-
 napalus. Belesis is represented both as a hero
 and a crafty knave. It is said he was base
 enough to endeavour to obtain from his col-
 leagues, by treachery, the immense treasures
 which had been concealed in the conflagration at
 Nineveh. When the secret was discovered, he
 was called to an account, and tried by the other
 chiefs who had been assistant in the war, and
 who, upon his confession, condemned him to lose
 his head. But Arbaces freely forgave him, left
 him in possession of the treasure, and also the
 independent government of Babylon, saying,
 The good he had done ought to serve as a veil to
 his crime. Under the successor of Arbaces he
 became a man of show and effeminacy, of whom
 we hear nothing more that is worthy of notice.

BELÉSME, or BELLESME, a town of France,
 in the department of the Orne, and ci-devant
 province of Perche; seventy-five miles south-west
 of Paris.

BELÉSTAT, a town of France, in the de-
 partment of the Arriege, remarkable for a spring
 which regularly flows and ebbs.

BELÉZ, or BELZ, a town of Austrian Galicia,
 circle of Zokien, not far from the river Bug, with
 a castle. It once belonged to Poland, and was
 the capital of a circle in Red Russia; but was
 annexed to Austria, at the first partition of Po-
 land, in 1772. The town is large, but neither
 rich nor-commercial. It lies in the middle of a
 plain, at the extremity of which is a morass; the
 houses are of wood, and the only buildings of
 note are the churches of the Catholic and Greek
 communions. The extensive oak forests in the
 neighbourhood yield abundance of potash. 148
 miles east of Cracow, and 152 S. S. E. of Warsaw.
 Long. 24° 12' E., lat. 50° 24' N.

BELFAST, a sea-port town in the county of
 Antrim, Ireland, situated at the mouth of the

Lagan river, here crossed by a stone bridge of twenty-one arches, and at the extremity of Belfast Lough, or Carrickfergus Bay. The appearance of the place is cheerful and animated. The streets are broad, well paved, cleaned, and lighted, and the public buildings and institutions numerous. Amongst them are the Collegiate Institution, the Belfast Academy, Linen Hall, commercial buildings, two churches, Roman Catholic chapels, meeting-houses of different dissenters, lunatic asylum, infirmary, &c., all on a scale suited to the liberality of this very spirited place. A museum and botanic garden has lately been added to the list of scientific institutions, and the healthy condition of two daily journals sufficiently testify the reading character of the inhabitants. The port of Belfast ranks next after Cork in amount of imports and exports. In 1832 the number of vessels belonging to this port was 219, their tonnage amounting to 23,681. Of these 60 were engaged in foreign, and 159 in the coasting trade. The total number of vessels entered at the same period exceeded 2500, carrying upwards of 250,000 tons. The imports are various; the exports consist of glass, vitriol, pottery, refined sugar, porter, whiskey, besides the staple manufactures, cotton and linen. To these are to be added a very extensive trade in butter, oatmeal, pork, and provisions generally, for the Liverpool market, shipped from this quay. The gross amount of customs may be estimated annually at £200,700. An inland trade is facilitated by means of the Lagan navigation, which, opening into Lough Neagh, affords a communication with four counties. The town is governed by a sovereign, twelve burgesses, and a commonalty, under a charter of James I.; and, by the provisions of the reform bill, returns two members to parliament. This is a permanent military station. Distance north from Dublin 102 miles. Population about 50,000.

BELFAST, a seaport town of the United States of America, in the district of Maine; situated on the west side of the Penobscot; 246 miles from Boston, and 591 from Philadelphia.—A town of Pennsylvania, in the county of Bedford.—A township of the United States, in Hancock county, district of Maine, on the mouth of the Penobscot.

BELFAST BAY, a bay on the coast of the district of Maine, which runs into the land by three arms.

BELFLOWER, *n. s.* From bell and flower, because of the shape of its flower; in Latin *campanula*. A plant. There is a vast number of the species of this plant. 1. The tallest pyramidal bellflower. 2. The fine panicle-lobed bellflower. 3. The white peach-aved bellflower. 4. Garden bellflower, with oblong leaves and flowers; commonly called Canterbury bells. 5. Canary bellflower, with oval leaves and a tuberose root. 6. Blue bellflower, with cordate roots, commonly called the purple. 7. A variety looking-glass bellflower, &c. &c. *W. B.*

BELFORD, a market town in Northumberland, north of Woburn, situated on the ridge of a hill on the east side of the river, twelve miles from Alnwick, and 129 from London.

BELFORD VINE, *n. s.* From bell and

found. He whose trade it is to found or cast bells.

Those that make recorders know this, and likewise *belfounders* in fitting the tune of their bells. *Bacon.*

BELFRY, **BELFREDUS**, is used by military writers of the middle age, for a sort of tower erected by besiegers, to overlook and command the place besieged. Belfry originally denoted a high tower, where sentinels were placed to watch the avenues of a place, and prevent surprise from parties of the enemy, or to give notice of fires by ringing a bell. In the cities of Flanders, where there is no belfry on purpose, the tower of the chief church serves the same end. The word belfry is compounded of the Teutonic *bell*, and *freid* peace, because the bells were rung for preserving the peace. Belfry is now used for that part of a steeple wherein the bells are hung. This is sometimes called by middle age writers campanile, clocharia, and tristegum. It is likewise used for the timber work which sustains the bells in a steeple, or that wooden structure to which the bells in church steeples are fastened.

BELGÆ, the ancient inhabitants of Gallia Belgica, styled by Cæsar the bravest of the Gauls, being untainted by luxury. See **BELGIUM**. The first migration of the Belgæ into Britain took place at a very early period; some of the latest colonies were established here but a short time prior to the Roman invasion. At that time their main body inhabited the present Hampshire, Wiltshire, and Somersetshire. Those on the south coast, according to Cæsar, Com. l. v. c. 10, had passed over from different parts, and still retained the names of the states from which they descended. The last by Divitiacus, the king of the Suessiones, one of the most powerful Belgic nations of Gaul; and, having obtained a firm settlement on the British coast, he continued to exercise his authority on both sides of the channel. The Romans found in these tribes the most powerful opponents to their arms; and the honor of their final subjugation was reserved for Vespasian, who fought thirty-two battles, and took more than twenty towns, before he could regard his conquest of them as complete. After this the Romans greatly improved the country of the Belgæ by their celebrated military ways, the erection and rebuilding of towns, &c.; among the most celebrated of which were Ventæ Belgarum, the present Winchester, and Aquæ Solis, the modern Bath. See **BATH** and **WINCHESTER**.

BEL'GARD, *n. s.* Fr. *belle egard*. A soft glance; a kind of regard; an old word, now wholly disused.

Upon her eyelids many graces sat,
Under the shadow of her even brows,
Working *belgards*, and amorous retreats.

Færie Queen.

BELGICA, a town of the Ubii in Gallia Belgica, midway between the Rhine and the Roer: now called Balchusen, a citadel of Juliers.

BELGICA GALLIA, or **BELGIC GAUL**, one of Cæsar's three divisions of Gaul, contained between the ocean to the north, the Seine and the Marne to the west, the Rhine to the east, but on the south at different times within different limits. Augustus, instituting everywhere a new partition of provinces, added the Sequani and Helvetii,

who till then made a part of Celtic Gaul, to the Belgic.

BELGINUM, a town of the Treviri, in Gallia Belgica: now called Baldenan, in the electorate of Triers.

BELGIUM, a kingdom of Europe, formerly called the Austrian Netherlands, bounded on the N. by Holland; on the E. by Germany; on the S. W. by France, and on the N. W. by the German ocean. It extends from 49° 25' to 51° 30' N. lat. and from 2° 40' to 6° 30' E. lon., comprises 14,459 square miles, and sustains a population of 4,082,427 souls, including the province of Luxemburg. Its chief rivers are the Scheldt, which is both broad and deep, and the Maese, which flows from France to Holland. Forests constitute a characteristic feature of this country; those of Namur, Liege, Luxemburg, and Soignes are very extensive, and the remains of the famous forest of Ardenaes have hitherto escaped the axe. Brussels, on the river Senne, is the capital, but Antwerp, Ghent, Bruges, Ostend, Liege, Namur, Maestricht, Louvain, and Luxemburg, are all remarkable places, either for their commercial relations, military strength and position, or literary or other celebrity. Genappe and Waterloo, otherwise unimportant, will be remembered by the desperate and decisive battles fought in their vicinities. The history of Belgium will be found connected with that of Holland, until the revolt of the latter from the crown of Spain. Belgium continued under Spanish control even after the independence of Holland. Early in the eighteenth century, it passed into the possession of the Austrians, and so remained until the breaking out of the French revolution, when it was wrested from the Austrians and annexed to France in the year 1795. Upon the overthrow of Napoleon, the congress of Vienna attached Belgium to Holland, constituting thereby a kingdom, to be denominated "the Netherlands." This union appears to have been solemnized without the existence of any previous affection between the contracting parties, and accordingly, upon the successful termination of the revolution of Paris in 1830, the Belgians rose *en masse* and threw off, in the most entire manner, the yoke of Holland. Their independence was declared on the fourth of October, 1830, after several sanguinary conflicts with their former masters at Antwerp, Brussels, and other places. On the fourth of June, 1831, the Belgian congress elected Prince Leopold of Saxe Cobourg as their king, who was solemnly crowned at Brussels, on the twenty-first of July following. After the accession of Leopold, the Dutch continued to manifest a disinclination to a peaceful separation, and even retained possession of the citadel of Antwerp; remonstrances from the courts of Great Britain, France, Russia, Austria, and Prussia, for its restitution, proving fruitless, a French army set down before the fortress, which was defended with undaunted bravery by general Chassé, and, after a deplorable sacrifice of lives, succeeded in obtaining its surrender. See **NETHERLANDS** and **HOLLAND**.

BELGRADE, the ancient Alba Græcorum, a city of European Turkey, the capital of Servia, seated on a hill a little above the confluence of the Save and the Danube. Belgrade was for-

merly large, strong, and populous, surrounded with a double wall, flanked with towers, and defended by a castle, built with square stones. The suburbs are still very extensive, and the appearance of the place imposing. The dilapidated walls of the fortress enclose the principal mosque, and the residence of the pacha, or governor, of Servia. Belgrade has always been an important bulwark on the north-west of Turkey; a strong garrison is maintained here, and most of the inhabitants consist of the families of the Janissaries, who defend it. The whole population is estimated at twenty or twenty-five thousand; and when the town was taken by the Austrians, in 1789, about 7000 of them were soldiers. It is, indeed, rather a military dépôt than a trading city.

In the fifteenth century it was unsuccessfully attacked by Amurath II.; but was taken by Solyman, the Ottoman emperor, in 1522. Being retaken by the Imperial army, under the elector of Bavaria, in 1688, it reverted again to the Turks in 1690, with whom it remained till August 1717, when it surrendered to prince Eugene; and will always be famous in military history by the battle fought at this time in its vicinity, and which was the last grand victory obtained by that prince. It then remained in possession of the Austrians for twenty-two years, during which they were engaged in repairing and strengthening its defensive works. In 1739, however, it was given up to the Turks, on condition that these should be demolished; but so important did the possession of it always appear to the Austrians, that they again invested it in 1789, under the command of Field-marshal Laudohn. The suburbs were all carried sword in hand, and the garrison surrendered upon honorable terms. About 300 pieces of artillery and vast military stores, were said to be found in the fortress on this capture. It was again restored to the Turks, however, by the peace of Sistova, in 1791, under whom it has since remained. Long. 20° 10' E., lat. 44° 43' N.

BELGRADE, a small town of Romania, on the strait of Constantinople.

BELGRADE, a township of the United States, in Lincoln county, district of Maine, between the Kennebec and the Androscoggin.

BELGRADO, a town, late of Friuli, in the Venetian territories in Italy. It stands near the river Tagliamento.

BELGRAM, a town in the Nabob of Oude's territories, twelve miles north-east from Kanoge in lat. 27° 13' N., long. 80° 3' E. It is of considerable antiquity, and is still distinguished by a ruinous fort and moat. The buildings appear to have been in the best style of Mogul architecture.

BELIAL, בלעיל, Heb. i. e. wicked, worthless, or unprofitable; a name given in Scripture to the devil. Thus the inhabitants of Gibeah, who abused the Levite's wife, Judges xix. 22, are styled sons of Belial. Hophni and Phineas, the high priest Eli's eldest sons, are likewise called sons of Belial, 1 Sam. ii. 12, upon account of their crimes. And that the name Belial denotes the devil, is evident, from what St. Paul says, 2 Cor. vi. 15.

BELIDES, in mythology, the fifty daughters of Danaus. See **DANAIDES**.

BELIDOR (Bernard Forest de), a Catalonian engineer in the service of France, member of the Academies of Sciences at Paris and Berlin, and of the Royal Society of London; he was a celebrated mathematician, and author of a number of military tracts, in which the science of mathematics is applied to military uses. He died 1765, aged seventy.

BELIE, *v. a.* From be and lie. To counterfeit; to feign; to mimic. To calumniate; to raise false reports of any man. To give the lie to; to charge with falsehood. To give a false representation of any thing. To fill with lies.

BELIEVE, *v.* } The old Sax. *lyfan*, *be-*
BELIEVE, *n.* } *lyfan*, is the English to
BELIEF, } *live*, to believe. In Pier's
BELIEF**UL**, } Plouhman to bring forth
BELIEF**ULNESS**, } your *belve* is to bring
BELIEV**ABLE**, } forth that by which you
BELIEV**ER**, } live. It was early applied
BELIEV**ING**, } to Christianity, and to re-
BELIEV**INGLY**, } ligious, as the revelation of
 life; and as crediting the divine testimony was the means of life immortal, that credit was called life and belief—hence to believe. It is now of much more comprehensive import. *Belief* is credit given to something which we know not of ourselves, on account of the authority by which it is delivered. It is likewise the theological notice of faith; the creed and body of tenets held by the professors of faith; to believe is the act or habit of the mind; in reference to all these a *believer* is one that gives credit to a testimony; a professor of Christianity.

Sire, it is Cristes might,
 That helpeth folk out of the fendes snare,
 And so ferforth, she gan our lay declare,
 That she the constable, or that it were eve,
 Converted, and on Crist made him believe.

Chaucer.

And though that I, unworthy son of Eve,
 Be sinful, yet accepteth my believe. *Id.*

As he that readeth *Caesar's Commentaries*, believing the same to be true, hath hereby a knowledge of *Caesar's* life and notable acts, because he believeth the history of *Caesar*; yet it is not properly said, that he believeth in *Caesar*, of whom he looketh for no help nor benefit, even so, he that believeth that all that is spoken of God in the Bible is true, and yet liveth so ungoddily, that he cannot look to enjoy the promises and benefits of God; although it may be said that such a man hath a faith and belief to the words of God, yet it is not properly said that he believeth in God, or hath such a faith and trust in God, whereby he may surely look for grace, mercy, and everlasting life at God's hand. *Homily on Faith.*

Infidels themselves did discern, in matters of life, when believers did well, when otherwise. *Hooker.*

If he which writeth do that which is forcible, how should he which readeth be thought to do that, which, in itself, is of no force to work belief, and to save believers? *Id.*

Discipline began to enter into conflict with churches, which, in extremity, had been believers of it. *Id.*

And sundry battels, which she had achieved
 With great success, that her hath glorified,
 And made her famous, more than is believed;
 No would I it have ween'd had I not late it privied,
Spencer.

Superstitious prophecies are not only the belief of fools, but the talk sometimes of wise men. *Bacon.*

Now God be prais'd, that to believing souls
 Gives light in darkness, comfort in despair.

Shakspeare.

Horatio says, 'tis but our fantasy;
 And will not let belief take hold of him
 Touching this dreaded sight, twice seen of us. *Id.*

When suddenly stood at my head a dream,
 Whose inward apparition gently moved
 My fancy to believe I yet had being
 And liv'd. *Milton.*

The action is baptizing or immersing in waters; the object thereof, those persons of any nation, whom his ministers can by their instruction and persuasion render disciples; that is, such as do sincerely believe the truth of his doctrine, and seriously resolve to obey his commandments. *Barrow.*

Adherence to a proposition which they are persuaded, but do not know, to be true, is not seeing, but believing. *Locke.*

Though they are, I believe, as high as most steeples in England, yet a person, in his drink, fell down, without any other hurt than the breaking of an arm. *Addison on Italy.*

I could not be so duped, even by the arch-enemy himself, as to be made to question the divine nature of those comforts; but I have been made to believe (which you will say, is being duped still more) that God gave them to me in derision, and took them away in vengeance. *Couper's Correspondence. vol. 2.*

BELIEF, in its general and natural sense, denotes, 1. A strong assent of the mind to the truth of any proposition. In this sense, belief has no relation to any particular kind of means or arguments, but may be produced by any means whatever. Thus, we are said to believe our senses, to believe our reason, to believe a witness, &c. And hence, in rhetoric, all sorts of proofs, from whatever topics deduced, are called *πειται*, because apt to produce belief or persuasion touching the matter in hand. 2. **Belief**, in its more restrained and technical sense, invented by the schoolmen, denotes that kind of assent which is grounded only on the authority or testimony of some person or persons, asserting or attesting the truth of any matter proposed. In this sense, belief stands opposed to knowledge and science. We do not say we believe that snow is white, or that the whole is equal to its parts; but we see and know them to be so. That the three angles of a triangle are equal to two right angles, or that all motion is naturally rectilinear, are not said to be things credible, but scientific; and the comprehension of such truths is not belief but science. 3. But when a thing propounded to us is neither apparent to our senses, nor evident to our understanding; neither certainly to be collected from any clear and necessary connexion with the cause from which it proceeds, nor with the effects which it naturally produces; nor is taken up upon any real arguments, or relation thereof to other acknowledged truths; and yet, notwithstanding, appears as true, not by manifestation, but by an attestation of the truth, and moves us to assent, not of itself, but in virtue of a testimony given to it—this is said to be properly credible; and an assent to this is the proper notion of belief or faith.

BELIEVERS, in church history, an appellation given, towards the close of the first century, to those Christians who had been admitted into the church by baptism, and instructed in all the mysteries of religion. They had also access to all parts of divine worship, and were authorised to vote in the ecclesiastical assemblies. They were thus called in contradistinction to the catechumens who had not been baptised, and were debarred from these privileges.

BELI'KE, } Be and like. See **LIKE**.

BELI'KELY, } Belike in our older writers, and in vulgar speech, at the present day, is used for it is likely, probably, perhaps. It is sometimes used in a sense of irony, as it may be supposed.

There came out of the same woods a horrible fowl bear, which fearing, *belike*, while the lion was present, came furiously towards the place where I was.

Sidney.

Lord Angelo, *belike*, thinking me remiss in my office, awakens me with this unwonted putting on.

Shakespeare.

Josephus affirmeth, that one of them remained in his time; meaning, *belike*, some ruin or foundation thereof.

Raleigh.

We think, *belike*, that he will accept what the meanest of them would disdain.

Hooker.

God appointed the sea to one of them, and the land to the other, because they were so great, that the sea could not hold them both; or else, *belike*, if the sea had been large enough, we might have gone a fishing for elephants.

Brewer. on Lang.

BELINGELA, in botany, a name given by some authors to the *malum insanum*, or mad apple.

BELIO, in ancient geography, a river of Lusitania, called otherwise *Limæas*, *Limeas*, *Limius*, and *Lethe*, or the River of Oblivion: the boundary of the expedition of Decimus Brutus. The soldiers refusing, out of superstition, to cross, he snatched an ensign out of the hands of the bearer, and passed over, by which his army was encouraged to follow. He was the first Roman who ever proceeded so far, and ventured to pass. The reason of the appellation, according to Strabo, is, that in a military expedition a sedition arising between the Celtici and Turduli after crossing that river, in which the general was slain, they remained dispersed there; and from this circumstance it came to be called the river of *Lethe*, or *Oblivion*. It is now called *Lima*.

BELISARIUS, general of the emperor Justinian's army, who overthrew the Persians in the East, the Vandals in Africa, and the Goths in Italy. See **ROME**. But after all his great exploits, he was falsely accused of a conspiracy against the emperor. The real conspirators had been detected and seized, with daggers hidden under their garments. One of them died by his own hand, and the other was dragged from the sanctuary. Pressed by remorse, or tempted by the hopes of safety, he accused two officers of the household of Belisarius; and torture forced them to declare that they had acted according to the secret instructions of their patron. Posterity will not hastily believe, that a hero, who in the vigor of life had disdained the fairest offers of

ambition and revenge, should stoop to the murder of his prince, whom he could not long expect to survive. His followers were impatient to fly; but fight must have been supported by rebellion, and he had lived enough for nature and for glory. Belisarius appeared before the council with less fear than indignation: after forty years service, the emperor had prejudged his guilt; and injustice was sanctified by the presence and authority of the patriarch. The life of Belisarius was spared, but his fortunes were sequestered; and, from December to July, he was guarded as a prisoner in his own palace. At length his innocence was acknowledged, his freedom and honors were restored, and death, which might be hastened by resentment and grief, removed him from the world about eight months after his deliverance. That he was deprived of his eyes, and reduced by envy to beg his bread, is a fiction of later times; which has obtained credit, or rather favor, as a strange example of the vicissitudes of fortune. The source of this idle fable may be derived from a miscellaneous work of the twelfth century, the *Chiliads* of John Tzetzes, a monk. He relates the blindness and beggary of Belisarius in ten verses, *Chiliad* iii. No. 88. 339—348. in *Corp. Poet. Græc.* tom. ii. p. 311. This romantic tale was imported into Italy with the language and MSS. of Greece; repeated before the end of the fifteenth century by Crinitus, Pontanus, and Volaterranus; attacked by Alciat for the honor of the law, and defended by Baronius, A. D. 561, No. 2, &c. for the honor of the church. Tzetzes himself had read in other chronicles, that Belisarius did not lose his sight, and that he recovered his fame and fortunes. The statue in the Villa Borghese at Rome, in a sitting posture, with an open hand, which is vulgarly given to Belisarius, may be ascribed with more dignity to Augustus in the act of propitiating Nemesis.—*Winkelmann's Hist. de l'Art*, tom. iii. p. 266.

BELIVE, *adv.* *buhve*, Sax. probably from *bū* and *live*, in the sense of vivacity, speed, quickness. Speedily; quickly: a word out of use.

By that same way the direful dames do drive
Their mournful chariot, fill'd with rusty blood,
And down to Pluto's house are come *belive*.

Facrie Queene.

BELK, one of the Serangani islands in the Eastern seas, high, and with a bold north coast. It is partly cultivated, and the inhabitants have plenty of cocoa nuts and yellow wax. It is the most northerly of the group, which consists of three, and lies about twelve miles from *Magindanao*.

BELL, *v. & n.* } **Bel**, Sax. supposed by
BEL'FRY, } Skinner to come from *pelvis*,
BEL'ROPE, } Latin, a basin; Ang.-Sax.
BEL'RINGER. } *bellan*, signifies to bellow, and to sound a bell. A vessel, or hollow body of cast metal, formed to make a noise by the act of a clapper, hammer, or some other instrument striking against it. Bells are in the towers of churches, to call the congregation together. It is used for any thing in the form of a bell, as the cups of flowers. *Belfry* is a tower where bells are hung.

Get thee gone, and dig my grave thyself,
And bid the merry bells ring to thy ear,
That thou art crowned, not that I am dead.

Shakspeare.

Now see that noble and most sov'reign reason
Like sweet bells jangled out of tune. *Id.*

As the ox hath his yoke, the horse his curb, and
the falcon his bells, so hath man his desires.

Id. As You Like It.

Where the bee sucks, there suck I,
In a cowslip's bell I lie. *Id. Tempest.*

What time the native bellman of the night,
The bird that warned Peter of his fall,
First rings his silver bell t' each sleepy wight,
That should their mindes up to devotion call,
She heard a monstrous noise below the hall.

Spencer.

The humming bees, that hunt the golden dew,
In summer's heat on tops of lilies feed,
And creep within their bells to suck the balmy seed.

Dryden.

He has no one necessary attention to any thing but
the bell, which calls to prayers twice a-day.

Addison. Spectator.

How too like is this (cracked) bell to scandalous
and ill-lived teachers! His calling is honourable:
his noise is heard far enough: but the flaw which is
noted in his life, mars his doctrine, and offends
those ears which else would take pleasure in his
teaching.

Bishop Hall.

When cockle-shells turn silver bells,
And muscles grow on every tree,
When frost and snow shall warm us aw,
Then shall my love prove true to me.

Burns's Ballads.

But the sound of the church-going bell
These vallies and rocks never heard,
Never sighed at the sound of a knell,
Or smiled when a Sabbath appear'd. *Cowper.*

To hear the BELL. To be the first; from the
wether, that carries a bell among the sheep, or
the first horse of a drove that has bells on his
collar.

The Italians have carried away the bell from all
other nations, as may appear both by their books and
works. *Hakewell.*

To shake the BELLS. A phrase in Shakspeare,
taken from the bells of a hawk.

Neither the king, nor he that loves him best,
The proudest he that holds up Lancaster,
Dares stir a wing, if Warwick shakes his bells.

Shakspeare.

To BELL, v. n. from the noun. To grow in
buds or flowers, in the form of a bell.

Hops, in the beginning of August, bell and are
sometimes ripe. *Mortimer.*

BELL-FASHIONED, *adj.* from bell and fashion.
Having the form of a bell; campaniform.

The thorn-apple rises with a strong round stalk,
having large bell-fashioned bowers at the joints.

Mortimer.

BELL. The parts of a bell, are the body or
barel, the clapper, on the inside, and the ear or
cannon, by which it hangs to a large beam of
wood. The matter of which it is usually made
is a composition called bell-metal. The thick-
ness of a bell's edge is usually one-fifteenth
of the diameter, and its height twelve times its
thickness. The best foundries have a diapason,
or bell-scale, wherewith they measure the size,

thickness, weight, and tone of their bells. For
the method of casting bells, see *FOUNDRY*.

The theory of the sound of bells belongs pro-
perly to acoustics, but we may here observe
that the most sonorous bell, according to a paper
by M. Reamur (Mem. Acad. Par. 1726), may
be formed of the segment of a sphere. The
sound of a bell, says the Campanalogia, arises
from a vibratory motion of the parts thereof,
much like that of a musical chord. The stroke
of the clapper, it is evident, must change the
figure of the bell, and of round make it oval,
but the metal having a great degree of elasticity,
that part which the stroke drove farthest from
the centre will fly back again, and this even
somewhat nearer to the centre than before; so
that the two points, which before were the ex-
tremes of the longer diameter, now become those
of the shorter. Thus, the circumference of the
bell undergoes alternate changes of figure, and
by means thereof gives that tremulous motion
to the air, in which sound consists. M. Per-
rault maintains, that the sound of the same bell,
or chord, is a compound of the sound of the se-
veral parts thereof; so that where the parts are
homogeneous, and the dimensions of the figure
uniform, there is such a perfect mixture of all
these sounds, as constitutes one uniform, smooth,
even sound: and the contrary circumstances,
produce harshness. This he proves from the
bell's differing in tone according to the part you
strike; and yet strike it anywhere, there is a
motion of all the parts. He, therefore, considers
bells as composed of an infinite number of rings;
which according to their different dimensions,
have different tones, as chords of different
lengths have; and when struck, the vibrations
of the parts immediately struck, determine the
tone; being supported by a sufficient number of
consonant tones in the other parts. Mr. Hawks-
bee, and others have found by experiment, that
the sound of a bell struck under water is a
fourth deeper than in the air: though Marsennus
says, it is of the same pitch in both elements.
This writer has treated largely of the different
metals of which bells are formed, of their figure,
crassitude, and degrees of penderosity, as they
respect each other in a given series.

Bells are observed to be heard farther, placed
on plains, than on hills; and still farther in val-
leys than on plains; the reason of which it will
not be difficult to assign, if it be considered,
that the higher the sonorous body is, the rarer
is its medium; consequently the less impulse it
receives, and the less proper vehicle it has to
convey it to a distance.

The use of bells is very ancient as well as ex-
tensive. We find them among Jews, Greeks,
Romans, Christians, and Heathens, variously ap-
plied, as on the necks of men, beasts, birds,
horses, and sheep: but chiefly hung in build-
ings, either religious, as in churches, temples,
and monasteries; or civil, as in houses, markets,
and baths; or military, as in camps and frontier
towns. Among the Jews it was ordained, that
the lower part of the blue tunic which the high
priest wore, when he performed certain religious
ceremonies, should be adorned with pomegran-
ates and golden bells, intermixed equally and at

equal distances. The sacred historian mentions the use and intent of them in Exod. xxviii. 33—35. 'It shall be upon Aaron to minister, and his sound shall be heard when he goeth in unto the holy place before the Lord, and when he cometh out, that he die not.' The sound of the numerous bells gave notice to the assembled people that the most awful ceremony of their religion had commenced. It was a signal, perhaps, that they should prostrate themselves at the moment in which the high priest entered the sanctuary with a vessel of incense, in order that their prayers might ascend with the column of fragrance before the throne of heaven. The kings of Persia, from a remote period, are said to have had the hems of their robes adorned like the Jewish high priests with pomegranates and golden bells.

The poet, Cowper, gives a moral turn to this circumstance, worth remembering:

With golden bells, the priestly vest,
And rich pomegranates bordered round,
The need of holiness expressed,
And called for fruit as well as sound.

The prophet Zachariah, xiv. 20, speaks of bells hung to war-horses.

Among the Greeks, those who went the nightly rounds in camps or garrisons, carried with them a little bell, which they rung at each centry-box to see that the soldiers on each watch were awake. A codonophorous, or bell-man, also walked in funeral processions, at a distance before the corpse, not only to keep off the crowd, but to advertise the flamen dialis to keep out of the way for fear of being polluted by the sight, or by the funeral music. The priest of Proserpine, at Athens, called hierophantus, rung a bell to call the people to sacrifice. There were also bells in the houses of great men to call up the servants each morning. Zonaras assures us, that bells were hung with whips on the triumphal chariots of their victorious generals, to put them in mind that they were still liable to public justice. Bells were put on the necks of criminals going to execution, that persons might be warned by the sound to avoid meeting so ill an omen, as the sight of the hangman, or the condemned criminal. Maggi has given the print of a wretch whose neck is weighed down by an enormous bell, while his back is exposed to the lash of the hangman.

The responses of the Dodonæan oracle were doubtless in part conveyed by bells. The description of it which Strabo has left (lib. vii.), the *lebetes* of Virgil, the *pelves* of Juvenal, and the *tironitus aheni* of Ausonius, admit of no other interpretation. The bells were of copper, and so suspended round the temple, that one being struck put the whole in motion; and, by the manner in which the sounds died away, the priestess framed her revelation. Plutarch mentions (Symf. xiv.) a bell in the Grecian fish-markets, which reminds the writer of this article of an exactly similar construction in the little sea-port town of his birth.

Strabo connects with this custom a curious story. A musician being deserted by his au-

ditory in the town of Jassus, found it was the fish-bell which had attracted them away. One person alone remained, as if decidedly preferring his melody. The grateful harper approached, thanked his hearer for the honor which he paid to the art, and congratulated him on the superior purity of taste which prevented him from accompanying the rabble, which had vanished at the first stroke of the bell. 'Has the bell rung?' answered the other, 'alas! I am deaf; good morning to you!'

Ornamental bells in building, after the manner of the Chinese, were clearly in use among the Romans. Pliny (vii. 45, xxxvi. 13.) mentions the monument of Porsenna as decorated with pinnacles, each of which was surmounted by bells. The dream of Augustus transferred a similar ornament from the portals to the roof of the Capitoline Jove, (Suetonius, Oct. xci.)

On the origin of church bells, Mr. Whitaker, in his History of Manchester, observes, that bells being used, among other purposes by the Romans, to signify the times of bathing, were naturally applied by the Christians of Italy to denote the hours of devotion, and summon the people to church.

The first application of them to ecclesiastical purposes is, by Polydore Virgil and others, ascribed to Paulinus, bishop of Nola, a city of Campania, about the year 400. Hence, it is said, the names *Nolæ* and *Campanæ* were given them; the one referring to the city, the other to the country. Though others say they took the latter of these names, not from their being invented in Campania, but because it was here the manner of hanging and balancing them, now in use, was first practised. It is obvious, that during the days of early persecution, any public summons to the meetings of Christians would have betrayed them to their enemies. In Britain, bells were used in churches before the conclusion of the seventh century, in the monastic societies of Northumbria, and as early as the sixth, even in those of Caledonia. They were, therefore, used from the first erection of parish churches among us. Those of France and England appear to have been furnished with several bells. In the time of Clothair II. king of France, A. D. 610, the army of that prince was frightened from the siege of Sens, by the ringing of the bells of St. Stephen's church. The second ex-cerption of Egbert, A. D. 750, which is adopted in a French Capitulary of 801, commands every priest, at the proper hours, to sound the bells of his church, and then to go through the sacred offices to God. And the council of Euham, in 1011, requires all the mulcts for sins to be expended in the reparation of the church, clothing and feeding the minister of God, and the purchase of church vestments, church books, and church bells. These were sometimes composed of iron in France; and in England, as formerly at Rome, were frequently made of brass. As early as the ninth century there were many cast of a large size and deep note. Ingulphus mentions, that Turketulus, abbot of Croyland, who died about A. D. 870, gave a great bell to the church of that abbey, which he

named Guthlac; and afterwards six others, viz. two which he called Bartholomew and Betelin, two called Turketul and Tatwin, and two named Pega and Bega, all which rang together; the same author says, Non erat tunc tanta consonantia campanarum in tota Anglia. Not long after, Kinscus, archbishop of York, gave two great bells to the church of St. John at Beverly, and at the same time provided that other churches in his diocese should be furnished with bells. Mention is made by St. Aldhem, and William of Malmesbury, of bells given by St. Dunstan to the churches in the west. The number of bells in every church gave occasion to a curious and singular piece of architecture in the campanile or bell-tower; an addition, which is more susceptible of the grander beauties of architecture than any other part of the edifice, and is generally therefore the principal or rudiments of it. It was the constant appendage to every parish church of the Saxons, and is actually mentioned as such in the laws of Athelstan. The Greek Christians are usually said to have been unacquainted with bells till the ninth century, when their construction was first taught them by a Venetian. But it is not true that the use of bells was entirely unknown in the ancient eastern churches, and that they called the people to church, as at present, with wooden mallets. Leo Allatius, in his Dissertation on the Greek Temples, proves the contrary from several ancient writers. He says bells first began to be disused among them after the taking of Constantinople by the Turks; who, it seems, prohibited them, lest their sound should disturb the repose of souls, which, according to them, wander in the air. He adds, that they still retain the use of bells in places remote from the intercourse of the Turks, particularly very ancient ones in Mount Athos. E. Simon thinks the Turks prohibited the Christians the use of bells, rather from political than religious reasons, as the ringing of bells might serve as a signal for the execution of revolts, &c.

In the dark ages bells were constantly baptised and anointed, or consecrated, as well as exorcised. Usually the bishops from a belief, that by the baptism of bells performed, they held a way to drive the devil out of the air, to extinguish pestilential fire, and even to revive the dead. The ritual for these ceremonies is contained in the Roman pontifical; and it was usual in their baptism to give to bells the name of some saint. In Charney's History of Northamptonshire, p. 330, there is a relation of the consecration of bells in Italy with great ceremony, a short time before the publication of that work; and so late as September, 1782, the Milanese Chronicle contains an account of the consecration of vesuvial ceremonies running through Paris, to see the ceremony of consecrating the bells of St. Sulpice, of which the king and empress, the king and makame, were invited to witness. At St. Sulpice, near Paris, the bells were consecrated by an Abbot, near the same place, who gave them several names, such as St. Sulpice, St. Sulpice, or rather St. Sulpice, St. Sulpice, &c. The bells of the church of St. Sulpice, near London, at Bedford-

shire, had their names cast about the verge of every one in particular, with these rhiming hexameters:—

Nomina Campanis hæc indita sunt quoque nostris.

1. Hoc signum Petri pulsatur nomine Christi.
2. Nomen Magdalen campana sonate melode.
3. Sit nomen Domini benedictum semper in eum.
4. Musa Raphaelis sonat auribus Immanuelis.
5. Sum Rosa pulsata mundique Moria vocata.

Weev. Fun. 122.

By an old chartulary, once in the possession of Weever the antiquary, it appears that the bells of the priory of Little Dunmow in Essex, were, A. D. 1501, new cast, and baptised by the names of St. Michael, St. John the Evangelist, St. John the Baptist, the Virgin Mary, and the Holy Trinity. Weever further mentions, that bells had frequently this inscription:

Funera plango, Fulgura frango, Sabbata pango,
Excito lentos, dissipo ventos, Paco cruentos.

Durandus mentions six kinds of bells in the ancient monasteries, viz. Squilla rung in the refectory; cymbalum in the cloister; nola in the choir; nolula or dupla in the clock; campana in the steeple; and signum in the tower. Belethus has much the same; only that for squilla he puts tintinnabulum, and places the campana in the tower, and campanella in the cloister. Others place the tintinnabulum or tinniolum in the refectory or dormitory; and add another bell called corrigiuncula, rung at the time of giving discipline or to call the monks to be flogged. The cymbalum is sometimes, also, said to have been rung in the cloister, to call the monks to meat.

Abroad, bells are found of great magnitude. In the steeple of the great church at Ronen in Normandy there was in modern times a bell with the following inscription:

Je suis George de Ambois,
Qui trente cinque mille pois.
Mes lui qui me pesera,
Trente six mille me trouvera.

I am George of Ambois,
Thirtie five thousand in pois;
But he that shall weigh me,
Thirtie six thousand shall find me.

The great bell at St. Peter's in Rome weighs 18,607 pounds. In the Palazzo Vecchio at Florence, is one weighing 17,000 pounds; and it is raised 275 feet from the ground. Great Tom, of Christ Church, Oxford, weighs 17,000 pounds; of Lincoln, 9894 pounds. The bell of St. Paul's, London, 8400 pounds.

It is a common tradition that the bells of King's College chapel, in the university of Cambridge, were taken by Henry V. from some church in France, after the battle of Agincourt. They were taken down some years ago, and sold to Phelps, a bell-founder, in Whitechapel.

The Musurgia Universalis of Kircher describes a bell at Erfurth, which was cast in the year 1497, by Gerard Von de Campis, at the expense of the citizens, the neighbouring princes, and noblemen. Its thickness is a quarter and half quarter of an ell; its height four ells and three quarters; its exterior periphery fourteen ells and a half; and its weight 252 cwt. Twenty-four

men are required to ring it, besides two men who, on each side, push forward the clapper. Its sound is plainly heard at the distance of three German leagues. Its fundamental note is D sol re, but it gives also F faut, making a consonance of a minor third. But from the above account, Sir John Hawkins (*Hist. of Music*, iv, 211) has doubted whether the bell is ever rung at all; that is, whether it is elevated by a rope and wheel. The action of the twenty-four men is obscurely described; but the two are plainly employed not in ringing but in tolling.

A bell in the church of St. Ivan, at Moscow, weighs 127,836 pounds. But the wonder of travellers is the unsuspended bell in the Kremlin of that city. It was cast in 1653, in the reign of the empress Anne, and a fire took place in the building erected over it. The metal thus became hot, and the water, which fell upon it while in this state, occasioned a fracture, by which it was rendered useless. Dr. Clarke, in his *Travels*, has given the following account of it:—'It reaches from the bottom of the cave to the roof. The entrance is by a trap-door, placed even with the surface of the earth. We found the steps very dangerous; some of them were wanting, and others broken, which occasioned me a severe fall down the whole extent of the first flight, and a narrow escape for my life in not being dashed upon the bell. In consequence of this accident, a sentinel was stationed afterwards at the trap-door, to prevent people becoming victims to their curiosity. He might have been as well employed in mending the steps, as in waiting all day to say they were broken. The bell is truly a mountain of metal. They relate that it contains a very large proportion of gold and silver; for that, while it was in fusion, the nobles and the people cast in, as votive offerings, their plate and money. It is permitted to doubt the truth of traditionary tales, particularly in Russia, where people are much disposed to relate what they have heard, without reflecting on its probability. I have endeavoured, in vain, to assay a small part. The natives regard it with superstitious veneration, and they would not allow even a grain to be filed off. At the same time it may be said, the compound has a white shining appearance, unlike bell-metal in general; and perhaps its silvery aspect has strengthened, if not given rise to, a conjecture respecting the richness of its materials. On festival days, the peasants visit the bell as they would a church, considering it an act of devotion; and they cross themselves as they descend and ascend the steps. The bottom of the pit is covered by water, mud, and large pieces of timber, which, added to the darkness, render it always an unpleasant and unwholesome place, in addition to the danger arising from the steps which lead to the bottom. I went frequently there, in order to ascertain the dimensions of the bell with exactness. We applied a strong cord close to the metal in all parts of its periphery, and round the lower part where it touched the ground; taking care at the same time not to stretch the cord. From the piece of the bell broken off, it was ascertained that we had thus measured within two feet of its

lower extremity. The circumference obtained was sixty-seven feet and four inches; which allows a diameter of twenty-two feet, five inches, and one third of an inch. We then took the perpendicular height from the top of the bell, and found it correspond exactly with the statement made by Hanway, namely, twenty-one feet, four inches and a half. In the stoutest part, that in which it should have received the blow of the hammer, its thickness equalled twenty-three inches. We were able to ascertain this, by placing our hands under water where the fracture had taken place, which is above seven feet high from the lip of the bell. The weight of this enormous mass of metal has been computed to be 443,772 pounds; which, if valued at three shillings a pound, amounts to £66,565. 16s. lying unemployed, and of no use to any one.

In 1684, Abraham Rudhall, of Gloucester, brought the art of bell-founding to great perfection. His descendants in succession continued the business; and by a list published by them, it appears, that at Lady-day, 1774, the family, in peals and odd bells, had cast to the amount of 3594. The peals of St. Dunstan's in the east, and St. Bride's, London, and St. Martin's in the Field's, Westminster, are in the number. See **FOUNDRY**.

The practice of ringing bells in change, or regular peals, is said to be peculiar to England; whence Britain has been termed the bell-ringing island. The custom seems to have commenced in the time of the Saxons, and was common before the conquest. The tolling a bell is nothing more than the producing a sound by a stroke with the clapper against the side of the bell, the bell itself being in a pendent position and at rest. In ringing, the bell, by means of a wheel and a rope, is elevated to a perpendicular; in its motion to this situation the clapper strikes forcibly on one side, and in its return downwards on the other side of the bell, producing at each stroke a sound. There were in London, formerly, many societies of ringers, particularly one known by the name of the College Youths; of this it is said the celebrated Sir Matthew Hale, was, in his youthful days, a member; and in the life of that judge, by bishop Burnet, are some facts that at least prove his attachment to such exercises. Ringing has sometimes claimed the name of a science, and peals have been composed which bear the name of inventors. Some of the most celebrated of these were composed about fifty years ago by one Patrick. This man was a maker of barometers; in his advertisements he styled himself Torricellian Operator, from Torricelli, who invented instruments of this kind. The ancient peals do not appear to have exceeded five in number. Holden, in his *Treatise on the natural grounds of Harmony*, remarks, that 'the completest and most perfect ring is a peal of six, in which, whether ascending or descending, the hemitone holds the middle position, as it does in both the natural and the durum hexachord; in the molle hexachord the tritonus intervenes.' cap. vi. Stowe, in his *Survey of Cornhill Ward*, mentions, that in 1430. a sixth bell was added to the peal of five

in the church of St. Michael; after which it was accounted the best ring of bells, for harmony and sweetness, in all England.

The theory of ringing may be completely learned from either the *Campanologia* (of 1733), or the *Harmonia Universalis* (the Latin not the French work) of Merseus, in which he has enumerated and reduced to musical notation, the changes of the hexachord, or the *Tintinnaloga*, or Art of Ringing, (1668), in which every possible change of diatonic sound, from two bells to twelve, is laid down; and innumerable passages presented wholly new to musical composition. This may easily be imagined, when it is recollected, that in the simple arrangements of natural sound, without the intervention of a single flat or sharp, twelve bells produce 479,001,600 changes. Not all the changes, however, if reduced into an air, would be equally agreeable or practicable; and it is somewhat remarkable, that in the art of ringing, melody has never been studied. Mechanical order and succession has been all in all; and Dr. Burney, from whom we borrow the observation, states, that even in the claps or collision of two bells together in counterpoint, no knowledge of harmony has ever been displayed.

The number of changes upon a given number of bells is readily calculated: $S = 1 \times 2 \times 3 \times 4 \times \dots \times n$. So that the changes upon

2 bells are	2
3 ———	6
4 ———	24
5 ———	120
6 ———	720
7 ———	5,040
8 ———	40,320
9 ———	362,880
10 ———	3,628,800
11 ———	39,916,800
12 ———	479,001,600

No peal beyond twelve, we believe, has ever been erected. The churches having twelve bells, in London, are St. Bride's, St. Martin's in the Fields, St. Michael's Cornhill, St. Leonard's Shoreditch, St. Saviour's Southwark, St. Giles's Cripplegate, and Christ Church Spitalfields. In the country, York Minster, Cirencester, Great St. Mary's Cambridge, St. Martin's Birmingham, St. Peter's Mancroft Norwich, St. Chad's Shrewsbury, and Payne Church Gloucestershire, have the same number.

It is calculated that twelve changes may be rung in one minute, that is 720 in an hour. On this computation, all the possible changes on twelve bells could not be rung in less than seventy-five years, ten months, and ten days.

A peal is the whole number of changes which can be rung on any given number of bells: and as the style of each peal differs according to the succession in the succession of these changes, so each peal is distinguished by a peculiar name, and is so in perpetuity. The peal of regular permutation of twelve bells, is called a *grandsire*. The peal of six bells is represented in the following manner.

12345	13542	31254	25143
———	31524	32145	52413
21354	35142	23415	54231

31452	45123	42315	53421
34125	54213	43251	35241
43215	52431	34521	32514
42351	25341	35412	23154
24351	23514	53142	S 21345
25413	32154	51324	12354
52143	S 32145	15234	12345
51234	13254	12543	
15324	13245	21534	

The letter B, in the above example, signifies a bob, or an alteration in the direction of the changes. S denotes single; a term used when half the peal is rung, and, also, when one change only remains. A plain bob, *grandsire bob*, or single bob minor, is the peal of regular permutation on six bells. A *grandsire treble* is the same on seven. A bob major the same on eight. *Caters* the same on nine. *Ten in*, or bob royal, the same on ten. *Cinquus* the same on eleven. *Twelve in*, or bob maximus, the same on twelve. In the *grandsire treble* complete, there are 5040 changes: to ring through which, admitting 720 changes in an hour (a number which cannot be kept up), seven hours would be required. It is plain that this is the most extensive complete peal which can be rung. The next in order, the bob major, contains 40,320 changes, and could not be rung even on a light peal in less than twenty-four hours, a length of time during which no eight men could stand to the labor.

These regular changes, in which the place of two bells only is altered in each round, are called plain changes. When the place of more than two bells is altered, and the changes do not succeed each other progressively, but by intervals, they are called cross changes.

The bell, the regular motion of which guides the rest, is called the hunt, and it is generally the treble bell. In the above example, the figure 1 represents the hunt; it moves from its own place into the second's place, and so on till it reaches fifth's place, which is called *hunting up* behind. Here it strikes two blows, called *laying in* behind a whole pull; and it then hunts back again in the reverse order, and so on to the end

of the peal. 'The first step,' says the *Campanologia*, 'he (the learner) makes in this art, is to learn perfectly to set a bell, both back stroke and fore; and to have it so much at his command, as that he may be able to cut it down at either hand (being the sally or back stroke), and set it again the next pull; without which he cannot attain to any perfection or knowledge in this art. And, to make this the more easy to him, he must observe to keep the rope tight or stiff, to stand upright to his bell, not stirring, or using any ungentle posture; which in ringing, as well as dancing, is very ridiculous. When he is master of this, he may then try to ring one round in three, four, five, or six bells, and afterwards in eight or ten, wherein, as in all ringing, the principal thing to be observed is a true and exact compass, which in music is called time, otherwise the ringing becomes very displeasing and disturbing to the hearers, and may be compared to the nauseous music of a country fiddle-player before a company of boors and peasants going to the celebration of a homely country-wedding.' p. 11.

In the Low Countries, particularly at Ghent and Antwerp, is a species of chime termed carillons, played with great labor by a performer, the carrillonneur, upon a number of bells, disposed in a scale of tones and semitones like a harpsichord. The bass is played by pedals; the treble by violent strokes of the hands edgeways upon a series of projecting sticks, which act as keys. From this barbarous and unwieldy music, the term carillon has been applied to a small keyed instrument, imitating a peal of hand-bells, in which box hammers are made to strike iron bars of different lengths. Handel employed this instrument as an accompaniment in his air, 'O let the merry bells ring round,' in *L'Allegro*; and to the chorus, 'Welcome, welcome, mighty king,' in *Saul*. See CHIMES.

The *Passing Bell* was anciently rung for two purposes; one, to bespeak the prayers of the minister and all good Christians for a soul just departing; the other, to drive away the evil spirits who were supposed to wait about the house, ready to seize their prey, or to molest and terrify the soul in its passage. By the ringing of this bell, for Durandus informs us evil spirits are much afraid of bells, they were thought to be kept aloof: and the soul, like a hunted hare, gained the start, or had what is by sportsmen called law. Hence, perhaps, exclusive of the additional labor, was occasioned the high price demanded for tolling the greatest bell in the church. This dislike of spirits to bells is mentioned in the *Golden Legend*, by W. de Worde. 'It is said, the evil spirytes that be in the regyon of thayre, doute moche when they here the belles rongen: and this is the cause why the bells ben rongen when it thondreth, and when grete tempeste and outrages of wether happen, to the ende that the fiends and wycked spirytes shold be abashed and flee, and cease of the moyngye of tempeste.' Lobineau observes, that the custom of ringing bells, at the approach of thunder, is of some antiquity; but that the design was not so much to shake the air and so dissipate the thunder, as to call the people to

church, to pray that the parish might be preserved from disasters.

Legends Concerning BELLS, as might be expected, are endless. The bells at Canterbury are said to have rung of themselves on the murder of Thomas à Becket: but the influence of bells as exorcists has occasionally failed. The history and antiquities of Shrewsbury, by Phillips, contains the following item: 'This yere 1533 upon twelffe daye in Shrewsbury, The Dyvyll appearyd in Saint Almonds church there when the priest was at high masse, with great tempeste and darknesse, so that as he passyd through the church, he mounted up the steeple in the sayde church, teryng the wyers of the seid clocke, and put the print of hys clawes upon the 4th bell, and tooke one of the pyynacles away with hym, and for thertyme stayed all the bells in the churches within the said towne, that they could neyther toll nor ringe.' It is clear that this is simply the reference of a thunder storm to diabolical agency. We are told of a bell of St. David, which cured the King of Dublin of a mortal disease by applying it to his cheek. This was preserved in the church of Glasewm in Radnorshire. It was portable, and endowed with great virtue. Giraldus Cambrensis says, that 'a certain woman secretly conveyed this bell to her husband, who was confined in the castle of Raidergwy near Warthrenia, which Rhys, son of Gruffydd, had lately built, for the purpose of his deliverance. The keeper of the castle not only refused to liberate him for this consideration but seized and detained the bell; and in the same night, by Divine vengeance, the whole town, except the wall on which the bell hung, was consumed by fire.' A similar bell, called Bangu, was kept in all Welsh churches during Popish times. On the day of a funeral, the sexton took it to the house of the deceased. When the procession began a Psalm was sung, and the bellman sounded the Bangu in a solemn manner, till the corpse arrived at the church. Within the memory of living persons this custom is said to have prevailed in Wales. We must mention yet one more marvellous bell in Ireland, which, unless it were tied fast every night, used to wander far from home into another church! We read also of a comet, which in the time of Pope Calixtus III. cast upon the Turks all the mischief which it threatened, in consequence of the ringing of bells, by order of the pontiff, precisely at noon. *Plat. in vita*.

We may finally observe (with Stavelay, on Churches,) that anciently and sometimes besides the before specified offices, an extraordinary and dreadful use was also made of bells, and that was the cursing by Bell, Book, and Candle: the manner whereof, he adds, I hope, will not be altogether impertinent here to relate; out of an ancient Festival, and the articles of the general great curse, found at Canterbury, A. D. 1562. It was solemnly thundered out once in every Quarter; 'The Fyrst Sunday of Advent, at comyng of our Lord Jhesu Cryst: the fyrst Sunday of Lenten: The Sunday in the Feste of the Trynyte: and Sunday within the Utas (Octaves) of the blessed Vyrgin our Lady St. Mary.' At which action the prelate stands in the pulpit

in his Aulbe, the cross being lifted up before him and the candles lighted on both sides of it, and begins thus, 'By authority, God, vader, Son, and Holy-Ghost, and the glorious Moder and Mayden, our Lady St. Mary, and the Blessed Apostles Peter, and Paul, and all Apostles, Martyrs, Confessors, Vyrgyne, and the hallowes of God; All thos byn accused that purchases writts, or letters of any leud court, or to let the processe of the law of holy church of causes that longen skiffully to christen court, the which should not be demed by none other law: And all that maliciously bereaven holy chirch of her right, or maken holy chirch lay fee, that is hallowed and blessed. And also all thos that for malyce or wrathe of parson, vicare, or priest, or of any other, or for wrongfull covetyse of himself withholden rightfull tyths, and offerings, rents, or mortuaries from her own parish church, and by way of covetyse fals lyche taking to God the worse, and to himself the better, or else torn him into another use, then hem oweth. For all chrysten man and women been hard bound on pain of deadly sin, not onlyche by ordinance of man, but both in the ould law, and also in the new law, for to pay trulyche to God and holy chirch the tyth part of all manner of increase that they winnen trulyche by the grace of God, both with her travell, and alsoe with her craftes whatsoe they be truly gotten.' 'And then concludes all with the curse itself, thus: 'And now by authoritie aforesaid we denounce all thos accursyd that are so founden guyltie, and all thos that maintaine hem in her sins or gyven hem hereto either help or counsell, soe they be departed froe hell, and all holi chyrch: and that they have noe part of the passyon of our Lord Jhesu Cryst, ne of noe Sacraments, ne no part of the prayers among christen folk: but that they be accused of God, and of the church, froe the sole of her foot to the crown of her hede, sleeping and waking, sitting, and standing, and in all her words, and in all her works; but if they have noe grace of God to amend them here in this lyfe, for to dwell in the pain of hell for ever withouten end: fiat: fiat. Doe to the boke: crouch the candles: ring the bell: Amen, Amen.' And then the booke is clapp'd together, the candles blown out, and the bells rung, with a most dreadfull noise made by the congregation present bewailing the accursed persons concerned in that black doome denounced against them.' 236.

The uses of bells were summed up in the following distich, as well as one above mentioned: *Lauda Deum, vindex, phoebe voco, conjuga cicerum, Deum os patro, postem fore, lista decoro.*

BELL, in a Botany, is used to denote the body of the Cornelian and Composite capital, by reason of its resemblance to the figure of a bell inverted. It is, as with the vase and tambour, and sometimes even to be mistaken of the bell should always be even and perpendicular with the bottom of the flutings of the column. See Architecture.

Bell, in chemistry, denotes a glass vessel placed over some matter in a state of exhalation, either to collect the vapor, or rather the flowers. Chemical bells are made of materials chiefly used in preparing the acid spirit of sulphur, for

gathering and condensing fumes into a liquor.

BELL, DIVING. See DIVING.

BELL (Benjamin), member of the Royal College of Surgeons, and F. R. S. Edinburgh, was born at Dumfries, in 1749, and after a classical education, under the celebrated Dr. George Chapman, began his medical studies at Edinburgh, in 1766. About 1770 he went to Paris, and from thence to London. Mr. Bell returned to Edinburgh in 1772, with a design of settling there. His address and dexterity, and the success of his cures in the infirmary, were soon observed, but his fame was not confined to the circle of practice: in 1778 he published *A Treatise on the management of Ulcers, &c.* which soon passed through several editions, and was occasionally improved by the author. He afterwards incorporated it into his *System of Surgery*, of which Mr. Bell published the first volume in 1783 which was well received. He completed it in 1788. Before the year 1801 it had gone through six editions, receiving, as they came out, whatever improvements his experience could add: the 7th edition, considerably improved, was that year published in 7 vols. 8vo. In the year 1793 Mr. Bell published a *Treatise on the Gonorrhoea Virulenta, and Lues Venerea*, 2 vols. 8vo. which passed to a third edition. In 1794 appeared a more enlarged treatise on *The Hydrocele, on Sarcocele or Cancer, and other diseases of the Testes*, than what was contained in his *System of Surgery*. In 1782 Mr. Bell published the first volume of a *Series of Essays on Agriculture*, with a plan for the speedy improvement of land in Great Britain; the 2d volume of which he was preparing for the press immediately before his death. He also sent abroad into the world several anonymous political tracts. Mr. Bell married a daughter of the Rev. Dr. Hamilton, professor of Divinity; and some years before his death he was assisted in his professional pursuits by his eldest son, Mr. George Bell. He made different tours for the improvement of his health about the year 1800, but nature continued to fail, and he expired without any symptom of pain, on 4th April, 1806.

BELL (John), an eminent surgeon of Edinburgh, delivered anatomical lectures there, and published some professional works of considerable importance. Among these are *Discourses on the Nature and Cure of Wounds*, 8vo; *The Anatomy of the Human Body*, 3 vols. 8vo; *Principles of Surgery*, 3 vols. 4to. A few years ago he travelled to Italy, and dying at Rome in 1820, left for the press a work published in 1825 with the title of *Observations on Italy*, 4to.

BELL (Henry Nugent), a student of the Inner Temple, of considerable heraldic and genealogical research. His exertions were the means of the recovery of the dormant Huntingdon Peerage. He died October 18, 1822, on the day a verdict was given against him for a sum of money advanced to him by Mr. Cooke, an engraver, towards the investigation of a claim to an estate. He published an account of the claim to the Huntingdon peerage.

BELL (Elizabeth), of Kinvaid, and her friend Mary Gray, of Lednock, celebrated in the well known song, *Bessy Bell and Mary Gray*, were

both natives of Perthshire, where these estates are situated. The history of these young ladies is recorded by the ministers of Methven and Monedie, in Sir J. Sinclair's Stat. Acc. Vol. III. 604; and X. 621.

BELLA (Stefano De la), an eminent engraver, born at Florence, A. D. 1610. His father was a goldsmith; and he began to follow that business, but whilst learning to draw, Callot's prints fell into his hands; with which he was so delighted, that he prevailed upon his father to permit him to apply to engraving; and he became the disciple of Canto Gallina, the instructor of Callot. Bella at first imitated the manner of Callot, but soon adopted one, his own, which in freedom and spirit is said even to have surpassed that of his fellow pupil. He went to Paris A. D. 1642, where he formed an acquaintance with Israel Silvestre, and was much employed by Henriette, Silvestre's uncle. Some time after, Cardinal Richelieu engaged him to go to Arras and make drawings of the siege of that town by the royal army. After staying a considerable time at Paris, his family affairs obliged him to return to Florence; where he obtained a pension from the Great Duke, and was appointed to instruct Cosmo, his son, in the art of design. He was subject to violent head-aches, which terminated his life, A. D. 1664, when he was only fifty-four years of age. He drew very correctly, with great taste, and vast fertility of invention. The animation which appears in his works compensates for their slightness, which we can hardly be surprised at when we are told that he engraved 1400 plates.

BELLADONA, in botany the trivial name of a species of *Atropa*. See *ATROPA*.

BELLADONA LILY. See *AMARYLLIS*.

BELLAI (William du), lord of Langey, a French general who signalled himself in the service of Francis I. He was also an able negotiator, so that the emperor Charles V. used to say, that Langey's pen had fought more against him than all the lances in France. He was sent to Piedmont in quality of viceroy, where he took several towns from the Imperialists. His address in penetrating into the enemy's designs was surprising. In this he spared no expense, and thereby had intelligence of the most secret of the imperial councils. It being then the interest of France to favor the king of England, he was extremely active in influencing some of the French universities to give their judgment agreeable to the desire of Henry VIII. on the subject of divorcing Queen Catharine. He was sent several times into Germany to the princes of the Protestant league, and was made a knight of the order of St. Michael. He was also a man of learning, and composed several works; the most remarkable of which was the History of his Own Times, in Latin, divided into several parts, each consisting of eight books; most of which, however, have been lost. He died at St. Saphorin, between Lyons and Roan, the 9th January, 1542, and was buried in the church of Mans.

BELMOPRESKOY-LEPOROI, a province of Russian Lapland, on the White Sea, which is called in the language of the country *Bella* or *Bieloi More*.

BELLAMY (Thomas), was born at Kingston-upon-Thames in 1745, and bred a hosier, became subsequently a publisher, and also an author. Among other things, he produced *Sadaski*, a novel, *Lessons from Life*, *Miscellanies*, and *The Friends*, a musical interlude. He was the original projector and editor of the *Monthly Mirror*. He died in 1800.

BELLARDIA, in botany, a genus of plants, of the class tetrandria: order monogynia: CAL. four-cleft: NECT. with a four-lobed margin, surrounding the style: CAPS. two-celled, two-partible, many-seeded. One species; a native of Guiana.

BELLARMIN (Robert), an Italian jesuit, one of the best controversial writers of his time. In 1576 he read lectures at Rome with such applause, that Sixtus V. sending a legate into France in 1590, appointed him as an attendant divine, in case any dispute should arise in religion. He returned to Rome, and was raised successively to different offices, till at last, in 1599, he was honored with a cardinal's hat; his acceptance of which, it is said, they were obliged to force, by threatening him with an anathema, in case of refusal. It is certain that no jesuit ever did greater honor to his order, and that no author ever so well defended the Romish church. Protestants have owned this; for, during the space of fifty years, there was scarcely any considerable divine among them, who did not fix upon this author for the subject of his books of controversy. Notwithstanding the zeal with which he maintained the power of the pope over the temporality of kings, he displeased Sixtus V. in his work *De Romano Pontifice*, by insisting that the power which Jesus Christ gave to his vicegerent was only indirect, and had the mortification to see it put into the index of the Inquisition, though it was afterwards removed. He left, at his death, one half of his soul to the Virgin Mary, and the other to Jesus Christ.

BELLASPOOR, a town of Delhi, Hindostan, on the east side of the Sutubje river, which is here 100 yards broad. Lat. 31° 35' N., long. 76° 21' E. It is well built, and exhibits a regularity not often seen in this part of Hindostan. The streets are roughly paved, and the houses built of stone and mortar. From Bellaspoor, fertile valleys, though not wide, extend to Bipolie; and it is the residence of the ranny, or female ruler of the Calowr territory.

BELLATRIX, in astronomy, a ruddy glittering star of the second magnitude, in the left shoulder of Orion. It takes its name from bellum, war, as being anciently supposed to have a great influence in kindling wars, and forming warriors.

BELLE, *Belle*, Fr., from the Latin *BELL'YCHE*, } *bellus*, is applied to the female,
BEL'DAM, } as beau to the male. *Beldam*,
BEL'SIRE, } now a term of derision and re-
BELL'IBONE, } proach, literally signifies fair lady. *Bellibone*, bonny belle; bonny lass; *Bellyche* occurs in Pier's Ploughman. *Beldam*, in Ford, simply, as an aged woman; and Shakspeare applies it to the earth,—shakes the old beldame earth: he uses it, however, in its common acceptation. *Belsire* occurs in Drayton.

Who this land in such estate maintain'd,
As his great *belsire* Brute from Albion's heirs it won.

Drayton.

Pan may be proud that ever he begot
Such a *bellibone*,
And Syrxin rejoice that ever was her lot
To bear such a one.

Spenser.

PER. I saw the bouncing *bellibone*,
WILL. Hey, ho, *Bombell*,
PER. Tripping over the dale alone,
WILL. She can trip it very well.

Id. Shepherd's Calendar.

— What motive could compel

A well-bred lord t' assault a gentle *belle*?
O say, what stranger cause, yet unexplor'd,
Could make a gentle *belle* reject a lord.

Pope.

BELLEAU (Remi), a French poet, born at Nogent le Rotrou. He lived in the family of Rénatus of Lorraine, Marquis of Elbeuf, general of the French galleys; and attended him in his expedition into Italy in 1557. This prince highly esteemed Belleau for his courage and abilities, and entrusted him with the education of his son, Charles of Lorraine. Belleau was one of the seven poets of his time, who were denominated the French Pleiades. He translated the odes of Anacreon, but is thought not to have preserved all the natural beauties of the original. His pastoral pieces are most in esteem. He also wrote an excellent poem on the Nature of Precious Stones; he died at Paris in 1577, in the family of the Duke d'Elbeuf.

BELLE or **NTR.** in botany, a name given by the French to the flower of the jasp.

BELLEFORIST (Francis de), a French author, born in Guienne in 1520. He was seven years of age when he lost his father; but his mother, though left in poor circumstances, contrived to fall in her power to his education. He was supported some years by the queen of Navarre, sister to Francis I. Some time after, he went to study at Bourdeaux, then at Toulouse, and at last Paris; where he became acquainted with several men of learning, and was honored with the friendship of many persons of quality. He wrote, 1. A History of the Nine Charlees of France. 2. Annotations on the Books of St. Augustine. 3. An Universal History of the World. 4. The Chronicles of Nicholas Gillet augmented. 5. An Universal Cosmography. 6. Annals, or a General History of France; and many other works. He died in 1583.

BELLEGARDE, a strong barrier town of France, in the department of the Eastern Pyrenees, and ancient province of Roussillon, on the frontiers of Catalonia. It commands a passage through the Pyrenean mountains. Early in the revolution war it was taken by Spain, and stood a siege by the French in July and Aug. 1793; but was obtained by a treaty of discretion on the 14th of September, 1793, to the Duc d'Anguier, who made it his residence. It is 20 miles south-west of Perpignan, and 100 miles from Perpignan.

BELLE-ISLE, a small island, in the department of the Eastern Pyrenees, and late province of Roussillon, in France. It is 15 miles north-west of Perpignan. Long. 5° 10' E., lat. 43° 47' N.

BELLEISLE, an island in France, called also Belleisle, lying in the Bay of Biscay, on the coast

of the department of the Morbihan, in the elevated Brittany. It is the largest of the French European islands, being fifteen miles long and five broad. It is a mixture of craggy rocks and fertile soil; but the inhabitants are very poor, and the principal trade carried on in it is the curing of pilchards. There are three harbours in the island, every one of which is defective, either in being exposed, shallow, or dangerous of entrance. Its chief town is Le Palais, besides which it contains three county towns, 103 villages, and about 5000 inhabitants. In 1742 it was erected into a duchy, in favor of Marshal Belleisle. The town of Palais has a citadel fronting the sea, fortified principally by horn-works, provided with two dry ditches, the one next the counterscarp, and the other so contrived as to secure the interior fortifications. This citadel is divided from the larger part of the town by an inlet of the sea, over which there is a bridge of communication. In this state was the island in 1761, when an expedition was undertaken against it by a British fleet, under the command of Commodore Keppel, having on board a considerable land force, commanded by General Hodgson. The fleet sailed from Spithead on the 29th of March, and arrived before Belleisle on the 7th of April. The attempt to land was made in three places with great resolution; but the British were at last repulsed, with the loss of 500 men. It was not before the 25th of April that the weather allowed a second attempt, which was successful, though the assailants had many obstacles to encounter. The French were driven into Palais, and there the chevalier de St. Croix, a brave and experienced officer, resolved to hold out to the last extremity. It was not till the 7th of June that he capitulated, and the garrison marched out with the honors of war. At this siege the marine corps, then newly formed, gave the first signal proofs of that intrepidity, discipline, and fidelity, for which they have ever since been so much distinguished. The island was restored to the French by the treaty of 1763. Long. 3° 6' W., lat. 47° 18' N.

BELLE-ISLE, an island of North America, lying at the mouth of the strait between New Britain and the north end of Newfoundland; whence the passage between them is called the Straits of Belle-Isle. The island is twenty-one miles in circuit, and the nearest land of the Labrador coast is sixteen miles distance. It has a harbour for fishing vessels, and a cove which will admit shallops. Long. 55° 15' W., lat. 51° 58' N.

BELLENDEN, or **BALLANTINE** (William), a Scottish writer, who flourished in the beginning of the seventeenth century, was professor of humanity, or belles-lettres, at Edinburgh, and master of the requests to James I. of England. But both appointments are supposed to have been only nominal, since he appears to have resided almost constantly at Paris, where, by the favor of his sovereign, he was enabled to live in easy circumstances. There he published in 1608 his Cicero Princeps, a singular work; in which he extracted, from Cicero's writings, detached passages respecting monarchical government, with

the line of conduct to be pursued, and the virtues proper to be encouraged by the prince himself. This treatise, when finished, he dedicated to the son of his master, Henry, Prince of Wales. In 1612 he published a work of a similar nature, called *Cicero Consul, Senator Senatusque Romanus*. He now conceived a plan of a third work, *De Statu prisci Orbis*, which was to contain a history of the progress of government and philosophy, to their various degrees of improvement under the Hebrews, Greeks, and Romans. He proceeded so far as to print a few copies of this work in 1615, when it was suggested to him that his treatises *De Statu Principis, De Statu Reipublicæ, and De Statu Orbis*, being on subjects so nearly resembling each other, there might be a propriety in uniting them into one work, by republishing the whole under the title of *Bellendenus de Statu*. With this view he recalled the few copies of his last work, and the three treatises appeared together under the new title in 1616. These pieces were reprinted by the late Dr. Parr. He inscribed them to Mr. Burke, Lord North, and Mr. Fox, whose talents and virtues he celebrates in a preface of seventy-six pages, and enters upon a very free and bold discussion of public men and measures, under names borrowed from antiquity. Bellenden wrote another work, published after his death, *De tribus Luminibus Romanorum*, whom he conceives to be Cicero, Seneca, and the elder Pliny. Dr. Middleton has been charged with borrowing not only the matter, but the arrangement, of his *Life of Cicero*, from Bellenden, without the least acknowledgment.

BELLENDENA, in botany, so called by Mr. Brown, in honor of John Bellenden Ker, Esq. a scientific botanist; class tetrandria, order monogynia: natural order proteaceæ. Its essential characters are: PET. four, regular and spreading: COR. white, and soon falling: STAM. inserted into the receptacle: GERM. two-seeded: STIG. simple: CAPS. without wings, not bursting: SEEDS one or two. 1. *B. montana*, mountain bellendena.—The only known species; found by Mr. Brown on the mountains of Van Diemen's land, but as yet unknown in our gardens. This is a perfectly smooth shrub: the leaves are scattered, flat; three-cleft at the extremity: flowers scattered, rarely in pairs: seed-vessel colored, furrowed along one edge.

BELLER, BELLAY, or BELLEY, a town of France, in the department of the Ain, and capital of the *ci-devant* district of Bugey; seated near the Rhone, among the hills, on the borders of Mont Blanc, twelve or sixteen miles north-west of Chambery, and 250 south-east of Paris.

BELLEROPHON, or BELLEROPHONTES, in fabulous history, the son of Glaucus, king of Epirus, happening accidentally to kill his brother, he fled to Pretus, king of Argos, who gave him a hospitable reception: but Sthenobea, his queen, falling in love with him, and finding that nothing could induce him to injure his benefactor, she accused him to her husband of an attempt to violate her honor. Pretus, however, not willing to infringe the laws of hospitality, sent him to Iobates, king of Lysia, and father of Sthenobea, with letters desiring him to put him to death;

whence the proverb, *Bellerophonis literas afferet*, equivalent to carrying the letters of Uriah. That prince, at the receipt of these letters, was celebrating a festival, which prevented Bellerophon's destruction. Iobates, however, sent him in the mean time to subdue the Solymi, the Amazons, and Lysians, and thought to get rid of him by exposing him to the greatest dangers; but by his prudence and courage he came off victorious. Iobates next employed him to destroy the Chimæra: when Minerva, or, according to others, Neptune, in consideration of his innocence, furnished him with the horse Pegasus, by whose assistance he killed the Chimæra. Iobates, on his return, being convinced of his truth and integrity, and charmed with his heroic virtues gave him his daughter Philonoe in marriage, and declared him his successor; which when Sthenobea heard, she killed herself. Bellerophon at length growing vain with his prosperity, resolved, by the assistance of Pegasus, to ascend the skies; when Jupiter checked his presumption, by striking him blind; on which he fell down to the earth, and wandered till his death in contempt and misery: but Pegasus mounting into heaven, Jupiter placed him among the constellations.

BELLES LETTRES.—Of the meaning of this term no precise definition has yet been given. It appears to be a vague designation, under which every one may include whatever he pleases. Sometimes we are told, that by the belles lettres is meant the knowledge of the arts of poetry and oratory; sometimes that the true belles lettres are natural philosophy, geometry, and other essential parts of learning; and sometimes that they comprehend the art of war, by land and sea. In treating on the belles lettres, some even talk of the use of the sacraments, &c. See Rollin on the Belles Lettres. Some comprehend under the term all those instructive and pleasing sciences which occupy the memory and the judgment, and do not make part either of the superior sciences, or of the polite arts (see ARTS), or of mechanic professions: hence they make history, chronology, geography, genealogy, blazonry, philology, &c. the belles lettres. In a word, it were an endless task to attempt to enumerate all the parts of literature which different learned men have comprehended under this title.

BELLEVILLE, a town of France, in the department of the Rhone, and *ci-devant* district of Beaujolois, seated near the Saone. Wine is its principal article of commerce.

BELLEVOIS, painter of sea-pieces, is known through all parts of Europe, though no particulars have been handed down concerning his life. He died in 1684. His subjects are views of havens, sea-ports, shores, calms, and storms at sea. In his calms he shows peculiar excellence. His pictures are often in public sales; and those of his best style are sold pretty high.

BELHEIM, a large market town in the circle of the Rhine, and district of Spire, subject to Bavaria. The population, which amounts to 1500, is partly Catholic, partly Calvinistic, and partly Lutheran. The first two persuasions have churches.

BELLICA COLUMNA, in antiquity, a column near the temple of Bellona, from which the consuls or fociales threw javelins towards the enemy's country, by way of declaration of war.

BELLICAL, } Latin, *bellum, bellicum*,
BELLI'COUS, } warlike; waging war. Old
BELLI'QUE, } Douglas introduces, in his
BELLI'GERENT. } translation of the *Æneid*, the
 word *bellical* in the sense given. Feltham, in
 his *Resolves*, denominates Cæsar 'the bellique
 Cæsar.'

Never mind, brother Toby, he would say, by God's blessing we shall have another war break out again some of these days; and when it does the *belligerent* powers, if they would hang themselves, cannot keep us out of the play. *Sterne.*

BELLICULI, or **BELLIRICI MARINI**, among naturalists, denote a species of sea-shells of an umbilical figure, sometimes of a white color, spotted with yellow; and sometimes of a yellow, streaked with black lines.

BELLIDUFF, an ancient tumulus, in the parish of Meikle, Angus-shire, which tradition says is the spot where Macbeth fell. At some distance, a stone of granite, twenty tons in weight, stands almost erect, to commemorate, it is said, the death of one of his generals. 'But, (Dr. Playfair, who records this tradition, observes that) that tyrant, it is more probable was slain at Lumphanan, in the Mearns.'

BELLIE, from Beul aith, Gaelic, i. e. the mouth of the Ford; a parish of Scotland, situated in Banffshire (except the town of Fochabers, which lies in the county of Murray,) extending from north to south about six miles, and from east to west nearly four, on the left bank of the river Spey. It contains about 1900 inhabitants. The soil is abundantly fertile in grain, sown grass, potatoes, and pasturage for cattle. Among its spontaneous productions is the rare plant, called *satyrium repens*. The town of Fochabers lies on the other side of the river, and the parish church is now built there. A handsome bridge has been thrown over the Spey at this place by the duke of Gordon. On a rising ground stands Gordon Castle, the seat of the duke of Gordon, the front of which is 568 feet in length. Near this place the duke has a capital salmon fishery on the Spey.

BELLING, applied to hops, denotes their opening and expanding to their customary shape, supposed to bear some relation to that of a bell. Hops blow towards the end of July, and bell the latter end of August or the beginning of September.

BELLINGHAM'S BAY is on the west coast of America, in the gulf of Georgia, extends from north to south about twelve miles, and has everywhere good anchorage. The bordering shores are high and rocky, but the interior consists of fruitful lawns.

BELLINI Gentil, a Venetian painter, born in 1421. He was employed by the republic of Venice; and to him and his brother John, the Venetians are indebted for the beautiful paintings which are to be seen in the council-hall. Mahomet II. emperor of the Turks, having seen some of his performances, was so struck with

them, that he wrote to the republic, entreating them to send him. Bellini accordingly went to Constantinople, where he executed many excellent pieces. Amongst the rest, he painted the decollation of St. John the Baptist, whom the Turks revere as a great prophet. Mahomet admired the proportion and shadowing of the work; but he remarked one defect in regard to the skin of the neck, from which the head was separated; and, in order to prove the truth of his observation, he sent for a slave and ordered his head to be struck off. This sight so shocked the painter, that he could not be easy till he had obtained his dismissal; which the grand seignor granted, and made him a present of a gold chain. The republic settled a pension upon him at his return, and made him a knight of St. Mark. He died in 1501.

BELLINI (John), brother to Gentil, painted with more art and sweetness; and died in 1512, aged ninety.

BELLINI (Laurence), an eminent physician, born at Florence in 1643. After having finished his early education, he went to Pisa, where he was assisted by the generosity of the grand duke Ferdinand II. and studied under two of the most learned men of that age, Oliva and Borelli. At twenty years of age he was chosen professor of philosophy at Pisa, but had acquired such a reputation for his skill in anatomy, that the grand duke procured him a professorship in that science. This prince was often present at his lectures. About thirty years after, Bellini, now in his fiftieth year, accepted of an invitation to Florence, where he practised physic with great success, and was advanced to be first physician to the grand duke Cosmo III. He wrote in Latin: 1. An Anatomical Discourse on the structure and use of the Kidneys. 2. A Speech by way of thanks to the serene duke of Tuscany. 3. Of the Urine and Pulse, of Blood-letting, Fevers, and Diseases of the Head and Breasts. 4. Several Tracts concerning urine, the motion of the heart, and bile, &c. He died January 8th, 1703, His works were read and explained publicly, during his life, by the famous Scotch physician, Dr. Pitcairn, of Leyden.

BELLINZONA, a district of Switzerland, on the east bank of the Ticino. It has for boundaries the country called the Gray League of the Grisons, the lake of Como, and the districts of Riviera, Locarno, and Lugano, containing 530 square miles, 46,000 inhabitants, and twenty parishes. On the re-organisation of the Swiss republic in 1798, Bellinzona constituted for some time an independent canton, but was formed in 1801, along with the other Italian districts of Switzerland, into the canton of the Ticino, of which the town of Bellinzona is capital.

BELLINZONA, a town of Switzerland, formerly the capital of the preceding district, and now of the canton of the Ticino, is at the extremity of a valley of the same name, where two projecting rocks leave only sufficient room for the course of the Ticino, and the road to Milan. The town is built on these rocks, and forms the main pass on the Italian side of mount St. Gothard. It contains 1500 inhabitants, an old citadel (formerly the residence of the governor of the district), a

collegiate church, and three convents. It is well built, has its own magistrates, and is much benefited by the continual passage of merchandise between Switzerland and Italy. It suffered much in the campaign of the French and Russians in 1799. Twenty-five miles S.S.W. of Como, and forty south of Zurich.

BELLIRICI MARINI See **BELLICULLI**.

BELLIS, in botany, the daisy; a genus of the syngenesia order, and the polygamia superflua class of plants; ranking in the natural method under the forty-ninth order, compositæ discoides. The receptacle is naked and conic; there is no pappus; the calyx is hemispherical, with equal scales; and the seeds are ovated. There are three species, and many varieties. 1. *B. annua*, with leaves on the lower part of the stalk, is a low annual plant growing naturally on the Alps, and the hilly parts of Italy. 2. *B. hortensis*, the garden daisy, with a large double flower. 3. *B. perennis*, the common daisy, with a naked stalk, and one flower, grows naturally in pasture lands in most parts of Europe. It is often a troublesome weed in the grass of gardens, and so is never cultivated.

BELLIS MAJOR. See **CHRYSANTHEMUM**.

BELLIUM, in botany, bastard daisy; a genus of plants of the class syngenesia, order polygamia superflua. Generic character is receptacle naked; seeds conical; crown paleaceous, of eight leaves; awned, and furnished with a pappus: leaflets of the calyx equal. It is a genus allied to bellis, containing two species, one of which is a native of Italy, and the other of the Levant.

BELL-METAL, a composition of tin and copper melted together, which is more sonorous than either of these ingredients taken apart. The ordinary proportion is about twenty-two or twenty-three pounds of tin to 100 pounds of copper; though it varies according to the size of the bells; a greater quantity of copper being used in the greater bells than in the smaller. Some add lead and brass, others zinc or spelter. Though tin is specifically lighter than copper, yet the gravity of the compound is greater than that of copper. Some speak of a native mineral under the denomination bell-metal, from which Becher affirms he procured zaffer and smalt. See **CUE-MISTRY**.

BELL-MUSCIUS, in botany, a name given by some authors to the plant called *bania moschata*, the mosch seed.

BELLON, a distemper common in countries where they smelt lead ore. It is attended with languor, intolerable pains and sensations of gripping, and generally costiveness. It frequently proves fatal. Beasts, poultry, &c. as well as men, are subject to this disorder: hence the term

BELLON GROUND, for the space round the smelting houses, because it is dangerous for an animal to feed upon it.

BELLON, or **BELLONIUS** (Peter), a celebrated French physician, born at Caen, in Normandy, was the author of many tracts on botany, natural history, &c. and gave name to the genus of plants called *Bellonia*.

BELLONA, in Pagan mythology, the goddess of war, is generally reckoned the sister of Mars;

some represent her as both his sister and wife. She is said to have been the inventress of the needle; and from that instrument is supposed to have taken her name. *Βελουη*, a needle. She was of a cruel and savage disposition, and is commonly represented in an attitude expressive of fury; her hair composed of snakes, clotted with gore, and her garments stained with blood: thus she drives the chariot of Mars, with a bloody whip in her hand; or sometimes holding a lighted torch or brand; at others a trumpet. She had a temple at Rome, near the circus Flaminius, before which stood the column of war, from whence the consul threw his lance when he declared war. She was also worshipped at Cumana, in Cappadocia: and Camden observes, that in the time of the emperor Severus, there was a temple to Bellona in the city of York. This goddess is represented on medals of the Brutii, &c. as in the annexed figure, with a shield in both her hands, and a spear resting on her shoulders.

BELLONARIII, in antiquity, priests of Bellona. The bellonarii cut and mangled their bodies with knives and daggers, to pacify the deity. In this they are singular, that they offered their own blood, not that of other creatures, in sacrifice. In the fury and enthusiasm wherewith they were seized on these occasions, they ran about raging, uttering prophecies, and foretelling slaughter, devastations of cities, and revolutions of states: whence Martial calls them *turba entheata Bellonæ*. In after-times they seem to have abated much of their zeal, and to have turned the whole into a kind of farce, contenting themselves with making signs and appearances of cutting. Lampridius tells us, the emperor Commodus, out of a spirit of cruelty, turned the farce again into a tragedy, obliging them to cut and mangle their bodies really.

BELLONIA, in botany, a genus of the monogynia order, and pentandria class of plants. The characters are, the flower is wheel-shaped, of one leaf with a short tube, but spread open above, and cut into five obtuse segments; it has five stamina, which close together; the germen is situated under the receptacle of the flower, which afterwards becomes an open turbinated seed-vessel, ending in a point, having one cell filled with small round seeds. Of this genus there is only one species known, viz. *B. aspera*, or shrubby bellonia, which has a rough balm leaf. It is very common in the warm islands of America.

BELLORI (John Peter), of Rome, a celebrated antiquary and connoisseur: author of the lives of the modern painters, architects, and sculptors, and other works on antiquities. He died in 1696.

BELLOVACI, a people of Gallia Belgica, reckoned the bravest of the Belgæ; who anciently possessed that part of France called Beauvoisis, before the revolution in the isle of France.

BEL/LOW, } Ang.-Sax. *blowan*; a low-
BEL/LOWER, } ing; a loud roaring noise,
BEL/LOW'ING. } like a bull, or like the sea in

a storm; any continued noise that may cause terror.

Till, at the last, he heard a dreadful sound,
Which thro' the wood loud *bellowing* did rebound.

Jupiter became a bull, and *bellowed*; the green
Neptune a ram, and bleated.

He fastened on my neck, and *bellow'd* out,
As he'd burst heaven.

The rising rivers float the nether ground;
And rocks the *bellowing* voice of boiling seas rebound.

What bull dares *bellow*, or what sheep dares bleat,
Within the lion's den?

But now the husband of a herd must be
Thy mate, and *bellowing* sons thy progeny.

The dull fat captain, with a hound's deep throat,
Would *bellow* out a laugh in a base note.

This gentleman is accustomed to roar and *bellow* so
terribly loud, that he frightens us.

BELLOWS are properly defined a machine, so contrived as to expire and inspire the air by turns, by enlarging and contracting its capacity. This machine is used in chambers and kitchens, in forges, furnaces, and foundries, to blow up the fire: it serves also for organs and other pneumatic instruments, to give them a proper degree of air. All these are of various constructions, according to their different purposes; but in general they are composed of two flat boards, sometimes of an oval, sometimes of a triangular figure. Two or more hoops, bent according to the figure of the boards, are placed between them; a piece of leather, broad in the middle, and narrow at both ends, is nailed on the edges of the boards, which it thus unites together; as well as on the hoops which separate the boards, that the leather may the easier open and fold again: a tube of iron, brass, or copper, is fastened to the undermost board, and there is a valve within that covers the hole in the under board, to keep in the air.

Annals, the Scythian, is said to have been the inventor of bellows. The action bears a near affinity to that of the lung; and what we call blowing in the latter, affords a good illustration of what is called inspiring in the former. Animal life may on some occasions be subsisted by blowing into the lungs with a pair of bellows. Dr. Hooke's experiment is remarkable: having laid the thorax of a dog bare, by cutting away the ribs and diaphragm, pericardium, &c. and having cut off the aorta and arteria below the epiglottis, and bound it on the nose of a bellows, he found, that as he blowed, the dog recovered, and as he ceased, fell convulsive; and thus was the animal kept alternately alive and dead above the space of an hour. These bellows made wholly of wood, without any leather about them; one of which I preserved in the repository of the Royal Society; and Dr. Hooke describes another in the copper-plates at Eilston in Staffordshire. Bellows are also invented, which the apparatus of the Royal Philosophical Society, for the recovery of the apparently drowned, and will enable any intelligent person to raise the lungs, and by external pressure on the breast to imitate the action of the diaphragm.

For the great uses of metallurgy, such as the blowing of iron, and great power,

are found necessary, and have generally assumed the name of **BLOWING MACHINES**, which see.

Chinese BELLOWS consist of a box of wood, about two feet long, and one foot square; though the machine may be made of any requisite dimensions. The opposite boards are exactly parallel to each other, smooth, and varnished both on the outer and inner sides. A thick square board of wood, which exactly fits the internal cavity of the box, is pushed backwards and forwards, from end to end of the box, by means of a cylindrical rod of wood, which comes out at an aperture in the centre of one end of the box, and in order to make the rod move steadily, and prevent the escape of air, the aperture through which the rod passes has a wooden tube projected from it to the distance of a little more than an inch. For the conveniency of pushing the rod backwards and forwards, its extremity is furnished with a handle, or cross bar of wood, like the head of a gimlet, by which it can be laid hold of. In the bottom of the box, at each end, there is a small conical or plug valve, concealed in the upper board of the box. The two valves below admit air alternately into the box, while the valves above alternately discharge the air; and, at the same time, the valves prevent the air from returning the same way it had once passed. The upper board is double, and the space betwixt them serves as a reservoir in which the accumulated air is condensed. Into the side of this reservoir, between the boards, a metallic pipe is inserted, which conducts the air, in a constant stream, into the furnace or forge. It is evident that if the movable board or piston, within the box, be pushed by the rod from the end next the handle to the opposite end of the box, all the air in the box will be forced up through the valve above that end of the box; while the under valve at that end will shut, and prevent its escape downwards: at the same time new air will rush in through the under valve next the handle, and again fill the box. By pulling out the rod, the movable board or piston will be drawn in the opposite direction, and all the air in the box will now be forced up through the upper valve next the handle, into the reservoir, and from thence, as it cannot escape by the opposite valve, rush through the metallic pipe into the furnace. Thus these valves, by opening and shutting alternately, as long as the piston or movable board is pushed or drawn by the rod, backwards and forwards, from end to end of the box, a constant and powerful stream of air will be blown into the furnace. The above description is copied from a machine of this sort, which the ingenious Dr. Lind, of Windsor, brought from Canton, in China. By its help he could melt pig-iron in a small furnace, consisting of an Austrian crucible, fixed on a table. Such bellows are neither so costly, nor so apt to go wrong, as those composed of leather. They may be made of any dimensions, and may be wrought by any power as well as that of the hand. It is surprising that no attempts have been made to bring them into use in this country.

BELLOWS, HYDROSTATIC. See **HYDROSTATICS**.

BELLOWS OF AN ORGAN are commonly six feet long, and four broad; each having an aperture

of four inches, that the valve may play easily. There should likewise be a valve at the nose of the bellows, that the one may not take the air from the other. To blow an organ of sixteen feet, there are required four pairs of these bellows. They are wrought by a man called the blower; and, in small organs, by the foot of the player.

BELLOWS, WATER, a contrivance to save expense in the fusion of metals, wherein water, falling through a funnel into a close vessel, sends from it so much air as blows the fire. See **FURNACE**.

BELL-PEPPER, in botany. See **CAPSI-CUM**.

BELL-ROCK, or **CAPE**, a dangerous ridge of sunken rocks, lying about twelve miles east from the point of Fife-ness, and an equal distance south from Arbroath harbour, between the openings of the Friths of Tay and Forth. The ridge extends about a mile in length, and half a mile in breadth; the top of the rock only being seen a few hours at low water in spring tides. This rock not only renders the navigation of the Tay and Forth very hazardous, but is also highly dangerous to all vessels navigating coast-wise. Every year, formerly, vessels of great value were wrecked upon it, and there is reason to suspect that many which were supposed to have foundered at sea, have suffered on this dangerous reef. It is a remarkable fact that hardly a single instance has been known of a vessel being saved which had the misfortune to strike upon this rock. Captain Brodie of the royal navy placed a beacon on it some years ago, but though the greatest care was taken to have it properly secured, the first storm broke the chains, and the beacon was driven ashore. Previous to the erection of the new and noble light-house now placed here, it was commonly remarked that even if it were practicable to erect it upon such a sunken rock, no one would be found hardy enough to live in an abode so dread and dreary, and that it would fall to the lot of the projectors themselves to possess it for the first winter. The bill appointing commissioners for this great undertaking, however, passed both houses of parliament late in the session of 1806. In the following summer, a vessel was fitted out as a floating-light, and moored off the Bell-rock. Captain Brodie had previously constructed a very ingenious model of a cast-iron light-house standing on pillars; and Mr. Murdoch Downie, author of several marine surveys, brought forward a plan of a light-house, to stand upon pillars of stone. Mr. Telford, the engineer, was also employed in some preliminary steps, connected with Mr. Downie's enquiries. But Mr. Stevenson, engineer for the commissioners of the northern light-houses, modelled the first design, which was submitted to the opinion and advice of Mr. Rennie. This distinguished engineer coincided with Mr. Stevenson in preferring a building of stone, upon the principles of the Eddystone light-house.

The **BELL-ROCK LIGHT-HOUSE** is a circular building, the foundation-stone of which is nearly on a level with the surface of the sea at low-water of ordinary spring-tides; and consequently at high-water of these tides, the building is immersed to the height of about fifteen feet. The two first or lower courses of the masonry are imbed-

ded into the rock, and the stones of all the courses are dovetailed and joined with each other, forming one connected mass from centre to circumference. The successive courses of the work are also connected by joggles of stone; and to prevent the stones from being lifted up by the force of the sea, while the work was in progress, each stone of the solid part of the building had two holes bored through it, entering six inches into the course immediately below, into which oaken tree nails, two inches in diameter, were driven, after Mr. Smeaton's plan at the Eddystone. The cement used at the bell-rock, like that of the Eddystone, was a mixture of pozzolano, earth, lime, and sand, in equal parts, by measure. The building is of a circular form, composed of stones of the weight of from two tons to half a ton each. The ground course measures 42 feet in diameter, and the building diminishes, as it rises to the top, where the parapet-wall of the light-room measures only 13 feet in diameter. The height of the masonry is 100 feet, but including the light-room, the total height is 115 feet. The building is solid from the ground course to the height of 30 feet, where the entry-door is situate, to which the ascent is by a kind of rope-ladder with wooden steps, hung out at ebb tide, and taken into the building again when the water covers the rock; but strangers to this sort of climbing are taken up in a chair, by a movable crane projected from the door, from which a narrow passage leads to a stone stair-case 13 feet in height. Here the walls are seven feet in thickness, but they generally diminish from the top of the stair-case to the parapet-wall of the light room, where they measure one foot in thickness. The upper half of the building may be described as divided into six apartments for the use of the light-keepers, and for containing light-house stores. The lower or first, formed by an inside scarfement of the walls at the top of the stair-case is chiefly occupied with water tanks, fuel, and the other bulky articles; the second floor is for the oil, cisterns, glass, and other light-room stores; the third is occupied as a kitchen; the fourth is the bed-room, the fifth the library or strangers' room, and the upper apartment forms the light-room. The floors of the apartments are of stone, and the communication is made by means of wooden ladders, excepting in the light-room, where every article being fire proof, the steps are made of iron. There are two windows in each of the three lower apartments, but the upper have each four windows. The casements are all double, and are glazed with plate-glass, having besides an outer storm-shutter, or dead light of timber, to defend the glass from the waves and spray. The parapet wall of the light-room is six feet in height, and has a door which leads out to the balcony or walk formed by the cornice round the upper part of the building; which is surrounded by a cast-iron rail, wrought like net-work. This rail rests upon batts of brass and has a massive coping, or top rail, of the same metal. In the kitchen, there is a grate or open fire-place of cast iron, with a smoke tube of the same metal, which passes through the several apartments of the light-room, and heats them in its passage upwards. This grate and

chimney merely touch the building, without being included or built into the walls, which, by this means, are neither weakened, nor liable to be injured by it. The timber of the doors, the pannelled partitioning of the rooms from the stairs, and the bed frames and furniture in general, are of wainscot.

The light-room, and its apparatus was entirely prepared at Edinburgh. It is of an octagonal figure, 12 feet across, and 15 in height, formed with cast-iron sashes, glazed with large plates of polished glass, measuring about 2 feet 6 inches by 2 feet 3 inches, each plate being a quarter of an inch thick. The light-room is covered with a dome roof of copper, terminating in a large gilded ball, with a vent-hole in the top. The light of the Bell-rock is very powerful, and is readily seen at the distance of six or seven leagues, when the atmosphere is clear. The light is from oil, with Argand burners placed in the focus of silver plated reflectors, measuring 24 inches over the lips; the silvered surface or face being hollowed or wrought to the parabolic curve. That the Bell-rock light may be easily distinguished from all other lights upon the coast, the reflectors are ranged upon a frame with four faces or sides, which, by a train of machinery, is made to revolve upon a perpendicular axis once in six minutes. Between the observer and the reflectors, on two opposite sides of the revolving frame, shades of red glass are interposed, in such a manner, that during each entire revolution of the reflectors, two appearances, distinctly differing from each other, are produced; one is the common bright light familiar to every one, but, on the other, or shaded sides, the rays are tinged of a red color. These red and bright lights, in the course of each revolution, alternate with intervals of darkness, which, in a very beautiful and simple manner, characterise this light.

In foggy weather two large bells of about 12 wt. each, are tolled day and night by machinery. Vessels who cannot see the lights, thus get warning to put about. The establishment at the Bell-rock, consists of a principal light-keeper, who has 60 guineas per annum, paid quarterly, a principal assistant, who has 55 guineas; and two other assistants at 50 guineas each, besides a suit of uniform clothes, in common with the other light-keepers of the northern light-towers, every three years. While at the rock, these men get a stated allowance of bread, beef, butter, oat-meal, potatoes, and vegetables, besides small beer, an allowance of fourpence per day each for the purchase of tea and other necessaries. At Arbroath, the most contiguous town on the opposite coast, a suite of buildings has been erected, where each light-keeper has his apartments for his family. Here the master and mate of the light-house tender, have also accommodations for their families; a plot or piece of inclosed garden, and is attached to each house, and likewise a seat in one of the pews in the parish church of Arbroath. Connected with these buildings there is a small tower erected, which is used for the purpose of lighting. At the top of this tower is a small lantern about five feet diameter, and is covered with copper. From the lantern a light is sent out, which is

arranged, and kept up with the light-keepers at the rock. Three of the light-keepers are always at the light-house, while one is ashore on liberty, whose duty it is for the time to attend the signal room; and when the weather will admit of the regular removal of the light-keepers they are six weeks at the rock, and a fortnight ashore with their families.

The attending vessel for the Bell-rock, and the light-houses at the isle of May and Inchkeith, in the Firth of Forth, is a very handsome little cutter of about 50 tons register, carrying upon her prow a model of the light-house, and is appropriately named the *Pharos*. She is stationed at Arbroath, and is in readiness to proceed for the rock at new and full moon, or at spring-tides, carrying necessaries, and the light-keeper on leave, to the rock, and returning with another. This vessel is navigated by four men, including the master, and is calculated for carrying a boat of 16 feet keel, or of sufficient dimensions for landing at the rock in moderate weather. The master and mate are kept in constant pay, and have apartments in the establishment ashore; the former, acting as a superintendent, has the charge of the buildings and stores kept at Arbroath.

BELLULÆ, in zoology, the sixth order of the mammalia; the character of which is, that their fore teeth are obtusely truncated, their feet hooved their walk heavy, and their food vegetables. See *ZOOLOGY*.

BELLUGA, in ichthyology, a large fish, accounted a species of sturgeon, and called by *Artesi*, *accipenser tuberculis carens*. It is like the sturgeon in shape, but its snout is shorter and thicker. Of its row or spawn is made caviar, and some of them are so large as to yield 200 weight of it. The fish is very common and very large in the Volga, near the city of Astracan. It has been caught there thirty-six feet long, and eighteen thick. It is also found in the Don, and other rivers, and in the Baltic and Caspian seas. See *ACCIPENSER*.

BELLULA *Bos*, in ichthyology, a name given by *Paulus Jovius* to that species of the ray fish which was called by the old Greek and Latin writers *bos marinus*, and by the late authors *raja oxyrynchus*. It is distinguished by *Artesi*, by the name of the variegated ray, with ten prickly tubercles on the middle of the back.

BELLUM, *Lat.* war; in old law, trial by combat.

BELLUNESE, a territory of Italy, which belonged to the Venetians, till ceded to Austria, by the treaty of Campo Formio. It now forms a part of the Lombardo-Venetian kingdom, and lies between Friuli, Cadorino, Feltrino the bishopric of Trent and Tyrol. It is thirty miles long, and twenty-two broad, and produces plenty of corn, wine, fruits, &c. besides rearing great numbers of cattle. It contains besides the capital, Belluno, 200 towns, villages, and ferts, with 40,000 inhabitants.

BELLUNO, a town of Italy, and a bishop's see; is situated among the Alps, on the river Piave.

BELLUTUS (*Sicinius*), a plebeian Roman, who, about the year of Rome 256, headed the people in their opposition to the exorbitant power

of the Senate and Patricians; and under whom they retired to the Mons Sacer, about three miles from Rome, intending to form a new establishment for themselves, till, after repeated messages sent in vain by the senate, Menenius Agrippa persuaded them to return, by the well known fable of the belly and the other members. On this occasion the tribune-ship being first instituted, Bellutus was appointed the first of the five Tribunes, A. U. C. 560. See **ROME**

BELLY, *v. & n.* } Gothic, *bulgs*; Ang-
BELLY'ACHE, } Sax. *balg*; Lat. *bulga*;
BELLY'BOUND, } that part of the human
BELLY'CHEER, } body which reaches from
BELLY'FULL, } the head to the thighs,
BELLY'FARE, } containing the bowels;
BELLY'SLAVE, } the womb; any thing
BELLY'GOD, } that swells out to a large
BELLY'PINCHED, } capacity. To belly out,
BELLY'TIMBER, } is to swell out; to in-
BELLY'WORM. }flate; to sketch; to dis-
 tend.

The body's members

Rebell'd against the *belly*; thus accus'd it:—

That only like a gulf it did remain,
 Still cupboarding the viand, never bearing,

Like labour with the rest. *Shakespeare.*

Do you set down your name in the scroll of youth,
 that are written down old with all the characters of
 age? Have you not a moist eye, a dry hand, a
 yellow cheek, a white beard, a decreasing leg, an
 increasing *belly*? *Id.*

This night, wherein the cubdrawn bear would
 couch,

The lion and the *belly-pinched* wolf
 Keep their fur dry, unbomnetted he runs. *Id.*

Back and side go bare, go bare,
 Both hand and foot go cold:
 But *belly*, God send thee good ale enough,
 Whether it be new or old. *Still. Old Song.*

With Methos, Gluttony, his guttling brother,
 Twin parallels, drawn from the self-same line;
 So foully like was either to the other,
 And both most like a monstrous *belly'd* swine.

Fletcher. Purple Island.
 What infinite waste they made this way, the only
 story of Apicius, a famous *bellygod*, may suffice to
 shew. *Hakewell.*

Thus, by degrees, day wastes, signs cease to rise,
 For *bellying* earth, still rising up, denies
 Their light a passage, and confines our eyes.

Creech's Mamilus.
 Loud rattling shakes the mountains and the plain,
 Heav'n *bellies* downwards, and descends in rain.

Dryden.
 'Midst these disports, forget they not to drench
 Themselves with *bellying* goblets. *Philips.*

The strength of every other member
 Is founded on your *belly-timber*. *Prior.*

BELLY in anatomy, the abdomen. See **ANA-
 TOMY**, Index.

BELLY, **DRAGON'S**, *venter draconis*, is used by
 some astronomers to denote the point in a plan-
 et's orbit, wherein it has its greatest latitude, or
 is farther distant from the ecliptic, more frequent-
 ly called its limit.

BELMONTE, a town of Italy, in the hither
 Calabria and kingdom of Naples. It is situated
 on the coast of the Tuscan sea. It is celebrated
 for its fine marbles.

BELLOCK, be and lock. See **LOCK**.

BELOE (William), a native of Norwich,
 educated at Cambridge. About 1773 he became
 assistant to Dr. Parr, who was then head master
 of the Norwich grammar school. He shortly
 after obtained the vicarage of Earham. Re-
 moving to the metropolis, he was made master of
 Emanuel College, Westminster, and he joined
 with Archdeacon Nares in establishing and editing
 the British Critic. His connexion with this
 work continued till the close of the forty-second
 volume. He also obtained the living of Allhal-
 lows, London-wall, a prebend in St. Paul's, and
 the desirable post of a librarian to the British
 Museum. Of the last situation, however, he was
 deprived, in consequence of the loss of some
 valuable prints, which were stolen by a dishonest
 artist. He died at Kensington in 1817. He
 translated Herodotus, and Aulus Gellus, and was
 the author of *Miscellanies*, 3 vols. *Anecdotes*
of Literature and Scarce books, 6 vols. 8vo. The
Sexagenarian (his own memoirs), 2 vols. 8vo. and
 some works of minor importance.

BEL'LOMANCY, *n. s.* From *βελος* and *μαν-
 τεια*.

Belomancy, or divination by arrows, hath been in
 request with Scythians, Alans, Germans, with the
 Africans and Turks of Algiers.

Brown's Vulgar Errors.

BELOMANCY, **BELOMANTIA**, was practised in
 the east, but chiefly among the Arabians, and
 in different ways. One was to mark a parcel
 of arrows, and put eleven or more of them into
 a bag: these were drawn out; and according as
 they were marked or not, they judged of future
 events. Another way was to have three arrows,
 upon one of which was written, 'God orders it
 me;' upon another, 'God forbids it me;' and
 upon the third nothing. These were put into a
 quiver, out of which one was drawn at ran-
 dom; if it happened to be that with the first
 inscription, the thing was to be done: if it
 chanced to be that with the second, it was let
 alone; but if it proved that without inscrip-
 tion, they drew over again. *Belomancy* is an
 ancient practice, and probably that which Ezekiel
 mentions, chap. xxi. 21. At least St. Jerome
 understands it so, and observes that the practice
 was frequent among the Assyrians, and Baby-
 lonians. Something like it is also mentioned in
 Hosea, chap. iv. only that slaves are mentioned
 instead of arrows, which is rather that of de-
 mancy than *belomancy*. Grotius, as well as Je-
 rôme, confounds the two together, and shows that
 it prevailed among the Magi, Chaldeans, and Sey-
 thians; whence it passed to the Sclavonians, and
 thence to the Germans, who, as Tacitus observes
 made use of it.

BELON (Peter), born at Mans, in France
 flourished about the middle of the sixteenth
 century. He was murdered near Paris by one
 of his enemies, in 1565. His principal works
 are, 1. *De Arboribus Coniferis*, 4to. Paris,
 1553. 2. *Histoire de la Nature des Oiseaux*,
 fol. 1555. 3. *Portraits d'Oiseaux*, 4to. 1557.
 4. *Histoire des Poissons*, 4to. 1551, with plates.
 5. *De la Nature et Diversité des Poissons*, 8vo.
 1555.

BELONE, in ichthyology, the trivial name of
 a species of esox. See **ESOX**.

BELONG, *v. n.* Dutch *belangen*. To be the property, province, or business of; to adhere, appertain, or have relation to.

To light on a part of a field *belonging* to Boaz. *Ruth.*

There is no need of such redress;

Or if there were it not *belongs* to you.

Shakespeare.

The declaration of these latent philosophers *belongs* to another paper.

To Jove the care of heav'n and earth *belongs*

Dryden.

He went into a desert *belonging* to Bethsaida.

Luke.

To whom *belongest* thou? whence art thou?

I Samuel.

The faculties *belonging* to the supreme spirit, are unlimited and boundless, fitted and designed for infinite objects.

Cheyne.

He careth for things that *belong* to the Lord.

I Corinth.

BELOSTOMA, in zoology, a genus of insects of the order hemiptera, family hydrocorisæ. Its generic character is, fore feet terminated by a single hook; antennæ semi-pectinated. There is no European species.

BELoved, *part.* From *belove*, derived of *love*. It is observable, that though the participle be of very frequent use, the verb is seldom or never admitted; as we say 'you are much *belored* by me,' but not 'I *belove* you.' Loved; dear.

I think it is not meet,
Mark Antony, so well *belored* of Cæsar,
Should I outlive Cæsar.

Shakespeare.

In likeness of a dove
The Spirit descended, while the Father's voice
From heav'n pronounc'd him his *beloved* Son.

Milton.

Each lonely scene shall thee restore,
For thee the tear be daily shed;
Belov'd till life can charm no more,
And mourn'd till pity's self be dead.

Collins' Dirge.

BELOW, *prep. & adv.* Be and low. Low
BELOW, *v.* } is the past participle
of the Ang.-Sax. verb, *liegan, jacere, cubere*.
Belov'd, is to treat as a *low*. Under, in place;
not high; unbecoming; unworthy of; in the lower
place; in hell; in earth, in opposition to
heaven.

For all *below* the moon I would not leap.

Shakespeare.

He'll beat Audin's head *below* his knee,
And tread upon his neck.

Id.

To men standing *below* on the ground, those that be on the top of Paul's seem much less than they are, and cannot be known; but, to men above, those *below* seem nothing so much lessened, and may be known.

Bacon.

The upper regions of the air perceive the collection of the matter of the tempests and winds before the air here *below*; and therefore the obscuring of the smaller stars, is a sign of tempest following.

Id.

His sultry heat infects the sky;
The ground *below* is parch'd, the heav'ns above us fry.

Dryden.

'Tis much *below* me on his throne to sit;

But when I do, you shall petition it. *Id.*

This said, he led them up the mountain's brow,
And show'd them all the shining fields *below*. *Id.*

The gladsome ghosts in circling troops attend;

Delight to hover near, and long to know

What bus'ness brought him to the realms *below*. *Id.*

When suff'ring saints aloft in beams shall glow,

And prosp'rous traitors gnash their teeth *below*. *Tickell.*

And let no tears from erring pity flow,

For one that's bless'd above, immortaliz'd *below*. *Smith.*

The fairest child of Jove,

Below for ever sought, and bless'd above. *Prior.*

The noble Venetians think themselves equal at least to the electors of the empire, and but one degree *below* kings. *Addison.*

His Idylliums of Theocritus are as much *below* his Manilius, as the fields are *below* the stars. *Felton.*

Sieur Gaulard, when he heard a gentleman report, that at supper they had not only good cheer, but also savoury epigrams and fine anagrams, returning home, rated and *belov'd* his cook as an ignorant scullion, that never dressed him either epigrams or anagrams. *Camden.*

Father of all above and all *below*,

O great! and far beyond expression so,

No bounds thy knowledge, none thy power confine,

For power and knowledge in their source are thine. *Parnell.*

BELPECH, a town of France, in Languedoc, department of the Aude. In 1369 this place was taken by the English, and among the prisoners was Isabella, mother of the queen of France. It is seven miles north-west of Mirepoix, and twelve south-west of Castelnaudary. Long. 150° E., lat. 43° 12' N.

BELSHAZZAR, **NABONADIUS**, or **LABYNI-TUS**, the last king of Babylon, is generally agreed to have been the son of Evil-Merodach, by the celebrated Nitocris, and grandson of Nebuchadnezzar the Great. He succeeded upon the deaths of his uncle-in-law Neriglissar, and his infant cousin Laborosoarchod (with whom some authors confound him), about A. M. 3393, or, according to others, 3449. He is said to have reigned seventeen years, but was so devoted to pleasure, that nothing is recorded of him, excepting his folly, dissipation, and impiety, till the last day of his reign and life: when the miraculous vision of the hand-writing on the wall, denouncing the immediate overthrow of his empire, alarmed him and his impious nobles, in the midst of their guilty festival; and led him to apply for advice, when too late, to the long neglected prime minister and prophetic instructor of his grandfather. See Daniel, chap. v. Babylon was taken by Cyrus, Belshazzar slain, and the kingdom transferred to the Medes and Persians; A. M. 3410, or 3466, and about A. A. C. 538. See **BABYLONIA**.

BELSWAGGER, *n. s.* A cant word for a whoremaster.

You are a charitable *belswagger*; my wife cried out fire, and you cried out for engines. *Dryden.*
